of a snob and utterly devoid of that power of detachment revealed in a sense of humor, fired the suitor out, forbade his daughter to have anything to do with him, and broke up the whole affair. The young man went away. He loved the girl but was independent, and also sore at his treatment. The girl obeyed, because her mother had made her promise to stay by her father. Six months later, when the old man came to the slow realization that, after all, maybe it wasn't so bad, he wrote a lofty letter to the boy and asked him to come back. The boy, who in the meantime had had his salary doubled, wrote back and said, "Nothing doing. You had your chance. I am not a piker."

The other case was of a girl (whose father was also very rich) who ran away with a chap who has since proved a model husband. They live near me now. The father immediately disowned the girl, and, although this marriage is a great success, the poor man has to this day never forgiven his daughter. Apparently he has not enough of true humor to absorb his embarrassment and chagrin over her correct choice. Think of all the accumulated resentment, false pride and perverted thought which, over a series of years, flowed in to poison this most sacred of relationships; for I still contend that, while the mother-and-son love has figured more largely in the annals of human nature, the father-and-daughter love is equally powerful. If in the cases I have mentioned a sense of humor had been one of the household ornaments (no better antique than that) it would have been impossible to have had a continuance of strained relationship. No matter how severe have been the crises in my own family, at some point the ridiculous aspect of the affair has always suddenly struck us all a heap. In the case of my own boy, nothing, seemingly, could have been more tragic, more intensely impractical and idiotic. He was one of that kind of persons who cannot adjust themselves to the machinery of civilization, who had no protective intelligence. These people, who are really more numerous than we realize, are always bewildered by the world, and this boy was precisely like that. His irresponsibility was complete, for it included himself. Consumed by his affections and so democratic in his tastes that he once gave away his clothes to a poor devil hanging around a railroad station (one of those acts which afterward never brings any regret, no matter how good the clothes were). He was the friend of all derelicts within a radius of twenty miles, hopeless in his studies, beloved by all because I suppose he never excited any envy. After he had spent all his money, was completely out of luck, he ran off and got married. His mother was horrified. I was horrified. All the neighbors were horrified. But our solidified sense of humor, now accumulated about us like the mantle of Elijah, saved the day. We took these poor innocents in and laughed at them, although I am free to confess that at times it choked us. I recall that some nice unmarried ladies, who had the best intentions in the world, attempted to commiserate with us on our regarded calamity. We replied:

"Never mind. If you should want to get married come around and live with us. The thing's in the air in our house. We'll guarantee results in three weeks."

I am by no means upholding this sort of thing. I think it is dreadful. If I ever get married again I am going to have my wife examined first by a board of financial experts, and then make her take a course of interior decoration, so she will be able to select the right kind of wall paper. There are other things I shall have her do. But in the case of my boy, while it was bad enough, to have done anything else would, or might easily, have been ruinous. As the event proved, humor was too much for him. He couldn't stand the silent pressure. In a few weeks he decamped with his fine little wife and thenceforth began to make good.

If you have gathered my meaning from all this, my point is a simple one. Nobody is purposely bad. Our mistakes are generally due to a combination of ignorance and bewilderment. When enlarged upon, these invariably grow into a process of self-destruction. A right sense of humor, always applied to everyday affairs, is merely the ability to compare ourselves at critical moments with something larger and better. Dr. Samuel Johnson once attended a party where a fat, perspiring lady, full of her own importance, arrived late in the anteroom and complained to the doctor that there was no chair to sit in.

"Ah! Madam," replied the doctor, "where you are there are never any chairs."

This poor lady never knew the doctor was guying her. She would, though, if she had been living in my family.

Webster says that wit is more purely intellectual than humor, and that it implies swift perception of the incongruous, depending for its effect chiefly on ingenuity or unexpectedness of turn, or patness of application. On the other hand, humor implies broader human sympathies than wit, and a more kindly sense of the incongruous, often blended with pathos. Therefore, let us be humorous if we can; wit may follow if it will.

The Evolution of the Bathing Girl

By ZETA ROTHSCHILD

Just going to have a dip (from Paul Pry's Trip to Margate). First bathing girl.

ON YOUR right is the first representation of the bathing girl!

Coyly posed on the top step of her bathing machine, she is about to venture into the water. She is enveloped in a garment for which we have no name. Made of some dark stuff, it covers her from neck to ankle, including arms. But thanks to a breeze that has penetrated the canvas awning, we learn that she does not wear stockings. We also deduce that this voluminous gown is her only covering.

At the foot of the steps stands the lady guide who, after leading the horse attached to the other end of the bathing machine into the water as far as he can or will go, is ready to help the lady bather take her dip.

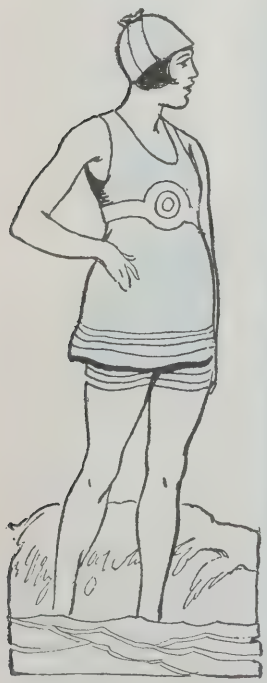
Bathing, one hundred and seventy-five years ago, was just coming in as a fashion. John Wesley from his pulpit was preaching the doctrine, cleanliness is next to godliness. In addition to this pious incentive which alone might not have sufficed to persuade people to take up the new fad, the doctors were hailing bathing—especially sea bathing—as a cure for all ills. Sea-bathing became the medical innovation of the decade. Without broken bones, there would be no need for hospitals, grouched those who prophesied only bad results from too much water. It never occurred to the eighteenth-century Briton and his spouse that sea bathing might be a pleasure; to both of them the ocean was a medicine to be taken internally as well as externally. They went to the sea in the same spirit they went to the chemists for a tonic.

So for the sake of her health did the fair dipper of our engraving approach the surf at Margate. Early in the morning she went to one of the bathing rooms on High street and, after registering, awaited her turn for a bathing machine. Each room had only seven machines in its service so, while she waited, she amused herself thrumming on the pianoforte, read the newspapers from London or exchanged symptoms with the other invalids who filled the room. They would argue about the benefits of the sea water; they said "it strengthened, and it weakened—it made people fat, it made them lean, it thinned and it thickened the blood, it hardened and it relaxed, it was good for everything, it was good for nothing." Even to sit still and smell the sea mud was beneficial, claimed one.

Eventually the model of our illustration was told her turn had come. She left the company and descended the steep steps that led from the rear of the bathing rooms down to the beach and her bathing machine.

This bathing machine was a Margate product, the invention of Benjami Beale, a Quaker. It seems that a one time some hoydenish folk had gon down to the beach in a covered ca and, after driving into the ocean u to the horse's neck, had jumped int the water. History doesn't mentio their costumes, but the procedu shocked the gentle and farsighte Benjamin who had viewed the spectac from the beach. Shortly after th incident, Benjamin, who was a co structive censor, if there is such thing, offered the bathing public bathing machine which shielded t bather from the eyes of the public and out of the water.

At one end of the bathing machi was a horse; at the other, steps and cornucopia-shaped canvas. The bo was a very small room of wood mount on a cart. Our bathing girl entered one end fully clothed. She probab unfastened her wig, hopped out of h hoops, carefully put aside her artifici beautifiers and donned her bathi suit. Getting ready for a bath wh George III ruled was not the simp



Bathing suits in America in 1871.

t it is in the term of President olidge!

When our lady was attired in that rdy, billowing covering we see her in, e was ready to descend the steps and nge into the ocean. While she was tting ready, her guide had been ding the horse into the ocean. uarded and assisted by this attendant, e bathed in the privacy of her rnucopia. Only an X-ray could have netrated her retreat. It was not a ry long bath, for guide, machine and rse waited until she was ready to turn to her shelter. Then she was awn up on the beach where, still the machine, she made ready to eet her friends in the bathing rooms on the beach.

For her bath, including machine d lady guide, she paid one shilling d threepence, a goodly sum in those ys. Small wonder that at first the thing machine did not prosper and at the widow of the inventor spent e last years of her life at Draper's mshouse—that unique institution here every one of its eight inmates ved in her own cottage with its very vn garden. There the old lady, who ed to be ninety, would give her ends a dish of tea and tell of the ys before the folk from London came wn to Margate to go into the ocean.

Margate, and other bathing places at soon shared its popularity, owes a eat share of its prosperity to the thing machine. For, despite the ge of its doctors and the approval of e pulpit, it is doubtful whether this tra-modest generation would have red to bathe in so public a place as the ocean.

When Dr. Johnson Bathed at Brighton

"The pleasures of bathing," reads an advertisement of this period, "may, der their friendly shade, be enjoyed so private a manner, as not to end the strictest and most refined licacy."

The bathing girl and her contemporaries were the making of Margate. Until the bathing boom struck the town, it had led a rather depressed existence among fishermen's shacks and deserted malting houses. But now the fashionable "persons of delicacy" came down from London in their coaches or by post chaise. But the *hoi polloi* came in hoys by water. These hoys were sloop-rigged vessels, varying from 8 to 120 tons burden. They sailed from the Ralph Quay, Billingsgate, to Margate Pierhead and if the weather was good, made the trip in nine or ten hours. If the weather was not so good, the journey might take from two to three days. The advent of the first steamboat, *The Thames*, which docked at Margate in 1815, meant the passing of the hoy, for it made the trip in eight hours.

Then the people flocked to the seashore as never before and Margate counted its guests by the thousands.

Other coast towns shared in this growing fancy for surf bathing. Dr. Johnson favored Brighton and took his daily bath there for several summers, where his fellow bathers could hear the learned man "roaring and bellowing Latin hexameters and English heroics" as he dressed in his machine.

George IV favored Weymouth and soon made this resort the mecca of the fashionable of his generation. The town folk, delighted at both the honor and the dividends that His Majesty's patronage brought them, decided to serenade him with a local band. So one morning, just as the King was about to pop the royal head under the water, the band struck up "God Save the King."

How Things Are Done at Trouville

Sea bathing does not seem to have made much of an impression on the French until the nineteenth century. Some of their customs they borrowed from the English but tempered them with Continental conviviality. Although the Frenchmen adopted the bathing machine they refused to be separated from their women folk in the water. While the English isolated the sexes in the ocean, across the Channel, fathers, mothers, children and sweethearts bathed together.

The English commented on this illogical attitude of the French. To appreciate modesty and to make use of the bathing machine to preserve it was understandable. But then why break down the reserve so necessary between the sexes by allowing men and women to enter the ocean in each other's company?

But those travelers who crossed to Trouville to see the sights of the French summer resort came home with admiration for foreign ways.

On the beach at Trouville three or four barefoot women with "Service des Bains" written on their caps took care of the bathing machines. A *buvette* held stimulating liquids for those who became chilled. For a sou, the bather could get a can of hot water from the large copper which was wheeled up to his door.

But what impressed the Britisher most was the sight that met his eyes between the sea and the machines. In the short walk between the two, for here the machine awaited the end of the bath on shore, he got a glimpse of the ladies in their Gallicized bathing suits. He marveled at their trimness, he had only words of praise for their brevity and compared them favorably with the costumes of his countrywomen.

Transformations in Styles and Materials

The bathing suit adopted and so attractively worn by the French women was a three-piece suit. It consisted of a loose blouse and a tunic which came to the knees. Underneath was worn a pair of trousers to within a few inches of the ankle. Though it completely covered the body, it was not unbecoming.

One Englishman was so favorably engaged by its modesty and style that when he returned home he wrote about the Frenchwoman's bathing costume for his favorite weekly and advised his female readers to adopt it and discard forever those abominable "shifts of frieze" which Englishwomen were then wearing.

To those not familiar with mid-Victorian lingerie, a shift was a voluminous chemise. Of material more noted for durability than transparency, it was the woman's chief and only undergarment. Evidently she copied it for her bathing suit.

As for the material, a modern dictionary says frieze is "a kind of coarse woolen cloth or stuff, with a shaggy or tufted nap on one side."

Before the end of the century a great change took place in bathing suits for the Englishwoman. She did not adopt the French style of long trousers and skirt but went much further toward comfort. In the last decade of the last century she wore an abbreviated costume that no American girl would attempt to wear on the beach today. Her bathing suit was a one-piece garment, very low-necked, no sleeves, above the knee, of a flimsy material, and buttoned up the front.

It was, even including the modern array of Kellermans and similar styles, about the most revealing bathing suit of the ages!

Englishwomen Make Great Changes

Of course, the Englishwoman never expected anyone to look at her. Her bathing machine now waited for her drawn up on the beach and she had to cross about twenty feet of sand with the water only lapping at her ankles. The only time she was visible was when she hunted for her bathing van.

And even during that short time she considered herself safe from prying eyes. A bath in the ocean was still just a bath to her and a decidedly personal matter of no interest to the world. No refined person would think of peeping through the keyhole as she took her morning tub; therefore, as the ocean was only a larger, outdoor tub to her, she wore but one more garment as a concession, and considered herself amply covered for a bath, and of no interest to her fellow bathers. She bathed in a section reserved for women and in no way could see why anyone could question the meagerness of her bathing suit. This feminine garment was really the first B. V. D.

A few words on what the men have been and are wearing seems appropriate here. An American visiting the English bathing beaches for the first time in the summer of 1895 was horrified at the sight of an Englishman ready for his dip in the ocean. Until this period bathing suits for men had been very much of the one pattern for one hundred and

twenty-five years. One-piece suits buttoned in the front, or later a two-piece garment, both of a fashionable horizontal-striped material, never went out of style. But this period, when the women were wearing the brief one-piece suit, the men wore only swimming tights. And not a word did the Brighton authorities have to say as the men made their way from the ocean to their bathing machines in this scant costume!

Some Englishmen felt hampered by even the tights and, at most resorts, those who preferred bathing in the buff were permitted to take their dip before eight in the morning.

This, the most undressed period of bathing suits, on either side of the Atlantic, was in the reign of good Queen Victoria!

Our attitude toward surf bathing has been more in accord with the French; to both of us surf bathing is one more way of getting pleasure out of life.

Also, men and women in this country have always bathed together—but without bathing machines, for this custom was never imported; we have always spent some time before and after bathing on the beach in the company of friends, both male and female.

Such familiarity, such boldness, shocked our friends across the sea. Since that day, however, they have seen the light, and men and women enjoy sand baths together as well as ocean dips.

The bathing girl at the beginning of the century looked as if she were wearing her last winter's serge or mohair dress, cut off at the knees.

The princess dress was now the rage and bathing suits were made à la princess. They were worn over corsets and fitted snugly with darts and plaits. She was as rigid in her dress, as tightly corseted for a swim as she was for a formal dinner.

Gradually and logically a change began to take place. First the small waist began to go, and with it the corset. Women in their daily dress began to leave off more and more of their undergarments. There came a simplicity in women's attire which the bathing girl adopted as appropriate to her needs. Knickerbockers, short skirts, all did their bit to bring about the abbreviated costume so popular today. First her bare arms appeared, then her bare legs, her knees, and now she is quite comfortable. What a new style in bathing suits could be is difficult to imagine if the fashion for elimination continues.

Photography has probably been the cause of the striking and abbreviated bathing suit. The rotogravures, the Sunday supplements, the magazines, and the movies have all put a premium on the pictures of the girl in a bathing suit, and mostly girl and very little suit at that. Beauty competitions on the beach have also been a great encouragement to the one-piece suit.

How France Aided American Liberty

(*Concluded from page 5*)

United States in the Treaty of Amity and Commerce early in 1778.

On June 10, 1776, Beaumarchais received one million livres from the French Government to be expended for supplies for the Americans. A second million was obtained from Spain through the intercession of France. A third million came from the Farmers-General of France, to be repaid in shipments of tobacco, indigo, and other American products.

Even before these loans, arms and powder had been gathered by Beaumarchais for shipment to America. A fictitious firm, Roderiguez Hortalez, and Company, was organized in June, 1776. To this firm the French arsenals sold powder and cannon which were providentially not stamped with the French Royal Arms. For two years France participated in this fashion before openly espousing the American cause. These initial and determining steps were made possible by Beaumarchais.

In Francis Wharton's "Revolutionary Diplomatic Correspondence," published by the U. S. Government in 1889 in six volumes, the statement is made: "For nearly a year prior to the arrival of Franklin he (Beaumarchais) was the exclusive business agent under whose superintendence supplies were sent to America, and by these supplies the American armies received material without which they could not have maintained themselves in the field."

In the public press from the conclusion of our War of Independence down to the present day, the loans made by France and by Beaumarchais have been the subject of almost endless dispute. The loans were all eventually repaid. But the subsidies, stated by no authority at less than ten million livres, were gifts and never have been repaid.

The English historian of the American Revolution, Trevelyan, notes with some satisfaction that the war in which France involved herself with England at this time, by this aid to America, cost France "nearly a milliard and a quarter . . . and the royal government of France . . . was submerged in an ocean of bankruptcy.

James Breck Perkins, in his "France and the American Revolution," says:

> "France secured the independence of her American allies, but the material advantages she obtained were small recompense for a war which had cost her seven hundred and seventy-two millions."

Further, the interest on loans made by France during 1779 and 1782 was forgiven until 1783. Little interest was paid until 1790, ten years after the loans, as American conditions were very unsettled until after 1789 and the adoption of the Constitution.

Albert Gallatin, later Secretary of the Treasury, in his "Sketch of the Finances of the United States," published in New York in 1796, gives the arrearages of interest which were not commonly paid when due. This brough the total debt to more than 43,000,000 on December 31, 1789.

As conceded by all authorities the minimum of the Gifts of Money for which payment has never been asked by France or offered by America:

Gifts never paid	*Livres*
1777 Before Treaty of Alliance between France and America (at least)	2,000,00
1781 Though petition for loan of 25,000,000 is not granted, free gift is made of	6,000,00
1782 Interest and various costs remitted approximately	2,000,00
Total	10,000,00

Loans ultimately paid	*Livres*
1777 From the Farmers-General	1,000,00
1781 Obtained by France from Holland for America	10,000,00
Various advances made prior to July 16, 1782, as adjusted, consolidated and agreed to between the two Governments on that date	18,000,00
1783. Loan	6,000,00
Total	35,000,00

The interest rate was less than th current rate in Europe at the tim In 1783 France was actually payi 7 per cent and charging America 5 a even as little as 4 per cent. T security was not then considered exceptional, nor even good. A men like John Jay in Spain and Jo Adams in Holland found it impossible this time to negotiate loans for Americ although the countries were sympathe cally inclined toward the colonists.

Payments of principal began to f due upon the French loans in 17 but at this time the chaotic conditi of affairs in America made payments principal and interest equally unc tain. Not until after 1789 was a attempt made to pay the debt i curred. In 1790 the events of the Fren Revolution made a settlement imper tive. At this time some twenty-fo millions of livres were paid and t loans not yet due were replaced other securities so that not until 18 could the French debt of the revoluti be said to be fully extinguished.

In the War of the Revolutio France not only made us loans, wh every other nation refused, but remitt interest for long periods, extend times for payment of principal and addition *gave* us millions of livr

America Takes Her Place in Textiles

(*Concluded from page 23*)

ls and pushing them for they certainly compare with the finest of the ports."

The impetus the war gave to erican manufacturing has been held l this lead has brought out most ely fabrics both in silks and woolens, hough the cotton advancement has , as a who'e, kept pace with these textiles. When it comes to voiles, cales, ginghams and silk and cotton xtures there is not much foreign mpetition but when one enters the d of fine cotton fabrics for dress e encounters foreign merchandise at nost every turn. In this one field ne has the foreign manufacturer en able to win back some of his pre- r trade and in some few instances to ve increased it.

American silks equal and rank with e finest made in any country and the ne can be said of the woolens. The esent flannels, delicate in color and gantly bordered, are the season's l and yet when this same material s a style fabric twenty-five years ago iety-five per cent of the business s done on foreign merchandise. day, it is just the reverse, only a sible five per cent is imported.

The present importance of Ameri- fabrics has meant more to the mers of this country than the stylist gines. As a result of the increased nand for American-made materials re are many more producers of the materials.

There is enough cotton raised to e for our needs—approximately 00,000 bales. The farmers of the ited States produce one-third of the ol that is used in this country. Very le raw silk is grown here. About iety per cent comes from Japan and cheaper grades—such as are used manufacture pongee and shantung— nes from China and also from the d silkworms of the Orient, with a all amount of fine silk coming from tly. The finished product is often rned to these countries and is n by the "foreigners" living there.

The importance of the artificial i, or as it is now officially known, Rayon, is not to be carelessly thought ut. It is excellent in combination h any of the wool, silk or cotton ns and as it is a by-product of the ber and cotton waste it is very uable from a commercial standpoint. Y the world consumption of Rayon s only one per cent of the cotton duction and it will never displace of the present textiles.

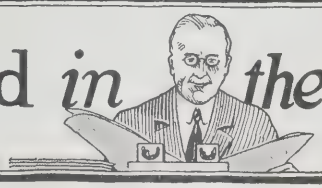
One firm in the Central West has a most capable man as buyer, a n who is considered the best in- med silk and woolen buyer in this ntry. When a new piece of material mes into the department it is sent ov to the laboratory for analysis. The report is given as materials, whether silk or wool, cotton or a mixture of any of the three or even the introduction of Rayon.

Also its resistance to sunlight, to washing and general wear. This report is posted for the salespeople to see and when a woman asks, "Will it wash?" the sales person can answer that question.

When a mill salesman is sent to cover this territory and offers a new woolen or silk for this buyer's consideration and possible order he is questioned in detail as to its construction, the type of yarn used, the dye and whether or not it has been well tested out by the manufacturer. The questions are always highly technical and many a man has failed to secure an order because he "did not know his merchandise," according to the mill report.

It is said that ninety per cent of the silks sold over the country today are "weighted," that is, giving the "hand-feel" as it is termed, but this is so scientifically done that there is no cracking, no loss in wear and absolutely no loss in the beauty and drape of the fabric. All wool is rarely that, because some cotton is introduced to give it both service and the drape or tailoring that such garments require. All cotton gives service of a lasting type, especially if the long staple cotton is used as one finds it in tissue ginghams.

"I Read *in the* Papers"—



I read in the papers much discussion of Jacob Epstein's sculpture for the W. H. Hudson Bird Sanctuary in London. Epstein, of course, has done what he did in the statues of Abraham Lincoln and Jesus of Nazareth, and has carved brutal ugliness to represent moron intelligence. The statue of Jesus is not quite so respectable as that of a desert whirling dervish would be, and Lincoln is a negroid idiot carved in a form which Nature in her cruelest sport seldom gives a man. Now comes the horrific caricature of the fey, gentle Rima of Hudson's "Green Mansions." She is represented as a tortured and bumpy anatomy which achieves immediately the force of a repulsion. Whether Epstein hates his environment and is pouring his hatred out on Anglo-Saxondom through the medium of his chisel, or is simply expressing an innate craving for ugliness under the delusion that he is finding strength, are questions widely discussed. It is perhaps charitable to think that Epstein is an extreme case of ego, which, of course, damns him as an artist. Art is supreme humility. The artist sits before his object, subordinating all to it. The rule for writer and sculptor is the same: fill eye and mind with the object; cast out self; be true to the truth of things as things reveal it to you. Epstein has not done this. He is continuously carving one thing, the soul of Epstein, and it is not beautiful.

I read in the papers that some correspondent has interviewed M. Balieff of the "Chauve-Souris," the glorified variety theater which has made as much of a hit on this side of the water as it did when it was located in a Moscow cellar. In the course of the interview, the correspondent exclaims in amazement that Balieff's show is made up of high spots lifted and adapted from Tolstoy, De Musset, Turgenev, Mussorgski, Chopin and other "highbrows." For the hundred and forty-ninth time within the past two months the word "highbrow" vaguely irritates me. Does the correspondent not know that every Polish factory hand enjoys Chopin? That Tolstoy and Turgenev have sold among the struggling people of Russia to the extent of millions of complete editions? That Mussorgski's rhythms go over the radio every night without apology? For how much longer must our writers continue to advertise our incapacity for enjoying all art that is enjoyable by this eternal gabble about highbrow and lowbrow?

I read in the papers that an American girl stenographer, who took passage for England and Germany, intending to work during her vacation and then return, was not permitted to land in either country and the American consuls were unable to help her. She had saved up her money for ten years to make the trip, and had about one hundred dollars for sight-seeing, which she hoped to eke out by doing stenographic work. When she told her expectation to British immigration officials they refused to let her leave the ship. The German officials were so disturbed by the presence of an American desiring to work that they locked the girl in her cabin until the ship sailed. If she had said she was a "tourist," there would have been no difficulty. Propagandists against American immigration laws who picture the United States as the only country that limits immigration and denounce us as inhumane forget to give all the facts.

Visby, a City of Ruins and Roses

It Stands on the Isle of Gottland, the Home of the Old Goths

By JAMES CLYDE GILBERT

LYING southeast off the coast of Sweden, wrapped in a haze of legends and traditions of past greatness, lies Gottland, the island of the old Goths, Sweden's most remarkable territory from a historic point of view.

The saga relates that the discoverer and first settler of the isle of Gottland was a man named Thjelvar. We also learn from the same source that the island was then in such an unstable condition that it was submerged in daytime, and rose to the surface of the sea at night, but Thjelvar exterminated with fire the trolls and evil spirits that infested it, and never since that time have the waters broken over the island.

The history of Gottland is most interesting. Centuries before the Viking raids, the ancient Goths, one of an ancient Teutonic race, made trading voyages to distant ports. Eastward they migrated and proceeded on the Russian rivers down to the Caspian and Black seas, to the Near Orient, Rome, and Greece. Tens of thousands of Arabian silver coins, masses of Roman emperors' gold coins, oriental ornaments from these places and even from far-off China, have been found in the soil of ancient Gottland.

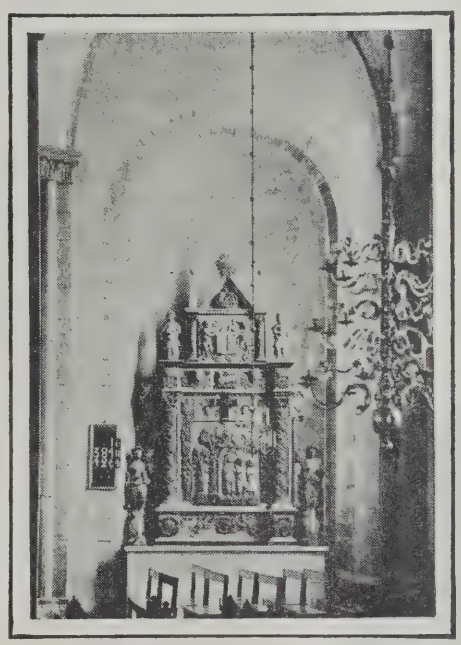
The city of Visby ("Vi"—anciently a place of sacrifice, and "By"—community) arose on the west coast of Gottland, on an eminence, rising in terraces from the sea. Gradually it grew until it advanced to a position of commercial importance. This was due to its intermediate situation in what was then the chief trading route between the Near Orient and Northern Europe. The town was one of the first to join the Hanseatic League, that confederacy of North German cities organized for mutual protection in matters pertaining to commerce and trade.

It long occupied a leading place in the trade and politics of Northern Europe. During the eleventh and twelfth centuries its wealth increased immensely, attracting traders from all parts of Europe.

Visby is today the seat of a bishop, the port of the island and a favorite watering place. The houses cluster beneath and above a cliff 100 feet high and the town is thoroughly medieval in appearance.

It was during this period of prosperity that the churches, whose ruins now excite the wonderment of visitors, were built, and also the great city wall, which today is the only one of its kind in Northern Europe.

Vineta, the capital of the Wends, at the mouth of the Oder, was for centuries a large and mighty city,



South altar in the Cathedral of Visby.

inhabited by industrious burghers and possessed of great wealth. In 1184 it was completely destroyed by the Danish soldiers and the burghers then moved with their treasures to Visby. Since then the fate of Vineta has taken the form of a legend, which is to the effect that the city was submerged and that it can still be seen at the bottom of the sea.

During their prosperous days the burghers of Visby built no fewer than seventeen churches, of which eleven still exist as ruins. Many of these ar picturesquely beautiful and impressiv The greatest ruin is that of St. Nichola the church of the Dominicans. S Catherine's is widely known and ad mired for its beautiful arches an stately columns. The Holy Ghos church, of octagon form and tw storied, is entirely original in i conception. The twin churches St. Hans and St. Per, as well as th sister churches of St. Drotten an St. Lawrence, are represented by wel preserved ruins.

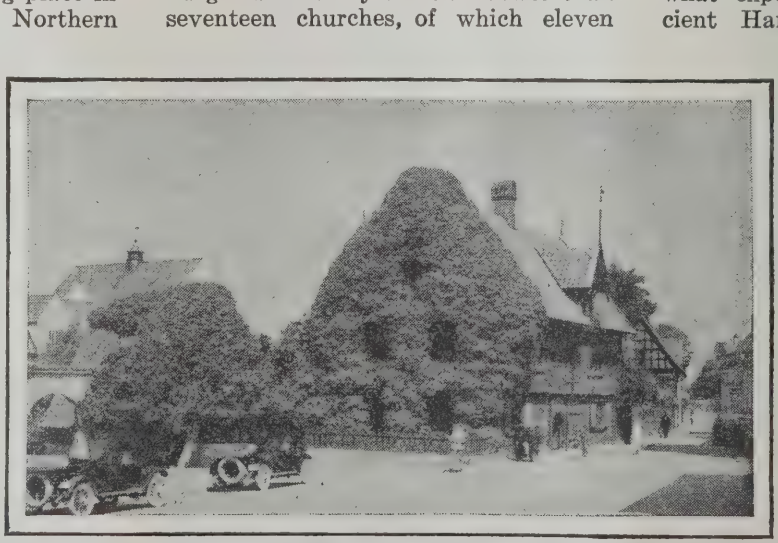
St. Catherine's ruin is the mo beautiful of all. The columns ri heavenward in solemn majesty, perfect as when the roof was fir arched across them six hundred yea ago. Where in olden days pious co gregations listened to the solem chanting of monks and nuns all now silence and deep peace.

Then there is the old Burmeist House with wall and ceiling decoratio dating from 1650. Green vines almo hide the windows and doorway.

The old city wall of Visby, whi is acknowledged to be one of t most interesting structures of its kin is quite out of the ordinary in Nort ern Europe. It would not be unco mon in Bavaria or the south of Fran but there are no Northern Europe city walls of the same proportio comparable with that of Visby impressiveness. It is 10,000 feet length and has thirty-seven tow varying in height from fifty to six feet. Its artistic beauty is furth enhanced by the aged yet cle tinted limestone of which it is bu and the effective contrast with t sea beyond.

Modern buildings include the Go land museum of antiquities, and t high school, with a museum a library. The artificial harbor, som what exposed, lies south of the a cient Hanseatic harbor, now fil up and covered with g dens. The town is t terminus of railways north and south. It is t headquarters of the ar division of Gottla troops, and there some modern forts.

The island is about 5 miles long and 40 mi wide. Many good ro form a means of co munication throughc the island. There approximately 50,0 people in the island which 10,000 are in city of Visby. Th living outside Visby for the most part farm



The Burmeister House, old *patricier* house in Visby.

JOHN COTTINGHAM, ANOTHER "ROMANTIC RASCAL" (see page 20).

CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

Since a number of deaths from tetanus have resulted after using bunion pads after vaccination, the Public Health Service has issued a warning against their further use.

In 1522, William Tyndale said, "If God spare my life, ere many years I will cause a boy that driveth a plow shall know more of the Scripture than thou doest." That is why this year, 1925, is the 400th anniversary of the completion of Tyndale's Bible. Just 86 years later, the Authorized Version appeared.

Eskimos do not drink oil. They actually consume less "food for power" than the average Scotsman or Norwegian, according to Vilhjalmur Stefansson.

Paper making must have flourished early in Bohemia, for among the effects of King Vladislav is a 1499 entry prohibiting the export of old clothes in order that the Abbot of Zbaslar might buy them and convert them into paper.

Irish sea herring are all autumn spawned.

For his work on the cockroach as a cancer carrier, Dr. Louis Sambon has been awarded the Gold Medal of the Society of Pestology for 1925.

Joseph Conrad is said to have formulated his sentences mentally in French and then translated them into English.

Only four states now remain without a tax on gasoline for motor cars. They are New York, New Jersey, Massachusetts, and Illinois.

A hive full of bees brought in by the manager and released quelled a free-for-all fight which developed in a Berlin Inn.

Taxidermy, as a decorative craft, was crudely practiced by the Carthaginians as far back as 500 B. C.

In Russia kerosene costs five and one-half cents a gallon, while gasoline sells for eleven cents.

A baby boy was born 6,600 feet up in the air in an airplane enroute from Budapest to Naples.

Cigaret consumption in the United States has increased from three and one-half billion in 1905 to 75 billion in 1924.

"The budget of the Jewish Kehillah of Berlin for the year 1925 is no less than seven million gold marks. When compared with the fact that the budget of the city of Berlin for the same year is 350 million marks, one gets an idea of the stability of the Jewish Kehillah here. In size the Jewish Kehillah of Berlin is the third in the world, following right after New York and Warsaw."—*Jewish Daily Bulletin.*

The murder rate in the United States is forty times as high as that of Switzerland.

In early Bible times, a pedagogue was not a school-teacher as now, but a servant, usually a trusted slave, who conducted the children of a household to and from school.

Owners of fancy dog shops are doing a flourishing business in London this summer, for it is the vogue for women to have pets to match their gowns, or dress schemes to correspond with the coat of their favorite dog.

The radiation of ultra-violet rays from the blue sky is far greater than that from the sun itself.

Because Russian farmers refuse to sell grain to the Soviets for credit, there is a struggle between the farmers and the city inhabitants.

A mahogany tree planted in the botanical gardens of Honduras only 113 years ago and felled for the Wembley Exhibition in London contained over 4,000 board feet of fine quality wood.

At a recent sale in England, 130 pounds was paid for a copy of "the letters wherein Henry the eight made answer unto a certayne letter of Martin Luther."

The Hudson's Bay Company, having kept records since 1845, finds that there is an increase in the number of rabbits, foxes, and lynx every eleven years.

Polar bears have been reported swimming 100 miles from land.

Oil made from grasshoppers is being used as airplane lubricant.

In Malay, "twenty men will work a half a day to land six dollars worth of little fish."

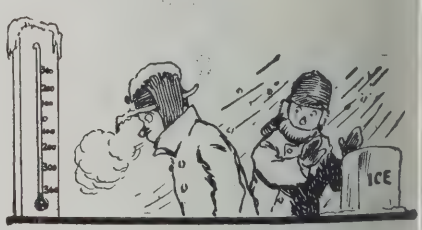
Inspired by American successes, the French people have founded silver fox farms of their own in the Dauphine and in Savoy, on the slopes of the Alps.

The saliva from the upper jaw of the Gila monster of Arizona is not poison, but that from the lower jaw will kill a rabbit in two minutes. Little injury to man has resulted because of the difficulty the monster has in penetrating the skin with its lower jaw.

The rat population of Britain is as numerous as its human population.

A new gas has been discovered by scientists as a result of the observations made during the recent total eclipse of the sun.

Prague has fitted up a new marriage chapel in its old city hall because an unknown soldier was buried in the chapel where marriages formerly were held.



A new thermometer registers accurately temperatures as low as 380 degrees below zero, Fahrenheit.

A filamentless bulb, the light being produced on two poles, one positive and the other negative, has been invented. There is no connection between the upper ends of the poles, which are heavy wires radiating a powerful light.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue

Mr. Ford's Page this week deals with the Machine the point of view which denounces it as the symbol naterialism. (p. 11)

Huston Thompson says that business which grows on mergers instead of on service is like the Tower of el—it totters and falls. He knows more about the le of the dangerous kind of Big Business than any n in the United States, and he illustrates what he ns by actual incidents. (p. 3)

The Abolition of Liquor came near preceding the lition of Slavery in our American program of Progress. coln was for the first before political conditions st the second into first place. After Slavery went, nation turned its attention again to Liquor, with hibition as the result. It is not new. It is one of the st of American moral reform programs. (p. 2)

You have been reading the spapers about the elevaof guns on our battleships, the racket it raised been nations. Ten to one wondered what it meant. e is an article that clearly ains it all. (p. 12)

"If You Were a Chinese" t would you do? The reviolence in the Orient has use which we shall do well eek and weigh. Mr. High Methodist missionary secry with a considerable wledge of China and nese character. (p. 5)

They say most of the best ers are leaving New York. n Masson delightfully deoes what literary New k is really like. There is arently a good deal of hip" in professional literary res. (p. 16)

Another Romantic Rascal, n John Cottingham, has his lurid career outlined by the pen of Mr. Finger. Truly the arts of evil are not new, and there is no inventiveness in criminals. How John preyed upon society and at last paid society a greater price than he had bargained for is very entertainingly told. (p. 20)

Please don't fall into the habit of closing your mind when you see the word "architecture." It indicates America's new lead in a great art. The ancients built low and long because they had only stone piers; we have steel to thrust into the skies, and glass to ease the weight of structures, and as a consequence we are leading the world in architecture today. Albert Wood, A. I. A., who has some notable work to his credit, wrote about it in a way easy to grasp and enjoy. The illustrations are good. (p. 32)

A second article on the behavior of Americans abroad appears this week. Some people object to such articles as disloyal. It is, however, better for us to criticise ourselves than provoke the critical spirit in others. American tourists are of much higher grade than their manners give foreigners to believe. Foreigners, however, measure more by manners than by morals. We have the morals; let us acquire the manners. (p. 8)

Keep cool these torrid summer days by reading an Epic of the Arctic. (p. 18)

Do snakes milk cows? Mr. Aaron has had lots of fun tracing the stories of nature fakers, and his story in this issue, illustrated by himself, is of much out-of-door interest. (p. 7)

The new Night Mail goes by air, and one of our contributors went with it. A thrilling tale of continent-hopping in the dark. (p. 21)

When Women Knelt in the Snow

Prohibition Began in a Little Ohio Town

Prohibition Commissioner Roy A. Haynes.

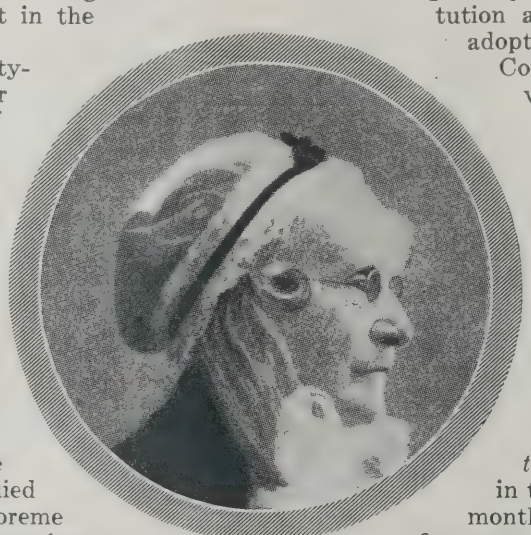
IN THE town of Hillsboro, Ohio—the year being 1873—seventy women marched out in a snowstorm the day before Christmas and prayed in front of the town's fifteen saloons. In four weeks there was not a grogshop in the place. America was American then, and the moral appeal won.

From the same town of Hillsboro—the year being 1920—came Roy A. Haynes to be United States Prohibition Commissioner.

His grandmother was one of those who knelt in the snow nearly fifty years before.

This would indicate that national Prohibition is in sincere hands. Haynes has his faith by family tradition as well as conviction; it is in his inheritance as well as in his deliberate thought. To this fact the nation owes more than it will probably realize, for if there is any field wherein the spontaneous generation of corruption may be expected, where wholesale trickery could be practiced, where the soul of the Government could be sold out every day and scarcely anyone be the wiser, it is in the enforcement of Prohibition.

However, standing in the shadow, forestalling all this, is the grandmother of Haynes, the courageous woman who knelt in the snow.



ELIZA J. T. THOMPSON

There were fifty-five applicants for the position of United States Prohibition Commissioner when the appointment came before Warren G. Harding. Roy A. Haynes was not among the fifty-five. But the President sent for him, laid the case before him, studied with him the supreme difficulty, the danger, the extent of personal sacrifice necessary, and Haynes answered in the same spirit that boys responded to the call for troops. It was not an office of honor; it was a hard and in many respects a most unpleasant job.

There is nothing fanatical about this man. He is not the typical "temperance crank." It is true that he believes strongly that liquor is doing more harm to this country than an invading enemy could. It is true that he believes that the "public welfare" clause of the Constitution covers the question of right to prohibit liquor—and cocaine, heroin, and other narcotics. Yet one can fancy him sitting down in a convention of bootleggers and having them agree with him that there is something in this whole matter which challenges the respect of intelligent men.

"I can't see this Eighteenth Amendment," said a candid man to Haynes one day.

"But you can see the Constitution, can't you?" was the answer.

And that *is* the answer. Neither liquor nor Prohibition is the question any longer; the question is the Constitution. There are residents of the United States who can't "see" the law which protects property. They are Bolsheviks. Their principles differ from that of the Constitution of the United States. They are just as logical in holding their opinions *and acting on them* as is the respectable citizen who cannot "see" the Eighteenth Amendment. For *that* is just as basic and integral a part of the Constitution as if it had been adopted by the original Constitutional Convention presided over by George Washington. Indeed, *no amendment has ever carried by so large a popular vote.* And it was one of few amendments which had *a time limit fixed for its adoption. Seven years was the limit.* But within two years and one month a total of forty-five states had ratified.

It is not a question of liquor, prohibition, personal liberty, Volstead Act or anything else now; it is a question of the Constitution, which every public officer, from policeman up, is sworn to defend and uphold.

An official in an eastern city wanted enlarged powers for his police force to deal with violations of the Prohibition law. He was asked to show the oath which his police officers took upon appointment to the police force. In the oath was the clause "and to uphol Constitution of the United Sta He was told that under that c he had all needed power; the Eight Amendment is an integral, indiv and indestructible part of the stitution of the United States. U that clause he discharged scor incompetent officers and dried u leaks.

One is somewhat surprised to the attitude of Mr. Haynes towar citizen who still supports the trade in liquors. And one learns, how increasingly dangerous it bec to drink anything purporting t American whisky. At first the p seemed to believe that all the inf tion given out about poison w was mere scare propaganda. It i percolating the intelligence of mi that there was no propaganda it—it was cold fact; which accoun the bootleggers of "American wh finding their trade dwindling day.

At first there were quantiti real American pre-war whisky curable. All the stories we for heard about large distillery "deliv and "robberies" and huge mover of liquor on false permits were The Prohibition officers will they were true. Here were 507 tilleries manufacturing 265,00 gallons of spirits a year. (The a consumption in the United State 140,000,000 gallons.) To care fo monstrous output there were bonded warehouses. On Janua 1922, manufacture stopped. But were the 300 bonded warehouse to the roof with the choicest ican barrel goods.

From Babel to Beef Trust

nce the Building of the Big Tower at Shinar False Expansion Has Not Paid

By HUSTON THOMPSON

Copyrighted, 1925, by Huston Thompson. All rights reserved.

OW big, after all, is Big Business? In my seven years as member of the Federal Trade Commission, listening er day to the special pleadings of ation attorneys, examining the nent, cost and profit data of nds of great business organiza- I have come to understand that ch of the so-called bigness of kinds of Big Business there is fat than fiber and more girth o. Goliath was a pretty big in his time, but he couldn't a slingshot like the little fellow they called David.

rient Thinks It May ess Baggage Some years ago I was delegated to conduct a distinguished Chinese through one of our most flourishd-western cities on the slopes of ckies. It was in the earliest days flying machine, and the spectacle of these American conquerors of flying over the city, coupled with agnificent stretches and sky-s which we were inspecting, in- in me so lively a pride in the and size of America and things an that I dilated to my guest, me eloquence, I thought, upon ness of our country, of its build- ts commerce, its accomplish- and its future. The Oriental's ere polite. He noted politely all tatistics, agreed politely with the ions I drew, and was most r impressed. But on the way o the hotel he remarked quietly, ll the air of a civilization and ound infinitely older than any n one: "But, my friend, this of which you show me so much , after all, the test of success? ur people happier for it, or more We of the Orient sometimes t may be excess baggage, and a ap. Is it not perhaps easier to light?"

ier to travel light! Often in the ven years, sitting behind the of the business world, I have bered this comment when I have the commanders-in-chief of oly and their corps of attorneys countants defending, to their omplete satisfaction, the case ir great combinations. I have ed whether in our American tion, which the venerable ey M. Depew recently praised it is "now guided by business d bankers," the word "big" has en made into a fetish and idol razen and false than any before my Chinese friend's ancestors bed.

live but do we learn? The ecy toward combination in American business is a periodic one. It began in the 1880's, and we devised the Sherman Law of 1890 to destroy its obvious errors and injustices in the light of what we then thought of them. Ten years or more later the Steel Corporation and other vast combines made their appearance, and what we had learned about monopoly in the interval was incorporated into our public and legislative attitude toward these "trusts." Another ten years and a new outbreak of combining brought government suits against the Standard Oil Company, the Steel Corporation, the International Harvester Company, and many others, and a new point of public view expressed in the Federal Trade Commission Act and the Clayton Act of the first Wilson Administration.

Today another decade has elapsed, and another prolific era of combining is here. The General Electric Company, already a vast and intricate combine of power and light companies, is reaching out to absorb dozens of new companies; the Bethlehem Steel Company, second only to the United States Steel Corporation in the steel industry, has absorbed the Lackawanna Steel Company; the Midvale Steel and Ordnance Company and the Cambria Steel Company, powerful units in the industry; Armour and Company, one of the "Big Five" packers, has absorbed Morris and Company, another of the five; the Standard Oil Company of Indiana has acquired control of the Pan-American Petroleum and Transport Company and the Midwest Refining Company; the vast Continental Baking Corporation is absorbing many of the principal bread companies of the country; and in numerous other industries the same almost frantic process of combining is under way.

What Have We Learned About Big Business? What public opinion, what legislative and judicial action, shall be brought to bear against this most recent of the ten-year cycles of combining? What have we learned about combinations and Big Business in this last ten-year period? I am inclined to think that we have learned a great deal, but that we are being hypnotized by powerful propaganda and personages, and an uncanny eye into believing that we have learned some things that we have never really learned and never will, because they are not true.

From important industrial quarters there are coming statements that America cannot afford longer to wage war on Big Business, that monopoly is not so bad as it has been painted, that our anti-trust laws must be modified or abolished, and that the most effective and efficient way of conducting our commerce and industry, after all, is through great combines.

Look at the Giant Trees of California It would be idle to deny that this is the trend of a powerful and articulate faction of present-day opinion. It would be equally idle to deny that in this opinion there is a grain of truth plucked from our forty years of experience. But it would be idler still not to examine this opinion carefully and divide the false from the true, if such a division exists. If experience has taught us that certain kinds of bigness are practical necessities to be permitted rather than fought, it has taught us in equal measure that there are other kinds of bigness which are as artificial and uneconomic today as they were in 1890. And unfortunately the present-day apologists for Big Business are too enthusiastic or too biased or too ignorant to admit a difference. They would have us swallow the whole dose, orange juice and castor oil. The arguments they use apply to the right kind of bigness, to the orange juice, but they fail to mention the castor oil.

My Oriental friend, I am sure, did not have in mind the bigness that is a natural growth under natural law. Size of that sort needs no apologists. It is logical and should be free to grow and expand as the giant trees of California, with their impenetrable, satiny, insect-proof bark, and their sap-channels from root-tip to the tops of the furthermost limbs, unimpeded by any obstacle of man or nature. Business that has taken its honest chance in an atmosphere of genuine supply and demand, that has expanded through its own efficiency and sturdy initiative in a fair field, is an asset to any community. It is the other type of bigness that presents the only real problem, the artificial bigness that rots the whole industrial forest with its deadwood, that feeds like a parasite on its customers, that extracts a monopoly price out of the consumer and carries with it a myriad of excessive and unnatural costs which can only be sustained through a camouflaged subsidy in the guise of inflated prices artifically maintained.

Against artificial organizations, against the types of combinations that are growing up again today, the most damning evidence comes from their own books and from the mouths of their own commanders-in-chief. Take, for example, the mightiest of all American

combines, the United States Steel Corporation. Twenty-five years ago, when the banks and the pawnbrokers of Wall Street were framing this elaborate structure out of many competing and efficient units, Andrew Carnegie, the grand old man of steel, who had forged a real steel company out of the fire of free competition and honest service, hurled at them a defy and a prophecy in these words:

Bigger They Are the Harder Is the Fall

> "We should look with favor upon every combination of every kind upon the part of our competitors; the bigger they grow the more vulnerable they become. It is with firms as with nations—scattered possessions are not in it with a solid, compact, concentrated force."

The bigger they are the harder they fall! The Iron Master is gone, but his prophecy lives after him in the evidence on the books of the great company which he refused to join. The United States Steel Corporation is today a composite of some one hundred and thirty corporations, and is popularly considered the most successful of modern combinations. It controls between forty-five and fifty per cent of the entire steel business of the nation, and its officially announced prices are the flags by which the lesser "independents" set their own price courses. It has its own ore fields, its ships and railways, its coal reserves, its pig-iron furnaces, rolling mills, finishing plants and distributing agencies. In other words, it is completely integrated. With every apparent physical advantage, every opportunity to cut down waste and duplication, it would seem to be a perfect model of a modern industrial colossus. With all of this it is perhaps a shock to the disciples of size to read the profit record of this organization in a recent report of the Federal Trade Commission, based on data taken from the Corporation's own reports. This record shows that by the business man's own and only standard—profit on the dollar invested—the United States Steel Corporation is outstripped by its lesser competitors who "travel light."

In 1915, the Commission's report shows, the Steel Corporation earned 6.8 per cent on the dollar invested, while the average rate of return for all other companies reporting was 9.6 per cent. In 1916 it earned, out of its enormous war profits, 18.6 per cent on the dollar, but the other companies earned 28.6 per cent in the same year. In 1917, with the entry of America into the war, the Corporation earned 24.6 per cent, but the other companies earned 36.4 per cent. Throughout the whole period covered by the report the highest average return on investment was earned, not by this colossus of the industry, but by the organizations of intermediate size and lesser multiplications of investment and overhead. And this in spite of Judge Gary's own statement that the Corporation can manufacture steel at an actual physical cost of five dollars a ton lower than that of any competitor. The margin between this advantage in real costs from integrated mass production and the relatively low actual profits that result is eloquent of the sort of thing that happens to an honestly earned dollar after it has been sat upon by an inordinate investment and an over-fat overhead. Each of the one-hundred-and-thirty-odd companies composing the great combine is probably an efficient, ably conducted unit, but on top of them all is the central organization with its high-salaried officials, its expensive offices, its costly propaganda, its fabulously paid attorneys, its go-betweens and legislative representatives, and its costly devices for keeping the whole expansive mechanism in a central control. The ghost of Andrew Carnegie may well laugh.

Rise and Fall of the "Big Five"

If the Steel Corporation is an example of efficiency whose honest efforts are frustrated by the parasitic burdens of artificial overhead, the great meat-packing combinations are illustrations of efficiency actually destroyed by these burdens. The rise and fall of the five big meat-packing companies, known as the "Big Five," is a story with a plot—and a moral. Armour and Company, one of the two largest of the five, began business in 1863 on a modest scale under a single operation. Step by step, however, it has expanded until in recent years it has done an annual business of nearly a billion do It has expanded naturally by incre its meat production and utilizing by-products of its plants. But i also expanded to an even greater e unnaturally, not only absorbing petitors, but undertaking the n facture of hundreds of products compete with its own products, are not directly related to the pr tion of meat.

Selling a Birthright for a Mess of Pottage

Similarly, and Company the other giants of the i try have conducted an artificial e sion side by side with a natural undertaking one unrelated line another, to destroy the competiti substitute foods with their own proc The power and capital these pa had acquired in the meat business which gave them so dominant a tion in that business, were exp little by little in these artificial sometimes very unremunerative cursions into unrelated busin until recently the whole structur grown fatally top-heavy, and so the packers have come to realize their splendid birthright is sold mess of pottage. Their eve fate was foretold, no doubt uncons ly, by Mr. Armour himself, wh clared in testimony before the S Committee on Interstate and F Commerce in 1919:

> "I find it is a matter of rec that the small packers always m more money than the big pack because they only do a limited bu ness, and that is recognized. Ev small packer will tell you that makes more money than the la packers in a percentage way."

Mr. Armour, it will be noted, a away the whole plot in his final ing phrase "in a percentage An utterly artificial and cumbe combination, if controlled by individuals, can stay in busin long time on a profit of, say, $25 000 a year, no matter how sm percentage on investment this i represents.

Testifying again before a com of the House of Representatives Armour stated:

> "There are a great many in pendent packers, and they are making more money than we . . . because the expenses of the packer are greater in proportion his size than the little packer .

"If You Were a Chinese"

How Would You Feel If You Were Publicly Classed With Dogs?

By STANLEY HIGH

T WAS in one of the great Pacific port cities of North America. My China-bound boat was due to sail the next , and with bag, baggage and pass- I visited the immigration office de the dock to get through with customary examinations. A young ese doctor was with me—a grad- from one of the greatest of erican medical schools returning hina to practice in a mission ital. At the immigration es the usual crowd was on d: tittering tourists; busi- men, sophisticated and d with the complexities of el; missionaries—and their ilies. My friend, being a ese, was taken in charge n inspector and led off to her part of the building appear an hour later, the alities finished.

'I've something to show " he said.

'Show away," I replied, followed him down a t of stairs and into that on of the building where e was set aside to handle examination of Orientals. rooms, there, were divided nto great pens. Into these a ley crowd was herded: Chinese, ans, and Filipinos, waiting their with the inspectors. Some of e returning Easterners had evi- ly arrived several days in advance had camped together in these pens. t of them had been there at least night. The place was overcrowded odoriferous.

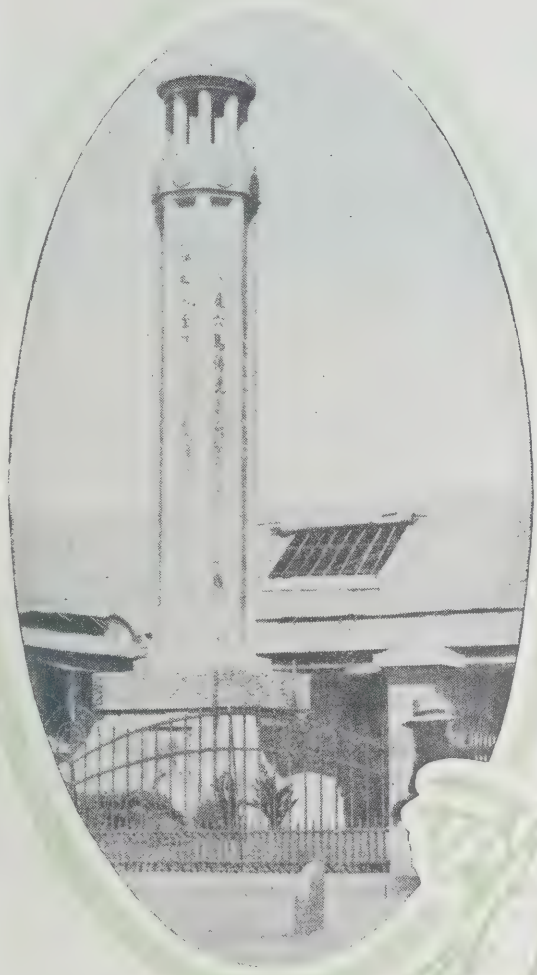
'Look at that," said my Chinese d, and he pointed to the wall inside ne pen where, with heavy pencil, ral Chinese characters had been ten.

'What do they mean?" I asked.

'They mean that my people are zening," he said. "Translated e characters read: 'Warning! will do worse than this to you when re strong.'

'How would you feel," said my or friend, "if you were a Chinese?" hanghai is a Chinese city—the port of a nation of 400,000,000 le; the country's industrial center; crossroads of the Eastern world as lon is the crossroads of the Western. dominating modern Shanghai is International Settlement. It is China, but a foreign city, that one coming up the Yangtsze from the ner to Shanghai.

eyond the International Settle- t—which has appropriated the est section of the city—one can something of China. There, in



A monument erected on one of the busiest corners of Peking to commemorate China's humiliation at the hands of Japan in the issuance of the twenty-one demands

narrow, congested streets, lined with dimly lighted shops and cluttered up with beggars and coolies, children, business men in long, flowing robes, and the venders of strange oriental sweets who announce their wares in shrieking chants, there, beyond the foreigners' Shanghai live the natives of the city. And the barriers that divide the Shanghai of the Chinese and the Shanghai along the water front which the foreigners control are many and unmistakable.

Walking down the bund in Shanghai one day I stopped at the entrance to one of these parks. A young Chinese student from a mission school was with me. Beside the entrance to this park a long list of regulations was posted.

"Can you wonder that we students resent this foreign city?" he asked. "Look at that last regulation."

I did. It was as follows:

"Dogs, unless on leash, and Chinese not admitted."

"How would you feel," the student continued, "if you were a Chinese and found that sign, posted by foreigners in your most important city?"

Westerners in China have frequently acted upon the presumption that the Chinese were an inferior race, legitimate prey for the exploiters. That the Chinese have a pride of race as deep—probably deeper—as that of the average westerner has been generally overlooked, save by the missionaries who, almost alone of Occidentals in the East, have come to an appreciation of the greatness of the people with whom they are working.

I know a missionary—formerly vice-president of one of the great mission colleges of China—who relates that when he went out, as a young man from England, a member of the House of Commons one day asked him about his plans.

"I am going to China to teach the Chinese," said the young man.

"Well, you are a brave man," said the English politician, "if you think you can teach anything to the Chinese. Do you realize that the Chinese discovered and developed the most widely used food in the world—rice; they discovered and developed the most widely used drink in the world—tea; they discovered and developed the finest cloth in the world—silk. You are a brave man if you think you can teach anything to the Chinese."

Out of the richness of their history, therefore, the Chinese have developed an intense—and wholly justifiable—pride of race. This pride, to be sure, has suffered during modern times. China, for a number of reasons, has not kept pace with the material developments of the west. Weak in guns and in armaments the Chinese have fallen an easy prey to those who came to divide the country for selfish gain. But China's weakness has not dimmed the memory of the former greatness of the Middle King-

dom, but has served, rather, to increase the conviction that some day, when the nation has come abreast of the times, it will once again be "strong" and able to reassert its rights against foreign aggressions.

The war, for a number of reasons, accentuated this nationalism. For the war suddenly revealed to the Chinese the fact that western nations were not so morally superior and, for some time to come, would not be so strong as they had claimed to be. Even before the war the disillusionment with the myth of "white supremacy" was developing rapidly. When Japan, an Eastern nation, defeated Russia, a western power, in 1906, China, with all the East, was aware for the first time of the potential strength of the colored races. Then, after the Russo-Japanese war the Chinese first began to see something of the less idealistic picture of western civilization.

One of China's pioneer missionaries related to me how, during that war, he was in Harbin, a city in Manchuria in the general zone of the hostilities. The population of Harbin was largely Chinese. Into Harbin, however, there flocked a large number of Russian refugees, among them many women, followers of the army. The picture of western white women, degraded, as these women were, was something wholly out of keeping with the conception of white civilization which had, for long, been held before the eyes of the Chinese. This missionary tells how he was put to it to explain the situation to the bewildered Chinese who had believed that all white women were of the high type represented by the wives of missionaries.

Since the war the increasing irritation against foreign domination, particularly among the student Chinese, has been apparent. It was thought for a time that the Washington Conference successfully halted this development and inaugurated a new era in the relations of the states that border the Pacific. China attended the conference as an equal with the Powers and a great many promises were made to China, all in keeping with the conciliatory spirit that dominated the meeting. Foreign post offices were to be surrendered, foreign wireless stations dismantled. More important the customs duties—previously fixed at a very low figure and collected by foreigners—were to be increased. Further, a commission was to undertake a study of the question of extra-territorial rights—which lift the foreigners in China above the jurisdiction of Chinese laws—and make suggestions concerning the relinquishment of the foreign concessions which, like the International Settlement in Shanghai, constitute in most of the port cities little foreign communities in and over which the Chinese have no authority.

Chinese farms are small, some no larger than an American dooryard.

These last reforms, those relating to customs and extra-territoriality, were by far the most important considered at Washington in regard to China. For three and one-half years, now, no steps have been taken to carry them through. These promises to China were incorporated in the Nine Power Pact which was to come into effect when all of the nations involved had ratified it. France, owing to a dispute with China, has not ratified and, as a consequence, the promises given have not been kept. This, too, has served to arouse the already developing nationalism and has led the students—who represent the most powerful nationalistic influence in the country—to an even greater distrust of foreigners.

An incident in Shanghai served to arouse this smoldering antagonism. A strike occurred in February in the Japanese cotton mills in Shanghai. Industrial conditions are deplorable in the foreign mills of Shanghai and they are said to be particularly deplorable in the Japanese mills. Force, in this instance, was used to suppress strikers. The students, aroused aga what they believed to be an infri ment of the rights of the workr organized a great protest and in demonstration that lowed a police of ordered his men to and several of the dents were killed a rather large nur wounded. The resul this action brought general strike. Br and Japanese busi has been paralyzed. only in Shanghai bu other cities there se to be a well-organ attempt to drive Br and Japanese inte out of the country.

Unquestionably uprising has been bla on the Russian Sov There is little doubt that the "Reds," eagerly looking symptoms of revolt against the Po wherever they appear, have welco and, to some extent, helped to fu this disturbance. But the Soviets only taken advantage of a situa and it is a superficial explanation lays upon the Soviets the responsil for a development that was ge under way several years before revolutionaries of Russia shattered throne of the Czars.

Another point needs to be clear. The present agitation is dire almost wholly against Japanese British interests, for those interest held, by the students, to be joint blame. In the French concessio Shanghai business is reported t proceeding "as usual." The str have not, as yet, threatened Ame concerns. But against the Japanese the British the movement has devel proportions which make it threatening than any situation has arisen in the East during the decade. And the suddenness which this spirit (Concluded on pa

o Snakes Milk Cows?

ome Popular Errors in Natural History

By S. F. AARON

ILLUSTRATED BY THE AUTHOR

A common black-winged and blue-bodied dragonfly commonly called snake doctor, snake-feeder, or devil's darning needle.

T IS not altogether silly superstitions regarding animals and plants that are the hand-me-downs from ancient legends, e ridiculous inventions of more n folk tales that most interest ther than as curious psychological

To this class of absurdities be- he hoop snakes, the stinging " lizards, the dance-compelling ulas, the kissing bugs, the cow- g snakes, the bird-charming ser- the venom-blowing spread , the ear-sewing snake doctors, oung-swallowing rattlers, the r-foretelling hornets and a horde untenable stuff. And yet some has been reaffirmed by those by educational opportunities, not be unenlightened. Witness rantula story as oft repeated th; the kissing bug referred to, nearly a generation ago, by a president as a dangerous menace ild had been bitten on the lip, leeping, probably by a mosquito), m reference by a nature writer attlesnake engulfing its young its stomach for protection and arly reference in news items of rnets nesting high or low as fore- the winter's severity. It is a on the breath of knowledge by ng to admit the acceptance by ed persons of these foolish tales. is with the high school professor pent one-half of a recitation telling his sympathetic students ar he had come to death, while g in his garden, by bringing his close to a spreading adder— ly the least harmful and trucu- all fair-sized snakes. One loses patience with the self-lauding sage converted to Christianity spired with the need of holiness who begins his tale with the statement of seeing a serpent charm a bird. But most amusing in this regard was the assertion of the intelligent hotel-keeper in a fishing resort frequented by educated men many of whom listened with credence to the account of the black snake that milked the cow. She had, when the act was discovered, become so pleasurably accustomed to the relief of her overloaded udders that she would, toward milking-time, leave the herd and approaching the thicketed lair of the ophidian utter a pleading bawl; whereupon the snake would emerge, rear itself under the cow and get busy. One comment upon this yarn was:

"Well, Mr. — —, if I had heard anyone but yourself tell that I would not have believed it."

There was a visible swelling with pride on the part of the narrator and then the naturalist took a hand:

"Very interesting. Did the snake continue until it seemed satisfied?"

"Milked that cow dry! Stripped her, every drop!"

"Was she a good milker?"

"Young cow; her first calf. She'd give about two-thirds of a bucketful."

"Could the snake, being so distended, get away without—"

"Oh, it wasn't bothered any; it crawled away quickly enough."

"A large specimen, one of the biggest you have seen?"

"Not at all; about four or five feet, I suppose. Got away and I couldn't measure it."

"Very wonderful, indeed, considering that the stomach of a five-foot black snake is about five and a half inches long and an inch in diameter, with a distending limit all along of about four inches and an excess in length of perhaps seven inches, so that it will, with the distention of the lower throat also, hold a young rabbit. The maximum capacity of the entire throat and stomach would not possibly exceed two quarts. A milk bucket holds eight quarts, does it not? And about two-thirds would be at least five quarts."

And then from another source:

"Your story, Mr. — —, reminds me of the man who fed a whole bucketful of milk to his young pig and then put the pig in the bucket. There are probably only two cases on record of the actual condensing of liquids. But perhaps your snake acted only as a hose connected with Mother Earth."

Our host, however, refused to discuss the subject further.

Now, there is one trouble with this checking of errors: some feelings are sure to be hurt. There are a number of really learned writers and teachers, deservedly popular also, who cannot help drawing the long bow. This began long before the time of Aristotle and has persisted. In America apparently not one of our nature students has been able to refrain from recording things they could never have seen. Catesby and Kalm throughout, Audubon widely in picture and text, Nuttall more rarely and even the most careful Wilson's account of the mocking-bird's song is an exaggeration, while it is hard to credit the story of the ruffed grouse that flew down the mountain with its one young in its bill.

But with the later and greater popularity of nature study and the literary efforts inspired thereby there has seemed to be hardly any limit, within or out of reason, to which the nature writer, in books and periodicals of all kinds, even to the daily press, might reach. (Continued on page 15)

Bunny, taken unawares, kicks at being bled by the weasel.

Does the American Tourist Misrepresent America?

By GEORGIANA LOCKWOOD

"AMERICA'S fame abroad is determined largely through what Europeans see of America," declares Robert E. McAlarney, production manager of the picture corporation of Yale University. If this be true, the movies have a good deal to answer for, among them the notion that America is a crude land, all speed and no control, where quantity, not quality counts; where all men have bad manners and all women are either vampires or amazons; where 95 per cent of the population is vulgarly absorbed in dollar-chasing, and where the other 5 per cent is equally vulgarly occupied in scattering its pile of accumulated dollars in a round of riotous living. Such absurdities, undeniably cherished by the mass of Europeans, may, according to McAlarney's theory, be directly traced to the showing of antiquated slap-stick comedies and "high society dramas" abroad.

A totally different explanation is now advanced by a United States consul, many years in the European service, who places the blame for misrepresenting America abroad not on the movies but on the unthinking American tourist. Coming from such a reliable and impartial source, this view has especial interest in a season in which a record-breaking number of American tourists are crossing the Atlantic.

"There is no more selfish being than the American who comes to Europe on a vacation and 'cuts loose' in a way that he would never think of doing in his home town, where he enjoys a more or less deserved reputation as a respectable citizen, and only dares do over here because he thinks he is far enough away from Main Street not to be recognized. Yet we are apt to smile indulgently at his adventures and even to encourage him to boast about them.

"If John Jones got very drunk or engaged in a brawl with a taxicab driver or waiter in his home town there would be gossip which would injure John Jones socially and professionally, whereas in Paris or Berlin no one has any idea who John Jones is. But one thing they all will know, that the person who made himself or herself (for there are plenty of feminine Johns) unpleasantly conspicuous, was an American, and the unfavorable comments which are inevitable will be directed not toward John Jones—who, after all, deserves them—but toward Americans in general, who are innocent."

"As you probably know," the consul explained, "a large part of our time is taken up with extricating Americans from difficulties into which they have got themselves. Investigation in these cases, I am sorry to say, usually proves the American to have been in the wrong. When a traveler combines total ignorance of the language, laws, and customs of the country he is visiting, with a vague suspicion of all 'foreigners' and unwillingness to adapt himself to anything that isn't exactly as it is at home, he is running a great risk of getting into trouble. This risk usually becomes a certainty when he also fails to provide himself with essential information from consular or other reliable sources before starting on a journey."

"Won't you give an example of the sort of situations out of which you have to help traveling Americans?"

"One of the worst mix-ups that ever came to my attention, was one right after the war, in which were involved two young fel American students at an I university, who decided to s their spring vacation atte a Sunday school conventio some such international gath of Christian students, whic to be held at Vienna.

"Not having much m they decided to make the on foot, and set out thirst adventure. They got it. All smoothly until they reached a mou pass on the Austro-Italian b Here they were stopped by I soldiers who refused to let them ceed until they had been iden

"Perhaps the boys didn't qui it through their heads what wanted. Perhaps they were just f spunky; but they grew indignan more insistent in their demands they be allowed to proceed w further ado until the soldiers impatient. 'Who are you and are you going?' they demanded. are American citizens,' they re 'What proof have you that yo really what you are and not Au spies?' At this one boy reluc produced his passport, but his panion stubbornly refused to over his, apparently being afra would never get it back.

"The Italians declared the story most improbable, especiall part about the Sunday schoo vention, and expressed their that the boy who had refused to his passport had never had s thing, and that the other on probably stolen his. Without ado they were marched off ur military guard to be locked up p investigation.

EDITORIALS

Butler Finds It Hard

GENERAL Butler, the Marine officer on whom Philadelphia pinned its hopes for a clean city, admits that until now his efforts have failed. He now proposes to create a police force within the police force, a unit answerable only to himself, and try what that will do. The experiment will be watched with much interest even if with small hopefulness.

The fault with Philadelphia is Philadelphia. Citizens are not themselves in the fight, they are spectators of a supposed struggle between two gangs, one gang being the police and the other the lawbreakers. Citizens in such circumstances are just as aloof as if it were a distant struggle between the Zulus and the Hottentots.

Complicating the situation is the natural sympathy of police forces with lawbreakers of a certain type. The policemen of America have not yet aroused to the fact that bootleg booze has killed more of their uniformed brothers than any other influence in the land; in every city there are police officers who are the friends and protectors of the illicit liquor sellers. General Butler has run up against that state of affairs: he has found a police force largely unwilling to protect the citizenry that pays it, while it actively protects a lawbreaking group —that probably pays it more.

Prevention of liquor violations is not impossible. Towns with a police force of only one member—the town marshal—do it; great cities can do it. Every illicit place is known to the police. But an undeniable natural sympathy between police and the liquor business exists, and it can be overcome, perhaps, only by a wholesale clean-up of the old type of police officer.

Philadelphia went outside for a police chief; why not go outside the usual police material for policemen? Thousands of husky young college men are zealously desirous of serving the people. Why should they not begin by cleaning up society at the bottom and at the top? Some inform us that there is a Youth Movement—where can it better be utilized than in rendering our cities better places in which to live?

Here is a field of municipal experiment in which the nation awaits some city to lead it. Policing a city is an honorable duty; it is a public service that might well appeal to young men of breeding and training. If General Butler had 1,000 college men of physical stamina and moral conviction, *and the citizens of Philadelphia behind him,* that city of ancient renown would not stand before the country in such shameful aspect as she now does.

A Story With a Moral

HERE is a true story. It concerns a lesson that was learned by the manager of a successful business. Upon his staff was an efficient employe, whose decade of service had brought an increase of responsibility far in excess of the increase in compensation. One day he notified his superior that he had accepted an unsolicited offer from another concern. Asked the reason, he stated it was a matter of salary—he was to receive 50 per cent more than his present wage.

"But why did you not consult me? We can afford to pay better wages than they, but we can't afford to lose such men as you. I will see their offer and increase it if you will stay with us."

"It is too late," replied the subordinate. "I have pledged my word and shall keep it. If I have been receiving less than I was worth to you, I have been treated unfairly. I never questioned your good faith; your present proposition could not restore my confidence in it. It seems like leaving home to go, but self-respect demands it."

Neither man is in his old line now. The manager is retired, while the subordinate is a successful employer of men, to whom he applies the rule that "the laborer is worthy his hire."

Senator Ladd

THE Senate and independent political thought suffer a second serious loss in one month in the death of Edwin Fremont Ladd, North Dakota's representative in the upper chamber of Congress. He was one of the few men of scientific training and outlook in that body. Much of his so-called radicalism was merely his scientific directness in examining public business. When the scientist and the engineer come more largely into politics there will be more of the constructive radicalism that marked Senator Ladd.

Born in Maine, he began early to apply chemistry to agriculture. In North Dakota he drew up pure food and other pure quality laws which have become models for Canada and

England. His thoroughness in his work brought him great opposition and many damage suits, of which latter he never lost one. The paint companies which fought him most bitterly now admit that he put their business on a higher plane, to the benefit both of manufacturers and users. He had a mind that fellow-scientists respected, and his work was so soundly based that most of it stands.

Politically, Senator Ladd knew nothing of pose and did not assume the attitude of radical. He examined each matter on its merits and took his stand as the weight of the facts indicated. It was this unbiased assumption of position and an equally cool maintenance of it that made him easily the most feared of the progressive group in the Senate. The fiery Lafollette and the less influential Brookhart and Frazier, and the petulant Norris, never caused the fear in old-line Republican Senators that Ladd caused. None of the so-called progressives ever took up the Money Question on the floor with the deadly scientific acumen that Ladd showed. It is because of the removal of his tremendous knowledge of the Money Question that most relief is expressed in some quarters. In intellectual grasp and thoroughness and courage, he was perhaps the strongest single member of the Senate. There are other strong men there, but they are not seeking to right what is wrong in our system; Senator Ladd was always seeking governmental betterment, not for a class or a party, but for the nation.

In these days of public distrust of legislators in general, it will repay publicists to study the work of Senator Ladd in the Senate, weigh the facts which he produced and the arguments he adduced from them, and see if in this man's outlook there were not some of the elements inseparable from future progress. Though the Senator himself may be forever silent, his work had the quality of life. His State and the Nation have lost a devoted servant.

The White Man's Burden

GREAT BRITAIN steadily moves toward the position of Guarantor of the Peace of Europe. With a courage that matches the peril of the proposal, the Empire ceases to be merely the ally of France but moves toward the higher place of judge between France and Germany. It is now clear that Britain, to allay the fevers whence wars spring forth, will give Germany no less a guaranty against French aggression than she will give France against German attack. Britain thus offers her faith, her prestige and her power as a neutralizing element thrown into the caldron of European fears and suspicions.

The extent of responsibility which this entails is not clear. To guarantee either country against attack by the other, means considerably more than a promise of alliance with the attacked country as against the aggressor. It means a guaranty against the aggression ever being made. And this in turn involves something else: it involves an oversight of each nation's tools of attack. If France goes on piling up armaments, or if Germany goes on restoring her military strength, of what value would Britain's guaranty be should either France or Germany assert the right to use its armament? There would seem to be no other way than for Britain to stipulate, in return for her guaranty, that the military preparations of both nations cease forthwith, since now reliance on Great Britain makes them needless.

Will France and Germany accept such terms? True, they have not been suggested as yet, but are they not involved in a guaranty against aggression from either side? And if they are not openly suggested they are at least dimly limned in the Chamberlain statement that this guaranty would be a real step toward disarmament since it would allay fear. Indeed, cessation of military preparations would be essential to the integrity of the guaranty.

Thus Britain checkmates the poker-laying of both France and Germany in their attempts to line up the Empire for war. Britain offers the guaranty in such wise as to line up both France and Germany for peace. It is one of the great developments of the times.

Collars!

ACTING apparently on behalf of civic order and beauty, the police commissioner of New York City required that not later than June 15 all taxicab drivers while on duty must wear a white collar and a necktie.

The white linen collar, now universally made of cotton, is yielding to the soft collar in the interests of personal comfort and efficiency and the New York police commissioner, like all officials, is looking backward instead of forward. The successors of the present generation may have sufficient common sense and courage to discard the collar altogether as woman has done. The average man wears a shirt band and collar that are both too tight with the result that the flow of blood to the head is hampered and the vastly complicated apparatus of the whole neck structure is adversely affected. The present use of starched collars is merely the adoption of an affectation of aristocrats who lived one hundred years ago.

It is amazing that in this age of so-called efficiency men insist on wearing collars around their necks although they would be horrified at the suggestion that their infants be similarly confined.

MR. FORD'S PAGE

MAN and the Machine is a favorite subject with those who know little of either. The ready assumption and glib assertion go together, that the introduction of machinery has made a machine out of the man, that the increase of mechanical aids is the measure of man's slavery to wheels.

The contrary is the truth: the function of the machine is to liberate man from brute burdens, and release his energies to the building of his intellectual and spiritual powers for conquests in the fields of thought and higher action. The Machine is the symbol of man's mastery of his environment.

One has only to go to other lands, or turn the pages of a book of travel, to see that the only slave left on earth is Man minus the Machine. We see burdened men and women hauling wood and stone and water on their backs. We see artisans clumsily devoting long hours and incredible toil for a paltry result. We see the tragic disproportion between primitive hand culture of the soil and the meager fruits thereof. Unbelievably narrow horizons, standards of life lower than the level of the beasts, poverty always on the edge of disaster—these are the conditions that greet us where men have not learned the secrets of power and method as they are embodied in the Machine.

The urge toward the Machine is one of the deepest in social life. The sling, the arrow, and the spear are man's attempt to lengthen the reach of his arm. His hammer is but a harder and more powerful fist. The knife is an auxiliary of his teeth. In these primitive tools man has sought to enlarge himself.

To release himself to more human duties, man has trained beasts to carry burdens. The oxteam and camel represent man's mind plus brute strength, for the release of man from the sphere of the brute to the larger occupancy of the sphere of man. The sail is man's release from the slavery of the oar to the higher sphere of the mysteries of navigation. The swift horse was man's dim sense that time had value, not for the horse but for himself and his human concerns.

Higher still than these is man's knowledge how to mingle stone and ore for the shrine, and fire and water for the secret of power. Then the oil of the earth and sparks of fire were brought under tribute, and man compelled a series of small and regular explosions to save his hours, and save the wastage of his strength, and greatly multiply the fruits of his application. With electricity and the ether waves, with motors and wings, his history has been a succession of emancipations from that gravity of necessity which held him to the plane of brutehood.

When man enlisted the aid of hammer and knife, of horse and camel, of sail and wind, did he increase his slavery, or did he increase his liberty? He became more and more a freeman in the earth, of course. That is the primal purpose of man's development. Why then assert that because he has harnessed engines and motors, electricity, steam and air-waves, he has increased his slavery? Only those do so who have not observed the service of the Machine in the liberation of Man's energies to their proper fields of action.

> *MAN minus the Machine is a slave; Man plus the Machine is a freeman. Contrast the people whose bodies are their only machines, and people who have modern mechanical inventions, and see who is slave and who is free. People who are capable of and fit for freedom liberate themselves from physical thralldom by substituting mind for muscle. The sail liberated man from slavery to the oar. The Machine releases man's energies from physical channels to higher activities. The Machine is man's dependable and multitudinous servant. Yet there are those who say that the Machine enslaves Men. Quite the contrary is true.*

It is too true, and a sad but temporary page it makes in human story, that the Machine has sometimes been used by those who owned it, not to liberate men, but to exploit them. This course, however, *was never accepted by society as right*, it has always been challenged, and as the use of the Machine became more widespread it effectually checked the misuse that had been made of it. The right and serviceable use of the Machine always makes unprofitable and at last impossible the abuse of it.

Our Western civilization has not yet begun to reap for itself the full benefit which the Machine can bestow. And the reason is that the need of the world for the tools of living is so great, and the fact that we are the only ones to supply them is so apparent, that we have postponed our own full measures of benefit to send throughout the world these discoveries and creations of ours and enable less fortunate nations to find higher levels of action. It seems to be our destiny to be the servant of less self-helpful peoples. And, after all, that is the only true superiority, the possession of the greater ability and also the greater wi lingness to share our benefits with other peoples.

When the enlightenment and liberation of which it is our good fortune to be the pioneers becomes generally distributed and the more pressing economic need of the world is met, then we may expect a social adjustment of effort which will extend to all of ourselves the benefit we thus far have been willing to forego in the service of other peoples. The type of civilization that produces and distributes a surplus cannot be called slavish or sordid or selfish.

Should Naval Guns Shoot Higher

Increased Elevation Means Greater Range and Therefore More Efficiency

By J. J. DEWEY

IT IS fairly well established by this time that our naval experts had little or nothing to do with the framing of the famous "Limitation of Armament Treaty." In fact, a prominent ex-Secretary of the Navy has charged that not only were the real experts prevented from having a hand in the treaty, but that the naval leaders were muzzled to prevent them from informing the country what was really going on. It is not surprising then to find the Secretary of the Navy going to Congress in haste a few months after the treaty went into force to obtain authority and the necessary money to elevate the guns on thirteen of the battleships left us by Mr. Hughes, to put them on a par, so far as range of guns is concerned, with those of Great Britain. It seems the question of gun elevation was entirely overlooked by those who were negotiating the treaty for America. The result was that only five of our eighteen ships had a firing range that would keep them within shooting distance in the case of battle. Congress immediately went into action and, without a word of debate or a particle of opposition on the part of anyone, on March 4, 1923, about a year after the treaty was drawn up and shortly after it was ratified, passed the following:

"For making such changes as may be permissible under the terms of the Treaty providing for the limitation of naval armament concluded on February 6, 1922, published in Senate Document No. 126 of the Sixty-seventh Congress, second session, in the turret guns of the battleships *Florida, Utah, Arkansas, Wyoming, Pennsylvania, Arizona, Oklahoma, Nevada, New York, Texas, Mississippi, Idaho,* and *New Mexico* as will increase the range of the turret guns of such battleships, to remain available until December 31, 1924, $6,500,000." A vigorous protest from Great Britain caused Congress to repeal this authorization.

For a time the question languished, but recent disclosures of deficiencies in our Navy brought it to the front again and Congress had it up for consideration in the last session. The stand taken by the President has settled it for the time being, but it is a subject of such vast importance that it is bound to come up again. In the meantime, the average citizen is asking: "Why is it necessary to elevate these guns?" "Why does one political party oppose it, another favor it?" "Does the Arms Treaty forbid it?" The function of the modern newspaper seems to be to record events, not to explain them, so little hope can be entertained for enlightenment from that quarter.

Why is it necessary to elevate these guns? Because our earliest ships have an elevation of only 15 degrees, while those of Great Britain have an elevation of 20 degrees. Why is there a difference? Our naval officers felt that 15 degrees was as far as you could go with elevation and obtain accurate shooting. That they have changed their opinion is proved by the latest ships we have built, for the *Colorado, West Virginia, Maryland, Tennessee* and *California* all have an elevation of 30 degrees. At the time their opinion was sound, but developments since in fire control and airplane and captive balloon spotting has greatly lengthened the effective range of fire. An increase in the size of the gun together with a corresponding increase in the size of the shell has made it possible to carry on a battle at ranges hitherto undreamed of. The 12-inch shell fired from the gun of the same classification, the kind mounted on our first dreadnought, the *Delaware*, weighs 870 pounds. The guns of our latest dreadnoughts, the *Maryland* class, fire from a 16-inch rifle a shell weighing 2,100 pounds. Thus in a little more than 15 years we have almost trebled the weight of our projectiles. An increase in the range of guns is useless unless a corresponding improvement is made in the method of detecting and accurately determining the position of the enemy at great distances and, what is more, directing an effective fire that will reach their position. Improved methods of fire control and the use of the airplane and captive balloon have solved this problem. It becomes imperative, therefore, to adjust the older units of our Navy to these new conditions of battle.

From the accompanying table it will be seen that only five of our eighteen ships have the new requirements as they alone have an elevation of 30 degrees. In the English Navy three, the *Nelson*,

The *Delaware* on the high seas.

, and *Hood*, have the maximum vation, and in the Japanese and *tsu* and *Nagato*. Japan has recently reased the elevation on the remain- of her battleships to 25 degrees. e seventeen other ships of the Eng- Navy have a 20-degree elevation ile thirteen of ours are limited to 15 rees. Since the whole English fleet, h the exception of the four vessels of *Iron Duke* class, can outsteam ours it uld be the easiest thing in the world the English to stage engagement in the nt of war at 25,000 ds, thus eliminating rteen of our eighteen sels and making five t the whole English t of twenty vessels. ce the Japanese bat- hips are from one to knots faster than s and have a maxi- m gun elevation of nty-five compared to fifteen degrees on the ps of ours that we e spoken of, they ld employ the same tics and thus compel five dreadnoughts to hstand their whole t of ten ships. "From nilitary standpoint," Chairman Hale, of ate Naval Committee, ntly, "as far as the stion of the elevation he guns of our capital ps is concerned, no ument can be made inst it. Of course, battle fleet which has the greater nber of fast ships and the greater nber of long-range guns can keep of range of its opponents and can ver its fire unopposed by ships ex- et those of the same range or speed or se which are faster and have a longer ge of guns. I do not think there is question about that; and there is question that a battle fleet that is er than its opponent can choose its ge and decide what the range shall and that is a great military ad- tage. I will go further than that say that the battle fleet that has equal range of guns with its oppo- et but faster ships has a military ad- tage in that it can run in and de- r its broadside and get out of ge whenever it sees fit to do so, the navy that has slower ships, ompensate for their lack of speed, uld have a greater range of guns n has its opponent." From the going statement it can be seen y it is necessary to raise the guns our capital ships and why also the y Department is most anxious to e it done.

There is only one critic of any rtance who holds it is unnecessary elevate our guns and he bases his nion upon the mistaken assumption h the Jutland fight showed the limit in range. Beatty's opening range in the North Sea fight was about 18,000 yards but most of the fighting was done at ranges of from 12,000 to 14,000 yards. The reason the battle was not fought at 18,000 yards was because the German fire was more accurate at that range than the British who, with their better speed, immediately closed in to deprive their opponents of their advantage. Another factor the critic has overlooked is the abnormal low visibility which prevails in the North Sea, lower than almost any other place in the world. Captain Dudley W. Knox, U. S. N., answers this argument in the following statement:

"Jutland was fought nine years ago, when the limit of accurate gun fire was about 19,000 yards. Meantime airplane spotting has been developed and has greatly increased this limit. There is every reason to suppose that battleships can now do accurate shooting at more than 25,000 yards, and progress is being made every year. The British battleship speed averages several knots faster than our battleships. They could choose the range, far or near, at which the fleet action would be fought.

It does not require any technical knowledge to understand *that they would be simple-minded not to choose a range at which a large portion of our fleet could not shoot back. Under such circumstances any superiority which we might possess in displacement, the number and power of guns, et cetera, could not be brought into play, and could not possibly save our fleet from a quick and very decisive defeat.* The cheapest and most practical way in which this great discrepancy of strength between the American and British battleship fleets can be brought to anything approaching parity is by increasing the reach of the older American ships; that is, by increasing the angle of their elevation."

It is more difficult to answer the second of our questions: Why does one political party oppose it and the other favor it? The answer to that brings us into the realm of politics face to face with problems with which, to paraphrase a scriptural expression, the unlearned and unwary wrest to their own destruction. It has been sort of an axiom in American politics for one party to oppose whatever the other party sponsored and favored. Since the President, the leader of his party, is opposed to gun elevation it is good politics for Republicans, seemingly, to get behind him and support his attitude. For the same reason it is good politics for the Democrats to oppose his position. It certainly is to be deplored that a question of so vital importance should be made the football of politics. Democrats and Republicans voted to accept the Arms Treaty as it was presented to the Senate and therefore bear a joint responsibility. The treaty contains many flaws, most of which we are only just now finding out. Both parties should turn in and see to it that the mistakes of the treaty are corrected so far as correction can be made without jeopardizing the treaty itself.

The third of our questions is: Does the Arms Agreement forbid the gun elevation we propose to make? There were five contracting powers in the drafting of the naval treaty, England, Japan, France, Italy, and the United States. Two of the signatory powers have already increased the elevation of their guns without bothering to inquire of the other powers whether they considered it permissible according to the terms of the agreement. None of the other powers, Great Britain included, made any move to protest even though it knew what was going on. As soon as the United States announced that the guns on our battleships were to be elevated Great Britain immediately filed a protest with our State Department at Washington. Secretary Hughes, in a letter to Chairman Butler of the House and Naval Committee, gave the following information in regard to the English protest: "In a communication under the date of March 15, 1923, the British Ambassador at Washington reviewed the reports that had been made as to the increase in the elevation of the turret guns of British

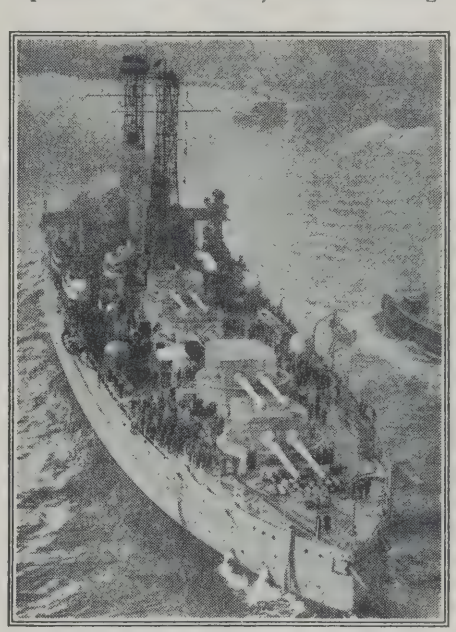
ships and made the categorical declaration that no alteration had been made in the elevation of any British capital ships since they were placed in commission.

"In subsequent communications from the British Ambassador at Washington it has been stated to be the view of His Majesty's Government that an increase of elevation of turret guns is not permissible under the terms of the naval treaty with special reference to Chapter II, Part 3, Section I which prohibits subject to certain exceptions expressly provided for any reconstruction of certain capital ships or aircraft carriers, except for the purpose of providing means of defense against air and submarine attack. As regards the question whether such increase in the elevation of turret guns involves any 'reconstruction,' it *is stated to be the view of the British Government that the increase of the elevation of guns together with consequential alterations, such as scrapping or replacement of existing fire control systems, and so forth, involves considerable "reconstruction" in the fullest sense of the term. The British Government lays particular emphasis* upon what is described as a larger aspect of the question—that is to say, that one of the objects of the treaty is to reduce the burdens of competition in armament—and the British Government feels that action by the United States in the elevation of turret guns would tend to defeat this object to a considerable extent. In these circumstances the British Government makes an earnest appeal that the Government of the United States should not impose upon the peoples of the countries concerned the burdens of competition in armament which are deemed to result from the execution of the proposal to elevate the turret guns in retained capital ships of the United States, it being considered that, even if arguments can be found in support of the contrary interpretation of the treaty, the effect of carrying out such proposals would be incompatible with its intentions."

Such an argument is like Shakespeare's "goodly apple with a smiling cheek, but rotten at the heart." The statement is not only at variance with the facts but conflicts with the purpose of the treaty itself. The United States did not need disarmament to attain the position of "First Nation on the Sea." But England did require the Limitation Treaty to preserve at least an equality with us in naval standing. The United States was ready and willing to cut down our immense programs that England might have equality. Now that it is found that through an error we went too far and conceded more than enough to achieve the equality, England opposes steps to ratify the error on the grounds that it might defeat the purpose of the treaty. How also is competition to be given a new impetus when the other Powers concerned have already done that which we are only debating?

In regard to the attitude of the Japanese Government, Secretary Hughes said in his letter: "I have been informed by the Japanese Government that it was not the view of the Japanese Government, that a change



The *Arkansas* at New York.

in the gun elevations, which did not require changes of the prohibited sort in the ships themselves, would not be a violation of the naval treaty."

Secretary Hughes was responsible for most of the treaty; in fact, he wrote very many of its paragraphs himself. After presenting the protests of the British Government and the opinion of Japan in his letter to Chairman Butler, he adds his own opinion: "I may add that in view of the detailed description given by the Navy Department of the nature of the changes which would be necessary to elevate the turret guns on the capital ships retained by the United States, these changes would appear to be of minor sort and *in my opinion would not constitute a reconstruction of the ships within the meaning which should be attributed to the p vision of the naval treaty." The rea for the British attitude might be found this statement of Senator Gerry, a mem of the Senate Naval Committee: "I fortunately for Great Britain, I und stand the turrets of her battleships are constructed that it would be practica impossible for her to make the chan without possibly a breach of the treat*

The point at issue is the interpre tion of Chapter II, Part 3, Section I the Agreement concluded at Washi ton, which is as follows: "No retai capital ship or aircraft carriers shall reconstructed except for the purpos providing means of defense against i and submarine attack, and subject the following rules: The contract powers may for that purpose equip isting tonnage with bulge or bliste antiair attack deck protection, pro ing the increase of displacement t affected does not exceed 3,000 tons placement for each ship. *No alterat in side armor, in caliber, number or g eral type of mounting of main armam shall be permitted.*"

Can the guns be elevated with changing the general type of mounti Various steps are necessary to incre the range of our gun mounting, s as cutting away the gun port ab the gun so that it can be raised hig

It is the attitude of the Navy partment and of well-informed me both branches of Congress that ought to be accomplished as soon possible. The President's course blocked action for the time, and based on the contention of the S Department that nothing should done until the difference of opinio adjusted with Great Britain. Perh a second Conference will present opportunity. If that is delayed postponed indefinitely, the ma should be settled by diplomatic changes as it will be 1939, accordin treaty, before we can replace the of the thirteen deficient ships those of modern gun range. The W ington Conference did not ab competition; it only eliminated cer forms of it, placing at the same definite bounds on other partic forms. As long as ships are built c petition will endure, so it is pu to oppose gun elevation on the of exciting or renewing competiti

here is not only a woeful ignorance ibits, the need of assuming to calling for the utmost supposi- often wide of facts, but even the r of geographic distribution is as understood and looked into—the wonder when anyone may pick zoölogical book of reference and imself and his readers aright. two great cats—the tiger and the r—are most often and contin- thrust out of their habitat.

hen Colonel Roosevelt planned frican trip there was a very al incentive to anticipate him, ularly by the so-called yellow als. One Sunday edition of a York paper told, with the aid of age pictures, of a hunter in who had shut himself in a cage the jungle the better to come uch with the denizens of the . This was related as an actual ience, but it was not mentioned somebody must have let loose a hereabout, for that strictly desert nl, the lion, roared around the hold; tigers, no doubt brought ally from India for the purpose, l upon the cage; jaguars got over South America to do some yelling, leopards, the only great cats rly placed, were also in evidence. e deponent, in *Collier's*, very criticized this at the time, but ature literati, even the book- s, must have entirely overlooked Several loose references have been made to hunting tigers rica, but most remarkable was ry in *The Saturday Evening* about five years back. The l-loving hero, after a managerie ing, goes to India and with a fences against a king cobra ll but defeats his skill, encounters hon that was so swift as to have ken a native boy running and s himself of protection against a by relying on a large dog—all l of the most glaring character. y he encounters a jaguar and sses a fight between it and a bear.

Almost as glaring is the contents of a recent book, "Claw and Fang," reviewed in the *Literary Digest*. One is a little at sea as to whether the author or the reviewer is most at fault. India is the country mentioned, but it is quite hopelessly mixed with Africa, for all the names and most of the creatures and situations are strictly African: the lion Ngonyama, the hunter Mahamba, the water holes, the water buck (meaning water bok, of course). But the whine of the bear is heard, which fits India only, except that in Africa the observer might have been in the Atlas Mountains. As to bears habitually whining, there may be some doubt. Sand grouse also are mentioned; they are chiefly European and Asiatic, not African, except along the extreme northern coast, which information tallies somewhat with the bear, but conflicts with the water buck and present-day lion.

Swarm of May flies, also called day flies, and, technically, ephemera.

However, all these inconsistencies in that book as to habitat are quite trifling when it comes to the scream of the jaguar, which is heard along with the snarl of the leopard. The jaguar does not scream; its vocal expressions consist of gutteral grunts and a coughing roar not unlike that of the lion, though not so loud, and if it could scream in India it would have to be in the Calcutta zoo, or escaped therefrom, or shout its protests so loudly as to be heard over seven thousand miles of land and water.

When will the rush-into-print nature story-tellers treat this big cat as other than a globe-trotter and recognize its limited habitat within the warm countries of the western mainland continent?

But even among the bona fide naturalists who write scientifically the jaguar has received a reputation not deserved, for in all the books, as "The Cat," "The Felidae," "American Quadrupeds," several extensive zoölogies, the encyclopedias, "American Animals" and the high-sounding "American Natural History," which is only half of what it pretends to be, the big, yellow, black-spotted American cat is persistently described to be the largest of the New World *Felidae*. Not one record of the size of either captured or killed specimens for zoölogical gardens or museum mounts comes anywhere near equaling in length, height or weight the largest puma; the latter, indeed, almost doubling those of the jaguar, and the naturalist Hudson states that the puma, in the LaPlata country, is clearly the master of the two when they come in contact.

Animal behavior is as yet the least understood, the most difficult to comprehend in its wide variations of all nature study and because of this and its certain attractiveness it offers the largest opportunity for the imagination.

Contests that result in the death of well-matched mammals or birds are but imagination; there is a common and certain respect for each other's prowess between the puma and bear, the bay lynx and fisher, the fox and raccoon, the badger and the coyote, the marten and mink, the ocelot and bay lynx, the red and gray squirrels, the hawk and owl, the heron and sea gull and it is only when the winter food is scarce to the point of starvation and the aggressor greatly overmatches the defendant in strength or numbers that attacks are made at all by any powerful animal upon another capable of inflicting considerable injury.

Our author, as above, tells of a battle to the death between two wild cats—the bay and the Canada lynxes—and also between a fox and a mink over a captured rabbit and the intention is to convey good natural history. It is, however, pure fiction, though not less true than his story of the hunting of both parent lynxes with the young. Everyone should know that, except with the lion, there is a mortal hatred on the part of male *Felidae* toward the young and there is never the semblance of a family circle. The mere approach of a male within hailing (*Concluded on page 26*)

So This Is Literary New York

Some Clubs Are Literally Literary But Others Are Only Salmagundi

By THOMAS L. MASSON

ILLUSTRATED BY W. O. FITZGERALD

ONE of the most prominent woman writers in America with whom I chatted one evening at the National Arts Club in Gramercy Park, New York, told me that she had been lecturing that afternoon to the idle rich in the home of a lady millionaire.

"What is to become of us," I asked, "if, through your well-meaning efforts, intelligence should spread to the idle rich?"

"There is no danger," she replied. "I don't think they had the least idea of what I was talking. The hostess had taken all of her antiques and valuables out of one room which was inhabited by the audience, and when I came informed me that she had hired a detective for the occasion."

Another writer, this time a man writer, told me that another lady millionaire had sent for him on an important matter. He had written several histories.

"You have been recommended to me," she said, "as an eminent historian. I have so many engagements that I have no time to read myself. I wish to be informed about European politics and the history of European countries generally. Will you write me a modern history of Europe and come and read it to me? I see you have a good voice."

My friend was rather paralyzed by the suggestion, and hesitated. She was quick to see that it might be money of which he was thinking.

"Tell me," she went on, "how much you think I ought to pay you."

On the spur of the moment he replied:

"Well, I once received thirty cents a word," and was about to explain that he would take less when she cut him off with:

"That is quite all right. Read to me for about an hour."

He went back and wrote the first chapter and the following week, at the appointed time, appeared and read it. It ran about three thousand words and the lady's secretary handed him a check for a thousand dollars. During the months that followed he collected about fourteen thousand dollars. One day he appeared and was informed that the lady had gone off on her yacht. She was sorry, but she had had enough. With the fourteen thousand dollars he bought him a house and got married. There were other details to this story, but in the main it is strictly true. The lady millionaire is well known.

I mention these incidents as a kind of background to show that in New York literature is sharply separated from finance. Yet here again a distinction must be made between the so-called idle rich and the cultivated rich. Mrs. Edith Wharton's novels of New York give a perfect picture of the cultivated rich of past generations. Things have changed very much since the period of which she writes; it is still true, however, that there is in New Yo small body of cultivated rich pe who are "up" in the classics, music art and of whom nobody ever kn The most that the smart people e in the way of brain work is to liste lecturers, and of these lecturers, most popular by far are those who on current events. Back of me at opera the other day one stout lady to the other—she was speaking of current events man:

"You know, my dear, he talk two hours and it's all solid meat; I hate to acknowledge it, at the end hour it is all I can do to keep aw And he is really wonderful!"

It is true now, as it never has before, that the literary set of York is a distinct entity; yet it is true that it is composed of a great r more varying elements. In the days Washington Square was the l ity of culture. Mark Twain, who within a few steps of the Squar lower Fifth Avenue, used to walk o Sunday mornings when people going to church, that they migh him. Below Washington Square, G wich Village carried its full quo Bohemians, shading into all ton genius. All this is now past. Gr wich Village lives mostly on its parted glories. Washington Sq holds itself proudly still, but th culture atmosphere has been dissip Now the literary set is scattered ab it has no set habitation; its demo is so intense that it would make th

The most that the smart people affect in the way of brain work is to listen to lecturers.

sidents of Washington Square turn
er in their graves if they were able to
ar its intimacies above the roar of
bways. There are highbrows a-plen-
, but today the highbrows are wallow-
g, where formerly they gazed serenely
om the heights. It is all such a curi-
s mixture of editors, publishers,
velists, poets, advertising men, play-
ights and scenario gentlemen! One
the most distinguished poets in the
untry confided to me that he had but
cently delivered an address before a
otary Club, and, moreover, liked it.

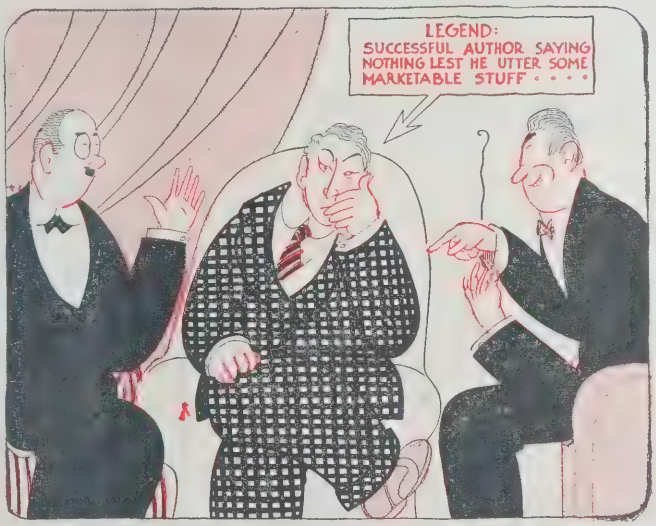
That does not mean that the high-
ows of today are not offensive; but
eir offensiveness takes on another
rm from those of the past. The old
clusives were silent; they withered
u with a look. Walt Whitman and
dgar Allan Poe, both of whom, with
ndred spirits, used to meet in a raths-
ller near the present entrance to the
rooklyn Bridge, were anathema to the
clusives. Now, among all kinds and
grees of literary men, there is an inti-
ate atmosphere quite difficult to de-
e. I think it is probably due to com-
ercialism. That is to say, every in-
pient, or otherwise genius is a go-
tter, or is trying to be; he can, there-
re, overlook no possibility. A man
nployed in a publishing office took
nner one evening with a short-story
iter. "I have an idea for a story,"
said, outlining it. The writer grabbed
e idea. It involved much research,
t his work was completed in a few
eks and he sold the result for $2,400.
ey are still friends. As for the intel-
tuals, as I have had occasion to re-
ark before, they
ake no bones about
e main chance.
ey are out for the
in. But let us
rticularize.

There are a dozen
more clubs in New
rk which, among
em all, contain
ractically all the
erary men and wo-
n there are. The
ntury Club is, of
urse, the most ex-
usive, but it is a
erary club only in
rt. Very few of its
mbers are under
y. The Authors'
ague is a lively af-
r, presided over
gely by Ellis
rker Butler, Arthur Guiterman, Alice
er Miller, and Gelett Burgess. Its
in object is apparently to protect
thors from themselves. As a matter
fact, it has in practice been found ex-
mely useful and is now engaged in
thering and mothering a pet copyright
l.

Perhaps the largest and most repre-
sentative literary club is the National
Arts, although a large part of its mem-
bership, as the name suggests, is among
artists. This is the only housed club of

As to the intellectuals—they are out for the coin.

its size that admits both men and wo-
men as members. Every year it has a
book week, in which are on display the
principal publications of the year. One
evening is devoted to speaking. It has
all the atmosphere and intimacy of a
small-town gathering, where Folk is
Folk. This year I spoke there myself
with Margaret Widdemer and Harold
Howland and young Ben Hecht of
Chicago, who was very amusing. Last
year it was at the National Arts that
Israel Zangwill publicly accused us of
not having a sense of humor, and nearly
precipitated a riot. The Dickens Club
has its annual dinner at the National
Arts, and also they have other dinners
once a month. Almost next to it is the



They nurse their pet ideas with stern regard for the almighty dollar.

Players Club, which is more truly liter-
ary, more gossipy and more artistically
Bohemian, than perhaps any other. It
consists largely of artists and writers,
although there is a fair sprinkling of
actors. Don Marquis, perhaps our
best humorist, is to be seen there con-
stantly, usually playing pool with John
Adams, a retiring but delightful artist.
Oliver Herford is also an habitué, his
inimitable wit never failing him. Down
on lower Fifth Avenue, not so far from
Washington Square, is the Salmagundi
Club, consisting largely of artists; but
here there is a sprinkling of writers and
publishers. Uptown, on Forty-fourth
and Forty-fifth streets respectively, are
the Lambs Club and the Coffee House,
but, oh, how different! The Lambs Club
consists mostly of actors, but there is a
sprinkling of artists and writers, and
what a noisy crowd they all are! The
Coffee House was fathered originally
by Frank Crowninshield, the distin-
guished and delightful editor of *Vanity
Fair*, who is probably the most perfect
specimen of editorial gentility and good
manners in literary captivity in this or
any other country. Mr. Crowninshield,
if he needed it, would be entitled to a
pension from the British Government
in his old age for having introduced so
many British authors to American au-
diences. If I mistake not, it was he who
first induced the talented Pelham
Grenville Wodehouse to come over here.

Quite different from those clubs
mentioned is the Newspaper Club, on
Forty-first street. At one time this club
consisted largely of merchant tailors,
haberdashers, and a few lawyers; these
gentlemen were induced into the club
to make it pay. There was an enor-
mous row in consequence. Now the
newspaper club, singular to relate, con-
sists almost entirely of newspapermen.
Irvin Cobb, who never forgets his news-
paper training, is to be seen there oc-
casionally. It produces a lively club
paper—the only club that does.

These clubs I have mentioned are
all housed. But there are others which
are not. One of these is the more or
less notorious Algonquin Club, which
is not a club at all, and is held together
only by the attraction of good food and
a round table at the hotel whose name
it bears. So strong is the attraction,
however, that it draws in frequent
outsiders, so that in the course of a
season, probably most of the chief liter-
ary men of America will have been there.
The regular attendants consists of Hey-
wood Broun, of the *World;* Alec Woll-
cott, formerly of the *Times* and now of
the *Sun;* Marc Connelly and George
Kauffman, successful (*Concluded on page 27*)

Blond Eskimo.

Rasmussen's Fifth Epic of the Arctic

Four Years in the Great White Wastes

By GUDRUN TOKSVIG

Hupo, Victoria Land.

Oval—Dr. Knud Rasmussen, after more than four years in the Arctic.

Above—A long trail in the Canadian Arctic.

Left—Kormick; a bad face on a bad man.

Right—Ulursuk, a Blond Eskimo at Coronation Gulf.

THE Fifth Thule expedition is the crowning achievement of Knud Rasmussen's career as an Eskimo ethnologist and folklore expert. The main object of all his exploration trips has been to investigate the Eskimo migrations and race peculiarities. As early as 1910, concurrently with the founding of the Thule station, he came forward with plans of a big expedition, which should stretch from east to west in the North Canadian archipelago. Different factors made this plan unrealizable at this time, and he now, using Thule as a base, made the first two Thule expeditions to Greenland's most northerly regions, the one in 1912 back and forth over the inland ice to Peary Land, the other in 1916 to the North Coast of Greenland. Later in 1919 he was in Angmagsalik (Fourth Thule). Eleven years later, in 1921, he was able to realize this his most cherished dream—the conquest of the Northwest Passage. (The Third Thule expedition in 1918 under the leadership of the Dane, Captain Godtfred Hansen, was a link in Amundsen's polar plans.)

The motorship *Sokongen* (the *Sea King*) had been especially built for the expedition with the aid of the Danish Government and private capital. Some ten days after leaving Godthaab, a little island by Lyon Inlet was reached, which Knud Rasmussen christened Danske Island (Danish Island). Here the expedition made its headquarters; a little house of boards and tar-paper roof was built, and finished at the end of September of that year, and christened *Blaesebaelgen* (The Bellows). During the two following years, with this little hut as a base, a series of expeditions toward the north, west and south were undertaken therefrom by the different expedition members, counting twelve in all, when the Eskimos are included. They were Knud Rasmussen, expedition leader and ethnologist, specialty: folklore; Peter Freuchen, cartographer and natural scientist; Therkel Mathiassen, archeologist and cartographer; Helge Bangsted, anthropologist and author; Kai Birket-Smith, ethnologist and geographer. Upon its arrival in Greenland, the expedition was joined by six Cape York Polar Eskimos, six men and six women and the West-Greenland Eskimo, Jacob Olsen, who served as the expedition's interpreter and secretary. Jacob Olsen alone wrote down some 400 Canadian Eskimo myths as fast as Knud Rasmussen's magnetic gifts could wheedle them out of the Canadian Eskimos. Transcribing these stories will keep Jacob Olsen busy all winter in Copenhagen. In 1923 the expedition was further joined by the world's first polar cameraman, Leo Hansen. The *Sea King's* valiant captain, Captain Petersen, who often sailed in waters full of hidden dangers, unknown to white mariners, must not be forgotten either.

The selection of Hudson Bay for the headquarters of the expedition was particularly advantageous, for here were to be found the most primitive of the Canadian Eskimo tribes. Toward the south on the vast tundras, Barren Grounds, lived an Eskimo tribe which the expedition had all reason to believe, according to the theory of Professe Stensby, a Danish scientist now deceased constituted the final remnant of the primordial Eskimos, from which tribe the Greenlandic, Alaskan and other Eskimos have migrated. Knud Rasmussen spent one summer among this tribe and Birket-Smith two. Both have reached the conclusion that in a far past—how long ago cannot definitely be estimated—the same type of Eskimo culture predominated from west to east in the Canadian polar regions. Archeological investigation showed that the primeval inland Eskimos had had much closer connection with the sea than is the case at present—at any rate, the land around Hudson Bay has elevated itself about 10 meters since that time.

Accordingly, the primeval Barren Grounds Eskimos were in many ways

re similar to the present Alaska and eenland Eskimos than the present ren Grounds inland Eskimos. The ter have never seen a seal nor a ar bear, and live almost exclusively wild reindeer and salmon. The avations, which partly led to this ilt, were conducted by Mathiassen r Repulse Bay, on Southampton nd, and in the northerly Baffin id under immense difficulties, for n in the summer the soil freezes some extent, and when the top tum is removed one has to wait il the next layer thaws. But that only half of it. Worse was the fact t the Eskimos did not encourage se excavations to any great extent ause they believed that the departed its of the old-time Eskimos felt red at this disturbance of their nal rest, and Mathiassen and Jacob en barely escaped being murdered ring their stay on uthampton Island. Birket-Smith would call inland primitive tribe ndeer Eskimos because he importance of these imals for their sub- ence. If the reindeer mi- tions fail, these people ve, and repeated famines e accordingly brought ir number down to about souls. Although not so y far removed from the adian station Churchill, tribe has had almost no nection with white men. st of the women and dren had never seen a te man. Birket-Smith's asurement of the male Es- os here show that they under middle height but not be considered as belonging to especially low-stature race as, for mple, the Japanese. The women's ceptions of modesty were so inter- ven with superstitious taboos that thought of measuring them had to abandoned. In comparison, the eenland Eskimos are taller because the admixture, in many cases, of nish blood as well as the better nomic and hygienic living conditions. While Mathiassen and Birket-Smith were homeward bound after concluding these investigations in February, 1923, Peter Freuchen, the expedition's cartographer and natural scientist, lay illat "The Bellows" with gangrene in one foot occasioned during a snowstorm in Baffin Land. A couple of months later he managed to reach Repulse Bay, north of Southampton Island, partly by sled and partly by whaleboat, where he was operated on. Freuchen, together with Mathiassen, charted in all a distance of some 14,000 kilometers from the most northerly Baffin Land to Chesterfield Inlet—a territory about half the size of Sweden. The last 200 kilometers of this stretch caused Freuchen much suffering because of his injured foot. He has since had two toes removed upon his return to Denmark but is now well and on a lecture tour through the Danish provincial towns.

Blond-Copper Eskimos, seven miles west of Cape Lambert, Canadian Arctic.

Ever since Knud Rasmussen stepped ashore in Copenhagen from the gangplank of the *Oscar II*, December 2, 1924, the Danes have put to shame the old saying that a prophet is not honored in his own country.

Fru Nina Bang, Denmark's Socialist minister of education, delivered the address of welcome at the banquet to the guests of honor. The assembly was electrified by Fru Bang's *Skaal* for the King of Denmark as the patron of the Fifth Thule expedition, because the minister's recent refusal to have the royalistic national song, "King Christian," played at the Royal Opera House where the song was part of the opera "Elverhöj" did not indicate any particular warm adherence to court formalities. In view of the minister's well-known views on this subject, it was a graceful thing to do, and her toast was warmly applauded.

The twentieth of January was the really festive occasion, however, when Dr. Knud Rasmussen was to hold his first official lecture on the expedition in the Royal Danish Geographical Society. The most exciting part of the program was the *premiere* of the first Arctic motion picture taken under great difficulties by Leo Hansen. It was an event beside which even the entrance of the King and Queen into their balcony box paled.

A moment after, the stately white-haired president of the Society, Admiral Wandel, who greatly resembles Clemenceau, mounted the rostrum, and presented Dr. Knud Rasmussen with the Hans Egede medal, which is given for special distinction in Arctic exploration. The latter already has the Society's gold medal.

Dr. Rasmussen paid a tribute to Leo Hansen, a man never before in Arctic regions, but who now because of his indomitable will power and courage had succeeded in taking these remarkable pictures, which show the most salient features of the trip from the magnetic North Pole to Bering Strait—alas, only one-tenth of all the adventures encountered. There was not time for more.

Leo Hansen joined the expedition the fifth of November, 1923. A couple of years after Knud Rasmussen had left Godthaab, he sent out a call for a cameraman. Hansen (*Continued on page 24*)

WOOD BLOCKS CUT BY PAUL HONORÉ

(Copyright, 1925, by Charles J. Finger)

JOHN COTTINGHAM, chimney sweep, better known as "Mulled Sack" because of his taste in drink, had climbed and cleaned London chimneys as long as he could remember, and might have gone on climbing and cleaning, had not coal as fuel become popular in the reign of King Charles I. But because it did, the sweep revolted when he was fifteen years of age, and his declaration of independence was made in the taproom of the Gold Hind in Bell alley, what time he relieved his soul on many subjects besides that which stood nearest his heart, denouncing king and commons, officers of the law and Puritans, and all and sundry. He had his audience drinking at his expense, some of whom had witnessed his plight at the whipping post that morning when he received his four dozen lashes, and they were men much of his own kind. Wat Smith was there, who had only one ear, the other having been shorn off because its owner had passed bad coin. Then there was Harry of Southwark, branded on the forehead with the letter T and so known for a thief. Also Jack Fisher who lacked two fingers on each hand, his judge having decided that a fingerless man would forsake pocket picking for more honest courses.

"I got feelings like anyone else," protested Mulled Sack after he had recited the tale of his grave discomfort at the whipping post. "What do they care though? All that whipping makes me sick, it does. I wouldn't have dropped the silver cup if it hadn't been for the soot that beastly coal makes. It gets in your throat and makes you sneeze. Your eyes hurt. You get a pain in the 'ead. They'd never a-missed the cup. This here Sir Banks is rich enough. But they nabbed me. Four dozen. There ought to be a law against burning coal."

He sighed heavily and heaved his shoulders cautiously because of the welts on his back, then made a gesture at which the tapster refilled the cups with swift alacrity. After drinking, Mulled Sack went on with increasing earnestness, but what with the drink and his emotions, his fortitude overcame him, his voice failed and he wept. Soon he recovered and announced his determination to leave the path of honest employment, assuring his hearers that those in power were but robbers on a large scale. "Where does the king get his money?" he asked. "Where does all the rich people get theirs?"

"From us poor folk a course," answered the branded man, while the fellow who had lost an ear nodded agreement, and expressed his conviction that daily the rich grew richer and the poor poorer, then, being eloquent and a hero-worshiper, went on to declare the glories and virtues of such as Mary Frith, the woman highway robber, and of Speedy Bob who had once taken a bag of gold from the Lord Mayor. "Such as them evens up things," he said. "They robs the rich and gives to the poor."

That praise marked a climax in Mulled Sack's career. He stood up, his cup held high in air, and called on one and all to witness that he, also, would be a philanthropic robber; that he would make himself the terror of the highest in the land; that he would be the scourge of kings; that before him, some day, the greatest would stand dumb and fearful. So there were cheers of encouragement and brisk talk, and the drink circulated freely, until, at last, overcome with one thing and another, the valiant chimney sweep dropped his head on the table and fell into un sleep. Then the man with the lett on his forehead tiptoed to the slee side and examined his pockets businesslike way, collecting what in them and dividing it among party, after which he left the pl singing at the top of his voice:

"I'll be a good workman, all ha
and free,
'Till I ride in the cart to be ha
on the tree."

Mulled Sack's first venture fruitful of nothing more than ano public whipping, for he was caught his hand in Oliver Cromwell's po while the Puritan leader sat in ch But he did not allow failure to inter his ambitions, and made a rich ha the thirtieth of January, 1649, v King Charles stepped from a win of Whitehall Banquet House to a form on which stood the headsman his ax. Good men were too bewild and distracted that day to pay he the thief in their midst. There other rich hauls later, for London was in a state of something very anarchy with disorder everywhere; wild destruction of beautiful th the robbing of churches; agitator citing to violence; religious enthus running naked through the str Puritan against Royalist and Roy against Puritan; actors seized whipped at the cart's tail in the r of religion; pleasure of all kinds scribed; a fanaticism rife which Hudibras said, came to the "killing cat on Monday for the catching of on Sunday." It was all a black on the fair name of England. Pres Royalists refused to serve Cromwel his Council of State and many of became wandering knights of the attacking Roundheads wherever found them.

With all that confusion, M Sack was in high feather, and in the of a Puritan went about at the he a party of rapscallions who oper mostly at night, doing their mis and making much sorrow. Ma good honest man was slain, ar them Sir John Banks, who was sm on the head with a mallet wielde Mulled Sack. Then the former c ney sweep was exultant, holding he had evened matters for his whip

Air Mail Ships That Pass in the Night

By BURT M. McCONNELL

AT FOUR minutes to eight on a crisp October morning Baron d'Orcy, "Slim" Lewis, and I reach the Air Mail flying field on Long Island. The day's schedule calls for breakfast in New York, lunch in Cleveland, and dinner in Chicago.

At three minutes to eight "Slim," ace of the Air Mail's most picturesque pilots, climbs into the rear cockpit of the Second Assistant Postmaster General's aerial limousine, glances quickly over the twelve indicators on the instrument board, tests the "flippers," and warms up the powerful Liberty motor until the 10-foot propeller is turning over at the rate of 1,500 revolutions a minute. "Slim" straps on his leather helmet, pulls down his goggles, and waves the Baron and me into the forward cockpit, roofed with some transparent material and luxuriously upholstered. It is just large enough to accommodate two persons, and fitted with all the conveniences of a Pullman smoking compartment. There is even a writing table.

At one minute to eight, after we have strapped ourselves in, "Slim" abruptly "gives her the gun," as he expresses it, opening the throttle to its last notch, and at eight o'clock we are spiraling dizzily upward over the field. The weather report, sent by the Air Mail's wireless from our first scheduled stop, Bellefonte, Pennsylvania, promises fair weather. My destination is Chicago, almost eight hundred miles away; the Baron is going to Detroit.

Off to our left is the south shore of Long Island, with its long, narrow sand pits. Waves break lazily upon them, for it is calm. The sun, a dull red ball of fire, struggles feebly through the mist and turns the Hudson, half a mile below us, into a stream of molten copper. A toy train, puffing stertorously, crawls across one of the toy bridges that span the East River. Ferryboats, like so many waterbugs in a mill pond, churn their way between the New Jersey shore and the metropolis. A thin, blue haze blankets Jersey City, but we can see the foothills of the Orange Mountains. The automobiles that creep along the highways, like so many beetles, were soon left behind. For we are traveling twice as fast as the speediest express train. Our Liberty motor, noisy but efficient, precludes all conversation, of course. The Baron and I write our messages on the little card table fitted into the side of the fuselage.

Off to the left is a black pall of smoke, and beneath it a silvery ribbon. For the sun is higher now, and powerful enough to dispel the mists which hang over Trenton and the Delaware River. Suddenly the machine begins to "porpoise," that is, to ascend sharply, and dive just as quickly to the original altitude. But there is nothing wrong with the steering gear; this is merely "Slim's" way of drawing our attention. He points to the State Capitol.

We fly above the low, rolling hills of Eastern Pennsylvania at an altitude of 2,500 feet, but as we near the Alleghanies "Slim" points the nose of his ship slightly upward until the altimeter registers 3,200. More haze, but the peaks loom through it. We are about to enter the worst stretch of the entire transcontinental Air Mail route of 2,680 miles. There is but one landing field in three hundred miles—and we have no parachutes. But we don't mind; we took our chances in the Army Air Service without parachutes during the war, and we agree that we can struggle along without the clumsy things in peace time. Of course, if the engine were to stop—

As these disturbing

Coast-to-Coast Air Mail is handled by short flights and frequent relays.

thoughts flit through my mind, the wooded hills, with their bright autumn foliage, flow beneath us like a richly colored carpet. Here and there are dark gashes in the earth, through which coal trains, long and sinuous, roll eastward. I lean over the side, looking down upon Sunbury, until "Slim" attracts my attention and points northward to the Susquehanna's placid surface and sharply defined banks. We are above the anthracite region, with culm banks to the left of us, collieries to the right of us. A treacherous section for flying. Yet we fly along, free from earthly cares; conquerors of the air. An amazing thing, flying.

Fortunately, there is no fog this morning. Along the ridges on either side, and some 600 feet below, are pockmarks on the face of Mother Earth which indicate mining operations. But for the most part all we can see are tree-covered hills and valleys, with the river flowing peacefully between. Eventually we find ourselves above the Bellefonte Air Mail field, marked with a huge cross on the ground and nestling in the valley between the precipitous Alleghanies. A perfect "three-point" landing, that is, a gradual and simultaneous settling of the two landing wheels and the tail skid as we glide earthward with the motor stopped, and we "taxi" up to the hangar. The wireless station has been advised of our coming, and a supply of fuel and oil is ready. We slide over the side of the sleek yellow air cruiser, glance at our watches, and find that we have flown 225 miles in exactly two hours and fifteen minutes. The train time from New York to Bellefonte is about twelve hours.

We walk about the hangar for twenty minutes, stretching our muscles. An encouraging weather report from Cleveland, two and a half hours distant, comes in. Then we are in the air again. "Slim" points the nose of his splendid ship upward at a rather steep angle; he is anxious to get out of the Bellefonte pocket as quickly as possible. Climbing steadily, we reach 3,000 feet, follow for a time the west branch of the Susquehanna, then "drop over" to the Allegheny River. It is "bumpy" at this altitude, despite Cleveland's favorable weather prediction.

Once on the other side of the mountains, and farms—rolling, fertile, Ohio farms—reveal themselves as small patches in a crazy-quilt. The sun, though worsted in its perennial battle with the mountain mists, now shines down upon shocks of corn and stacks of golden grain. The tree-covered hills and valleys are safely behind us; the worst of the flight is over.

Directly ahead, perhaps thirty miles away, a light blue haze indicates the location of a large manufacturing community. And off to the right, almost as far distant as Cleveland, is an ultramarine patch, over which hovers a blue-gray mist. My first view of one of the Great Lakes from the air! Below us are the Erie Railroad tracks, friendly ribbons of steel, but there is no need to follow them; the city lies directly ahead. A flying field looms through the thin veil of smoke—the first of thirteen transfer points between the Atlantic and the Pacific.

Here the Baron and I are initiated into the mysteries of the Air Mail Service. The 2,680-mile route, we are told, is divided into three zones—New York-Chicago, Chicago-Cheyenne, and Cheyenne-San Francisco. The postal rate is 8 cents an ounce per zone or fraction thereof, and through the coöperation of the Railway Mail Service it is possible to send Air Mail letters and packages to points not on the transcontinental line without paying additional postage.

For more than five years the Air Mail Division has worked and planned for a transcontinental day-and-night Air Mail Service. As a result, every day, whatever the weather, two sturdy airplanes climb into the air above their respective flying fields near New York and San Francisco, circle about like homing pigeons, and start across the continent, loaded with mail. At the next landing field, pilots and machines are changed, just as the crew and the locomotive of the Limited are changed at each division point.

The field manager at Cleveland is enthusiastic over the Air Mail's achievements. On the way to lunch no opportunity to inform us of these performances is lost. We are told, for example, that the transportation of mail, day after day, in winter and summer, between the Goddess of Liberty and the Golden Gate, marks the first real development of aviation in the United States. The gain is relatively as great as that which the United States and Great Britain achieved when steamships took the place of sailing vessels as mail carriers. A mail plane now flies farther in an hour than the pony express traveled in an entire day, sixty years ago. The Pacific Coast, in terms of transportation, is no farther from New York today than Philadelphia was a hundred years ago.

A letter, says our host, is carried from New York to San Francisco in 34 hours 45 minutes, and the return trip is made in 32 hours 5 minutes. The service West to East is almost 3 hours shorter because of prevailing westerly winds, but the westbound Air Mail pilot has the advantage of three hours more of daylight because he is flying with the sun.

The Baron and I, after listening to this barrage of information, are permitted to enjoy our lunch. That is D'Orcy is; the "bumpy" air above the Alleghanies, which buffeted our 4,200 pound machine about, combined with the long vacation from flying, has been too much for me. But how "Slim" can eat! Finally, however, he sits back with a sigh of content; he is ready to continue on to Detroit with Baron d'Orcy.

We part company here, and Wesley G. Smith, whose regular "run" is between Cleveland and New York, has a dilapidated De Haviland wheeled out on the field. Soon we are flying low over a level, monotonous country dotted by farms, orchards, and small towns, with numerous streams flowing northward into Lake Erie. A fog rolls in, and Smith drops to an altitude of a thousand feet, to keep within sight of familiar landmarks.

At Bryan, Ohio, another Air Ma

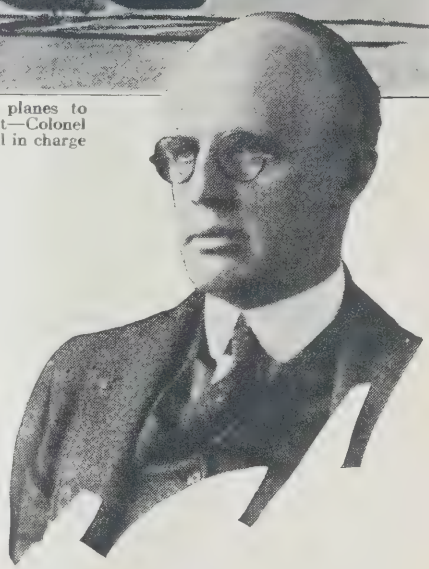
ıeling station, we land, taxi up to the angar, wait ten minutes while our ınk is filled, and take to the air again. lying low over drab, smoke-incrusted ›wns and level, monotonous outlying stricts makes me drowsy; I wonder ›w Smith manages to pick out and llow a certain railroad among this aze. An hour out of Bryan we sight ake Michigan, off to the right, and e Indiana sand dunes. Then comes city of smokestacks, foundries, and ast furnaces, which can be none other an Gary. Here all the railroads in e world seem to converge. Ordinarily ese bands of steel would point the ay, but twilight is swiftly approaching d a murky pall of smoke virtually des the railroads from view, although e are flying at a dangerously low itude. As we sweep over the city e street lights are switched on; rkness comes suddenly at this ason.

For some inexplicable reason I feel, on after we pass Gary, that Smith has t the trail, although the lakeshore is metimes visible in the moonlight. aring to the left and almost skimming e telegraph poles, the pilot is able to cern the railroad beneath. But a ht fog from the lake complicates tters; we most certainly are lost. a point about twenty miles north of ry, Smith circles about, peering wn into the darkness in search of a dmark. The moon, breaking through ift of clouds, saves us this time, and er another ten miles the lights of icago loom ahead. But these, instead of being our salvation, are our ndoing; in the intricate network streets and railroads, Smith is able to locate Maywood Field, e terminus of the second relay on e transcontinental Air Mail route.

By this time it is barely light enough distinguish the trees and telephone les that line the highways on the outrts of the city. The lake is no longer be seen. Both of us are praying that se at the Air Mail field, having been vised of our departure from Bryan, l light a flare for us. But no such lcoming signal appears, although ith circles about the vicinity of the A Mail field for ten minutes before iding to come down on a field a mile uare, bordered with street lights and

M plane equipped with skis, to overcome the heavy snows in the mountains. These skis enable postal planes, fully loaded, to alight on soft snow.

Above—A new type of high lift wing, which enables planes to carry greater loads without reducing speed. Right—Colonel Paul Henderson, Second Assistant Postmaster General in charge of Air Mail Service.



trees. Gliding to within fifty feet of the earth, the pilot wisely decides that this stretch of prairie is probably as good a landing spot as he can find in the darkness.

Circling back to our starting point, Smith swoops downward at a sharp angle toward the bottomless black pit. We miss some telephone wires by a scant six feet, and crash through the limbs of a tree with our left wing tip. Slithering through the damp atmosphere at eighty miles an hour, Smith cuts the switch of his motor, and our landing speed is reduced to sixty miles—the speed of an express train. The wires sing. I look out over the side; nothing but an inky black carpet sweeping beneath us. Suppose there are barbed-wire fences—

The street lights, a hundred yards distant, whiz past. We settle rapidly. Bracing my feet against the compartment in front of me, mentally hoping the machine will not flip over on its back, I wait for the crash. It does not come. A miracle! Here, in an entirely unfamiliar spot, so rough that later we frequently stumble as we walk about, this Air Mail pilot brings his ship down in total darkness without breaking a strut or bending an axle. It was not even a rough landing, in the accepted sense of the term.

Silently we unbuckle our safety belts and slip over the side. I reach for Smith's hand. "I've landed lots harder than that on a field that cost half a million dollars," I blurt out.

"Well, it might have been worse," Smith admits, taking off his helmet and mopping his forehead. "That would be a nice souvenir to take home with you," he adds, disentangling from a strut a tree limb about the thickness of the handle of a baseball bat.

Our watches tell us that we have been in the air eight hours and fifteen minutes. My dream—breakfast in New York, lunch in Cleveland, and dinner in Chicago—is to be realized, for "rescuers" who have seen the fiery trail of our exhaust, like a comet in the sky, now appear from all directions, and while two of them volunteer to guard the machine, others take us into their automobile. The driver's companion insists that I sit in the seat, while he maintains a precarious foothold on the running board. Smith sits on my knees. In this fashion we arrive at Maywood Field, three miles from our landing point. But we *might* have arrived in an ambulance.

The adventurous part of the trip is over, presumably, for the balance of my schedule calls for a prosaic journey to the Pacific Coast by train. And the zone between Chicago and Cheyenne, says the field manager at Chicago, is the most interesting of all, because it is "covered" between darkness and dawn. When night comes these aerial postmen pick up their beacons as sailors do at sea, for no longer do lighthouses belong only on capes and reefs. They are strung along the plains, a line of blinking lights, from Chicago to Cheyenne, making a Great White Way a thousand miles from the sea. Emergency landing fields, equipped with powerful beacons, are established at intervals of approximately twenty-five miles along this line, and at points about every two hundred and fifty miles regular landing fields—division points—are established. The beam from the searchlight with which each field is equipped is visible on clear nights a hundred miles away. What the lighthouse-

Rasmussen's Fifth Epic of the Arcti

(*Continued from page 19*)

volunteered, and now began the some 4,000-mile long trip to find Knud Rasmussen, who, he had been given to understand, should be somewhere in the vicinity of Herschel Island. He set out from Nome with sled and Eskimos, but when he reached Herschel Island he learned that it would be a whole year before Knud Rasmussen, who was to come from the east, would reach this point. The latter, who had left the headquarters on Danske Island March 11, 1923, was on his way west over King William's Land toward Kent Peninsula, accompanied only by the two Cape York Eskimos, Mitek and Arnarulunguak. Hansen resolutely whipped up his dogs and set off through the white wastes to meet his countryman halfway. Many thousand miles glided away under his sled before there was any news of *Kununguak* (Eskimo for Knud). But at last some 200 miles from the magnetic North Pole, the little film expedition could camp by Kent Peninsula with some certainty that Knud Rasmussen would pass this point. All Eskimos for miles around were cautioned to watch for Kununguak, and the fifth of November, 1923, the historic meeting took place—a twentieth-century Stanley and Livingstone in a polar edition!

Leo Hansen's picture opens with nothing but trackless, white wastes as far as the eye can reach but with the shadow of a man turning a motion picture camera in the lower right-hand corner, the only way Leo Hansen could get in the picture. But toward the left we now see a black point on the horizon which grows bigger and bigger. The point develops into a team—two teams—of galloping, frisky, yelping Greenland dogs, and in front swinging the whip high over his head—Knud Rasmussen! What a welcome is here! The dogs frisk around like a pony ballet. True to his profession, Leo Hansen obtains close-ups of both Kununguak and his dogs, not to mention Arnarulunguak's smiling chubbiness and Mitek's youthful gravity.

Turning his crank at this moment, Leo Hansen was repaid for his months of weary traveling. But further trials were ahead. Arrived at their "location" on Kent Peninsula where Hansen was to "shoot" a tribe, called by Knud Rasmussen the "musk-ox tribe," trouble began piling up like pack ice. A whole week was wasted, with the light getting poorer every day, until Kununguak, with all the charming persuasive powers that he commands, finally succeeded in convincing these people who had never seen a white man, that their souls would not be whisked out of their bodies, as they believed, when they were faced with Leo Hansen's camera.

We are first shown the Kent Peninsula Eskimos building a snow hut or igloo. "I thought I knew a thing or two myself about snow-hut building from Greenland," laughed Dr. Rasmussen as the picture moved across the screen, "but it was a mistake. These Eskimos are the cleverest snow-hut builders in the world. I have never seen Eskimos laugh so much as when they beheld my efforts in the snow-building industry. Within half an hour the two Kent men had built a hut which was larger, more solid and snug than any hut I had ever seen in Greenland."

Next, we have a drum dance where the leader goes through remarkable gyrations from which an American college cheer leader could learn much. The men had on cutaway coats of dark fur bordered with white fur, which had an astounding resemblance

During six weeks in midsummer the Eskimos of the Coppermine River region seek the sparse vegetation that grows on the Bad Lands of the Arctic Coast.

to modern male evening clothes. Dr. Rasmussen has brought one of these costumes home. Again, we are shown close-ups of prominent tribe members, both male and female. Kununguak evidently succeeded in thawing these people up to the *nth* hilarious degree, for they are all grinning from ear to ear. One little maid laughed so much that she collapsed upon the ground from sheer weakness.

The so-called musk-ox tribe is one of the most poetically gifted that Knud Rasmussen encountered in Canada. They have songs and poems for every occasion, some of singular beauty. Here is a little poem by one "Willow-twig" to his wife Unaja:

"I will sing a song, a little song about myself.

"Sick I have been since the leaves fell, and now I am weak like a lit child.

"Unaja, Unaja! Sadly I wish woman to go away to another ho to another man, who can be her refu strong and firm like the thick wi ice! Sadly do I wish her another tector now that I can no longer from my bed!

"Unaja, Unaja—who knows his fa Now I have only the memories, strong memories left!"

These people also have a sense humor, shown in the following li tale about a Kent Peninsula mosqu

"A mosquito sat on a man's ha and bit and bit and sucked blo Suddenly it heard a loud voice 'Kill that insect. Crush it!'

"But now the mosquito spoke the man could suddenly underst its language:

"'Oh, no, don't kill me. I hav little grandchild who would weep mourn if I do not come home again

"So tiny—and still a grandfath

History does not relate if the K mosquito-grandfather ever saw grandchild again.

The Kununguak-Hansen ent now break up camp, and steer t sleds toward Alaska. Here we shown the immense transporta difficulties. With a 1,000-kilo loa each sled, the dogs had enough to without pulling passengers. Co quently, most of the trip was trave on foot. The pack ice barriers were worst. Here the dogs had to be harnessed from the sleds, and tie a nearby ice block. Otherwise heavy sleds in the steep descent w have landed on the dogs and k them. With two of the expedi members pulling in front and others pushing from behind, the he sleds were hauled over the icy rid Knud Rasmussen took a nasty h long spill on such an occasion. assure you it was involuntary," replied as the audience seemed un amused.

Romantic Rascals

(*Concluded from page 20*)

ttle order was brought about in the own, Mulled Sack went into the coun- y, proclaiming himself a Royalist. He as clad in stolen silk and velvet, a umed hat bearing a stolen ruby was n his head, a stolen silver-hilted sword his side, and the dappled-gray horse e rode had been stolen from the Royal ables. So a fine show he made as he de into villages, scattering gold right nd left on occasion, and there were mple folk whose eyes glittered and hose hearts beat quick when they w the rascal. And a gold coin here there unlocked many secrets for him, pecially when he said that he was a ng's man who would not sheath his ord until homely and familiar things ere again established in the land.

One day his name reached Crom- ell's ears. It was because of the affair n the Dover road, and commenced hen Mulled Sack dismounted at the ed Rose Inn. At first the stable boy the place was silent enough, but with gold coin in his hand he grew loose of ngue, and with two gold coins was ady to answer questions. Thus, Mulled Sack learned that a government agon had lately passed and could not avel farther than Turner's Ford that ght, where the men with it must bait the Three Fish. With eyes bent on te ground, and speaking softly because ears within the house, the boy told te highwayman that the wagon driver as no Cromwell man, and also let it be known that in the wagon was gold for Blake's fleet which then lay at Dover. Mulled Sack thought awhile, and soon had a plan. Half an hour later he was iding away, dressed in a countryman's smock, an old greasy cap on his head, his horse in rusty harness instead of bright and shining gear.

He timed matters well enough and a Turner's Ford came up with the agon. The two soldiers guarding the ehicle, seeing what they took to be a simple countryman, ordered Mulled Sack to help pull up the steep hill. That he did, willingly enough as it seemed, but no sooner was the crest gained and the chain cast loose, than the highwayman turned, a dagger glitted, and the nearest soldier fell, pierced through the throat. As the other soldier stood, too astonished to move, for he had dismounted going up the hill, Mulled Sack drew a pistol and fired. The ball missed the soldier by an inch but struck the horse he led, on which the man turned and fled, while the driver of the wagon sat on his seat without lifting a hand. By that attack, Mulled Sack gained four thousand pounds.

The next day the fellow was in Lon- don, his gold safely hid away, going about dressed in sober black and look- ing like a man bowed down with hu- mility and with a mind on righteous things. Matters seemed to shape them- selves to his hand, for he learned of one called James Naylor, a crazed man but leader of a new sect and adored as a deity by those who followed him. People swore that he did miracles, some hailed him as the Son of God, and one hysterical creature, a woman named Dorcas Erbury, declared that she had been dead and Naylor had brought her to life.

While Mulled Sack cared nothing for Naylor's strange beliefs, he cared a great deal for the fact that Naylor heartily denounced all who bought and sold, or who wore jewels, so not many hours passed before Mulled Sack was an ardent Naylorite. But he went a step or two further than his leader, declaring that it was not only a sin and a shame to handle jewelry, but that all who did so deserved punishment. Give him, he said, a dozen true men, and there would be swift confiscation. And robust and energetic men were not hard to find who offered themselves for such a mission, consequently Mulled Sack was soon at the head of a noisy mob marching down Coleman street to a jeweler's shop. The crowd grew swiftly, for hearing of what was afoot, many of those Jews, who had been invited back to London by Cromwell, joined the party. Yet though they were full enough of the lust of gold, they got none, for Mulled Sack, sword and pistol displayed, stood at the door and ordered the spoils to be brought to him. When one man demurred, Mulled Sack's sword ran him through. The sack of the shop being completed, the booty was loaded on the robber's horse, and the rascal rode away, in order, as he said, that he might find a quiet place in which to destroy the things of iniquity where no other man might be tempted by the sight of them.

After that, England lost her heroic chimney sweep for a time, for Mulled Sack found his home atmosphere heavy with disapproval. There were complications and intricacies which it seemed well to avoid. So he went to France and posed for awhile as a loyal King Charles man. Then came the Straw Sedition of July 4, 1652, when the Place de Grève in Paris was black with people, when shots were fired into the crowd by Conde's agents, when the Hôtel de Ville was sacked and laid in ashes, when sane men went mad. For affairs of state Mulled Sack cared nothing, but he went about at the head of a hysterical crowd, his keen wolf's eyes seeking his own advantage.

There was one more flourish in the grand manner, when Mulled Sack took six thousand golden pieces from five of Cromwell's Ironsides on the Reading road. The rascal had dressed himself in the garb of a Cromwellian, and when the treasure wagon passed a certain mulberry tree near a wood, the soldiers saw, standing in the shade, a tall man with his sword unsheathed, who saluted them and hailed them in friendly manner. So there was a halt and some talk, and Mulled Sack soon became loquacious, and solicitous, too, as it seemed, warning the officer in charge against the redoubtable highwayman. "That rogue who calls himself Mulled Sack," he said, "is in the neighborhood and may try his tricks." The officer laughed and said that it was his chief desire to meet the rascal.

"Indeed, it would be glad tidings to me," said Mulled Sack, "to learn that the rope was about the fellow's neck, and no man would be better pleased to fasten the collar for him than I."

So there was much talk with Mulled Sack telling of his gentle blood, and how he had fought for the Commonwealth at Dunbar and at Worcester, then there were rejoicings because Blake had beaten the Dutch navy. In the end, Mulled Sack declared that such good fellowship was not to be lightly broken, and said that he would ride with the party, his sword in their service.

Because he seemed to be a pleasant and brave soldier, when the edge of the wood was reached the officer was glad enough to have Mulled Sack stay with him by the wagon as his companion, while the four soldiers went forward into the turn of the road to see if the outlaw was in wait. "It shall go hard with us if we two are not more than a match for this robber-sweep," said Mulled Sack, loosening his pistol in his belt. At that robber and soldier clasped hands, and the officer dismounted to rest awhile, declaring that his new companion was a brave and loyal man.

No sooner were the four out of sight than Mulled Sack was on the officer in two leaps, and had run him through the body. As for the driver, to fly and hide was his only thought, but when Mulled Sack threatened him with his pistol, the fellow was glad enough to help the robber load the bags of gold on his dappled-gray.

The noise of that bold robbery had hardly died, when Mulled Sack was laid by the heels. It was in the gray dawn of a May day in the year 1659, when the man with the letter T branded on his forehead led two soldiers to the place where Mulled Sack slept, heavy with drink, and three days later the body of the chimney sweep creaked and swung on the gallows.

To say that H. G. Wells is one of the makers of history is no mere figure of speech or flight of fancy. He is one of those writers who are more like comets than stars, so rarely do they flash across the literary sky. He is even better known and appreciated in the New World than in the Old. An intimate interview with H. G. Wells will appear in our next issue.

Do Snakes Milk Cows?

(*Concluded from page 15*)

distance of the female nursing or leading the kittens is met with offensive yells and threats that fully cower him. There are statements of the kind by less capable authors in books and articles, the writers wishing to assume for the sake of pleasantly rounding a story that all animal parents must feel kindly toward their young.

A present-day author, Boy Scout instructor and a very entertaining story-teller recently made the statement that cold weather is always fatal to the *Reptilia*, as everyone knew. But everyone who has observed even casually knows precisely that the reverse is true; that many snakes winter underneath stones but a few inches below the surface when the ground freezes two feet or more down; that salamanders, wood frogs, toads and lizards also hibernate beneath logs and shallow mold where the ground freezes solid and that there are authentic cases of snakes being found within the ice of ponds and recovering completely, upholding Aesop's fable. One such instance came within the observation of the present exponent.

Much the same misunderstanding has been given expression concerning the effect of low temperatures upon insects, but it is known that no amount of cold can destroy any arthropod that has yet its natural functions to perform; there is merely a suspension of animation and the hosts of late summer insects that fail to reappear in the spring have become the easy prey of gleaning birds, mice and shrews.

The purpose of the cocoon is also commonly misunderstood. The writer lately heard a lecture by a generally capable naturalist who referred to the wisdom of nature as shown by teaching the caterpillar to protect itself from winter cold by a thick web of silk.

The cocoon, however, serves a very different purpose: that of a protection against enemies. There is not sufficient heat in the body of the chrysalis within to retain a higher temperature and the insect does not need this to survive the cold. Certain species that develop two broods each year build thicker cocoons in the summer period than in the winter and the butterflies, with chrysalides no more hardy than those of the moths, build no cocoons, but rely upon protective resemblances to guard them against enemies. Moreover, the cocoons of tropical moths are thicker and denser than those of any species inhabiting temperate climes.

The author last indicated tells, in a story for boys, of a wolverine attacking a well-grown lad in the forest, but this, with unprovoked attacks of wild cats, peccaries, et cetera, is without the least foundation in fact. All our wild creatures, however hungry, have too long experienced the sting of the arrowhead and the bullet not to respect most thoroughly the man associated therewith and to evade the odor of him.

A common error and one that has given a name to any brevity of existence is the notion that day-flies (ephemera) live no longer than from sun to sun. As a matter of fact, they exist commonly for a week or more, which a little close observation of certain forms trapped in screened buildings and living in pond lily houses will prove. Recently the U. S. Department of Agriculture made the statement that no one had ever known the common house-fly to survive the winter, but no greater misstatement could have been made, for several observers have recorded the opposite. There is a pleasure in taking this opportunity to state that the writer has marked several flies in a house cellar and found that they survived, partly in a semi-lethargic, semi-active state, where enemies were not, until spring.

The leaping snake is another fallacy. Possibly it began in print with E. P. Roe's "Near to Nature's Heart" and has been indulged ever since. No venomous reptile can strike over one-half its length—rarely over a quarter of it and it never leaves the ground when striking. Another popular error is that rabbits are hypnotized by weasels.

"I Read *in the* Papers"—

I read in the papers statements by Mr. Scopes, the Tennessee schoolteacher, that please me very much. It is easy to visualize that drug store debate out of which the whole trouble grew. Such debates are going on everywhere in these United States. Barber shop theologians and drug store scientists and garage high financiers make up a large portion of our population. I lectured down in North Carolina and woke up one morning to find the whole state talking about Evolution—a most amazing circumstance! What I like about Scopes is that he says he doesn't know anything about it. He is only 24, his education is comparatively limited. All he knows about Evolution, he says, is what he reads in the book, and what he reads he teaches the children. That's honesty. Indeed, it sets an example for those protagonists of scientific theories who roar and thrash as if the theory had the same status as the multiplication table. There is no objection whatever to teaching children that there is an evolutionary theory; no objection to giving them the history and bases of the theory; but they should be impartially informed of the existence of other theories as well. No one is educated who is ignorant of all the ways in which man has tried to account for his presence on the earth.

I read in the papers that the Jerusalem Chamber of Commerce is having the usual trouble about rents, which have increased 300 to 400 per cent in the last year. In this way, as in others, Jerusalem resembles New York. Except that the Chamber of Commerce has demanded that the government protect the tenants from exploitation, and will resign as a protest if the government refuses. It would seem that one of the first cares of the Zionist would be to give the world some indications of that idealistic State which they have promised, and that rents might be a good place to begin. The Mosaic Law is a mighty good law in business matters, if only it could find some practitioners.

I read in the papers that the Union of Orthodox Jewish Congregations of America has written to Mayor Hylan the following letter demanding that no school events be arranged by the Board of Education from Friday sundown to Saturday sundown.

Hon. John F. Hylan,
Mayor of the City of New York.
My dear Mayor Hylan:

I have just spoken to the Principal of Stuyvesant High School, who informed me that the graduation exercises of his high school will take place Friday night, June 26, which, as you know, is the Jewish Sabbath. With five minutes of my conversation with him I was called to the telephone and told by a young lady, who is a Jewess, that she is unable to take the examination for substitute teacher in the high schools because it is scheduled for Saturday morning, June 20.

As President of the Union of Orthodox Jewish Congregations of America, I call upon you to safeguard the religious rights of a large part of the citizenry of our greater city.

I hereby formally demand that these dates be changed and that the Superintendent of the Board of Education be notified that hereafter no events be arranged by the Board of Education from Friday sundown to Saturday sundown.

RABBI HERBERT S. GOLDSTEIN,
President.

New York, June 17, 1925.

So This Is Literary New York!

(*Concluded from page 17*)

ollaborators in many plays; Robert herwood of *Life*, and Robert Benchley lso of *Life;* Dorothy Parker, Ruth Hale (Heywood Broun's wife); Jane Grant who is the wife of Harold Ross—ust launching a new magazine, *The New Yorker*. I see Joe Hergesheimer here occasionally.

Much more extensive than this athering, but also unhoused, is the Dutch Treat, which I myself, some ighteen years ago, launched in company with Robert Yard, at that time a ublisher and later editor of the *Century Magazine*.

This brings me to the marked difference between the present literary atosphere of New York, and that kind leisure which is so well expressed by r. Samuel Johnson, who, as a member the celebrated Literary Club of London (founded in 1764 by Sir Joshua Reynolds) when he spoke to Boswell of Wesley:

"John Wesley's conversation is good, it he is never at leisure. He is always oliged to go at a certain hour. This very disagreeable to a man who loves fold his legs and have his talk out, as do."

There is very little of that sort of ting in literary New York nowadays. the beginning the Dutch Treat Club as formed, that men could meet once aweek at luncheon; no speeches were aowed, and—as the name implies—rbody was allowed to treat. The club hs moved about ever since, but has avays kept going. During the past fw years the weekly program has uually included some distinguished speaker; the affair lasts about two hurs, but during this interval, in addition to the entertainment, there are oportunities for the members to get together. Almost every week one will see there Arthur Train and Charles Norris, the novelists and story writers; Rupert Hughes, Will Irwin, Ellis Parker Butler, Lawrence Perry, Frederick Sykes, the publisher; Orson Lowell, artist, Ray Long of *Hearst's*—in fact it is an almost even division of editors, writers, artists, and publishers, almost all of them successful and prominent. I mentioned the democratic spirit prevailing in the New York literary set, but perhaps this should be qualified; for I once invited a member of the Coffee House to go to a meeting of the Dutch Treat Club, and he hissed back at me, "Rabble!"

This leads me to refer once again to the redoubtable Dr. Johnson. The Literary Club, of which he was so conspicuous a member, was at first composed of only nine men. This number was increased by one, but at this it stuck for ten years. Evidently Dr. Johnson was not satisfied with the membership even at that, for, on March 14, 1777, he wrote to Boswell:

"It is proposed to augment our club from twenty to thirty, of which I am glad; for as we have several in it whom I do not much like to consort with, I am for reducing it to a mere miscellaneous collection of conspicuous men without any determinate character."

Certainly no better declaration of exclusiveness has ever been so nicely phrased!

There is another club in New York which perhaps better represents the more definite literary set than any other, in that it is composed exclusively of poets, essayists, and novelists. This is the P.E.N. Club, and this club now has branches, or chapters in many of the principal cities of the globe—in England, Europe, and South America. The idea of the P.E.N. Club was I believe first broached by Mary Austin to John Galsworthy, who made the initial contribution financially to set it going. Authors who travel about, when they arrive in any large city where the P.E.N Club has a branch, if they are members, are immediately taken in hand and treated to all the comforts of home. In New York the P.E.N. Club meets once a month during the winter. There is always a gathering of distinguished people, and where an English author has just arrived, he is the guest of the evening. There are no speeches, but the rule is, immediately the dinner is served, for the members to move about, and hold converse with one another. At these gatherings one sees Fannie Hurst, Alexander Black, Will Irwin, Harvey J. O'Higgins, Hamlin Garland, Sherwood Anderson, Burton Rascoe, Ida Tarbell, and a host of others who have "arrived" as authors. The conversation is general, and concerns itself with the same sort of trivialities in which ordinary people indulge.

These gatherings I have briefly indicated show, on the whole, a rather conglomerate mass of human beings, all more or less engaged in making their livings by creative writing or other forms of creation. There are still more clubs like them. But on the outskirts of what we may term "regular literary guys" are a fringe of Would-Bes. These are the small gatherings of those who are trying to break into literature and have not yet succeeded. The pathetic intensity of the membership in these clubs would cause tears to flow from the eyes of a copper Indian. An evening meeting of the Would-Bes bears the most accurate resemblance to the real thing. The talk in many cases I think is even brighter, for the reason that they can afford to waste it.

Air Mail Ships That Pass in the Night

(*Concluded from page 23*)

is to the ocean navigator, these beacons are to the conquerors of the air.

At Omaha, my next stop, I arrive at the Air Mail field at midnight.

Just inside the hangar, sturdy yet graceful, is a gigantic man-made bird—a converted De Haviland day bomber. Half a dozen mechanics swarm over its back and engine and wings, casting fantastic shadows on the field as they hurry to and fro. A section of the crowd is brushed aside. Through the opening the big machine is wheeled. Blocks are placed in front of the landing wheels. One of the gnome forms climbs into the cockpit, while three others align themselves at the left of the propeller, ready at the signal to "turn her over." And this is no light task; to crank a 400-horsepower Liberty engine requires the combined strength of at least two men.

The majority of the spectators fail to see the weird figure, belted, hooded, and goggled, which now appears on the field. This is "Slim" Lewis, back on the job of carrying the mail. There is no better pilot in the Air Mail Service.

With the crowd surging about, dangerously near the whirring blades of the westbound plane's "prop," the pilot goes about his critical examination of the machine as if the crowd didn't exist; hero worship, to him, is "old stuff."

The curious throng permits this strange-looking creature, with his helmet, goggles, high boots, and fur gloves, to approach the cockpit and climb in. He opens the throttle, races the engine at full speed for a moment, glances to right and left, waves a hand to the crowd, and gives the signal.

A mile in the air, the pilot sweeps on with terrific speed. Plunging through the blackness, climbing steadily as he swiftly approaches the Rocky Mountains, his brow fanned by the crisp night air, he is thrilled with the apparently unlimited power of his motor. The whole world is below.

My next stop is at Cheyenne. Here, at Salt Lake City, and at Reno, I am told of some of the adventures of Air Mail pilots.

In the not too distant future the public will come to a full realization of the splendid pioneer work of the Air Mail pilots, and of the tremendous practical business value of the Air Mail Service. The daring exploits of the pioneer fliers who have made it possible will then go down in history. For no other branch of the Post Office Department more fully lives up to the motto from Herodotus which is carved above the portal of the New York Post Office:

"Neither snow, nor rain, nor heat, nor gloom of night stays these couriers from the swift completion of their appointed rounds."

When Women Knelt in the Snow

(*Concluded from page 2*)

It is no easy task to guard 300 large depots of liquor at the beginning of a Prohibition era; losses were inevitable. This nation simply repeated its war history; war has never found us prepared. There was no preparedness for Prohibition. But when Mr. Haynes concentrated in 40 warehouses the contents of the 300, and placed them under government guard, with a fool-proof and crook-proof permit system, that was the end of "American whisky."

There is now in government warehouses 28,000,000 gallons of whisky, which at the present rate of legal withdrawal will last for 25 years. The present rate of withdrawal, however, will tend to slow up. There are already twenty-three states which prohibit the prescription of liquor for any purpose whatever, and more states are coming to that point. When prescription of liquor is prohibited in all the states, naturally withdrawal will cease.

With the control of the bonded supply, half the battle was won. The other half of the battle pertains to smuggling. There is still considerable smuggling. It is the result of immense combinations of capital. A certain gentleman sat in a board of directors' meeting at London where the whole scheme of smuggling liquor into America was perfected and financed. He gave the details to an American and they are fully known to the United States Government. It is strictly true that, for several years, the crooks of the high seas have been twiddling their fingers-at-nose at the government of this country. They had the fastest boats, the best seamen, everything that threw the merry "ha-ha" at our coastguard tubs and antiquated methods. Uncle Sam cut a very undignified figure in his first encounters with booze smugglers. In fact, they made him look cheap. It was another case of going to war unprepared. But though we start unprepared, we never lose. The intolerable situation at the twelve-mile limit forced millions for defense, and now that the new "dry navy" is getting into action, the second half of the battle is under way, with no possible doubt as to the outcome.

In the meantime there is a great swing-around of sentiment on the part of citizens. Although the Jew comedian still whoops it up for liquor and the New York radio stations fling liquor propaganda across the country every night, the fact is that the joke is fading from the subject and the real people are taking sides with the government in the fight.

By the real people is meant those who go to work in the morning and go home at night. Not the crowd one meets around the city hall and the newspaper offices. The newspapers have utterly ceased to express the mind of the people on this question, and the reason is very plain. Newspapers don't know the people. There is no "Residence Beat," no "Common Citizen Reporter" on our metropolitan newspaper staffs. Reporters see the downtown crowd, the political and sport crowd, the police court crowd—in brief, the groups who live in a more or less liquorish atmosphere, the groups who know least what the real people are thinking.

The real people are for the Constitution, and in this particular matter they are in favor of Prohibition.

Crusade women praying in front of Bales' saloon, 1874, Hillsboro, Ohio.

Let it be clear that there were large sections of this country which were prohibition before Prohibition came. You don't have to sell the South and the West on the subject today; they took the initiative years ago. They went dry *on the moral issue*. Prohibition came up from the states. It was not imposed on the country by the Federal Government. The government never had the power and never will have the power to impose any regulation or restriction on the people without the people's consent. And that word "consent" in America is more than an academic term; it is electric with the fundamentalist principles of the Revolutionary-Constitutionalist era.

In the eastern part of the country one hears that Prohibition is a restriction imposed from above or without. And the eastern part of the country has, perhaps, the strongest battery of newspapers that exists on earth. The major number of all of those papers are "wet." In editorial and news columns, in humor columns, and even in advertisements, they are consciously and deliberately wet.

As to the citizen who, as they say, "takes his drink," Mr. Haynes is no denunciatory. He figures that tha citizen, all other things being equal does not know. Mr. Haynes neve refers to such a citizen as a "la violator"; he refers to him as a "nor observer." They are most numerous i the North and East. Why? Becaus we have two conditions in this countr —one in the West and the Soutl where Prohibition grew up of itsel as a moral issue, and one in the Nortl and East where Prohibition came firs as a law. When a law comes dow overnight, it naturally has not th same force as a law which grew up ou of the moral sentiment through years The problem is to educate thos portions of the country where Pro hibition still has the unpopularit of "sudden law." It is easy t get a drink in the North an the East and public sentimen does not count it a seriou crime; it is much harder in th South and West, except th Californian coast, because peopl there really regard the act a something like a crime. Educa tion is the problem, therefor and it is being strenuousl tackled.

People forget how old Pro hibition is in this country. It i nearly 100 years old. Liquor race Slavery as one of the two grea evils which this country ha to eliminate. For half a centur it looked as if Liquor would b the first to go. Even Abraha Lincoln began his career as a Abolitionist of Liquor. H earliest addresses were on the tem perance question. But graduall the political aspect of Slavery pushe it to the front, the war came, Slaver was abolished, and for the time th Abolition of Liquor was given a se back. For the first time the governmen heavily taxed it to get revenue.

When, however, the nation ha recovered from its exhaustion due t war, it returned immediately to th other item on its national clean-u program, the Abolition of Booz The first revival of purpose was in dicated by that meeting of women a Hillsboro, Ohio, from which Roy A Haynes sprang. It grew and grew state by state going dry, and count by county going dry in states tha remained wet. Then, in the pressin necessities of the new time, the whol country joined constitutionally to wip it out as completely as Slavery wa wiped out. Thus were accomplishe two items of progress on which mor America set its mind nearly 100 year ago.

No, there's nothing sudden abou Prohibition.

(*Continued from page 8*)

"After proceeding a short distance he prisoners tried to escape, whereupon he soldiers fell upon them, and, as the oys put it, 'beat them up.' Investgation proved the boys' story to have een true and they were released, too te, however, to get to the convention.

"There were never two more ingnant fellows than that pair, and ey came to the consulate demanding at the matter be taken up. After tting the details from both sides I as obliged to admit that they had t exactly what was coming to them, d that if the situation had been reersed, and the scene had been America, d two young Italians, speaking no nglish, had defied American soldiers the exercise of their duty, they ould have probably met with even ss consideration.

"Another very frent cause of trouble is ggage. I remember one an who was making the p from Paris to Conntinople and who her had forgotten or s unaware of the ruling over Europe that one ist personally supere the customs examinatn of one's baggage. Ayway after he had cked his trunk at Pris he dismissed the tter from his mind and nfidently expected it proceed on the same in with him without further bother his part.

"What was his amazement upon iving in Constantinople, to learn t during the night his trunk had en thrown off at some border station nother. I could only advise him to go k and repeat the whole tiresome l expensive journey, making inries at each customs office en route.

"Then another man in buying a cet, allowed the agent to sell him r to another city in the opposite ection, the name of which was mewhat similar to that of the place which he wished to go. He got the right train all right, but the nductor would not accept the ticket n he was obliged to pay his fare r again, which in this case was a nsiderable sum. I put in a claim ginst the railroad for him, and it s shifted from one office to another, n disclaiming responsibility. The ffir dragged on for two years, until nally the American wrote requesting not to bother any further.

'Here is our entire correspondence the subject, literally dozens of ters. In this case the original mistak was the ticket agent's, but on the ther hand it would not have happened h the American had a perfectly finite idea where he was going and examined the ticket at the time it wa handed to him. It is also quite ssible that the American's faulty pronunciation of the name induced the agent to make the mistake.

"People frequently ask the impossible of a consul. There was one case of a young fellow—an American—who was engaged to marry a Macedonian girl who had been exiled from her own country for political reasons. She came to me to get a visa for the United States, desiring to join her lover there, but as her passport showed signs of having been tampered with I was obliged to refuse her. There was then nothing for her fiancé to do but come after her, which he did. He asked me to be a witness to their marriage and I agreed, but when he went out to find a priest he learned that the ceremony could not be performed unless he could produce proof that he was not already married.

"Confidently the American came back and demanded that I make out a certificate to that effect; but I could not do that as there is nothing on a passport to indicate whether the holder is married or single and the man was absolutely unknown to me. I advised him to cable his parents to cable back to me that he was unmarried. He sent them a cable which was never answered, and he was obliged to return to the United States without a bride and with, no doubt, very hard feelings toward me.

"Another thing we are asked to do which is not within our authority, is to lend money, particularly to women. The government has no appropriation to provide for such a loan, and if out of sympathy a consul should lend it out of his own pocket, as he sometimes does, the chances of his being repaid are very slight."

"You say the requests come largely from women. Do they get into more difficulties when traveling than do the men?"

"No, on the contrary," was the astonishing reply. "It is true they are apt to spend too much on clothes or at an expensive resort and then find they haven't enough on which to get home, but in general they get into fewer difficulties, partly because Europeans are usually very gallant to women traveling alone, and partly because women, when they get into a situation which they do not understand, are usually content to obey instructions and find what it was all about afterward, whereas a man's impulse is to put up an argument which usually accomplishes nothing beyond antagonizing officials and putting the American in a ridiculous position.

"The key to most of the unpleasantness with which Americans meet abroad may be found in their own critical attitude which would be improved by an acceptance of the fact that just as America has many wonderful achievements which only a young country could produce, so have the older countries many wonderful achievements which are inseparable from an environment heavy with centuries of tradition. It seems impossible to have both at one and the same time, so take your choice and concentrate on the pleasant!

"I can give you a sort of traveler's ten commandments which if followed would do away with most of the difficulties:

"1. Know what you are doing. Before starting for any new country inform yourself from consular or other reliable authority as to visas, dutiable articles and other special rulings of the country in question. Find out before you get on any train, whether it is a through train or not and if you must change, where and when, so that you won't get carried past your destination or lose half your belongings in the scuffle. Know what hotel you are going to, if possible.

"2. If you are in doubt about anything, consult the nearest consul. He will always be glad to give you information and advice and assist any American in any way within his power.

"3. Don't take any more baggage than you absolutely need and know where it is, all the time.

"4. Remember that your American citizenship does not excuse you from complying with the laws and regulations of the country in which you happen to be staying and that you cannot reasonably expect to interfere with government or train officials in the carrying out of their duties—and get away with it.

"5. Don't leave your manners at home. You are brought more closely in contact with your fellow travelers in a Continental train than you would be in the United States so that your actions in distributing your baggage, feet and elbows, entering and leaving the compartment, opening and closing windows will affect the comfort of your fellow passengers as well as yourself. It is well to know the foreign equivalents for 'pardon me,' 'permit me,' 'please' and 'thank you,' and 'good day,' for it is in many localities a breach of etiquette not to greet your fellow travelers upon settling yourself (*Concluded on page 31*)

NEXT WEEK

"It is now sex-o-clock." What do you make of this phrase? Does it not strike you as peculiar? It looks like a pun, but there is much more in it than mere punning. It involves the theory of psychoanalysis and Freudism.

There is an ultra-modern school of thinkers (at least they think they are thinkers) who hold that sex is the dominating factor in almost all that happens in the world. Novelists have encouraged this idea, using it to inflate their lucubrations.

Charles J. Finger, in that incisive way of his, has sharpened his pen and pricked a few of these Freudian bubbles. His article appears next week.

From Babel to Beef Trust

(*Concluded from page 4*)

I think in any business that the small man's expenses are always smaller than those of the big man."

Thus, in defending the meat-packing combinations against a charge of inordinate profits, Mr. Armour unconsciously was giving damning evidence against the economic justification of such combinations. His statements are borne out by the several extensive reports on the industry which have been made by the Federal Trade Commission. These show that in the years 1913 to 1916 sixty-five independent packers earned an average profit on investment of 15.9 per cent, while the Big Five packers earned 13.2 per cent. In 1918, one hundred and seventy independents averaged 18.1 per cent, while the Big Five earned 15.0 per cent. And when the period of post-war depression came in 1921, the Big Five, with their artificial house on the sand, insecurely set against the economic storm, lost an average of 10.8 per cent on invested capital, while the sturdier and more compact independents managed to earn a profit of 3.2 per cent.

When Retribution Reaches Through the Ages

Rich men, as I have already pointed out, can live on an income of $25,000,000 a year, no matter how small a return on investment this represents, but they cannot live long and lose $61,000,000 a year, which is the deficit shown for the Big Five packers in 1921. Ordinarily, when a powerful combination finds itself in the situation in which the Big Five stood in 1921, it has one sure recourse—it can use its monopoly influence to force prices high enough to insure itself a profit. But the Big Five were losing more than money; they were losing also their efficiency and, with it, their dominant share of business and the accompanying monopoly control over prices. The Federal Trade Commission's most recent report shows that these five companies, which were doing about seventy per cent of interstate slaughter in 1918, did only 65.5 per cent in 1920; by 1921 their proportion had decreased further to 62.7 per cent, and by 1922 it was only 59.3 per cent. The long arm of retribution for those who violate the natural law had reached down the ages from the Tower of Babel to the Beef Trust.

Already, by 1920, Swift and Company had read the handwriting on the wall and had begun voluntarily divesting itself of many of its unrelated lines. Wilson and Company went stumbling into a receivership and was obliged to enter Wall Street by the back door for "re-financing"; Morris and Company, hounded by its creditors, merged into the arms of Armour and Company, which was itself staggering under an investment and bonded debt of nearly a half-billion dollars. Today the Big Five are no more; there remain only a Big Two—Swift and Company, which "saw a great light," and Armour and Company, which is breathing hard over the corpse of its former confederate.

Another plot, another admission from another commander-in-chief testifying against his own interests:

The Corn Products Company, after a long life of practices and artificial accumulation of independent businesses, as described by Justice Learned Hand, was dissolved by order of a United States District Court in 1919. The court's opinion recited that this combine had in 1906 a 100 per cent control of the manufacture of glucose in the United States, and that by 1909 it had developed a capacity large enough to supply the entire glucose demands of the country. Testifying as late as 1924, E. T. Bedford, commander-in-chief of the combine, stated:

> "My experience in this industry and in several others is that there is weakness in size; that some (small) units economically managed can succeed more successfully than the larger unit as a rule . . . I might illustrate that that was proved in the case of the New York Glucose Company which had a capital stock of $2,500,000, as against our predecessors who had a capital of $80,000,000 . . . That is proved in our industry today by Mr. Ervin, who has a capital of $2,000,000, whose earnings per bushel are greater, as he tells them, than we make or perhaps any other manufacturer makes . . . It is a question of economy and efficiency. Capital doesn't always count." (The word "small" inserted by me. Text indicates that word "some" is typographical error.)

The fact that subsequent to the court decree, which deprived the Corn Products Company of some of its plants, the company built another plant and is now once more large enough in capacity to supply the total demands of the nation is another story.

"United They Fall" Sometimes Comes True

Another witness, Mr. Fels, of Fels and Company, a large and successful manufacturer of soap (but not a monopoly), stated recently:

> "The smaller manufacturer does not have freights to pay, doesn't have warehouse charges to pay; he sells mainly from hand to mouth and he is in a far better position to accommodate himself to any changes up and down without any loss than the large manufacturer. I think that in cases of a fluctuating market up and down the advantage is always with the small manufacturer."

In almost every industry into which the Federal Trade Commission has made inquiry, the record substantiates the state's evidence of the commanders-in-chief. The books of the southern pine companies for 1917 and 1918 show the companies of medium size earning a larger income on investment than the great combinations. The books of the farm implement manufacturers for the period 1914 to 1917 show the income rate of the International Harvester Company, the colossus of the industry, exceeded by those of nine smaller companies in 1914, by those of seven smaller companies in 1915 and 1916, by those of five companies in 1917, and ten companies in 1918.

The Undermining of the Initiative

Another witness, one not in business, but in public life, the Honorable Herbert Hoover, Secretary of Commerce, today the Field Marshal of business in America. To him the business world looks for leadership, and through him and his great office business is today securing the public ear. One of the most revealing things he ever said was said just seven years ago in a letter addressed to President Wilson, dated September 11, 1918, anent the proposed Federal control of the meat-packing industry.

"The problem we have to consider," he wrote, "is the ultimate social result of this expanding domination, and whether it can be replaced by a system of better social character and of equal economic efficiency for the present and of greater promise for the future. It is certain, to my mind, that these businesses have been economically efficient *in their period of competitive upgrowth, but as time goes on this efficiency cannot fail to diminish, and, like all monopolies, begin to defend itself by repression rather than by efficiency.* The worst social result of this whole growth in domination of trade is *the undermining of the initiative and the equal opportunity* of our people and the tyranny which necessarily follows in the commercial world."

How is it then that the commanders-in-chief of industries are today busy as never before linking company to company and combine to combine in new barbed-wire entanglements of overhead and over-capitalization? If artificial size means lower profits and an ultimate loss of efficiency, why do they still strain every sinew to get it and keep it? The answer is simple. Monopoly size means for them today not power over costs, but power over competition—the power that comes from prices and the prices that come from power. The strategy of the modern commander is directed not toward plant perfection but against the market price.

The whole matter is summed up by Chief Justice Taft when he wrote that "there is usually a limit beyond which economy of management by the enlargement of plant ceases; and where this happens and combination continues beyond this point, the very fact shows intent to monopolize and not to economize."

Watch Your Step

(*Concluded from page 29*)

a coupé. But even if you don't speak word, a few smiles and bows will do ich toward establishing the atmos- ere essential to such close quarters.

"6. Don't lose your temper. You n eventually get through any situa- n if you keep calm. The minute you excited you are at a disadvantage d stand no chance of being under- od. When traveling in a strange land u must be ten times more alert than ial as to the correctness of your own ions and ten times more patient as the actions of others, if you would oid misunderstandings. I am not gesting that you submit to obvious ustices but be sure of your facts ore you protest.

"7. Don't pay exorbitant prices anything. That sort of thing is at has given the impression that all ericans are millionaires and eager get rid of their millions and even if amount concerned doesn't particu- y matter to you individually, re- mber that you are helping to estab- a precedent with which less fluent Americans will later be ex- ted to comply.

"8. As to your tipping, be neither gy nor extravagant. The hotel ering force is dependent upon its ij and entitled to them, but if you ow your money away you won't eany better service than if you tipped eonably. The ten per cent rule is ti a safe one to follow in those stblishments where the service charge s ot reckoned in. Inquire what the uom is in each place. If it isn't econed in and you don't want to be oiered, leave ten per cent of your otl bill at the hotel desk for distri- u on and inform the people whom you old be expected to remember.

"9. Make an effort to learn at ea: a smattering of the language of the outry you expect to visit. An ability o sk and answer simple questions is most indispensable. Of course, if you remore ambitious it is a great ad- aiage to learn to speak the language el particularly if you expect to meet neeople of the country socially. Most eleducated Europeans speak at least nr: languages so you would probably ae out all right with English but he regard an American who can't ek any language but his own re- peably as rather a pitiable object. Tnmost important languages for you o udy are French and German as wit French you can make yourself ndrstood in France and in Belgium ndisually in Italy and many countries noi remote, while German will take outhrough Germany, Austria, Hun- ar; Holland and even the Scandina- iaiand Slavic countries.

10. Don't carry an antagonistic ttiide into any country. If there is nyiation or people against which you av a strong prejudice you had much ttr stay away.

"I am not trying to discourage any fellow countrymen from independent traveling," the consul concluded, "for if properly done, it is very useful in promoting international understanding but if it is improperly done it can be a source of international friction that is far from negligible. *During the last few years the consular policy of the United States has taken practically a right-about-face in its attitude toward those of its citizens absent from home.* Formerly the first concern was for those American citizens on foreign soil. Today, however, the prime interest is in those Americans who are on their own soil, and although we do everything in our power to aid traveling Americans in distress, we are also interested in knowing whether those citizens have a legitimate reason for being on foreign soil, and whether they are conducting themselves in such a way as to reflect credit on their country and on the folks back home."

If You Were a Chinese

(*Concluded from page 6*)

flared forth indicated that though it has not been directed in this instance against all foreigners, it might easily become a general anti-foreign movement should the situation be unwisely handled.

It is not always apparent, to the Western observer, how this extreme nationalism can reveal itself at a time when the central government of China is so woefully weak and so completely at the mercy of scheming politicians. But that very weakness is a contributing reason for the present situation. Intelligent Chinese are more and more convinced that many of China's political ills are a result of foreign influence.

Foreign interests, so the case is argued, desire that China shall remain weak. A strong China would be a threat to western exploitation.

It is altogether likely that the present crisis will not finally drive the Japanese and British interests from China. Those interests are deeply founded and every effort, doubtless, will be made to protect them. But even though they remain when this storm has passed the fact cannot be lost sight of that the spirit out of which the movement grew is likely to persist. Not only that, but in India, the Philippines, Korea and all through the East where nationalism is increasing the present uprising in Shanghai will be watched with eager and sympathetic interest. More than gunboats will be required to put down the growing belief among these peoples in the ideal of self-determination. Unless, at some future day, the white man is not to be ousted from the East by force, Western governments must inaugurate, at the present moment, constructive policies that will help both East and West toward a coöperative and conciliatory approach to their common problems.

Rasmussen's Fifth Epic of the Arctic

(*Concluded from page 24*)

using at the same time a bloated hunting-bladder as a skipping rope, before landing on the walrus skin.

Two Alaska Eskimos, brothers, turned somersaults under the water with their kayaks to show that they were just as clever as the Greenlanders in performing this well-known stunt. The picture closed with some magnificently colored views of ice bears, frothy green ocean rollers, sunset over the Arctic Ocean, and finally the royal Danish split-flag, a gift by the King of Denmark to the expedition, snapping in the breeze outside "The Bellows" on Danske Island.

The sight brought the large audience to their feet in a genuine wave of enthusiasm. The lights were turned on. Cascades of applause broke loose. It was some minutes before Dr. Rasmussen could get the floor to address himself to the King to thank him for the aid rendered the Thule expedition when the S. S. *Bele* was stranded in Greenlandic waters in the summer of 1921, with valuable equipment on board for the expedition. The King and the royal family, who were on board the S. S. *Iceland* on their inspection trip of Greenland, did not hesitate but immediately steered into the dangerous waters to aid the *Bele*. The expedition would have been seriously crippled, emphasized the speaker, without this prompt aid, and the King's action in thus disregarding danger for himself and his family was a resolute and manly act. "The King gave us the flag and a beech-leaf from the Danish woods," said Dr. Rasmussen in closing. "Now that we are back again, it is our hope that we may continue to be worthy of these Danish symbols."

Immediately afterward the King rose in his box, while all got to their feet, saying in a clear and ringing voice: "Welcome home, Knud Rasmussen! You are far too kind in speaking of our help. When we received the radio about the *Bele*'s wreck, the Queen and I stood together on the deck of *Iceland*, and there was no doubt with us for a moment what we had to do; we only did what anyone would have done. Thanks to the *Iceland*'s dauntless captain we reached the ship in good time, and we were happy to be able to help you. You remember our last handclasp up in Greenland, Knud Rasmussen? I haven't forgotten it. I am glad you have fared so well since that time—in your sturdy and straightforward way you have done our country honor. Thank you, Dr. Rasmussen!"

A few closing words by the white-haired Admiral Wandel, and the brilliant, colorful assembly ebbed slowly out of the hall. Knud Rasmussen was home again, and had received a meet Nordic welcome.

Building Castles in the Air

Architects of the Old World Now Look to the New for Inspiration

By ALBERT WOOD, A. I. A.

A SURE way to interest children in a story is to begin talking about a giant. No matter how a child's interest in a tale may lag, as soon as we bring the Giant on the scene, we get his active interest. It is much the same when we speak of architecture to grown-ups. No matter what charm or interest the building of moderate size may possess, it is the skyscraper that makes one sit up and take notice. Who would go out of his way to see a pile of stone seventy feet square and forty feet high? But let it be seven hundred feet square and four hundred and seventy-five feet high, as we find the great Pyramid of Egypt, and men will travel to the ends of the earth to gaze in wonder and awe. So, when we write about the great work that American architects and builders are doing today, we feel the proper illustrations to use are those of high buildings.

In general, two distinct types of construction may be compared. The ancient, heavy, wall-bearing masonry type and the modern steel frame, veneered with masonry, as exemplified in the "Cathedral of Learning" and in practically all of our skyscraper structures. It is perhaps in the steel-frame building that America will produce an original and distinctive architecture. In the skyscraper we see construction emerging from the stone age into the steel age. It might be said that as builders we have gone from the cave to the cage.

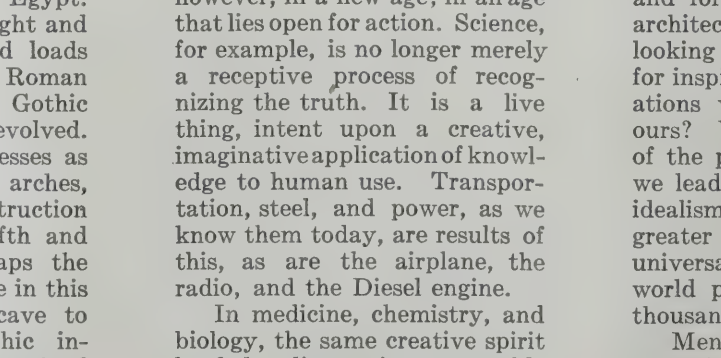
The Egyptians at an early period carved the houses of the dead in the mountain side; therefore it was natural for them to carve the houses of the gods in like manner. At Abou Simbel we find two temples excavated entirely in the cliff and from these glorified caves came the idea we later see developed in the many heavy masonry temples and tombs erected by the rulers of Egypt.

Now, to achieve greater height and yet eliminate the terrific dead loads of masonry imposed by the Roman system of construction, the Gothic system of construction was evolved. With this system, using buttresses as props to resist the thrusts of arches, the masonry method of construction was brought, during the twelfth and thirteenth centuries, to perhaps the peak of its possibilities. We see in this gradual evolution from the cave to the beautiful spires of Gothic inspiration, the constant and determined effort of man to build higher and yet higher and with ever-diminishing tonnage of structural material.

Strong perpendicular lines in a building seem to convey a feeling or mood of spiritual power and freedom. Such lines seem to signify a vigorous, living structural organism. Is this not the reason why the skyscraper type of building with its characteristic vertical lines seems so suggestive of American ideals of freedom and democracy? The ancients buried the records of their civilization under millions of tons of stone, but we seem determined to write the records of our achievements across the sky.

As buildings became higher and less masonry and more glass used, we began to distinguish the organic steel structure and to feel conscious of that force which is so well described by the University of Pittsburgh, in writing of their new skyscraper college, or "Cathedral of Learning," which we illustrate:

> The building breaks tradition in college construction. We live, however, in a new age; in an age that lies open for action. Science, for example, is no longer merely a receptive process of recognizing the truth. It is a live thing, intent upon a creative, imaginative application of knowledge to human use. Transportation, steel, and power, as we know them today, are results of this, as are the airplane, the radio, and the Diesel engine.
>
> In medicine, chemistry, and biology, the same creative spirit has led to discoveries comparable to the discovery of a new continent. In the social sciences, again, the same process goes on, though less obviously, broadening our outlook and dispelling sentimental theories.
>
> The building breaks tradition; it does this not to be merely different or high, but to express its age—an age of creative, forceful energy directed toward usefulness.
>
> The proposed building will help make a college life which is in dead earnest and creative; a college life which has an indomitable spiritual value in it. The architecture of the building talks that idea. Such a building will say all day through with unforgettable force, "Find your own usefulness. Do it now. The light of the morning stars is in you, and by courage and intelligence and everlasting drive you can attain to that high service which satisfies." That building with its parallel lines reaching up and up and up, and with its harmonies of mass, has such fire of emotion in it that we must feel it take hold of us. Culture is a by-product of that fire.
>
> Within the building, other things being equal, it is reasonable to believe that we can create the most effective, serviceable, virile college spirit in the world. Nothing else will do.



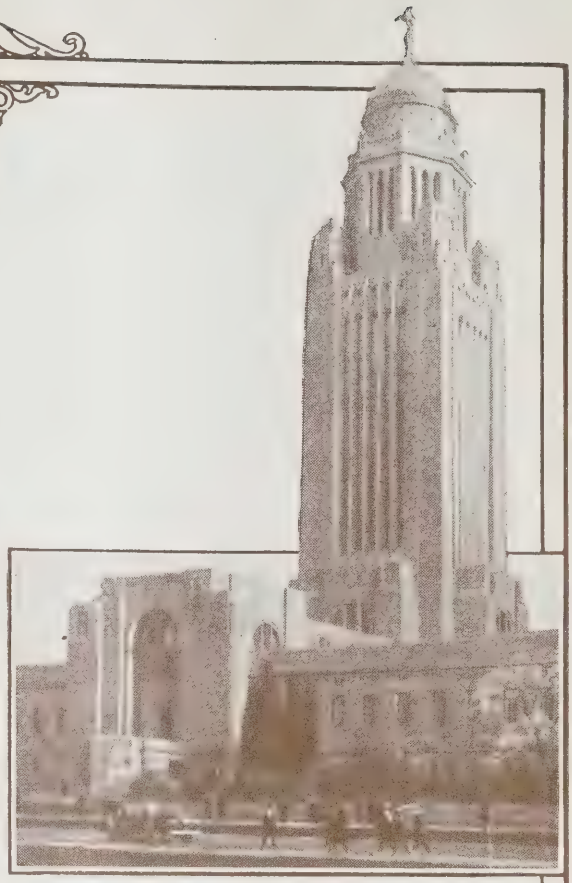
Portico in Luxor—To the modern builder this looks like the foundation for a forty-story building. Note the huge stone beams.

When a design for building inspires such com ment as this, it is abo time to check up on ou selves to see what emotio we experience and wh "kick" we get out of a chitecture, and just what is that stimulates such e thusiasm.

American architects a builders of today are leading the worl and for the first time in our histo architects and builders of Europe a looking toward America for ideas a for inspiration. How will future gene ations view these great buildings ours? What impression will they g of the people and life of today? A we leading the world toward a fin idealism, toward an expression greater service to mankind, towa universal brotherhood, freedom, a world peace? What will men say thousand years hence? We wonder!

Men of vision create imperishab works in every phase of human activit

THE winning competitive design by J. Mead Howells and Raymond M. Hood, selected by the Chicago "Tribune" from more than two hundred designs, shown above. It is a business edifice suggesting a cathedral with its strong vertical lines and church-like detail. Does such architecture really symbolize American business or is it rather expressive of something that business should live up to?



NEBRASKA State Capitol, winning design by the late Bertram Goodhue, an American conception and a work of genius.

RISING to a height of 700 feet, Charles Klauder's "Cathedral of Learning" proposed for the University of Pittsburgh seems to say "Let Freedom Ring." A thousand years hence men will feel the romance of this steel giant which by that time may be one of the few remaining monuments to this generation.

UNIV OF ILLINOIS
URBANA ILL

THE basis of our political systems is the right of the people to make and to alter their Constitutions of Government. But the Constitution which at any time exists, 'till changed by an explicit and authentic act of the whole people, is sacredly obligatory upon all. The very idea of the power and the right of the people to establish Government, presupposes the duty of every individual to obey the established Government. . . . . .

Towards the permanency of your present happy state, it is requisite that you resist with care the spirit of innovation upon its principles, however specious the pretexts. One method of assault may be to effect, in the forms of the Constitution, alterations which will impair the energy of the system, and thus to undermine what cannot be directly overthrown.—*George Washington.*

Famous Literary Man Discourses on Some of His Hobbies

Tea and Talk with H. G. W.

By W. TEIGNMOUTH SHORE

THERE are some big and many little men who are not overwhelming in their modesty; there are a few big ones who are almost too shy about speaking of themselves, among whom is Herbert George Wells, fine novelist and writer of many other worthy things.

It is quite a good many years since I first met him; when we were both keen politicals and fought side by side, or to be more truthful—he in front and I in the ranks.

My latest meeting with him was upon a glorious afternoon in the merry month of May. The sun shone deliciously. I strolled along from Westminster up famous Whitehall; past the sole remaining relic of the great Palace of Whitehall, Inigo Jones' Banqueting Hall now used as a military museum. I felt jolly; much inclined to be festive with someone. So, says I to myself, says I, why not drop in and have a cup of tea with the Wells? And I did.

Their pleasant flat is in Whitehall Court, a big block of apartments overlooking the Thames Embankment; one of the most beautiful locations in London. This was fully borne in on me as I stood with H. G. W. on the balcony outside his parlor—a glorious view: away to the left the gray dome of Saint Paul's Cathedral, dominating London City; to the right the towers of the Houses of Parliament; below, the bright May greenery of the gardens; beyond, the cars clanging along the broad roadway; then the gray river slipping along to the sea.

Mrs. Wells called us in to tea. She ensconced in a cozy armchair; he seated on the broad arm of another.

Suddenly an inspiration—a veritable stroke of genius, *I* calls it—hit me hard.

"Look here," I said, "I shall write down all the interesting things you are going to say; and I shall print them in America, where I know they'll be very glad to hear from you."

"You dare!" said he; but his smile and the twinkles in his eyes betrayed him.

"And I shall send you what I write and you will read it, amend it, and add all sorts of nice bits to it, and see that I haven't too grossly misrepresented you."

"I won't," was the emphatic reply, "I won't look at it."

"Goodness, good goodness, why not?" I asked, appalled, shocked, dismayed, surprised, flabbergasted, taken aback, jolted up.

"Because when your rubbish appears—if anyone is silly enough to print it—I can repudiate the whole thing! That's why."

"Oh, indeed. Thanks so much."

Then I turned to Mrs. H. G. W., who I knew would not be stony-hearted; appealed to her; and she good-naturedly said that she herself would read it, being anxious lest I should wreck her husband's reputation.

Greatly encouraged, I proceeded to enjoy my tea.

As I watched my host—he didn't know I was so doing—I found it hard to believe that he is nearly as ancient as myself: his face young; his eyes young; his voice young; his manner young; and, best, his mind young. One outcome of this irrepressible youngness was that we popped about from topic to topic, erratically, like busy bees flitting from flower to flower; *he* gathering most of the honey.

We somehow got talking about talkers; I mentioned Chesterton; then Bernard Shaw came up—

"Shaw's a great talker too," said H. G. W., "ready and amazing. By the way, as a writer, I don't think he has ever been given half enough credit for his English—for his style. I've seldom heard anyone speak about it. So lucid, clean, clear. So good that it's not noticed."

"Just like you don't notice the clothes of a really well-dressed man or woman."

"That's so."

It was a very pleasant room we were in; sunny outside and in; charming old-fashioned furniture, including a sweet old-time piano, made so many years ago by Clementi, who did much to improve the pianoforte—

"It's the right thing for Mozart," said H. G. W., "Tinkly, silvery notes, like the faint sweet voice of a little old lady."

"What vices have you?" I asked.

Mrs. Wells looked shocked at my audacity!

"None," was the reply, which was very disappointing. Surely a famous man should have at least one little vice.

"I'll try to believe you," I said; "What about hobbies?"

"Training elephants is one of them."

"And breeding canaries," added Mrs. Wells.

"The orange soprano kind is my specialty," said he, "I mean, of course in ele—no, in canaries."

"And hedgehogs," said Mrs. Wells.

"I lose my interest in an elephant when I have reduced him to order, so I have a constant supply of fresh ones—some of them are very fresh at first."

Feeling that the conversation was becoming too serious, also much too profound for my shallow intellect, I was about to hazard a remark about Shakespeare's sonnets, when H. G. W. horrified me by saying to his wife:

"Now, do pull yourself together and tell the truth."

I began to wonder if I were wandering. Surely——. I felt that I must change the subject at once.

"Which is the favorite with you of your books?"

"My next one," was the prompt reply. "I've said that before; but, my dear fellow, I can't be bothered to make up new answers to your old questions;" then he added, why I don't know, "I'm beginning to sense the tear-off calendar feeling. There's not so many years ahead as I used to have."

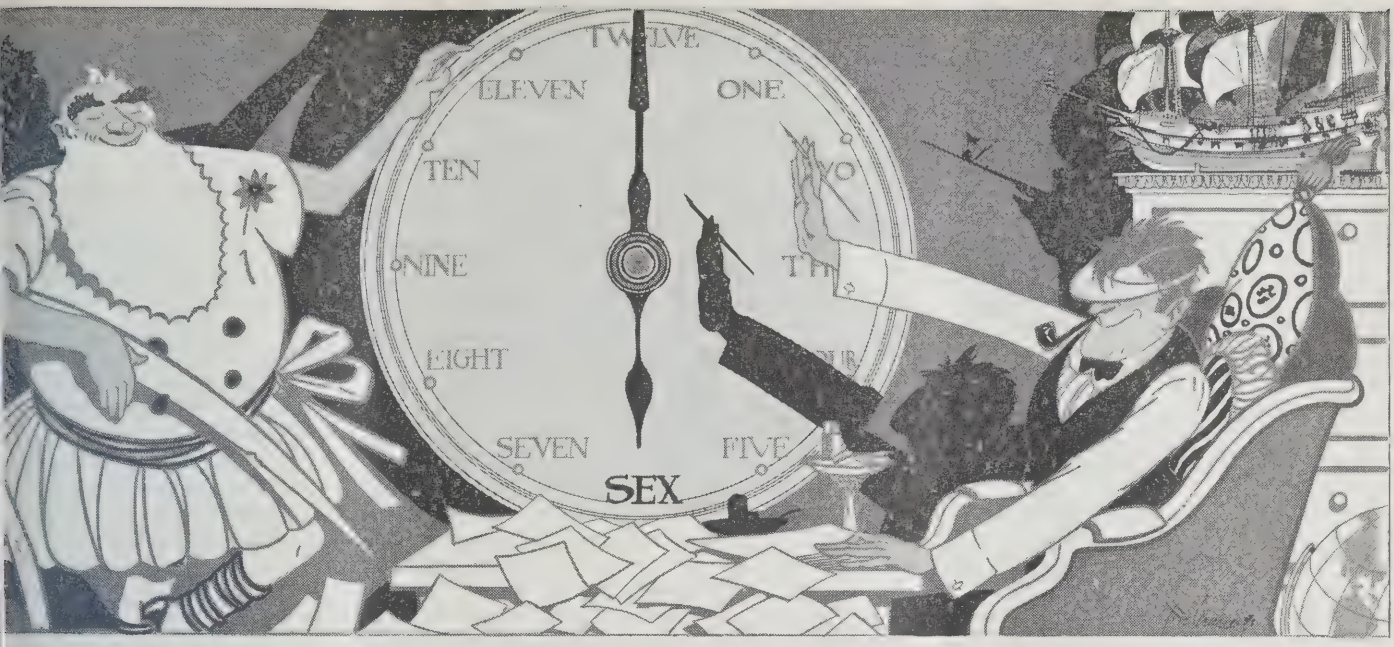
I could not contradict this, but expressed the hope that there were very many:

"Don't pretend to be old," I said. "You're nearly as young as I am; and what have calendars and dates got to do with one's age?"

"Quite a lot," he said.

"For example, I (Concluded on page 27)

"Training Elephants, Breeding Canaries—and Hedgehogs"



The novelist had come to sex-o-clock in his career and he held that there time would stop.

"Sex-O-Clock"

If a Novelist Lets the Sex Complex Dominate His Work, Does It Blind Him?

By CHARLES J. FINGER
ILLUSTRATED BY W. O. FITZGERALD

IT WAS Reedy who coined the phrase at the head of this article, saying of latter- literature in the form of novel, "it is now sex-o-." He put it in his Mirror ward, but he first said it evening when he sat talk- with a few, among whom a journalist, a novelist myself. After the novelist, who imbibed psychoanalysism, had ained in complicated and mysterious uage that there were three planes nsciousness in the ordinary man, ly went off into a tremendous dth of argument. Then the novel- ot back to his three planes again ig us that the ordinary plane of rciousness was that on which we when we went about our ordinary prosaic ways, the subconscious was under that, then deep down e mind of man was an unconscious l. On that lowest plane lived dark niac powers, as it were, and they wedged in by all kinds of memories ited from our remote ancestors; tropoid apes, ice-age men, canni- creatures of limited intelligence overwhelming passions. There the psychoanalysts's theory in . We gathered that when con- ins are ripe, when the censor who on the highest plane was off , as in sleep, up from the dark d leap these dark powers, dragging inds of things with them. Then enan or woman is the victim of his er complexes. The novelist, a well enough known, held that to the true man or woman, was the of the artist; that the true man l be known only by introspective ; that—then I think we all lost him use he went off into mysticisms. he was very severe on the older lists, and there we came to grips. novelist had come to sex-o-clock in his career and he held that there time would stop. Love, sex, the gratification of appetite; those filled his horizon. He seemed to be all retrogression. For him there was nothing fine or noble in Captain MacWhirr's fight against a malignant fate, as pictured by Conrad in "Typhoon." But he saw something tremendous in one of Sherwood Anderson's tales.

Since then I have read much, both aloud to a family group and alone. But in vain do I look for reality of character in the creations of those modern writers bitten with the sex-theory. And on reality of character creation I cannot but set immense store, holding as I do that those who have achieved immortality in the world of literature have achieved it because of their delineation of character. I think of an Eric Dorn, a John Webster, a Savaron, an Alvina Houghton, but they are to me unconvincing shadows. They refuse to live, these phantoms of the imagination. In them there is neither joy, nor good humor, nor energy, nor kindliness. Sometimes, with their preoccupation with their own appetites, they seem comparable to those fellows one sometimes comes into contact with who are on that debatable line between sanity and insanity. But clear cut they are not. More often they strike me as mental defectives. They seem to be intellectually twisted. Certainly, if I lived next door to a John Webster, I refer to the character in Sherwood Anderson's "Many Marriages," I would regard him with suspicion as a morbid and taciturn man without enough mental vigor to get his own living. And in such a character you would have the stigmata of a degenerate as surely as you would have them in Booth, or in Guiteau, or in Czolgosz. Or consider a Savaron or a Dorn with their nervous instability and those alternating fits of irritability and depression. They are, I hold, studies of diseased or, at best, of lopsided individuals. They are certainly not men who see life steadily and see it whole. Sherwood Anderson, W. L. George, Virginia Woolf, Magdelaine Marx, Mary Borden, Ben Hecht, Clemence Dane, Huneker—each and every one of them have ability, some of them are gifted with a certain kind of glittering wit, some of them are capable of work marked by grace and a certain felicity, but not one of them has produced a convincing, outstanding character. Moreover, viewing their fictional characters from a little distance where vision is not distorted by nearness to all those labored paradoxes, those wilful contradictions and those silly inconsistencies, one character is as like another as one sheep is like another in the flock that grazes a little way from my door. At bottom the problems with which they occupy themselves are similar. Also, in a sense, the origins of the characters were similar in that their creators bitten with the psychoanalytic craze have dived into their own subconsciousness for their material, dragged out what they found, or imagined they found, or thought they were supposed to find, and presented that pale ghost as a character.

But how was it (*Concluded on page 28*)

How Modern Monopoly Works Out

Monopolist Meets His Waterloo When Ranks of Consumers Refuse Support

By HUSTON THOMPSON

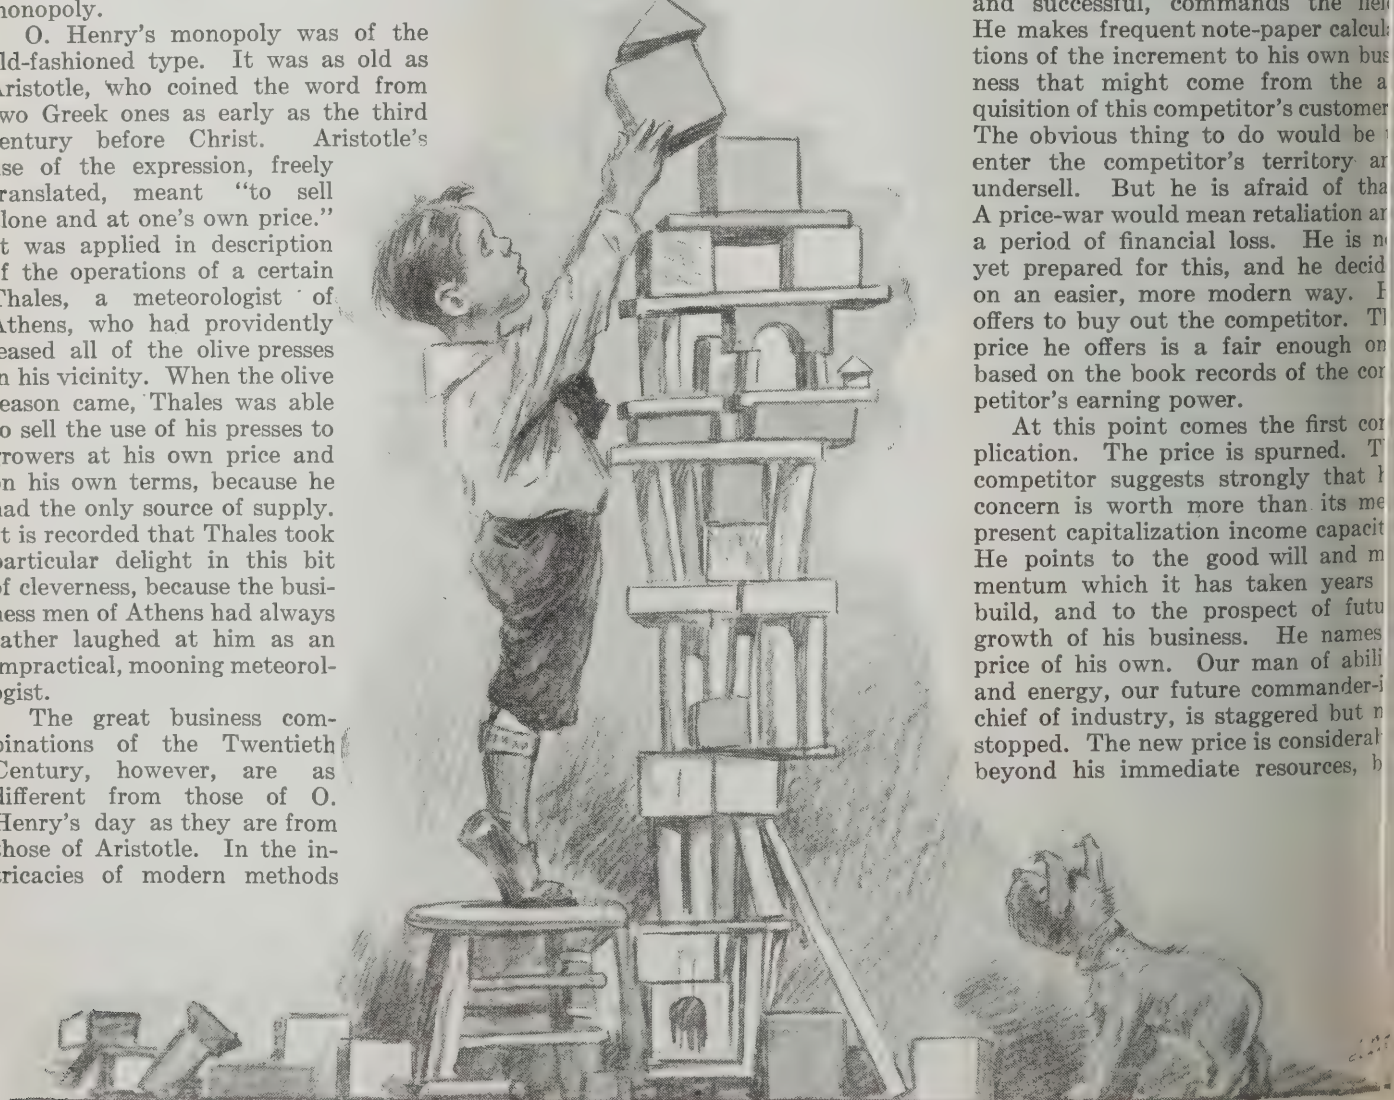
Copyrighted, 1925, by Huston Thompson. All rights reserved.

O. HENRY, in "The Gentle Grafter," describes two more or less gentle ones arriving one rainy day in a little Texas town on the banks of the Rio Grande. The town was situated between the river and a wide arroyo which had once been the river's bed. The heavy rains were gradually flooding this ancient bed until it became apparent that within a short time the town would be cut off completely from the land. The two grafters had $2,500 in their pockets —and an idea. When the arroyo was filled and the town isolated, they bought out each of the three saloons in the place, one for $1,200, another for $500, and another for $400; closed all but one of them, and raised the price of whisky to a dollar a drink. Customers demurred loudly, but they were surrounded with water and consumed with thirst. There was nothing to do but pay the grafters' price or go sober. In no time at all they were lined up against the bar four ranks deep and the cash register rang all day to the tune of dollar on dollar of tribute to the monopoly.

O. Henry's monopoly was of the old-fashioned type. It was as old as Aristotle, who coined the word from two Greek ones as early as the third century before Christ. Aristotle's use of the expression, freely translated, meant "to sell alone and at one's own price." It was applied in description of the operations of a certain Thales, a meteorologist of Athens, who had providently leased all of the olive presses in his vicinity. When the olive season came, Thales was able to sell the use of his presses to growers at his own price and on his own terms, because he had the only source of supply. It is recorded that Thales took particular delight in this bit of cleverness, because the business men of Athens had always rather laughed at him as an impractical, mooning meteorologist.

The great business combinations of the Twentieth Century, however, are as different from those of O. Henry's day as they are from those of Aristotle. In the intricacies of modern methods Thales would find himself completely lost, and the gentle grafter would probably be asking for police protection. Even the master minds which create the present-day monopolies eventually withdraw, a little confused and bewildered, I have no doubt, at the Frankensteins they have fathered.

These present-day counterparts of monopoly are hundred-headed and thousand-eyed. Their methods and make-ups vary like the awful permutations and combinations of arithmetic. Flattened out in one direction, they will bulge in another; caught in one pose, they assume a different one; classified in one manner, they acquire new features defying classification. Yet, because their motives are all finally the same and because their general contours have much in common, it is possible to paint a composite portrait of them which will vary from any given combination only in the latter's many lights and shades.



The colossal business combine o today has in most instances originate as modestly as a violet. A small loca manufacturing corporation, for ex ample, happens to be headed by a man of commendable ability and energy He is a careful buyer and an aggressiv seller. Catering only to his hom market he finds it easy to outstrip hi local competitors and to hold hi trade against distant manufacturer who are handicapped with the necessit of paying freight to enter his market His overhead expenses are light sinc he and his associates are able to mair tain a direct managerial contact wit the manufacturing and selling opera tions. After a time the movement of h little local machine becomes almos automatic and he grows restless. H begins to look ambitiously at furthe markets. The company, he decide should be occupying more territory His eye flashes belligerently at neighboring area in which anothe company, also snug, compact, hustlin and successful, commands the fiel He makes frequent note-paper calcula tions of the increment to his own bus ness that might come from the a quisition of this competitor's customer The obvious thing to do would be enter the competitor's territory ar undersell. But he is afraid of tha A price-war would mean retaliation ar a period of financial loss. He is n yet prepared for this, and he decid on an easier, more modern way. H offers to buy out the competitor. Th price he offers is a fair enough on based on the book records of the com petitor's earning power.

At this point comes the first com plication. The price is spurned. T competitor suggests strongly that h concern is worth more than its me present capitalization income capacit He points to the good will and m mentum which it has taken years build, and to the prospect of futu growth of his business. He names price of his own. Our man of abili and energy, our future commander-i chief of industry, is staggered but n stopped. The new price is considerab beyond his immediate resources, b

e talk of future growth from the mpetitor makes him all the more termined upon absorbing that growth. *he takes the first step toward artiial combination. He consults a banker.*

He too has an idea that the price of a siness should be based on its earning wer. If the two concerns are conlidated by purchase at the excessive ice, he points out, the earnings will t represent an adequate return on vestment. But our man of ability d energy is far too able and much too ergetic to accept this point of view. e takes the banker into his confidence. ice this most formidable competitor out of the way, he whispers, it will possible to raise prices. Raise them ntly but firmly. That will mean creased income, higher earning power. other words, if the investment is o great for the present earning power, is infinitely more sensible to increase e earning power than to decrease e investment. With a practical onopoly of the market it would be e simplest thing in the world to inease earnings by raising prices. The nker grows more cordial and less ssimistic. He gets the idea. Eventuy the loan is made and he becomes rty to a first economic error of tificial combinations—*over-capitalizan.* The competitor is bought out d the consolidated business proceeds der a weight of excessive investment nich calls for earnings impossible der any other than monopoly conions. This weight, of course, the nsumer carries in the price he pays.

Our man of ability and energy now eds to be very busy and very enertic, for he has a two-man job. The mediate personal direction which he d given to the original business is possible with two plants, and he is ced into the second error of artiial combination—*absentee managerip.* One or the other of the plants ust operate without the full benefit his ability and energy. Since, as s already been suggested, his ability d energy are exceptional, this means loss of efficiency. Also he must emoy someone else to manage the other ant, and this means increased overad expense. But the fever of possesn is in his blood now and his monopoly the two markets enables him to crease his earnings enough to more an cover his increased investment d costs. He flashes a belligerent eye out the state at further fields, hispers with more bankers, and buys out other and more distant competitors. Each flash, each whisper, and each purchase means more over-capitalization, more absentee-managership, more overhead, and the need of more profit on goods sold. But, luckily, it also means more monopoly and more resulting control of the necessary earning power. The consumer, of course, is still paying.

The combination by this time has acquired a reputation. Oddly enough, combinations are very modest about acquiring reputations. The limelight is bad for their peculiar complexions. Our man of ability and energy finds himself getting in the newspapers unpleasantly. People begin making speeches about his combination on the floors of the state legislatures, "demagogic" speeches about monopolies and downtrodden consumers. He doesn't mind their making speeches, but there is danger that they may also make laws, foolish laws inimical to "sound" business. So he is forced to add another artificial overhead to his costs (and increase his price a bit to cover it). He buys himself a "legislative representative" to argue practically with the would-be makers of laws. This representative does not object to being called a "lobbyist" by the demagogues, for he is usually a genial, friendly, large-handed fellow. He is, however, quite expensive—to the ultimate consumer.

This ultimate consumer meanwhile has remained in remarkably good temper. He has shown no inclination to discipline the combination (as he can always do) either directly through refusal to buy, or indirectly through invocation of government aid. He even takes, perhaps, a local pride in the organization, in the fine labels it puts on its products, in the handsome stores and factories it sets up, and in the attractive advertising it runs. He does not worry about competition and, even if he does, he thinks of the combination as competing with other great combinations from other sections or states. He grumbles at the increased prices, but is easily persuaded that these increases are natural and proper when he is shown that the combination is earning only a moderate return on investment. The artificial and excessive amount of this investment, and of the costs which limit the earnings, are carefully concealed from him in the combination's balance sheet, and even if he were told of them he would no doubt consider the point too complex for his concern.

Meanwhile the combination and its man of ability and energy are both becoming over-expanded. The man's ego and ambition are growing beyond even his exceptional abilities, and the combination's productive capacity is developed beyond its power to sell. The capacity has grown too great for the combination, and the combination is fast growing too great for the man. The seed of its own eventual destruction which lies in every artificial combine has begun to germinate. Coincidentally, the combination has arrived at the era in which it is destined to do its greatest injury to business and to the public. It is about to become interstate and national.

This final era is one into which the combine is partly pushed and partly pulled. Pushed by the insatiate dreams of its presiding genius, the man of ability and energy, and pulled by the over-capacity which calls for new markets. The immediate occasion for the next step may be a temporarily dead market which emphasizes the weight of excess capacity the combine carries, and which, coupled with the excess investment and excess costs, gives a terrifying threat of collapse for the whole artificial and inflated structure, unless an even broader monopoly can be brought up for support. The man of ability, the captain of industry, who is now beginning to think of himself as a commander-in-chief of his particular industry, meets the threat with an orgy of accumulation. He crosses one state line after another, whispers to many and bigger bankers, taking over here, there and everywhere the plants of his competitors. His motives have changed now; he no longer desires to add new plants to his operations, for he already has more plant capacity than he can use. *He gets the new plants only to eliminate them from the competitive field.* With the change in his motives comes a change also in his methods. To eliminate competition from certain areas, he takes over the inefficient, high-cost plants, as well as the successful, low-cost ones. For each plant which he buys and dismantles he pays a price which he knows will net him no return, but only add to the piling excesses of investment on which he must earn a return. This mounting over-capitalization is at last beginning to make him nervous. *(Continued on page 25)*

John Citizen on the Wing

JOHN CITIZEN, reading his newspapers, thinks that aviation is something like polo—a game for rich young fellows. And John cannot be blamed, though maybe the newspapers can.

But when John sees aviation in his taxes, he will be on familiar ground; he will get the right squint on this strange new power of flight which men are using.

John knows what railways are and what waterways are; he is beginning to know what airways are. Railways are limited by the land. Ships by the water. But airplanes can go wherever there is air—wherever men breathe. The air is the most universal "way" or roadstead that we know. It is the world's highway.

A little village in the Swiss mountains held a meeting several months ago. The patriarchal leader spoke: "I was here when the railway wanted to come, but we would not have it. It went to B____, and you know how B____ has become a big city, and we have remained a mountain hamlet. Now these planes that cross our mountains want to make our hamlet a station. Let us not be twice foolish; let us put our hamlet on the mainline of the new transportation system by preparing an airport and station." And the people did; some giving their labor, others donations of money.

What John Has Done for Steamboating

John Citizen will be an indispensable element in aviation development when he sees how far it is bound to go.

He will do for aviation what he has done for steamboating and railroading.

Take that for a cue. What has John done for steamboating? He has licensed captain and mate and engineer. He has inspected boilers. He has set limits to lading. He has marked out channels in rivers, lakes and seas. He has set up safety lights and signals. He has drafted life-saving regulations. He has patrolled the waters. Steamboating is private business, BUT because John Citizen, his family and his goods use steamboats, John has regulated them, from the route they must take to the fare they must charge. Steamboating in the last analysis is *his* business.

He has done more than that. He has supplied landing places for steamboats. No steamboat could possibly own all the docks at which she touches. A steamboat owner who owned all the docks would not need to remain in the steamboat business. John owns hundreds of millions in docks; he provides them, not primarily for steamboats, but through them for his own service.

Now, how can John figure out that his duty toward airships will be less than that toward waterships?

The Greatest Step in the Mastery of Time

As a Passenger he will insist on standard training, examinations and frequent tests of pilots. He will insist on the inspection of airships and motors. He will set limits to loading of passengers and freight. He will chart air routes, for the safety of those on land and those in the air. He will set up landmarks for use by day and signal lights for use by night, and will checker the country with convenient landing places along all the routes he approves. (These will correspond to docks for steamships.)

Airshipping will be private business as steamshipping or railshipping is, but it has a preponderant element of public interest which John Citizen will recognize as obligating him to do his part.

This takes aviation out of the class of polo. It is navigation and commerce and transportation. It lengthens man's days by saving man's time. Time is the unmastered element in all our work. The airplane is the greatest step yet made toward that mastery.

Men, Ancient and Modern

From very early times, though not perhaps from the earliest, a number of people lived on the land in various parts of the world, under various forms of a grave or even gross inequality. All fed off the land; but the ordering of the work and food lay with the lords, while most of the work was done by serfs. We disapprove of such slavery at its root; we desire chiefly to prevent its return. But men are not enlightened, men have not broadened their minds, unless they can see what was the case for it as compared with capitalism. The vital fact that few realize is this. The modern sort of abolition of slavery was really a much more paradoxical and provocative assertion of property. So long as the land fed everybody, however unequally, it was in one sense everybody's land. The lord was the only commander, but he was not the only consumer.

Now the modern type called an Abolitionist may have been right; but he reasserted in quite a new way the right of the lord to the land. He did it by turning all the serfs off the lord's land on to the king's highway; and treating them like trespassers on a back-garden if they came back on to the land except on the lord's private terms. There was a very real sense in which the freed serf was rather an evicted tenant. The landlord could impose terms upon him before he got back to the land, just as if he were drowning in the sea. We are not saying this was not better; we think it was, because we attach a mystical value to liberty. But to broaden the modern mind, it is essential to make it see the other side. The old lord was in some sense a public officer, wielding far too much power over a community conceived as naturally feeding on his land; and not to be driven from it. The new lord was a private owner and nothing else; and considered as a private owner, he owned far too much. But the Abolitionist or modern Liberal did not think of suggesting that he should lose his privilege as an owner of land, but only as an owner of men. We need not argue which of the two systems was worse; for our inference is not a preference for either. On the one hand, the hired man might be freer from direct indignity; on the other the serf was safer from economic terror; his position was settled by custom and not by competition.

They Should Have Said "Free the Farm"

Now our comment is simple. Whenever men said, "Let us free the slave," they ought to have said, something which medieval men would have understood, "Let us free the farm." They ought to have emancipated the land in proportion as they emancipated the men; so that each man took over as a citizen the work and sustenance he had had as a slave. Because that was not done, the whole modern misery has come on us. In the hope that it may still be done, this paper has been founded. But it is a fact too elementary to be easily seen; and you cannot see it by burying your head in Streatham or identifying the Golden City with Golder's Green.—*From G. K's. Weekly.*

Let the Globe-Trotter Guide Us

Some Succinct Suggestions Which Were Born in the School of Experience

By WILLIAM E. BARTON

REATHES there a man with soul so dead that never to his wife hath said, "Some day we will take a trip around the l"? If so he will not be likely to this article interesting. Still it hope to find readers, for there are few Americans who cherish the n that some day they will see this planet on an adequate letter of t supported by a sufficient bank ce, and make a thirty-five-thou-mile drive. Thirty-five thousand, if lease, for while the earth is twenty-thousand miles around at the tor and less than that nearer the , he who circumnavigates it will l more than the distance straight d it.

his man who talks to his wife about rip around the globe tells her that "we" go, we will not go on one of hurry-up parties, that are crowded me and crowded by too much com- on the ship, but that we will go red to spend a year, stay just as in each place as we like, and go on we get ready, making a thorough f it. He who wishes to do it in way will find facilities better than they ever were be-

mized Cruises Save ne and Money

fore. But while that method is much to be commended for those who can spare r and have made adequate intel- al preparation for the profitable f a year, the average American n who finally makes the trip goes ne of the four or five round-the- l tours that since the World War become such a marked feature of n travel.

ll of these cruises are timed to t a four months' schedule. That by any means the minimum time hich a tour of the world can be ; it is easily possible to cut below ime set by Jules Verne in his then sterous story, "Tour of the World ighty Days." Four months is t as long as an American party e held together in the matter of non interest and a moderate ex-

all these cruises there is a dem- ic spirit. There is no division into and second class passengers. Of e, the second-class rooms are oc- d, and for that matter part of the -class section, but the food is the in both cabins and the deck privi- are alike to all. He who pays the money gets the best room, as on hip or in any hotel, and everyone n equal opportunity to select his and pay as he can afford. On , also, he who has paid the highest gets the best room, but the board same, or as nearly so as can be provided where two or more hotels must be employed, and all is good according to the standard of the country.

Most of these cruises go eastward from New York. There are some advantages in that direction. One visits Japan in a more beautiful time and India is also reached in a more favorable season. But the law of compensation holds here as everywhere. No trip can be planned so as to visit every country in its most favorable season, and to be gone from America in its most unfavorable season and to do it all in four months. Those who sail westward through the Panama Canal and go in that direction around the world have the advantage of reaching Europe in the spring, and of being able to stop over for a time longer or shorter, according to inclination and purse. No one of these cruises has a vast advantage over the others. There is no great difference in the ships, the service, the shore programs or the hotels. The person who gets most for his money is the one who selects the cheapest cruise and the cheapest berth on that cruise. Every luxury above the minimum has to be paid for at something more than its proportionate advantage.

Some luxuries I think are well worth their added cost. If a man is traveling alone, and does not want to be put in a room with another man whom he does not know and may not like, he is justified in paying extra money for a single room. It will not cost him twice as much, but, of course, will cost him considerably more than a room similarly situated which might be shared with some one else. Personally, I would pay extra money for that, but I would not pay extra money for more deck space. The ships that carry the fewest passengers, of course, must charge more; the overhead on a large ship is immense. If it costs, as I think it must cost, a half-million dollars for the ship alone, that cost divided among four hundred persons is 50 per cent larger than if divided among six hundred persons. That is the whole story of the difference in expense. Sail on the ship that carries the larger passenger list, and you get your trip for less money. If you are afraid of being crowded by six hundred fellow passengers, go on the ships that carry four hundred, and dig deeper into your bank account. But none of the ships are uncomfortably crowded.

Advantages of Outside Staterooms

There is one extravagance which I think may well be afforded if one can afford it, and that is an outside room. I am no stranger to an inside room on the Atlantic, and I have traveled in one well content from America to Europe and back again. The inside rooms are well ventilated, and while one must depend on electric light, he probably does not use his light in his room very much in the daytime, and it does not greatly matter. But it matters in a trip to the Orient. On this present trip of mine I am paying for two of us exactly eight hundred dollars more for a room with a porthole than I should need to pay for a room in all respects similar next door, or diagonally across the corridor. That eight hundred dollars is well invested. If I did not have the eight hundred dollars, I would not on that account refuse to make the trip; the room next door is a good room occupied by an estimable judge and his wife, and they are as happy as we are; but for a trip through hot countries the porthole, with a windscoop in it, is worth four hundred dollars a ticket more to any man who can afford it.

Discard the Private Bath Custom

As for a private bath, I count that too dear a luxury for a person of moderate means. There are not many private baths on ships used in the round-the-world cruises, and those who have them pay well for them. My friends who have them occupy rooms not otherwise much larger or better than mine, and they pay $1,400 a berth, or $2,800 for a man and his wife, more than I pay.

So my judgment is that, unless one has plenty of money, the private bath is a needlessly expensive luxury. Bathrooms are abundant, and one may arrange for his daily salt water plunge at a specified hour and hold it all round the world. Not only so, but he will be able to work in an extra bath when he has come ashore after a fatiguing day. And the bathroom is not so far from his own door as to entail any serious difficulty. Few men enjoy a private bath more than I, but it would not be worth $2,800 to me. I take my salt bath early in the morning, every day in the week and now and then one besides.

All these cruises provide for the social, intellectual, and spiritual life of the passengers. There is a hostess with a group of assistants, and these plan what seems to me a quite sufficient number of dances and card parties. If I had to attend them all, I should think there were too many; but as it is, I merely say that there are enough. Each of these ships has a library, and if I am to judge by this one, which is the only one I have examined closely, these libraries are adequate. There is the regular ship's library of current fiction, which I have not had time to sample,

but which appears to be popular, and there is besides a well-assorted special library, purchased new for this cruise, of the best guidebooks and works of travel relating to the countries to be visited. Of the most important works, there are two or more copies. I carry more books than the average traveler, but I have had occasion to borrow from the ship's library and have only words of commendation for those who selected it. They showed good judgment and discrimination. I judge it is about the usual library for such a cruise. For its purpose it could not easily be better, considering the necessary limitations in bulk and reasonable requirements as to cost. The travel library is as complete and satisfactory as could well be expected.

I am able to answer now a question which has been asked me oftener than any other concerning a tour around the world. "What is the cheapest that it can be done for?" and "How much need a man and his wife who are able to travel in reasonable comfort, but who are not rich, expect to spend on such a trip?"

The minimum cost for what the cruise itself provided, which is room, transportation, board and shore trips from New York back to New York is $1,250, and as I have already said he who wants the very most of possible return for the very least possible outlay will get it in this rate and tour. But I do not advise a man to go so cheaply if he can afford some degree of added comfort. My own room is large, light and well located, comfortable and not luxurious. It cost $5,200 for two. For added shore trips I am paying about $700, and for the incidentals on these trips perhaps an extra $100. Tips on the ship will cost about $125. Laundry and other charges will be something. We shall have spent by the time we get back about $6,500 besides whatever we spend on our stop-over in Europe. It can be done comfortably for considerably less, or, one may add, for what appear to me needless luxuries, as much more as one likes. I think I am paying rather more than the average, and including a stop-over in Europe shall spend a total of $7,500 before I return. I give these figures without hesitation because there can be no secret about them. Everyone on a ship like this knows exactly what everyone else pays for his accommodation. Four thousand dollars is the most anyone can pay for the basic trip, and only thirty-two persons pay as much as that. As for purchases on shore, one may spend as much as he likes, and settle it with his conscience and the customhouse later.

What kind of persons does the American globe-trotter meet on the tour which he and his wife finally take around the world?

On an average they are older persons than he would meet on a voyage across the Atlantic. Also there are more men than on such a voyage, a considerable proportion of husbands and wives, which is a refreshing sight. Still, there is not lacking that group of women who are traveling, part of them on life insurance, and part of them on alimony. It is said that on this cruise there are 160 widows, sod and grass, and 116 unmarried women, maidens of assorted ages. There are relatively few unmarried men.

The average person on such a trip is a worthy, fairly prosperous individual. Seventy-five per cent are excellent people; ninety per cent are moral and temperate; not more than five per cent are positively objectionable. One per cent might be dropped overboard with distinct advantage to all concerned. They disgrace us in every port and shame their countrymen.

It is in the main a good-natured crowd, and will bear any ordinary strain on patience and courtesy. But it has in it some boors and enough genuinely selfish people to make others uncomfortable.

It is a good place to test the methods and results of gossip. People must talk, and mostly they talk about each other. Their gossip is for the most part kindly, but it very soon loses its original form. It is amazing how much you hear to the effect that some one said that some one else said that a lady said that a friend of hers heard the captain say something which the captain never dreamed of saying. If I knew a thing to be true, and heard it on deck, I should begin to doubt it. Not that people mean to lie, but gossip becomes untruthful before it gets down one side of the deck on which it originates, and it grows more so as it traverses the other decks.

The great American globe-trotter approaches his first landings with a consciousness that he does not know as much as he ought about the countries he is to visit. The management of the cruise has anticipated this state of mind, and provided a course of lectures. Shortly before each country is reached, a lecture is delivered, telling people something of the geography and history of that country, and something of what may be seen in a short time. Then, after the country has been visited there is an open meeting of what is called a Travel Club, in which people compare their impressions. Those who attend these meetings (and they are well attended) are helped by them. On shore guides are provided who are supposed to explain the places of importance as they are visited. One of the difficulties of the management of such cruises is that guides are eager to get through with this part of their work and conduct little groups of passengers to stores, where the guides get commissions on all goods purchased. Persons connected with the organization of the tours are forbidden to recommend particular stores, but guides are generally subsidized by local merchants.

How does the American globe-trotter behave on shore? In the main, he behaves well. He is frankly curious, and sometimes impertinently so, but he means well and is neither immoral nor unkind. But he sometimes does very rude things. And he is often more interested in telling people how much better we do things at home. I was interviewing a man from whom I was getting valuable information. A fellow passenger joined us, and as soon as the man I was interviewing made any statement, this American proceeded to tell him in detail the difference between that method and the method we employ in America. My time was limited, and this man knew facts which I wanted. It was sheer egotism and obtuse good-nature which caused my friend to "butt in" and deprive me of no small part of what I hoped to learn. It would be better if Americans went abroad to learn rather than to instruct.

I am writing this before the completion of the cruise. It is practically over except for its European stop-over. I have shortened that by two weeks since our first planning. Not that my mind has reached the saturation point. Not that I am sick or tired out. I have had enough for this time. I am glad the world is not any larger. It is a long way around—long enough. I shall be getting back before my friends have missed me. They will be saying, "Have you been away somewhere? I hear you were going. When do you start? It has not seemed long to them, but it is a long time as one measures it from the other side of the world. I am glad to have made the trip. It has been a strenuous and rewarding trip, but it is long enough. Five months I should make of it, and five months is a long time.

Is it superficial? Of course it is, and so it would be to spend only five years in studying foreign lands. But without pretending to any greater degree of thoroughness than the truth will justify, I can truly say that such a trip is not necessarily as superficial as some people suppose. I (Concluded on page)

General Smedley D. Butler's task of cleaning up Philadelphia may be compared to that of Hercules when he undertook to clean out the Augean stable. The Greek here accomplished his job in a day by turning two rivers through the stable, but General Butler has been working hard for a good many days to bring respect for the law into the Quaker City, and still he is a long way from being in the happy position of Hercules. Just why General Butler's broom handle has repeatedly snapped in his hands is an interesting story. It will be told in next week's issue of THE DEARBORN INDEPENDENT.

EDITORIALS

Coal's Annual Spasm

WE HAVE too much coal, therefore it is scarce; and because coal is so cheap, the price is high. Riddle this riddle who can; it contains the coal situation in a nutshell.

What is behind the rumblings of strikes, the pronouncements of the operators, the anxiety of the White House? Much human devilment, no doubt, but something besides—the twistings of an industry that is in process of change, and doesn't know it.

The operators want a strike, because it will be an excuse to hold up the public on the price. The miners want a strike, because it will close a number of surplus mines and make employment for the rest. These are the human elements, but they count for comparatively little.

The big facts are these: We have nearly twice as many mines open as we have need for. We have thousands of miners who are not needed in mining. And, in addition, the country is not using as much coal as it formerly did. Less coal does more work than it used to, because of the improved furnaces and machinery that have been evolved. Also, oil is lifting some of the load; and water-power is helping.

Coal is no longer king.

Ten years ago railroads used 275 pounds of coal per thousand ton miles. Today the same ton mileage is accounted for by 59 tons of coal. Railroad men prophesy that five years hence the figures will be 39 pounds.

That, in brief, is what is happening to coal. More economical use of it is resulting in less of it being needed. Coal was made so difficult to get that the public in self-defense devised means for decreasing the necessity to get it.

Of course, these basic facts are usually hidden. But concealment will not be so easily possible this year as in former years. The actual situation in the industry is widely known throughout American business circles. Bootleggers in coal have a small chance of pulling off their game this year.

Politics a Little Premature

TALK is commencing to dally with possible Presidential candidates and a third term for Coolidge. Most of the gentlemen whose names are mentioned will never be candidates: none of them will be President. Third term talk is entirely inaccurate. Coolidge has thus far only been elected once.

Jewish Fascisti in Italy

"THERE are only 50,000 Jews in Italy, yet this small Jewish group has produced more statesmen and men of affairs within the last quarter of a century than the rest of Continental Europe combined," says *The Canadian Jewish Chronicle.*

Two Jews have been Premiers of Italy—Luzzati and Sonino. A Galician Jew was Italian Minister of Foreign Affairs—Signor Schanzer. Nathan, a Jew, was Mayor of Rome.

But with the coming of Mussolini and his Fascisti the Jews of Italy enlarged their power. Mussolini's Minister of the Interior and the most influential man in his cabinet is Signor Finzi. Samueli Bellini, Angelo Olivetti, De Verona and Orios, the four strongest leaders of Fascism, are Jews.

Madame Mergherita Sarfoti, who occupies the responsible position of editor-in-chief of Mussolini's own paper, is a Jewess, and her husband, also a Jew, is one of Mussolini's close advisors.

When Italy emerged from the chaos of war and discovered that the International Jewish Bankers had hamstrung the country, a strong anti-Semitic feeling threatened to arise, but the Mussolini movement broke forth, and is now the protector of the pro-Jewish program throughout Italy. Mussolini's recent conference with Gabrielle D'Annunzio, who is also a Jew, is thought to have revolved around this question.

Power of the Press

THE reason such a multitude of books are being jolted from the presses of publishers is that today the world holds thousands of men who understand hardly anything and who are indefatigable in their desire to disseminate their uncomprehension. Hundreds of thousands of their fellow mortals stand ready to receive this many-worded misunderstanding, having been trained from childhood in the belief that cocksure formulae denote intelligence, that anything in print is wisdom, and that a book is necessarily to be respected.

There is a good case to be made out for the thesis that understanding is in direct ratio to the capacity for silence. Or conversely, lack of comprehension requires a great many words. Tolstoy, one of the most misunderstood of mortals, wrote huge books in his less mellow

years. Toward the close of his life he wrote less and less. Finally he achieved this:

"How well the peasants compose stories. Everything is simple, the words few, and a great deal of feeling. Real wisdom uses few words, for instance, 'God have mercy on us.'"

To enlarge on this sentiment would be to join the ranks of the uncomprehending.

Moral Training in Schools

WILLIAM A. McANDREW, superintendent of city schools, Chicago, has recently given to the press an interview worth reading. It deprecates the tendency to neglect moral training in the public schools, with material advantage emphasized.

Professor McAndrew will have appreciative approval of his sturdy demand that character building have a more important place than "money-grubbing" in the teacher's work. If the idea that to be illiterate is to condemn one to menial occupations, that a high school graduate is certain of employment at good wages, and that a college diploma is insurance of a still larger salary, could be forgotten, there would be less of disappointment when the eaglet first essays to fly.

The basis for moral training is, of course, in the home, but with parents careless, indifferent, or lacking in moral responsibility, their progeny must present barren ground unless their environment can be changed.

The value of the classics and the sciences is one of mental training, in itself an asset of inestimable advantage in any walk of life. The educated man has in it a treasure of which no one can deprive him, but if materialism is the chief end of education it is self-deceptive. The young man or young woman who entertains it will be satisfied with a diploma, whether earned or not. Anything to "get by," but an awakening most certainly follows if one cannot make good. The diploma is no certificate of genuineness or worth, ability or possibility, and the student who insists upon appreciation according to its face has something yet to learn.

New Methods in Arctic Exploration

IS MACMILLAN, with his airplanes and radio, taking the romance out of exploration?

Peary spent twenty of the best years of his life at one job—reaching the Pole. Now one of his former aides plans to accomplish in two weeks what explorers have dreamed of for two hundred years—the exploration of the million square miles of unknown area between Alaska and the Pole. Other explorers, with their old-fashioned methods, have bitten generous chunks out of this area, but it remains for MacMillan to eliminate the word "Unknown" from maps of the Western Arctic.

Peary and Stefansson faced many a blizzard that blinded both men and dogs; MacMillan will do his exploring in balmy summer weather. Peary and Stefansson traveled thousands of miles during the "Arctic night"; MacMillan will enjoy daylight for twenty-four hours each day.

Peary and Stefansson ate cold snacks at noontime in the lee of an ice-cake—or went without lunch; MacMillan and his followers will carry warm food and thermos bottles filled with hot coffee. Tired from sitting in cramped positions while FLYING over the hummocky white desert, rather than from hauling sleds over its surface, these modern explorers will be denied the fun of pitching a camp, building a snowhouse, or sleeping on a polar bear skin spread upon the ice; possibly they will don pajamas at their land base each night, and crawl into real beds.

Shades of Shackleton! What is exploration coming to?

Regarding Parliamentary Procedure

IN THE parliamentary world a question arises: Is Goose Creek worth widening? An appropriation is made, a committee founded. The committee investigates. Goose Creek becomes an issue, is debated pro and con. A bureau is begotten to take care of memoranda and correspondence relating to Goose Creek. Another appropriation is made to finance the bureau. Eloquence makes play. A committee is appointed to investigate the Goose Creek Bureau. An appropriation is made. The committee takes evidence. The Goose Creek Bureau becomes an issue. More pro and con. An election is won on the issue.

Three years pass. A government exploring party is fitted out and sent in search of Goose Creek. A temporary building is erected to house the clerical force which takes care of the memoranda and correspondence relating to the bureau founded to take care of the memoranda . . . and so on. Meanwhile Goose Creek has dried up in spite of all irrigation. In the end, nothing remains but the bureau and the clerical forces.

This account is exaggerated, but not sufficiently; where it fails in reality of detail, it succeeds in reality of idea. And the analogy falls short only in respect to the final achievement. In the parliamentary sequence, often enough, the window is not closed, nor the match blown out. Whether the window should be closed or the match blown out is fiercely fought about by rival factions down the corridors of time, and when the echoes begin to die away they are still echoes of an issue thrice removed from fact.

MR. FORD'S PAGE

A STUDENT of earthquakes, their causes and effects, rode through a scene of recent destruction and made this report: "In general, good design and honest workmanship stood, while incompetency and bad workmanship were exposed in all their miserable nakedness." It was the comment of a detached scientific investigator on industrial honesty.

There is nothing new in it. It is as old at least as the Parable of the House that was Built on the Sand. But its age is an evidence of its truth, for truth is the oldest element in the world; it becomes new only in our discovery of it.

One truth which humanity stares at all the time and yet seems unable to believe is *the permanency of change.* The common saying that "nothing is certain but death and taxes" is untrue; the most certain thing is change. Taxes are a charge and death is a cessation of functions on a certain plane, but change is continuous and is possibly one of the farthest reaching laws of the universe and life.

It is this element of change that makes life a perpetual surprise. The ambushed hour that will turn our fate or test our mettle is always just around the corner. To cultivate a sense of glad expectancy and greet the unknown with a cheer are signs that a man is coming to an understanding with life.

The truth of the continuous experience of change needs no demonstration; but the problem of what will survive change is, in all its aspects, one of the deepest that the mind of man has wrestled with. It is at the bottom of the oldest speculation about immortality and the youngest business policy.

The expert in earthquakes and the expert in the Parable both bear witness that good work survives. The well-designed and honestly built structure survived the earth-tremor. The house that was built upon the rock survived the storm. The business that was built upon service survived the panic. The man who did a day's work every day survived the clean-up of incompetents that swept through the shop. The young man who used his head and did not sell his youth for folly survived the "wave" of destructiveness that swept over his generation. Good work is what survives.

Change is always associated with developing life, but not with perfect life. The line of the old hymn which many think is very mournful—"Change and decay in all around I see"—is really a statement of development. Change indicates the ongoing of life; decay indicates the non-survival of what was unfit in life, or what had served its purpose.

Change is national and economic, just as it is personal and planetary. That nation is most highly developed which has seen most changes. Compare the changelessness of China with the rapid and all but bewildering changes that have occurred here. And even China is beginning to scent the winds of change blowing upon her.

Although it is a matter on which one would not pronounce finally, the impression is strong that here in America we have undergone more economic changes, more economic earthquakes, so to speak, than any other people, and, if so, we should be the better for it; we ought to follow the practice of earthquake experts and study what survives, and why.

> *IN A RECENT earthquake the well-designed, honestly built structures survived the shock. It is always so. In the world shakeup of ten years ago, it was the nations that believed in work and freedom that endured. In so-called "panics" the concerns that are built on service come through upstanding. There will always be changes and periods of testing, but they are not feared by those who have built honestly on sound foundations. What can be shaken off should be shaken off. Change means development, but only sound and honest qualities can remain attached to the developing life.*

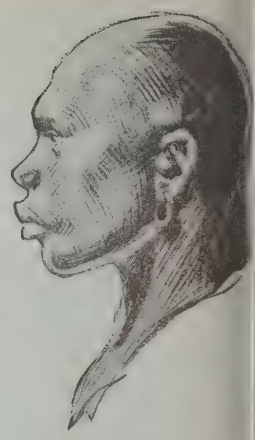
That is an excellent sort of shaking up that shakes down the false and leaves the true upstanding.

In human affairs, however, confusion should be avoided between disasters we bring on ourselves and those which occur under the beneficent law of change. Some periods of change we can attribute to the universe, others to ourselves. But the common element in both is the ability of the good, the honest and the true to survive. Hay, straw and stubble go up in the flame, but pure metal remains.

We are in an after-quake period of the world now. The rumblings of the last great change are hardly silent; the sounds of the world's rebuilding are heard everywhere. We can look back over a space of ten years and see what perished. All pretense perished. All incompetency perished. All political and diplomatic dishonesty perished. All of that peculiar fraudulence, which makes words do duty for things, perished. Religious hypocrisy is rapidly perishing, and with it a superficial and unscientific dogmatism in the realms of science. We are more honest with ourselves, on the whole, than we were previous to 1914, and thus we indicate what really survived the war—our capacity for honesty survived.

And this is the very essence of all good work. Honest intention has power to find or create its own ability, while talent without honor is strong only to work its own destruction.

The African Negro in His Own Home



An Intimate Study of the Black Man as He Is, Not as Many People Imagine Him to Be

By HENRI GALLAND
Administrator of the Colonies of French Equatorial Africa.

NO FEWER than 150,000,000 Blacks inhabit the Continent of Africa. If "Primitives" are to be met with in any number in Western Africa, their primitiveness does not present the interest of the tribes termed Bantu, the name traditionally used since Bleek in 1867—from the personal prefix BA and the root NTU—men whose dwelling place can be roughly located in the triangle made by the southern part of the continent. It is among those tribes that we find the greatest moral, social, and, to a large extent, linguistic unity. It is among them that we discover the primitiveness preserved by tropical forests and wide rivers, while the northern tribes, tainted by Islamism, by ancient contact of the whites, disorganized by invasions, by the more or less lasting successions of various Negro kingdoms, have undergone complete changes on many points.

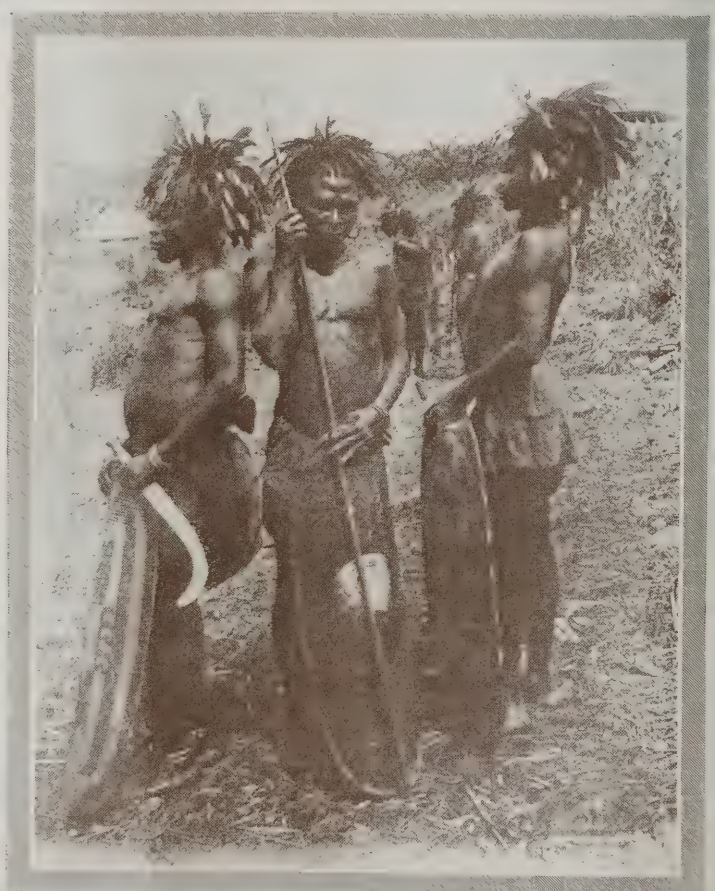
A wide gulf divides the mentality of the white man from that of the black man. Behind the strange customs of the latter are meanings hard to discover. But it is in their actions that the ways of thinking of a people are revealed; it is through those actions that we can grasp their habits of mind. We must remember that many customs that may, at first sight, look strange are almost identical with those which were observed by our ancestors.

At this point it may be interesting to cast a glance on those who are considered by historians as the last remnants of the aboriginal race—that is, the Negrilloes or Pygmies belonging to a human race somewhat distinct from the black one.

Homer, Herodotus, Aristotle and Pliny have mentioned them. We find them scattered in a sporadic state over the whole surface of tropical Africa as well as in other parts of the world, in India, in the Malacca peninsula, in the Philippine Islands, the Andaman Islands, et cetera. The names by which they are called (Watua or Batua, Babinga, Bek, Akowa, Baweya, Babi, Bakola, Babongo, Bakouya, Bakoa, et cetera) do not even belong to them; they have been given them by the surrounding tribes with whom they maintain a commercial intercourse.

The size of those Negroes is seldom above four feet eight inches; they have a very prominent chin, a rather light complexion, a flat nose, and upper limbs comparatively long. A light-colored down grows over their whole body. True children of Nature, they lead a life apart, in fear and loneliness.

Where did they come from? They themselves could not tell, and their being so scattered might seem to prove that, at a time which we cannot accurately state, they must have



Negro warriors.

before the invaders, that is, the pres
Negroes, the Bantu tribes, who reac
the continent by the southwest.

The tradition is unmistakea
among the latter; they easily recogn
that they are not the first inhabita
of the soil, and that they have conque
it over a wild race composed of r
living in trees in which they used
build huts, in grottoes or in lacustr
villages, according to the differ
regions. So powerful is that tradit
that, in several countries west of
Kivou Lake, for instance, the Negril
have retained a right of investitu
and they renew every year the leav
occupying the land to the leaders
the tribes.

Even nowadays it is not rare, in
equatorial forest of the Gabon, of

The latter, reserved for elephant hunting, is rather curious. It consists of a huge log fastened a few yards above the ground, at a tree, and provided at its lower end with an iron spear two or three feet long. Some bait—bananas or maize—is fixed to it. When the elephant tries to seize the bait, the snare falls on the animal, pierces it through and knocks it down at the same time.

Their weapons are, besides javelins and spears, small bows that they use with a remarkable skill. Those bows are about one foot long for rat-hunting and one foot six inches for antelope hunting.

Their language possesses words undeniably Bantu that are used as well by other Negroes who live in countries far distant in some cases. Thus, among certain Negrilloes of the Cameroon and of Gabon we come across Bondjo and Banzir words. Now the Bondjos live on the banks of the River Congo while the latter dwell in the region of Upper-Oubangui. However, it is certain that their language is their own and does not belong to the group of the Bantu tongues.

Some of them, urged by the wants of existence, have been obliged to become the "clients"—in the meaning the Romans imparted to the word—of certain villages that they supply mostly with game and whose tongue they have more or less adopted. At nightfall they come and lay at the entrance of the village the trophies of their hunting or fishing: they are well aware that, on the next night and at the same place they will find such goods as they cannot obtain on account of their nomadic life—manioc, small raphia, pieces of cotton, chickens, and so on.

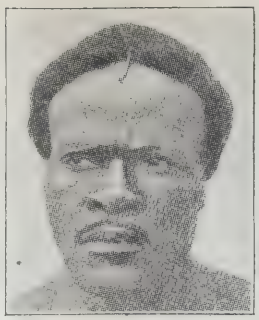
An old man of the tribe is generally entrusted with depositing their produce and taking the objects left in exchange, under the guard of a group of hunters.

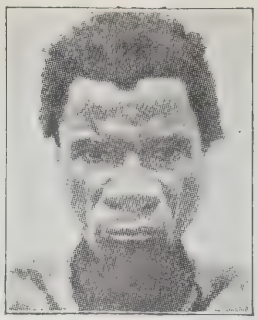
They have hardly been touched by the fetishism of the surrounding inhabitants. If they happen to possess a few amulets it is because they think those charms will bring them good luck in their hunting expeditions.

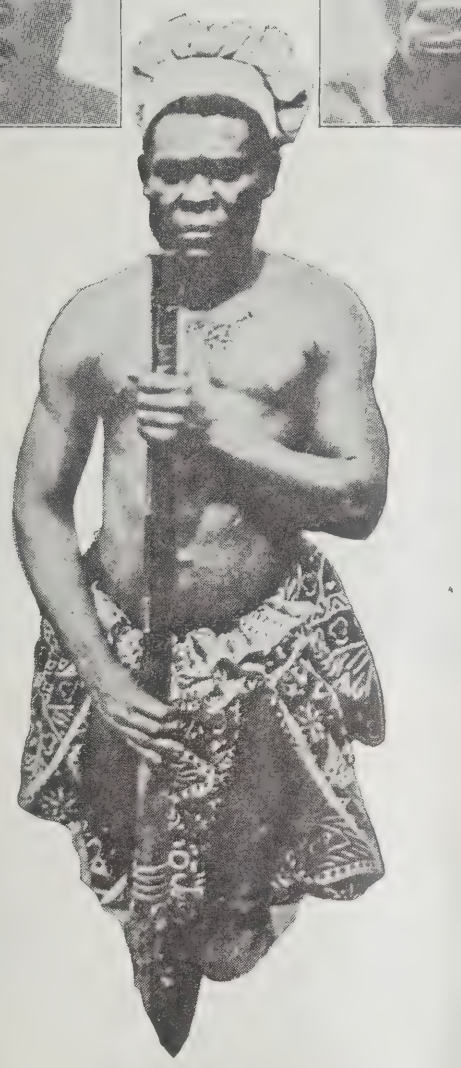
They do not, generally speaking, take wives outside their own tribes and monogamy is the rule among them. Each clan has its chief elected by the community.

The dances among those whom I was able to observe closely are not marked by the lewd character of those of certain African tribes. They are quiet, almost austere, with very short songs always in minor dirges of unutterable sadness which are never forgotten when once heard.

Those rites of separation, of reintating, et cetera, that are so numerous n other tribes are unknown to the Negrilloes. Thus it is that women







Some Negro types.

among them are free from the strictness of the seclusion cabin which many African women have to undergo at certain periods of their lives.

Neither birth nor death give rise to any special ceremony. Yet when a death occurs in the camp they repair to the grave of a Negrillo who has died in the country and take a handful of earth to cast on the tomb of the newly deceased.

Are we to interpret this custom as a rite tending to link the memory of the dead man to that of his ancestors, thus denoting the perpetuity of the right of ownership of the soil?

Whenever a child dies in infancy its body, which has been wrapped up in leaves, is laid in the pit by the mother herself. If the child is a few years older, the father fulfills the task of gravedigger. The body is buried in a squatting position, and, in certain regions, standing.

They observe taboos on food and also sexual taboos, as primitive people usually do. In spite of a few crossings that were unavoidable in the course of a contact that probably lasted several centuries, they are looked upon with a superstitious awe. The natives of Likouala in the Middle Congo consider them as the discoverers of fire; those of Fernan-Vaz, in the Gabon, believe the Negrilloes first found how to manufacture iron. In other places those whose "clients" they are and who, as a matter of fact, accept their help, will never enter the straw or leaf-built Negrillo huts. If they did so, they imagine they would be sure to catch some incurable disease. They would likewise energetically refuse the use of a fire lighted by Negrilloes.

Have the Negrilloes any fixed belief? The idea of a supreme being had for a long time been denied to primitive races by many ethnologists, even by missionaries. Sir John Lubbock, among others, supported that thesis; but a more thorough knowledge of this primitive people has forced all students of ethnology to acknowledge the facts.

It is undeniable that the Negrilloes believe in a supreme being, but they do not worship him. But who can tell their most intimate views on this subject as on many others? The life most of them lead in the heart of the wild and luxuriant, tropical forests will still, for many years, conceal them from investigation.

The Oasis of Adrar

THE Oasis of Adrar is in the western part of the Sahara Desert in North Africa, east of the Spanish possession of Rio de Oro, of which it formerly constituted a part. A considerable portion of its 30,000 square miles is fertile land on which dates and grain are grown. Ostriches are raised for their feathers and salt is mined. Due to its position on the caravan route of Morocco it is of considerable commercial importance. The inhabitants are for the most part Berbers.

An immense system of subterranean aqueducts, whose origin is lost in antiquity, supply the oasis with water. Not even the legends of the most ancient native tribes contain a history of their beginning. Adrar lies at the bottom of a natural depression that a marvelous irrigation system connects with reservoirs feeding the surrounding plains at a higher elevation. The natives, with no better implements than rude scoops and picks, have dug, at a depth of from 150 to 200 feet below the surface of the desert, spacious tunnels that extend for miles.

It rains but once in ten years at any given point in the Sahara and this sparse rainfall is conserved by collecting the ground moisture from a great expanse of territory at Adrar.

A Cathedral Crusade in Art

Does It Mean Another Renaissance Such as Transformed Fifteenth-Century Europe?

By OLIVER HOYEM

Above—The apse, eastern end of the cathedral now completed.

Right—Architect's drawing of completed cathedral.

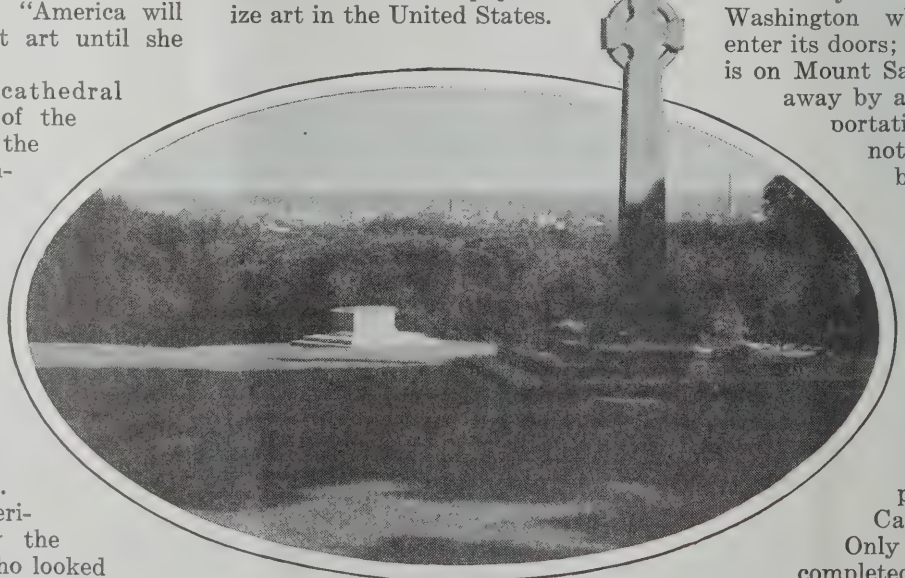
FROM the battlements of Washington Cathedral, a revolution in American art is threatened. Since it comes from the church it will be a peaceful revolution, but its object is nothing less than the restoration of art as the handmaiden of religion.

In the Middle Ages the cathedral builders were led by their bishops to Palestine to recover the Holy Sepulcher from the Saracens. The cathedral builders of today are leading a Christian crusade to recover art from the pagans.

The world's temples have been the greatest and finest influence upon the arts, say the artists and critics. We are told that the people of Europe have more appreciation of art than we because of their great cathedrals. Carrying this thought to its logical conclusion the critics have said: "America will never develop a great art until she builds cathedrals."

For many years cathedral building seemed out of the question so far as the United States was concerned. It seemed to belong to ancient history. America's great industrial genius might develop some influence upon art greater even than cathedrals, said some of the super-patriots who argued that we were too big to imitate Europe. Such beliefs were not seriously entertained by the great patrons of art who looked upon art as a phase of humanity not to be restricted by national prejudice and they expended vast sums of money in collecting the art treasures of Europe and placing them in the museums and art galleries. Each city wished to boast a great gallery of art. So we have stripped the cathedrals of Europe of some of their most valuable possessions. Yet something vital is lacking.

It is a fact that people as a mass are apparently not greatly interested in art museums. If they are they do not show it by their actions. The number who visit the Metropolitan Museum in New York City, the Corcoran Gallery of Art in Washington and the galleries in other cities is disappointingly small. It is a fruitful source of humor for cartoonists. Art galleries have failed to popularize art in the United States.



The Peace Cross, erected at the close of the Spanish War. Four hundred feet above the city, it is probably the finest cathedral site in the world.

Will cathedrals do more to give the average American an appreciation of art? The building of cathedrals in New York and Washington that will rank with the finest in the world, coupled with the remarkable interest on the part of the American people in them, has convinced many that a new Cathedral age is here and artists are beginning to consider seriously the possible influence of the new movement upon art.

Persons desiring to compare art museums with cathedrals asked about the number of visitors to the Cathedral so a year ago the verger in the Bethlehem Chapel of Washington Cathedral was given the job of counting noses. The figures from Easter to Easter showed a count of 189,425, not including the thousands who attended the great open-air services during the summer. During April more than 30,000 persons visited the Cathedral. The Corcoran Gallery of Art reported a count of 177,240 visitors during 1924. There is more significance in the figure than the fact that Washington Cathedral has forged ahead of the Art Gallery in the number of visitors. The Corcoran Gallery of Art is in the center of Washington where everybody may enter its doors; Washington Cathedral is on Mount Saint Alban, three miles away by airplane, and the transportation facilities thereto are not yet of the best. Anybody who makes the journey does so because of real desire to see the Cathedral. The museum with its beautiful building and its great art collection has been in existence for many years; at Mt. St. Alban there is no more than a promise of the great Cathedral that is to be. Only one-tenth has been completed. One small chapel is the only completed unit. Yet thousands visit the Cathedral who give no

ought to the Corcoran Gallery of Art. ndreds come out in taxis. Hundreds ke the Cathedral their sole objective visiting Washington. There is some- ng compelling about a cathedral, a gnetic power that art museums can- command.

Of course, the fact that Woodrow lson and Admiral Dewey are buried the Cathedral accounts for some of present interest, but before either them was buried there the count of itors was considerable. The Cathe- l as the Westminster Abbey of erica is not a new idea. It was the ention of the founders when they ained the charter from Congress in 3. The burial of great men is not accident. It is a part of ancient hedral tradition. When the Cathe- l is completed the Westminster bey appeal will be a minor factor in racting visitors, just as the burial of at men in Rheims, Notre Dame, artres, and other cathedrals is not the present day responsible for the rimages to these shrines.

Architecturally, Washington Cathe- l will be the finest exponent in the ited States of the Gothic style. erica has been imitating Roman hitecture, which was itself an imita- of Greek architecture except for the oduction of the Roman arch. Mod- industry and finance are enthroned Greek and Roman temples. So is ernment. Gothic was selected as architecture which would sym- ze Christianity in the cap- of the nation because it ssentially a Christian elopment. It was fruit of the re- ous fervor and nse devotion of cathedral build- of the Middle gs.

With the end of cathedral age in

Tomb of Woodrow Wilson in Bethlehem Chapel of Washington Cathedral

the sixteenth century, the building secrets of the masonic guilds were lost. Researches during the last fifty years are again bringing them to light. *During this period also there has been more cathedral building in the world than during the preceding three hundred years.* It seems as if some divine power had hidden these secrets from profane eyes until the beginning of the new cathedral age. At any rate the subtleties of the cathedrals of Europe are being incorporated into Washington Cathedral. They will differentiate the cathedral from the mathematically exact symmetry of commercial architecture. They are infinite in variety, in curves, angles, carvings and sculpture, carrying out the principle that Gothic never repeats, that every stone shall tell its own story. The introduction of Gothic architecture into the United States is in itself a revolution. Millions of words were expended in a desperate battle some years ago in which Gothic emerged the victor, but the echoes are still heard. The vanquished were not reformed, and so the Gothic exponents will for some years to come express their art principally in church building.

In sculpture and in painting the cathedral revolution will manifest itself in their more vital relationship to architecture, and in a greater stress upon religion and philosophy as the subject matter. The greatest art of the world has always developed as part of architecture, especially when it was consecrated to religious purposes. Sculpture and painting began as a decoration of architecture. But since the Middle Ages there has been a steady divorce from this first principle. Instead of being a builder's craft, sculpture is now regarded as a separate art. Its success today is marked by the production of separate and isolated statues or groups. The return to first principles is apparent in the work of the sculptors at Washington Cathedral. Sculpture as elaborate as that of Rheims will adorn the new Gothic fane, but it will be an integral part of the design. The building will come first.

In the light of this basic principle, it is interesting to study the plans for a more comprehensive scheme of Christian symbolism than exists in any American church edifice. In cathedral figure sculpture the tradition of centuries of religious expression has developed an art somewhat unique in its modes of expression. Physical beauty, the ideal of the Greeks, is not the *motif* of Gothic religious art. The spiritual message is of primary importance; spiritual grace and beauty the ideal.

Sculptured ceilings five hundred feet long east and west, and two hun-

The Adventures of Those Ancient Mariners Surpass the Romance of the Thousand and One Nights

Round Cape Horn. (From an etching.)

The Boston Marine Society

By MAY B. WHITING
ILLUSTRATED BY GEO. C. WALES
Courtesy of Goodspeed Bookshop, Boston.

THE Boston Marine Society is the oldest society of its kind in the world. In 1742 it was organized as the Fellowship Club and a little later it received its charter, under the present name, from William Shirley, Governor of the Province. Its members were captains of ships, "master mariners," as they are still styled, with an honorary membership of merchants and others interested in maritime affairs. John Adams is on the first honorary roster.

There is not one of the thousand and one adventures of the "Arabian Nights" that can surpass the romance and bold deeds of New England shipping. Before Boston was a year old Governor Winthrop built the *Blessing of the Bay* and launched her on July 4, 1631, for the maiden voyage to Long Island to trade with the Dutch. A few years later the *Trial* was built at the North End and sailed to the Azores and the West Indies. By the close of the seventeenth century Governor Bellomont reported that there were more seagoing vessels in Boston alone than in Scotland and Ireland combined, and fifty years later, when the Society was formed, 550 vessels a year cleared from Boston for foreign ports. On one October day in 1791, seventy vessels spread their sails for the seven corners of the globe.

At that time lighthouses were very few, seas were uncharted, channels unmarked, and even the approach to the home port difficult and dangerous. The first object for which the Society was founded was to collect knowledge that would aid navigation, and each member was invited, on his return from a voyage, to report variations in the needle, shoals and rocks that he had noted. The second object was to help the families of those whose fortunes or whose lives were lost at sea.

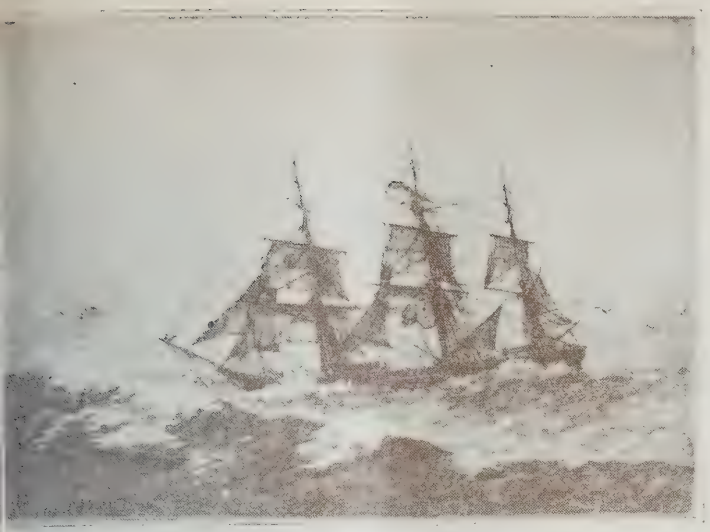
Money was collected for this purpose in a rather curious fashion. An old by-law required "that such members as shall go a voyage to sea, and shall return successful, without being cast-away, taken by the enemy, or meeting with any other misfortunes, shall pay Six Pence Sterling into the Box for the Use of the Society, for each and every month that he shall have been absent." There was also a fine of "5s Old Tenor for being absent from a meeting," another fine for not attending a brother member's funeral, and from this fund the needy were relieved "according to the nature of his misfortune and the Ability of the Box."

The records show that the Society in its earliest years rendered great service to shipping. In 1796 it conferred with the governor as to a lighthouse to be erected on Cape Cod and buoys for Boston Harbor, and that same year the Humane Society asked its advice as to the best place to build huts for shipwrecked me and the Society suggest Marshfield Beach, Na tucket, Lovell's Islan and Lynn Beach. Stran as it seems, many a go ship that had round the Horn and sailed t Indian Ocean came to sad end almost with sight of a haven. T Society from its foundi had charge of the pil ing of Boston Harbor a it still retains that p rogative. Today t governor appoints a co mission of two from t Society's recommend tion, and any complai of accident or mismana ment is referred to trustees.

With all its dange the sea was like a magn for the staunch N England stock. Gre treasures and brave a ventures lay away somewhere beyond t horizon, and there w no lack of youth to a-seeking them. M rose from cabin boys be captains at twen with power to sell t cargo and even the bo and in a few lucky v ages made their fortu or were broken by stor or mishaps impossible foresee.

Major Shaw, officer in the Re lution and ancestor of Robert Go Shaw, famous commander in the C War, is a type of the seafaring man his day. In 1784 he set sail from N York for the Orient in the *Empr of China*, carrying lumber, rum, a ginseng. Then vessels were not allow to go to Canton but must anch twelve miles below and carry th cargo up by lighter. Foreigners w forbidden to stay in the city, a after their business was transact must retire to some more frien island. Although the "hoppo," Chinese customhouse officer, was grea grieved because there were no "si songs" or presents for him, the Yan captain promised to repair the negl the next time, and the voyage wa great success.

A year or so later, in 1789, Sh built the *Massachusetts*, the larg merchant vessel up to that time in United States. Her launching wa



Head Seas. (From an etching.)

at event in New England, but just ore she sailed Moll Pitcher, the nous seer of Lynn, prophesied that would be an unlucky boat, and mediately her crew deserted. With at difficulty another was obtained l at last she got to sea, but her nking was of such green wood that rotted before the voyage was half r and spoiled her cargo. The ship s sold at Canton at a great loss, and jor Shaw, only thirty-nine years , died on the trip home.

Somewhat happier were the ven-es in the China trade of Daniel con, one-time president of the ston Marine Society. He was mate n the *Atahualpha*, when, at anchor ow Canton, she was attacked by ates. Bacon was then on shore, he managed to get away from nds who tried to detain him forcibly, l made his way a rowboat to his p, determined to re her fate. The ptain, Russell rgis, had powder dy to blow up boat in case the inese boarded r, but in the antime he poured all shot into the nks with such cess that he ally drove them . This exploit used the lazy ndarins to put a p to brigandage, l the pirate lead-e was captured and t to death by the rible "thousand s."

When Captain con retired from lowing the sea he nt into ship-bilding. His most nous ship was the *me Cock* whose rehead of a cock h outstretched gs was known in many harbors. The *Game Cock* was the fastest ship of her kind in the world and Bacon challenged British shipbuilders and mariners to beat her. At first the prize was ten thousand pounds, then the stakes were doubled with a start of two weeks over the course. The London newspapers tried to arouse maritime interests to accept the challenge, but in vain. The racing of those days makes ours seem like the matches between the toy boats on the frog pond. Then the course was to China and back and the prize a fortune.

The Chinese trade lasted for about three-quarters of a century and it was the foundation of many fortunes. There recently died in Boston a member of the Marine Society, Frederic Hinckley, one of the last surviving captains of that era. In his ship, *Living Age*, he was cast away for over a month on a reef in the China Sea.

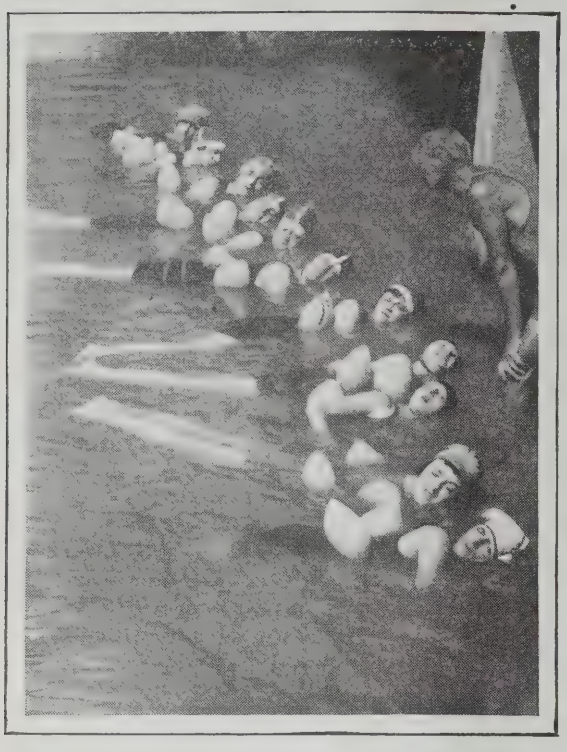
The most renowned of the early Yankee merchantmen was the *Columbia*, a little vessel eighty-three feet long, the first American ship to sail around the world. With her consort, the *Lady Washington*, an even smaller vessel, she set sail in 1785 for the perilous voyage, laden with hardware, tools, toys, and beads to trade with the Indians, and carrying aboard a surgeon, a furrier, and an artist, together with medals struck off by the government to be distributed among the natives.

Off Cape Horn they encountered heavy gales and it was a year before they reached the unexplored Northwest, the crews ill with scurvy. During the winter their cargo was exchanged for furs which, in turn, they sold in China to buy tea. After two years' absence, the *Columbia* reached Boston, bringing the young Hawaiian prince, Attoo, who marched through the city beside Captain Gray, wearing an exquisite cloak of red and yellow feathers. The artillery fired salutes in honor of the achievement and Governor Hancock gave a dinner to the officers and owners of the ship. Yet the voyage was unsuccessful financially. On a second trip Gray discovered the Columbia River which he named after his ship. This voyage was likewise unprofitable so that the *Columbia* was sold at auction. Yet these pioneer voyages opened up a great fur trade which, when developed, yielded fortunes, for it gave the skippers of the "Nor'westmen" otter and seal furs for which the Chinese mandarins were willing to pay high prices.

In 1848 came the gold craze in California and with it the most beautiful fleet of ships ever known, the Yankee clippers. Donald McKay in his shipyards at East Boston built ships that were the marvel of the world. Speed, rather than carrying capacity, was re- (*Concluded on page 32*)

The ship *Columbia* and sloop *Washington* to the Northwest coast, 1787.

Why Must Swimmers Drown?



Left—Mr. George H. Corsan putting a class of women through the rhythmic breathing drill in shallow water. The pupils are taught to breath in while the mouth is out of the water.

Right—After inhaling, the class next practices breathing out through the nose in the water.

If They Saved Their Breath They Wouldn't

By GEORGE HEBDEN CORSAN, SR.

AS SOON as the really hot weather is upon us, we have daily reports of men and women, boys and girls being drowned while bathing or boating to escape the heat. Two or three boys in some quarry; three or four young men and women in this inland lake; a half-dozen men and women at that ocean resort; a score in the nearest large river; sometimes hundreds when a river boat turns turtle. I have heard some directors of athletics say that from one-third to one-half of the people in this country do not know how to swim, but I would go further and say that fully 100,000,000 men and women, boys and girls are unable to handle themselves in an ordinary emergency in the water.

Last May, a steamer turned over in the Mississippi River near Memphis, having on board a group of men and women who were attending an engineering convention. Only one man, according to the reports I read, could save his life. A colored man, who happened to be passing in a launch, was a "Johnny-on-the-spot" and saved thirty-three lives. All of those saved acknowledged they could not swim. The drowned totaled twenty-two. The one man who was able to swim the short distance to shore was so completely exhausted as to be unable to tell inquirers of the catastrophe.

Such "accidents" to bathers and boaters have happened, will happen, again and again. There is no use protesting against people who are ignorant of the correct art of swimming, going in or on the water. You simply cannot prevent men and women, boys and girls from going to the nearest bit of water to cool off during warm weather. Then the question naturally arises: "What prevents such a mass of people—the men and women, the boys and girls of this country—from learning to swim?"

And another question:

"Why do so-called good swimmers, expert swimmers, wonderful swimmers, drown?"

And still another question:

"Why does anyone drown?"

Let us consider the last question first. Although I am almost sixty years old, and have made the teaching of swimming a business since 1898—first as an amateur, then as a professional—I have never seen anyone drown. I have seen thousands of men and women, boys and girls, in the act of drowning—but I have never seen anyone drown. Occasionally, I have been brought to the scene of a drowning for the purpose of resuscitating the drowned person but as my arrival might be anywhere from one to two or three hours late, nothing could be done. Yet, the Shafer Method of Resuscitation can be learned in a few minutes! Put into practice immediately, it would quite often mean the saving of a life otherwise lost while the crowd is waiting around for some person to be brought from a distance.

No person ever requires the slightest education on how to drown! One and all, persons in the act of drowning proceed about it in exactly the same manner. And, if you are not careful, when you go to rescue them, they will drown you too.

What drowning persons do:

1. They at once proceed to go from the horizontal or safe position to the vertical or extreme danger position.

2. They lift the top of the head as high out of the water as possible instead of the mouth and nose only.

3. They try to climb out of the water, instead of "grasping at straw" as they are said to do. The climbing out of the water means reaching the arms high in the air which at once submerges the entire body deep in the water. There is really no quicker way of submerging.

4. They holler all the air out of their lungs, which, of course, not only sends them under, but sends them under with empty lungs. Thus, they choke or strangle far more quickly than otherwise. If they went under with their lungs full and let the air out very gradually, as in normal breathing, then bobbed up to the surface on the instant of exhalation they could fill their lungs with air in the fraction of a second.

5. They inhale through the nose instead of through the mouth as

hould always be the case in the water.

6. They will make an up-jerk with h legs, from the hip joint, which con will surely pull them under. A wimmer will always draw his legs very slowly and quietly, and make h jerk on the downward blow. The el on the upward action is fatal.

7. They will always t ggle ridiculously a l. This shakes all h air out of h r clothing. f hey would e quietly in h water h could em a in flat long n gh to be e ued. A man, unex- e edly thrown n salt water, u clothed, could elat on her back and ot until a shark ate her r he was starved to death, as she ld not sink.

8. Without exception, they en- e or to get face down instead of a up.

9. When you dive in after a r ning person, he or she will at n proceed to drown you too, as a r ning person is temporarily in- a . Some years ago, I saw a uni- e ity professor drowning his son h was trying to save him—yet h same father would have given i life for his boy, quite cheerfully, t ny other time.

10. When a non-swimmer is being o ed by a powerful swimmer, while e nay not grasp him or try to drown i rescuer, he will make his task as i icult as possible by bending in- t d of keeping his body straight n flat. I have often towed a dozen n ionless women, each woman hold- n the head of the one in front of her, o g this stunt quite easily. On the t r hand, I have often found great i iculty in towing only one man who w ld insist on crumpling. I would a e to flatten him out forcibly be- o I could tow him ashore. Flatten- n a rescued person is a harder proc- s than towing him.

Now for the second question. P sonally, I have never known of a e ly good swimmer drowning. It is n asy matter for an onlooker to say h drowned person was a wonderful w nmer and really believe what he a s. Some time ago, when I was o ting on a three weeks' campaign t South Bend, a lady came in for e ons.

"My daughter is really a wonderful w nmer," she explained, "and, when I go about with her, I am ashamed to a I cannot swim when I am asked to o a swimming party. Can you e h me to swim? I am quite sure I w never learn."

She was so pleased with her first lesson that she brought her daughter down the following morning when she came for her next lesson. Would I give her daughter some coaching? I found that daughter full of faults, and it takes a long time to overcome a fixed action that is wrong. Before the campaign ended, the mother was a much better swimmer than daughter could hope to be. So you see, it all depends upon how much you know about the art of swimming as to whether some swimmer is expert or wonderful. Such a statement was made by a non-swimmer who had gone canoeing with a friend who could swim. Somehow the canoe had upset; the swimmer started for shore, while the non-swimmer clung to the canoe. He was rescued later but his friend never reached shore.

A class of women practicing the rhythmic breathing drill. Breathing is the most important detail in the correct art of swimming.

To leave the education of children and adults in the art of swimming either to themselves or to amateurs or professionals who are incompetent to teach is a very great mistake. Very often, it is a fatal mistake. Most systems of teaching swimming are wrong: this instructor will start his pupils on the breast stroke; that instructor will use the side stroke. Either method will utterly prevent the pupils from becoming skillful swimmers afterward. Another instructor will commence his pupils on the front crawl stroke, most likely discouraging his adult pupils at the very beginning, because the front crawl is the most difficult stroke in swimming and requires much constant practice for years to reach perfection. Again, the majority of instructors start their pupils in water four or five feet deep when water from one and a half to three feet is sufficient for a giant to learn to swim. Furthermore, they try to teach their pupils to swim—instead of giving them one detail at a time and letting them learn to swim. Each detail should be learned correctly before the entire stroke is attempted. The average girl or woman can acquire the elementary part of swimming, up to and including the back crawl or back racing stroke, in from one day to one week. The time depends upon her ability to learn, suppleness and flexibility, specific gravity, terror of the water. Elementary swimming includes one's own life-saving stroke so that each pupil is drown-proof. The front crawl stroke is learned next.

Architects also discourage swimming for the great mass of people by building unnecessarily deep pools for swimmers and divers. They never design the utility type of pool for instructing beginners. Then, too, swimming pools are placed in cellars with almost no ventilation, generally with insufficient light. No one can blame men and women for being discouraged from even attempting to swim in such an atmosphere.

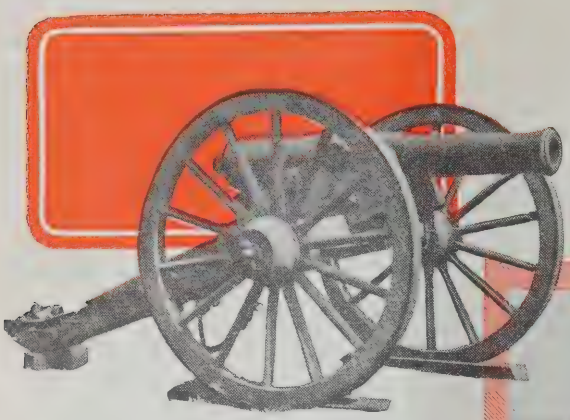
Every grade school in the country should have its swimming pool but boards of education, accustomed to such pools as described above, shrink from building such pools in the schools. But pools in every grade school, say from one and a half to two and a half feet in depth, would enable every child to swim perfectly in a very short time after entering school. Then, after school hours, these pools could be used by adults so that every one would be drown-proof. Such pools are economical to build and to keep running; they are safe and exceedingly effective. The water can be changed every day if desired. In this way, and this way only, will the men and women, boys and girls of this country learn to swim so as to prevent so many unnecessary drownings.

Jumping Balloons

Balloon jumping is the latest sport in Great Britain. A balloon about the size of a small haystack is attached to the wearer who becomes so buoyant that very little exertion will send him many feet into the air, over houses, trees or other obstacles. Care must be taken in jumping, for the merest touch of the foot sends the flier up twice his own height. The balloon folds up into a pack and is easily carried. It is an expensive sport as helium is used in the bags.

It is believed that helium will become cheaper as more advanced methods for rectifying it become known. Then balloon jumping will increase.

These balloons are adjusted to the weight of the wearer and are attached to the chest by means of straps. If it is windy weights of lead are carried so that one shall not jump too far and be carried aloft and out to sea.



"Old Fort Wayne

"Mad Anthony's" Bulwark, Yesterday and Tod

By MYLES DOUGLAS SAVELLE

Left—Old cannon. Above—Openings for cannon and muskets.

MAJ. GEN. ANTHONY WAYNE—sometimes called "Mad Anthony"—left a lasting impression on the Indians in and around what was then called the "County of Wayne" which comprised the present states of Michigan, Wisconsin and the northern parts of Ohio and Indiana. The present Wayne County is small and is mostly noted as the county in which Detroit is located. Detroit, in turn, was noted as one of the most beautiful and cleanest cities in the United States until it became famous over all the world as the Motor City.

In 1701 the Sieur de la Mothe Cadillac founded the trading station on the strait which gives the city its name and he built a fort, called Pontchartrain, to protect the settlers against the Indians. From then on there was constant friction between the Indians and French; the British and French and, finally, in 1812, the British and Americans. Fort Pontchartrain stood where the First National Bank now is and was abandoned when a new fort was built on the site of the post office. When the territory was surrendered to the Americans by the British, old Fort Lernoult stood until the present Fort Wayne was planned. It was later torn down and the post office erected on the spot.

Fort Wayne is located on the strait at a point nearest to Canada and is in the city of Detroit. On the site of the present fort, General Hull camped with his army which was sent to hold Detroit but which he surrendered. It was here also that General Wayne inflicted a crushing defeat on the Indians; a defeat from which they never recovered. It may be truly said of "Mad Anthony" that his madness always had method and that his enemies feared him more when mad than at any other time.

Fort Wayne was also an Indian burying ground. The Indians constructed huge mounds and buried all their dead in one place. There is a story that after the defeat the Indians decided never to use the ground again as it was haunted by bad spirits. The ground was given by the Potawatomie Indians to a Frenchman named Dupernon Baby. As part of the gift Baby agreed that the burial mounds were to be respected and that no planting was to be done on them. This, of course, is tradition as there are no written records to this effect. The land was finally sold to the United States Government for a fort and the present fort was constructed.

In these days of high-priced lumber and construction materials it is hard to believe that the scarp was built of red cedar and the embrasures of heart oak. Later on it was faced with brick and cement.

So much for the dry history of Fort Wayne. There is much tradition surrounding this old fort.

It is said that when the moon shines through the mist the solemn ceremonies of the Indians burying their dead may be seen. The Indians always buried their dead sitting and facing the north, surrounded by food, weapons and their favorite dog, that the trip to the happy hunting grounds might be accomplished. Sometimes in the case of a great chief the horse was also buried with the warrior.

In front of Quarters 13, there is a burial mound which has never been opened by scientists although another one just outside of the fort was opened some years ago.

To one not familiar with the terms of fortifications, such words as scarp, bastion, moat, counter scarp, parados, and the like, would be foreign language. It will suffice to say that the fort was built square and surrounded by a deep moat or ditch. Inside were the quarters for the garrison and the chambers for ammunition and supplies. The old cannons were mounted on a revolving platform on the walls and the openings for riflemen were cut through the walls.

An enemy attempting to capture the old fort would first have to get over the outer wall, then cross the moat and scale the inner walls. For modern warfare it has no value at all, for one well-directed shell would destroy and n it untenable.

During the construction of Wayne, the United States troops housed in Detroit Barracks under command of Lieutenant U. S. Gr Lieutenant Grant afterward wen the Pacific Coast, and he was also famous General and President.

In the days of the horse and bu Fort Wayne was the center of the s life of Detroit. The officers of garrison entertained lavishly for friends in Detroit who in turn d out to the fort for dinners and monies. Many an army wife wa cruited from the ranks of the families in Detroit. They are m old ladies now and their husband colonels and generals.

Times change. What was on marvel of military engineering is a landmark. Instead of being rounded by woods the fort is al lost amid the immense factories manufacturing plants.

The old cannons that so gr manned the walls are now ornam overlooking the parade ground. W battle practice was once held is n playground for the children of the rison. The curious visit the old and are struck with the green gra the bottom of the moats and wo what they were made for. Instea the roar of cannon one hears the c and hum of machinery in the neigh ing factories.

The science of war has progre as well. Instead of pipe-clayed m blue there is the alert, trimly young fellow in olive drab who is b taught to respect himself, his cou and his country's laws. Instea firing a musket at a target fifty y away he is taught how to hit over a mile away. Instead of marc toward the enemy in serried rank

taught to advance by ones and twos, ing advantage of cover and conceal- nt. If the shades of the departed l men can see they must smile to note w modern warfare has adopted the tics of Indian fighting.

Times change indeed. The old gar- on reports show that a corporal won prize of "a turkey and a pint of isky" for making the best score at get shooting. At this time any one nd with a pint of whisky promptly placed in the ardhouse.

Speaking of guardhouses, re is another great change. the old days a soldier com- tting a breach of discipline s placed in a cell in the lls of the old fort. Now man is questioned and his nse is explained to him. If is the first time, he is put probation, the assumption ng that any man will do ht if he realizes the neces- y for so doing. If he is an offender he is placed in the guard- use which is a large barrack building l is required to do extra work in lition to his military duties.

Although arms and equipment nge, certain things remain the same. e morning gun which salutes Old ory as it is hoisted to the top of the gpole is as old as the country itself. e parade at retreat when every one the garrison does honor to the lower- of the flag for the day is a daily les- in patriotism. Even the children ying around stop and stand rigidly attention with their tiny hands sed in salute as the flag is slowly ered while the bugles sound "To Colors."

Changing the guard daily is an- ier ceremony which dates back to crusaders and which always inter- s visitors. The command "Sound " has a significance which the lay- n always questions. Richard the Hearted first started this by re- iring those who had been selected to form a particularly dangerous duty march in front of the army, with gles and drums playing as a mark of nor. To this day those who are mounting guard stand at parade rest while the band marches and counter-marches in their honor.

In the old days at the fort sentries guarded all gates and no one was allowed to enter without permission. Now the visitor is cordially welcomed and the interesting things about the post explained. Old reports dating back sixty years tell that men were issued their rations and required to cook them. The inexperienced man cooked and ate his food at once and had to go hungry the balance of the period. Now the company kitchens and dining rooms are models of efficiency and cleanliness. The company cooks are men who have been especially trained and who are more saving than the average housewife. The menu is varied and tasteful and woe be to the captain who is not personally supervising his company mess.

Top—The saluting cannon on the wall.

Center—Ports for cannon and rifles in the walls.

Bottom—On the walls.

Eventually Fort Wayne will give way to some huge manufacturing plant and the walls will be torn down; the moat will be filled in and the green parade ground will be covered with buildings and tracks, but the spirits of those who lived and died in its walls will linger with those of the Indian warriors who sleep in the great grave facing the north and looking toward Canada.

Fort Wayne typifies our times. A great city has grown where once the red man roamed in the forests. It was built to defend Detroit against the Red Coat. Since then the Red Coat and the Yankee have fought side by side for a common ideal. The city is steadily crowding it and it has lost the original use and purpose, but the ideals which are sheltered beneath its walls will be continued in another Fort Wayne erected to carry on the training of the young American in "Duty, Honor and Country."

"Mad Anthony's" grim relic is not only a striking reminder of the struggle for American domination in the "City of the Straits," but it is a symbol of what our forefathers did to safeguard and consolidate the liberty we now enjoy.

Ministers' Code of Ethics

WHAT is believed to be the first code of ethics for ministers was recently drawn up in New Haven, Connecticut, by the New Haven Association of Congregational Ministers. The code deals with the minister's work, his relation to his parish and to his profession. Among the more outstanding features of the code are the following: He should tell the truth as he sees it and present it tactfully and constructively; he must pay his debts promptly and must not bring reproach on his calling by joining in marriage improper persons.

It is considered unethical for a minister to break his contract made with the church. He should make his service primary and the remuneration secondary. It is unethical for the minister to engage in other lines of remunerative work without the knowledge and consent of the official church board. Confidential statements made to a minister by his parishioners are privileged and should never be divulged without the consent of those making them. It is unethical for a minister to take sides with factions in his parish, to interfere with the parish work of another minister, to make overtures to or consider overtures from a church whose pastor has not yet resigned or to speak ill of the character or work of another minister, especially of his predecessor or successor.

Gold Standard Not a Union Jack

Lloyd George Protests Against Winston Churchill Replacing "Golden Calf"

By MAURICE MANNING

THE leading article in the *Times* "International Banking Section" of its annual "Trade and Engineering Supplement" is on "The Gold Standard: What it Means to the Nations," by Professor Edwin Cannan.

Gospel of Gold According to Edwin Cannan

I have known and read the arguments of all sorts of "currency cranks" —and conditions in the United States during the past half-century have encouraged the evolution of many varieties of the genus—but I have seldom read an argument so characterized by ignorance of the very fundamentals of the science of money and exchange as this by the eminent defender of things as they are. He seems deaf, dumb and blind to the refutation of his arguments by the invincible logic of cold facts when he comes to urge that the gold basis means stability of prices and a bulwark against inflation of the currency, as against the advantages of a properly managed and regulated currency controlled by the government. That gold basis or no gold basis, currency issues must be controlled by some one and that the some one should be a responsible government rather than a bank not responsible to the public or the government, Professor Cannan utterly fails to see. In fact, he distrusts popular government to such an extent that he advances as a clinching argument in favor of the gold basis that: "Experience shows that the general tendency of nationally managed currencies is toward over-issue and consequent depreciation at various rates, mostly rapid."

The same number of the *Times* annual contains a suggestive resumé and review of the first volume of the Senate Committee's report on European Currency and Finance, edited by John Parke Young, Ph.D., and which is boomed as containing an exhaustive survey of monetary problems and "a very lucid exposition of the case for the gold standard." Here again we find the assumption that the gold standard is inevitable, the only sure and sound basis for money. There are, however, some damaging admissions concerning the fitness of gold to serve as a basis for a stable currency. The value of the metal, even on a market in which it is given privilege and favor by such government action as surrenders to it the monopoly advantage of serving as reserve for currency issues at a government fixed price, is subject to frequent fluctuation. The Senate Committee's reporter tells us:

"The present purchasing power of gold is about 35 per cent below the 1913 level, and about 25 per cent below the average for the years 1788 to 1913 . . . Conditions, especially with respect to the demand for gold, have so changed that predictions as to the future value of gold are hazardous."

Comparison of this U. S. Senate Report with Mr. Churchill's references to the gold basis creates an impression that he must have had the report before him when he prepared his speech. Note this from the Report: "When the gold standard is reintroduced, European countries will doubtless economize in the use of gold and manage with as little as possible, since they need many things in addition to gold. The redemption of paper money in gold and the circulation of the metal in coinage will probably be discouraged as far as possible."

A Delusion Locked in Bank Vaults

In plain English, the new style "gold basis" is to mean the complete dependence on a paper circulating medium not really redeemable in gold. The pretense is that a reserve of the metal locked up in bank vaults gives to paper currency some mysterious element of real value, soundness and stability that is lacking in a paper currency backed by the credit of the nation! The farce is especially stupid in a country like Britain or the United States whose financial faith and resources are unquestioned, which is collecting a surplus revenue and paying its debts dollar for dollar and on the dot and yet is able to float loans at a premium.

Prominence is given to the fact that this Senate document advocates an international monetary conference to be held at an early date. Such a conference, it is suggested, would do much to bring about common action in the matter of the general adoption of the gold basis and the bringing about of "uniformity of different currency units." The fact that most European currency systems are in a state of flux is deemed to "offer a better occasion for currency unification than has probably ever before occurred."

International conferences of this sort are a favorite scheme of the International Jewish money-changers. They are a convenient device for investing schemes of spoliation determined in secret with a show of publicity and open consultation.

Much light is shed on the whole situation by a news dispatch from Geneva announcing that the Swiss Government, following England's example, intends shortly to adopt the gold standard *for international trade* the present prohibition of gold export being lifted, *but the circulation of gol coins in Switzerland not being allowe* And it is added "the pound sterling i now above par in Geneva and the pape Swiss franc has for some time been at premium over gold."

In a dispatch from Cape Town South Africa, further enlightenment a to the true inwardness of the presen situation is conveyed. The Currenc Commissioners are reported as recom mending a return to the gold standard but it is pointed out *this does not mea that bullion will be converted into sover eigns* at the Pretoria Mint. "So far a the mines are concerned," we are told "it is a fact that the premium on gold i now so low that it would be mor profitable to turn the bullion into coi at the Mint than to ship the gold i bars to London, if it could be done. Th deciding factor will be the *cost* of export taking the exchange into account At the end of January, the premiur was two shillings an ounce."

Obviously, the return to the gol standard simply means an increase i the purchasing power of gold and so c its commodity value on the market The manipulations arranged in Wash ington recently between the Governo of the Bank of England and the Pres dent of the Federal Reserve Ban means a substantial increase in th market value of gold in all the world markets, *to the immense profit of th owners of the metal*, to wit, th Rothschilds and their allies and con nections. The sedulously promote and disseminated opinion that th change means an appreciation i the value of the British Treasur Notes—now to be merged in Bank c England note issues *not* under the con trol of the British Government but c the Bank—is a mistaken notion. In short time, this will be made plain t the simplest con

The Hypnotic Spell That Holds British Politicians

sumer in the experi ence of rising price measured in th new currency.

Altogether the psychological mo ment seems near—if it has not alread arrived—when intelligent people every where will recognize the fallacy that restoration of the world's trade t normal conditions, and of improve conditions all 'round, will follow return to gold. The pretense is wearin so thin that people on either side of th Atlantic must surely see through it and seeing through it, riddle it thoroughly

There are encouraging signs of breaking of the hypnotic spell tha has so long held Britain's politica leaders in thrall in the course of th debates in the House of Commons o

Churchill's Budget, several utter-
es show a shifting of the wind of
ion concerning the gold basis.
rd George, who as Chancellor of the
hequer at the outbreak of the war
nished Europe, and especially Lom-
l Street, by the genius he displayed
national finance, had this to say a
days ago:

"I am not one of the wor-
hipers of the golden calf. I do
ot believe in an ideal that does
ot see you through your
roubles. In the war, its altars
vere deserted and the image
vas locked up. Now Mr.
Winston Churchill has come and
pened the cupboard with an
merican key. He has polished
t up with his burnishing rhetoric.
Ie has replaced it on its pedestal,
nd when they heard of it in
he Valhalla of Wall Street they
tarted twanging their golden
arps for joy. It is undoubtedly
omething of a gamble and those
vho are engaged most deeply in
British industry are those who
re least happy about it."

Mr. Philip Snowden, Mr. Churchill's
ediate predecessor as Chancellor
ne Exchequer, based his objection
he return to the gold standard on
precipitancy" and showed anything
a deep appreciation of what the
n really involves. Yet he had this
y:

"Immediately on the issue
f the report of the Cunliffe
Committee (the first open step
owards resumption of the gold
asis), the Government and the
Bank of England began a policy
f very rapid deflation, a policy
vhich has had serious conse-
uences. It has ruined thou-
ands of business men; it has
reatly enriched those who are
olders of fixed interest-bearing
ecurities; and it has been largely
esponsible for the great trade de-
ression and widespread unem-
loyment during the last three or
our years. The precipitate re-
urn to the gold standard may
ave similar consequences."

Of course, everyone who knows any-
ig about the money question knows
a drastic contraction of the money supply was a necessary and logical preliminary to Britain's restoration of the gold standard.

Another Pungent Protest Against Gold Myth

Much more pointed was the protest
ed by another Socialist, Mr. Wall-
d, the member for Merthyr.

'It was a curious thing," he said, 'that while deflation had been going on the shares of the Bank of England had been going up in value by £90 per share, and the values of the shares of the 'Big Five' joint-stock banks had advanced in proportion. While bankruptcy was facing thousands of traders and unemployment had knocked at the doors of millions of workers, the bankers had reaped a richer harvest than ever before, and had tried to cover up their profits by putting up palatial buildings."

This last was a hit at the fact that several of the big banks (like the Federal Reserve in the United States) are not only putting up magnificent main building offices in the City (where land is valued at anywhere from a million to five million dollars an acre), but that even the new branch bank buildings in small suburbs are on a scale of magnificent costliness. Each of the "Big Five" banks has more than 100 branches within the limits of the London district alone, and in England as a whole they have an aggregate of more than 5,000 branches.

The "Gold Standard Bill" passed its third reading after two brief and inconclusive debates. The outstanding feature of these discussions, with the exception of some expressions of vague uneasiness as already noted, was that Britain's legislators simply accepted what the bankers and "financiers" told them to accept. The general note was a weak confession that the members who voted for the bill were unable to penetrate "the intricacies of finance." They left it to the experts, assuming that the experts knew and recognizing their own ignorance of the subject. Mr. Churchill's own attitude is proof of this. So afraid was he of the British gold supply being raided that he felt obliged to make the remarkably unusual arrangements for its protection thus described:

Concerning Credits and Some Creditors

"Two credits have been provisionally negotiated: one with the Federal Reserve Bank of New York, who had undertaken to give the Bank of England a revolving credit of $200,000,000 for two years; the second was with Messrs. J. P. Morgan & Co., and was for $100,000,000 for a similar period."

Concerning this "revolving credit" certain facts have come to light as to the terms on which it was arranged, facts that are subjecting Mr. Churchill to considerable added criticism. It appears that the British Exchequer has agreed to pay Messrs. J. P. Morgan & Co., at the rate of 1¼ per cent, or £250,000, whether the credit is called on or not. In the second year, the payment will be at one-half this rate—that is £125,000—if the credit is *not used*, but at the full rate of £250,000 if it is used, so that the total liability of the British taxpayer is half a million pounds sterling. It is pointed out that this is an excessive interest rate, even if the credit were certain to be used, as any good merchant house in Britain at today's rates can get dollar credits in New York at ¼ per cent for three months' bills, which is equivalent to one per cent per annum.

By this bargain the Government, with the vast resources of the British Empire behind it, are to pay a larger commission by ¼ per cent than would be charged to any sound private firm in Britain. Indeed, it is likely that the big banking and acceptance houses in London would have been glad to have negotiated the transaction with their New York agents at one-half the price to be paid by the British Government, so that, through what is described as "Mr. Churchill's blunder," fully £250,000 of the taxpayers' money is being wasted!

Purchasing Power Is Quite Different Now

William C. Owen, an able financial authority, makes a bold and serious charge against the wranglers of the gold basis scheme in this connection. On March 31, 1914, that is just before the war, he says, the British National Debt stood at £661,473,765. On March 31 of this year the debt amounted to £7,646,394,000. The greater part of this enormous increase of nearly seven billion pounds (about 35 billion dollars) is for advances made to Britain by the Gold Clique when the nation was in the throes of a life and death struggle.

These advances were made *when the purchasing power of the pound sterling was only from eleven to thirteen shillings*, or say *little more than one-half of the present purchasing power of the paper pound* exchangeable for gold. Since then the efforts of the International Bankers have been concentrated on bringing back the pound to its twenty-shilling value, thus almost *doubling the burden of Britain's debt* and putting an extra rake-off of one billion dollars in the coffers of the international usurers!

Deflation is in the interest of the bond-holders; every penny of this enormous increase must be paid by the workers who are the wealth-producers.

The British national wealth at the beginning of 1920 was equivalent to thirty billion pounds and the national *debt* in round figures to seven-and-a-half billion pounds, or one-quarter of the national wealth. The doubling of the value of the pound since that date, *in order to reach the gold standard*, has practically doubled the already staggering burden of Britain's national debt. Measured by the gold standard, Britain's national wealth now amounts to roughly fifteen billion pounds, so that one net result of the return to the gold basis is the raising of the national debt from one-quarter to one-half the total of the national wealth! Incidentally, it has doubled the burden of the annual interest charge which the taxpayer has to shoulder. It has wrecked hundreds of British industries, stagnated trade, bankrupted thousands and perpetuated the era of unemployment.

Even with the Gold Basis bill a law, the financial writers in the daily papers unconsciously reflect the fact that the metal has come to be regarded not as money but as a commodity.

A Rare Book Now

New England Primer of Pre-Independence Days

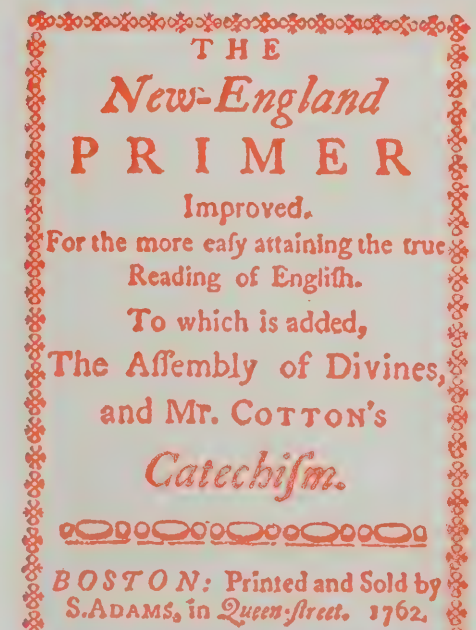
By LOUIS C. KARPINSKI

THE most widely used books of one age are by the irony of fate the great rarities of a later age. The very popularity of a work contributed to its being destroyed by use. With primers and horn books, the insignificance of the work, also, invited destruction when the book was slightly torn or mutilated. The large and magnificent specimens of early printing, like the Gutenberg Bible, even though printed in small editions, are more frequently found in printers' advertisements, than many earlier but more insignificant works. No book in early America was more frequently printed than the New England Primer. At a rough estimate two million copies were produced during the seventeenth and eighteenth centuries in America, yet of the seventeenth-century editions not a single copy survives and of the eighteenth century approximately 200 copies, some mutilated.

Books with the A B C's, with the Lord's Prayer or Pater Noster, with the Creed, and with prayers appeared almost with the invention of printing and were used for the instruction of the people by the clergy. In English Henry the Eighth permitted the publication in 1534 of a little book, "A Prymer in Englyshe with certeyne prayers and goodly meditations, very necessary for all people that understonde not the Latyne tongue." This was later replaced by the so-called "Royal Primer, Or, an easy and pleasant Guide to the Art of Reading, Authorized by His Majesty, King George II."

Henry the Eighth was animated by enmity toward the Catholic Church in the publication of the Primer. The religious quarrels in England occasioned numerous other works of that kind, with doctrines adapted to the views of the party in power, for more than a century.

Toward the year 1680 Benjamin Harris published in England, "The Protestant Tutor," said not to have been relished "by the Popish Party, because it is the design of that little Book to bring up Children in an Aversion to Popery." In 1686 Harris left England and sought new fields of endeavor in New England, having a "Coffee, Tee and Chucaletto Shop" in Boston, combined with a publishing house. This was not an infrequent combination in Colonial America. Some time before 1691 Harris published his New England Primer, an advertisement of which is found in an Almanac of 1691, "News from the Stars," printed by R. Pierce for Benjamin Harris at the London Coffee House in Boston, 1691." This advertisement does, in fact, refer to a "Second Impression of the New England Primer, Enlarged,



THE
New-England
PRIMER
Improved.
For the more eaſy attaining the true Reading of Engliſh.
To which is added,
The Aſſembly of Divines, and Mr. COTTON's Catechiſm.

Recently I
Worthington C. F
found in the Stat
er's Register, the list of books as prin
in England, under 1683, the annou
ment of a New England Primer p
lished by John Gain. This disturb
item possibly upsets the theory
vanced very ably by Dr. Ford's brot
Paul Leicester Ford, that the
issue of the Almanac appeared in N
England after the arrival of Benja
Harris in 1686.

The most comprehensive acco
of the New England Primer is fo
in the history of the modest li
book written by Paul Leice
Ford. This is supplemented by
fine bibliographical account of kn
copies, made by Charles Heartm
of Metuchen, New Jersey, giv
the location of two hundred copies.

Harris published Protestant d
ments during Catholic times in Engl
and in 1681 was hailed before an
friendly court, fined 500 pounds,
placed in the pillory. This unplea
experience directed the thoughts
Harris to America. It is quite possi
as Heartman suggests, that John C
was none other than Harris and it
be that the New England Primer
first printed in old England wit
view to subsequent sale in America.

The alphabet verses are presuma
the work of Harris. During the cours
time various changes were made in
verses. A pious printer, one could
say *poet*, changed:

"Thy Life to Mend
This Book attend,"
to
"Heaven to find,
The Bible Mind"

and similar changes in numerous ver
In particular after 1775 Ameri

Kings as good, and substituted
publican sentiments.

How Modern Monopoly Works Out

(*Continued from page 5*)

e will no longer buy at any price. here a price for a new plant is too gh, he refuses to haggle, but brings o play the enormous financial back- g and underselling power of his com- ie to force the owner of the plant o ruin or submission. He moves rough the sea of competition like a nking submarine, sinking his com- titors without a trace. But he does t sink the towering accumulations of pital and costs, which mount with ch competitor destroyed.

These accumulations have now ought him into closer and closer ntact with what the economists call e "Law of Diminishing Returns." everyday English, the point of iminishing returns" is the point at ich the consumer begins to rebel, accept substitutes or do without. is the point at which an artificial mbine begins to stumble under a ight so excessive that even its nopoly power cannot bring it more pporting income. It is the point at ich the bankers become pessimistic and balky.

He Now Borrows From the Public

The commander-in-chief, approaching the height of his power, finds himself approaching also a precipice. The nkers will lend him no more money. e prospect of the next dead market es him nightmares. *Since the bankers ll not lend, he decides to borrow from public through a great bond issue.*

For this purpose he enters Wall eet. He enters it, a monarch now, t not a Caesar with his legions intact. is, rather, a Damocles with a sword er his head that hangs by a thread. r the sale of his bonds he delivers nself over to a syndicate of so-called nkers who are in reality more pawn- kers than bankers. The syndicate dertakes and guarantees the sale of e bonds with a proviso for a sub- ntial "bonus" to itself. This bonus, ether paid in bonds or cash by the mbine, or in added cost to the pur- asers of the bonds, means more in- ltion, more investment in artificiality hout return in actual industrial eration.

The commander-in-chief moves on. s combine is colossal, but it carries a usand items which a single business uit, built out of honest competitive fits, would never need to carry. e economies of its mass production d mass distribution are less and less mpetent to offset the mass of its ess investment and mounting over- ad. It now controls, let us say, fty per cent of the business of the ntry, and the commander-in-chief cides that this is enough. He is ser and more modern than Thales. wishes to avoid a complete monopoly f several reasons. For one thing, there is a public prejudice and a Sherman Law against it. He finds it necessary in many ways to have a number of small pseudo-competitors in the field. These little fellows are all disciplined and harness-broke; they will follow his prices because they know he can always undersell them in a pinch (by taking losses). He lets them live, if they can, in those periods of dead markets which he has come so to dread because he fears public opinion should he become a 100% monopoly. In other periods of active consumption and high prices he can bring his excess capacity into play at any time and take all the business he wants from his pigmy competitors. In order, however, to have a clear, if silent, understanding with these "competitors" regarding the minimum price by which they are all to be bound, he fixes on a system of selling his goods at what is called a "delivered price," which means a price at his principal plant plus freight to the point of delivery. This pricing method,

Meanwhile the policy which has determined our commander-in-chief to limit his control of business to fifty per cent does not prevent his expansion into related and auxiliary lines. He has abandoned further horizontal development, but he now goes in for perpendicular development. This perpendicular development, which the economists call "integration," means the acquisition of power and importance in the production of the raw materials of his business, and in the distribution and retailing facilities for his finished products. The combine becomes self-sufficient, controlling its own raw materials and carrying its own finished products to the consumer's very doorstep.

Stabilization Becomes a Fetish

The commander-in-chief moves on. But there moves also, closer and darker, the deadly Law of Diminishing Returns. The day of the next dead market may be the day of doom for the combine. The commander begins frantic and even fantastic efforts to "stabilize" prices against the recurring business cycles that may one day turn him to economic perdition. He comes to emphasize the word "stabilization," to love it, to make it a part of his business faith. To accomplish it he uses his monopoly once more to put into effect two utterly artificial devices—resale price maintenance and the "guaranty against decline in price." The "guaranty against decline" means that, to maintain both his distribution and his price, he agrees to reimburse his jobbers or distributors for any losses resulting from a decline in his own factory price subsequent to their purchase of goods from him at the higher price. Of course he has no intention of lowering his own factory price unless he is forced to do so, and he hopes by this guaranty to maintain, at no cost to himself, the price discipline of his distributors. This is the device he uses to reassure those of his distributors who are dutiful but nervous. For those who may be rebellious or over-independent, he uses the other device, "the resale price maintenance" contract. This is a contract whereby, under threat of having their source of supply cut off, jobbers and distributors agree not to sell goods below a certain price stipulated by the combine.

When the Kick Comes From the Consumer

The "competitors" of the combine, of course, follow suit with guaranties and resale contracts of their own. The eventual result is a play into the very hands of the on-creeping Law of Diminishing Returns. Distributors, assured against loss on their purchases from the combine or its "competitors," buy recklessly. For them it is a "heads-I-win-tails-you-lose" proposition. As their stocks increase they force their goods on the consumer through all sorts of methods (except the one forbidden method of cut prices). The combine assists them by a national advertising campaign with added millions of dollars spent to hypnotize the consumer into buying more than he needs or can afford.

It needs no imagination to guess the final result. The point of diminishing returns, which is really the point beyond which the public refuses any further "forcible feeding," is at last reached. The buyers strike. Purchasing demand on the part of the consuming public fades to the vanishing point almost overnight. (This is exactly what actually occurred in the spring of 1920 when, after a protracted period of rising prices, demand fell off so abruptly that the whole price structure of the country collapsed and a near-panic ensued.)

It is the twilight of the gods. The voice of the people has sounded at last, as it will always sound in the end. The commander has come to his Waterloo. His distributors, who have placed large orders with him, ruthlessly break their contracts. Those whom he has guaranteed against price decline hover near him waiting for the break in his own price to claim their guaranty. If he does not lower his price he can sell no more and must carry an enormous inventory and overhead at a continuous loss. Bankers, scared out of their boots, refuse further loans and begin calling the loans outstanding. The great combine which has for so long forced the consumer to maintain it in artificial splendor must now shoulder the whole brunt of the consumers' strike.

There is only one thing to do—surrender and a plea (*Concluded on page 30*)

Oarsmen and the "Conibear" Stroke

College Coach's Discovery Which Led to the Winning of Many a Water Derby

By WM. A. SIMONDS

SOME call it the "Leader" stroke; others the "Washington" stroke; but out around Puget Sound waters, where it first originated, they call it the "Conibear" stroke.

Coach Hiram B. Conibear is now dead. Were he alive today, he would be just as much surprised as anyone to find that his pupils were making rowing history all over the world. With Yale under Ed Leader winning last year's Olympic finals and humbling Harvard; with Washington, Conibear's old school, winning the Poughkeepsie classic twice in succession; and with such institutions as Harvard, California, and others seeking Conibear graduates for rowing coaches, old "Conny" would suddenly find himself more famous than he had ever dreamed during his lifetime.

Circle—Coach Hiram B. Conibear. Left—Coach Ed Leader, of Yale, whose crews have yet to meet their first defeat. Right—Ky Ebright, of California, another Conibear oarsman now head coach at Berkeley. Below—"Rusty" Callow, coach at Washington, whose crews have won two Poughkeepsie championships in succession.

Of course, all of the credit for the phenomenal records these pupils have been making is not due to the old instructor or his stroke. The pupils themselves, Leader, Callow, Sam Shaw, Ky Ebright, Spuhn and Grant, have far surpassed their mentor. Fame such as the veteran coach never knew has come to them. But his memory still lingers and occasionally one of them pays tribute to the man who developed rowing at the University of Washington.

Conibear was not, strictly speaking, a crew man. But he was a developer and conditioner of athletes; he had had much experience as trainer in professional baseball; and his stroke which he taught the men left them at the finish of the gruelling four-mile race in perfect physical condition instead of exhausted.

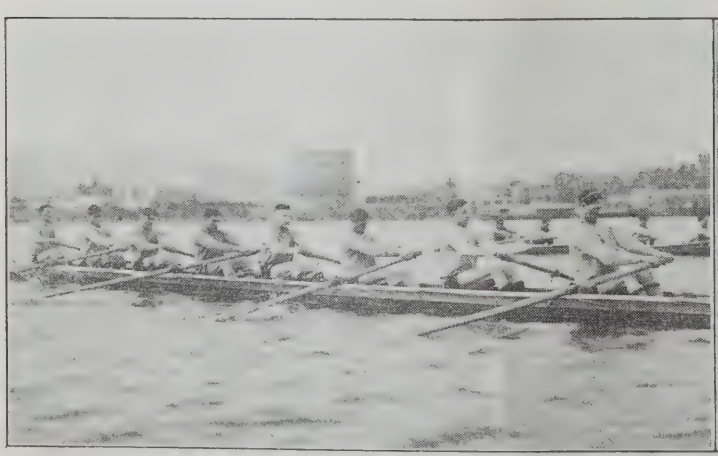
Things were not any too rosy for "Conny" at the Northwest University. In those days, particularly from 1908 to 1912, money was not plentiful and rowing did not supply funds for the athletic exchequer as did football. Consequently equipment was hard to obtain. A barge was pressed into service and christened *Old Nero* probably because it reminded the students of the ancient Roman galleys where slaves strenuously worked at the oars.

From *Old Nero* the successful crewmen graduated to the racing shells. Here they were taught to take full advantage of the long sweep which their oars had. Instead of pulling back the oar-handle as far as it would go, while they leaned back on their sliding seats and exhausted every ounce of energy they allowed a brief interval during which the shell glided along over the water between strokes. The momentum of the previous stroke was used to gain another yard or two, while the oars were swung back into position. With a readier recovery and reserve supply of energy, all they required was finish and polish to take their places among the great crewmen of all times.

The finishing touches have been added by the pupils. In 1924 the Yale crew under Coach Leader was kept in perfect condition for a month longer than any college crew has ever been kept, broke the Olympic record, and rowed four different distances, 1½ miles, 2 miles, 3 miles, and 4 miles.

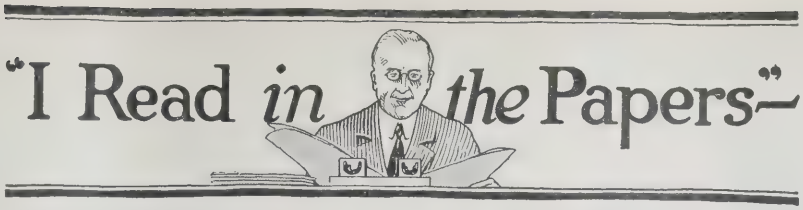
In 1923 the Washington crew, hitherto a contender at Poughkeepsie, swept over the Hudson course a winner over the élite of the East. In 1924 under Coach "Rusty" Callow, the tall westerners duplicated the feat. During those same years Washington did not know a defeat on the water. This spring the purple and gold oarsmen began their third year of triumph by setting a new record on the Oakland Estuary against California.

There are doubtless many more victories in store for the "Conibear" stroke.



This year's Cup Defenders—1925 Washington crew preparing for Poughkeepsie regatta.

Winner of 1924 race at Poughkeepsie. Washington crew coached by "Rusty" Callow. Don Grant, diminutive coxswain, is now on the Yale coaching staff.



ad in the papers t Dayton, Tenee, of Evolution e, owes its origin to Fiji Islanders. W. Gardenhire brought n to the United es, toured the coun- with the islanders reaped a small fortune. He later osed of them to P. T. Barnum and rned to the community of his youth. Mr. Gardenhire conceived the idea vesting the money he got from his oits with the Fiji Islanders in the truction of a town. He selected ton as the site and acquired 234 s in 1879. Many of the houses been constructed when the first passed through en route to ttanooga in 1880. Then he had town made a county seat, which ared it for its present fame. lation, 2,200.

I read in the papers that radio broadcasting in England has attained the dignity of an art, probably because a paid service is given. For example: the nightingales of the woods have been surrounded with microphones and their sweet songs sent all over Great Britain. It is as if the mocking bird of our South were enabled to sing for the delectation of Northerners on cold winter nights. The boom of Big Ben's bell has been sent broadcast, as has been the roar of the sea at Plymouth. Cornishmen are asking that the street sounds of London, the bustle of the Strand, the traffic of Piccadilly, be sent them in their distant retreats. Truly, radio has marvelous unifying possibilities. The time may come when perfumes may be wafted abroad or even weather transferred. For we are still in the beginnings of things.

I read in the papers that the airplane has been used as a hearse. Whether or not the following is the account of the first aerial funeral ever held, I do not know, but early in June a British officer was killed in action at the Azmir Pass near Suleimanie, in Iraq. His body was conveyed by airplane to Bagdad for a military funeral. There is nothing strange in the idea of using an airplane for such purposes, and we may yet see it become common, avoiding the long and sorrowful journeys often made by rail for purposes of burial in home plots.

Tea and Talk With H. G. Wells

(*Concluded from page 2*)

ld like to go round the world."

Why not do so? Gloomy pessi-," said I, and we laughed like -year-olds, "and don't be so lly serious. Tell me; don't you re-read one of your books?"

No. Yes. I had to do so for the cted edition. It was most dising. I felt that I had missed so y opportunities; wasted my youth. ht have done so much better. As a er of fact, I'm least dissatisfied t 'The Undying Fire'; I think it's got most finished shape of anything I've . Of course, nobody else thinks so."

How many plays have you en?"

None."

None?"

Well, nearly none. Never rd play. Chesterton and ll write, or rather put toer, some funny little as for a children's toy ter; tremendous fun! In of them we had Bumble character; he was cut nd popped into a cauldo. But that wasn't the end lm; he popped out again, e, alive and kicking. You n kill Bumble."

And, confess; you are a e?"

I am—not. O, well, I once write a poem; eight lines."

Hurray! Hand it over at once!"

I will not. And I won't tell you e you can find it."

appealed again for help to Mrs. es, but she simply said, "He's coy."

He doesn't look it," said I. "I ve it was an impassioned love net addressed—*not* to you, Mrs. es. You should look into this."

he first, last, lost and only poem te Famous H. G. Wells! Now then, ye lovers of literary treasure-trove, rise up and hunt. The only clue I can give you is that it appeared anonymously.

At last I was able to nail him down to momentous matters.

"You were at the Washington Conference in 1920, weren't you? What do you feel about the chance of a really permanent world peace?"

"I'm not very hopeful; at least I'm sure it won't come immediately. The League of Nations seems to lack a sense of proportions, of scale; their task is bigger than their vision. They don't seem to be able to break away from the old ways. It is the work of the Secretariat at Geneva that is most hopeful. Most promising. They do seem to be thinking out the old problems in new terms. Many of the members are able civil servants, from various countries; they are coming together finely; working together for a common end."

View of H. G. Wells' London home.

"Don't you think that France is a storm center?"

"Well, no. I've been a lot in France lately; am going back there in a few days. There's a change working there, I think. France is much more reasonable in substance than she seems to be on the surface. Less importance is now attached to nationalism. The press there is much more open-minded than it used to be. At the back of all there is the terror of another invasion. To us, and still more perhaps to Americans, the desire for security seems to be almost a mania. We don't know what invasion means."

After some minor matters, we turned to literature.

"What about modern fiction?" I asked him.

"There's much very good stuff being written, very good indeed some of it. There's a lot of fine fiction coming from America too."

Finally—in answer to a query of mine—

"I don't know that I've any particular form of amusement. Walking, and talking, yes, talking—"

"And—" I added, "kicking out impertinent fellows like me."

So I thereupon rose to depart. In the next room I noticed a formidable pile of proofs upon a table.

"What's that?" I inquired, "something new for us?"

"No. They are the proofs of a new issue of my 'Outline of History'; it's coming out in parts again. When I first wrote it the shadow of the War still darkened everything; made material things seem to be the only real things. Now I find I can add what then felt a bit out of touch with the sternness of life; almost unreal. I am putting in something about the beginnings and the growth of art, music, literature."

And so, away. Pleased and having profited.

Certainly I have found the world a place of more wholesome activities than my friend the sex-novelist seems to find it.

"Sex-O-Clock"

(*Concluded from page 3*)

with other creators of character? How was it with a Hawthorne, a Thackeray, a Dreiser, a Fielding, a Sterne, a Twain, an Austen? You may see for yourself that by no process of psychoanalysis could Thackeray have made a Becky Sharp. She, indeed, stands revealed to us as a living character by her acts. Or take Huck Finn. Mark Twain could no more have created him otherwise than by observing the outward boy, active and careless, than could have Robert Burns after seeing a dissected daisy have written that

Wee, modest, crimson-tipped flow'r
Thou's met me in an evil hour;
For I maun crush amang the stoure
Thy slender stem;
To spare thee now is past my pow'r
Thou bonnie gem.

Deeds, acts, these are in the long run significant index of the man. So by their deeds and their acts you know Hawthorne's Judge Pynchon, Zenobia, Hilda, Priscilla. So also you know Pickwick and you know Mickawber. So you know Natty Bumpo, Cowperwood, Major Pendennis, Beatrice Esmond, Mrs. Proudie, Tom Jones, Robinson Crusoe, the Shandy Brothers, Corporal Trim, Falstaff, Parson Adams, Juliet. You know them as persons of individuality and autonomy, as real types with lives of their own, acting according to their natures. Their conversations are characteristic, their prejudices, their ambitions, the manner of their minds are quite evident to us. And with the characters given action results from the collision of character upon character. You see them wavering in storms of uncertainty, each according to his nature, just as you see people in the world about you. But they do not run around on a subhuman plane. If you met them in the flesh you would know how to conduct yourself in their company with some hope of avoiding friction. You would, with excellent reason, expect Robinson Crusoe to struggle on in feebleness rather than to collapse in despair. You would not expect to find Falstaff self-conscious and self-absorbed. You would not look upon Tom Jones as one likely to luxuriate in sorrow. Each and every one of those named would stand forth clean cut and sharp edged, playing the game of life eagerly. But you never could know what an Alvina would do next because, dominated by the sex-theory, her creator lost his contact with human beings about him. And what ailed D. H. Lawrence ails all those running on the same scent.

Broadly speaking, that fictional literature which has achieved immortality has been that which was a faithful reflection of the contemporary world. If the sex-o-clock novelist pictures the contemporary world, then all's well. Perhaps it would be better to say that if he does, all's far from well. Certainly I have found the world a place of more wholesome activities than my friend the sex-novelist seems to find it. Something alert, vivid, exciting, seems to me to be going forward all the time and I can find in me no sympathy with those who, lusting for a piece of cake that they cannot have, wrap themselves in self pity and wail that they can never be happy again. For that appears to be something like the theme of the sex-novel.

As for the effect of the psy analyst theory upon style and manner of presentation, that ca dismissed in a few words, plain w and simple, as easily to be unders by ordinary men as the multiplica table. There is no need for myst no need for long words. As you see, the psychoanalyst novelist n above all things, give prime atte to the first thought that leaps t mind. Nothing, positively not must be allowed to interfere with direct impulse. Second thoughts not best. Down on paper the must go, whatever it is. Sha repolishing, rearranging would be tortion, distortion of the pre primal thing proceeding from his i consciousness. Not for him that w ing over of experience which Hawthorne to produce exquisite li ture in the Blithedale Romance; him none of that finished expre characteristic of Washington Ir for him none of that delicate and theatrical pathos of George found by common men in the fortunes of the Rev. Amos Ba certainly none of that quiet and ostentatious perfection of finish t found in the work of Walter P Certainly not. What he seek original crudeness, the cruder better. If there is incompleteness, and good. If because of all digging into the depths, the worl comes a place of gloom where m cholia is the normal mood, also and good. And if you tell him, psychoanalytic novelist, that t are honest cakes and ale in the w if you tell him that there is somet

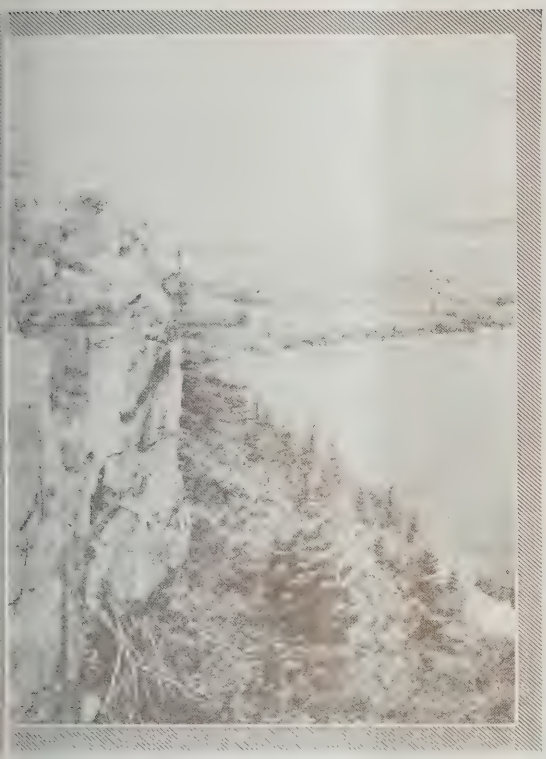
Down on paper the idea must go—nothing must be allowed to interfere with the direct impulse.

of dignity in the expression of h vague aspirations of man, he will be very apt to look upon you as a which is a little disconcerting. it is better to be looked upon as a than to be one.

Devils Lake Reveals Story of Ages

A Region Which Was Once in the Ocean Bed Is Now a Park

By FRED L. HOLMES



Inspect Point is more than 1,400 feet above the sea level and gives view of countryside.

DEVILS Lake is a peculiar name. It is a region in Central Wisconsin that reveals the geological story of the ages.

Perhaps it was the weirdness of the il and haunting scenery about the ey which caused the Indians, who abited the country centuries ago, to e it the evil appellation. Maybe it the craggy alpine cliffs that caused first traders to continue the tradi-n. But there is neither evil in the e nor in the scenery. There is bi-re picturesqueness. For a quarter a century it has been visited by ntists from all over the world, who il here in a single column the story of centuries that have passed.

In other places will be found records eological history. A mountain peak l tell one story, a pile of rocks an-er. The complete history is recorded a pocket edition at Devils Lake. ientists claim there is more geology hin a circle of ten miles there than rwhere in North America.

Over the face of dark heavy boulders y read the story of ages as if it were t yesterday. They need no keystone m the Egyptian lands. Nature has tten the tome in her own language l in her own inimitable way. This eion was one of the first places on the rth American continent to poke its e above the watery deep.

There are other lakes in Wisconsin re beautiful than this blue-glacial eyelet surrounded by towering pinnacles and ragged rock scenery. There are none that can surpass it for the geological history which it has been unfolding through eons of time. Surrounding it are hillsides shattered into hundreds of craggy fantastic shapes.

"I know of no other region of the state which illustrates so many principles of the science of geology," declared the late Charles R. Van Hise, a distinguished geologist and for many years president of the University of Wisconsin. Geology classes from the Universities of Wisconsin and Chicago have been making trips to this spot for a quarter of a century. By students it is looked upon as one of the geological wonders of the world."

Ages ago—who shall say how long—this region was a carpet of the ocean. Twice it has been deluged into the ocean or sea and again has risen. This is the story as told by geologists to whom generations of time are but ticks of a second. In the millions of splintered rocks, towering pillars and bold outcroppings more than 500 feet above the lake on either the east or west banks is written a pageant of history which the modern-day geologists can interpret.

As this story is revealed the Archean rocks lay possibly fifty millions of years ago at the bottom of a sea. Sand came shifting over its surfaces, which at a later time changed into sandstone and at a still later time into the hard quartzite which now forms the ragged sharp-edged cliffs of the bluffs on either side of the quiet, wind-protected lake.

Then some vast commotion shook the foundations of the sea. When peace was restored bleak mountains stood above the surrounding country rivaling the Alps for their majestic sublimity. The great beds of limestone and igneous rocks were folded into twists and layers and inclined about fifteen degrees as shown along the bluffs at the east side of the lakeshore.

"The Baraboo bluffs are among the oldest-formed things on the globe," declares H. E. Cole, the historian of this region, "older than the Rockies or Alleghenies, older than a pound of coal in the earth, older than any bird or beast that has ever lived."

From somewhere came a mighty river, eroding the surface of the rocks and plowing a gorge through the lower Narrows of the Baraboo River, over the present bed of Devils Lake and then onward in an avalanche of haste to its mouth.

At some later time, through some terrible cataclysm of the earth, the lands of the mountains and valley were again immersed in the waters of the ocean, and the tops of the bluffs stood as little islands to be lapped and wave-bitten by the surging waters about. Again the sea retreated and a river, flowing from the north and now known as the Wisconsin, cut a valley through the range. Geologists read this later story from certain sandstone outcroppings in Devils Lake gap and in the vicinity around.

Perhaps ages were to wear away before the glacier came nosing down from the north. The Wisconsin River, once flowing over the bed of Devils Lake, was changed from its course by the advancing Selkirk. It was this action which formed the gorge into a (*Concluded on page 30*)

End of the lake as seen from the headlands.

lake without a visible outlet after the melting ice sheet.

"Those who visit the state park at Devils Lake may picture three strikingly different scenes," declares Professor L. C. Martin, of the University of Wisconsin geological staff. "The first is the region as a stream valley. The river is the Wisconsin, flowing into the Devils Lake gap from the north, turning abruptly eastward near the present site of the Kirkland Hotel and its cottages, and then flowing around the Devil's Nose and southwestward toward Prairie du Sac. If you had climbed the bluffs at that time you might have found the Devil's Doorway, or Turk's Head, or some of the other picturesque crags and pinnacles of today. If they were not there it is certain there were others equally bizarre. You would have looked down, however, on a different scene.

More Beautiful Than Niagara Falls

"The surface of the present lake lies 600 feet below the East Bluff, but the waters of the preglacial Wisconsin River flowed along at a level at least 280 feet lower. The gorge was then 900 or 1,000 feet deep. The scene must have been even more picturesque than that in the present gorge below Niagara Falls. The river had less volume than the Niagara, but the gorge was deeper and more beautiful. At that time there was no lake. There was no hill at the railway cut east of the station. There was no hill where the wooded ridge now extends across the valley north of Devils Lake. There was no level land where the various groups of cottages now stand. The tumbled blocks in the talus slopes looked as they do now. The bluffs were much as today, except that they overlooked a deeper valley and, therefore, appeared much higher.

The second scene is that of Devils Lake during the Glacial Period. East of the site of Devils Lake railway station was an ice tongue, a lobe of the continental glacier. Since its terminus lay in a narrow valley it looked much like the larger glaciers in Alaska or in the Alps. No present-day ice tongue of Glacier National Park, of Mt. Tacoma (Rainier), or of the Canadian Selkirks, equals it in size or impressiveness. North of the lake was another ice lobe of equal beauty. They ended in sheer ice cliffs one or two hundred feet high. Between them was the glacial lake, dotted with icebergs, and at a much higher level than the present lake. This was at least 35,000 years ago, perhaps 80,000 years, perhaps more.

"The third scene is that of today, with the lake, the moraines, the bluffs, the fields, and the forests, a gem of true mountain scenery, such as cannot be seen elsewhere east of the Rockies."

The circumference of Devils Lake is three and one-fourth miles, its average depth 30 feet, and its greatest depth 43 feet. From Prospect Point on the West Bluff, 1,450 feet above sea level, there is a commanding view of the countryside—a vista of farmsteads and cities not unlike that to be had from the top of Rib Hill, near Wausau, the highest eminence in Wisconsin.

According to Mr. Cole, the Winnebago Indians have a tradition that the shattered rocky walls and loose rock at the lake are the result of a struggle which once took place between the thunderers (thunder birds) and the water monsters or spirits which inhabited the lake itself. The Indians thought the shattered rocks resulted or were caused by the thunderbolts hurled by the gigantic birds.

Rocks Which Suggest Many Things

It is the scenery, the bold escarpments of rock, the curious formations to be found on the trails over the cliffs on either side of the lake which mark the spot as a "world wonder." Several of these rocks from their grotesque forms have acquired whimsical appellations. "Cleopatra's Needle," a pointed pillar of rock standing out alone from the rocky hillside on the West Bluff trail, like the spire of a gigantic cathedral, is reached over a winding, tortuous path advancing up stony cliffs and promontories. Nearby is "Turk's Head," another unique formation in tabular stone. On the east bluffs, over a path still more precipitous, will be found the "Elephant Rock," "Balanced Rock," and the "Devil's Doorway."

For boldness of its setting and scenery, overlooking a valley for miles, and standing out like a protruding head at a height of more than 400 feet, the "Devil's Doorway" is a wonder in shattered-rock formation. Imperious waves of the ocean, when this cliff was below the sea, opened for their retre arches now lifted high above the valle through which the angry billows doub less crashed with tremendous fur About the scene the rocks are vivid color—splashes of burnt orange an dark-red on dark, ignorant lookir boulders. From this lookout tower, evening ushers over the valley and t sun dips crimson behind the west ridg the vista below presents an ever-chan ing diorama.

All these grounds were once with the currents of rushing waters. Abo are a score of potholes, where hard rocks had been snagged in the limesto and whirled in a pool of the migh river boring out circular, smooth-su faced openings on the boulders. The are also to be found the hard, igneo grinders, as if deserted by the gods the middle of a day's employment f work elsewhere in the valley.

From the eminences on the cliffs the foreground lay huge masses broken rock rent asunder and toss about like the ruins of a world. A bla of light struck one cliff while the oth lay in the deepe shadow, and on t rugged surface each might be trac a story of ages.

Flora and Fauna of Many Varied Kinds

The rough topography of the pa and the surrounding region prevent clearing, so the percentage of forest ar is large, and the native flora and fau have survived remarkably well. T native flora is extremely varied, a natural conditions will be maintain so that botanists will find not only t species, but also the ecological con tions under which they grow.

How Modern Monopoly Works Out

(*Concluded from page 25*)

for amnesty. The commander goes again to Wall Street, this time not a monarch, but a petitioner, slinking in from a side-street. The pawnbrokers who call themselves a "syndicate of bankers" have only one thing to offer—refinancing. There must be another great bond or stock issue, this time with a much larger bonus to themselves. The whole scheme of over-capitalization and artificial overhead must be attempted afresh. But before the public can be persuaded to buy this new issue there must be a gesture of good faith and repentance. In other words, the combine must be reorganized and re-officered. Particularly and especially, there must be a new commander-in-chief.

Sic transit gloria mundi. The man of ability and energy, the commander-in-chief of industry, yields his sword. If, out of the ruin of his organization, he has been wise enough or cunning enough to save something for his private account, he may retire to golf and gout in Florida. If he has not, his exile takes him to some economic Elba to dream of better days.

Globe-Trotting

(*Concluded from page 8*)

have met not a few distinguished m in military, political, educational, a religious work. I have discussed i portant questions with statesmen a soldiers and scholars and educato I have been sitting in at a wonder motion picture, and it has kept busy reading between ports that might be prepared in some degree what was to come. If a man has ti and money and has read widely and c go and stay a year, and if he is able apportion his time and select his ro so as to get the best results from journey, it is better for him to go dependently. But I think the avera American and his wife get more out a four months' cruise with lectures a guides and the assistance which such tour provides than some men get out a year of independent travel. It depe on the man. For among globe-trott there is a great difference. Some wo learn much about other lands if th never traveled at all. Others could be educated by any amount of tra But the average American learns so thing, and some of it is of value. Am the rest, he learns that home is a pre good place to which to return.

Wild Birds in the Barnyard

A Sanctuary Where Feathered Game Is Secure From the Pot-Hunter

By ESTELLINE BENNETT

IN THE sanctuary season of all wild birds comes occasionally a grouse, a partridge, or a pheasant into the open market. omes boldly without thought of ealment for it is not the hushed m of a lawless hunter but the wild r child of a little bantam hen on a -game farm in Northern Alberta, ada.

The Grath Side wild-game farm at ic, south of Edmonton, is one of the farms in the world where wild birds red in captivity. Unlike the silver s, they grow tame and friendly and rently as content with a home in a yard as ever they were in the far es. They like domesticity so much once they become accustomed to it hen they are hatched into it, they of their own accord, all their va- t instincts dormant. They live ives of domestic fowls without los- ny of their wild colorful charm and into the position of pets with gay ity.

This unusual and profitable enter- was developed, with no initial in- by David H. Bendick from the ng and care of a few wild birds on farm where sowing and reaping, ening, and the care of a few head vestock were his serious business, the wild-bird guests merely a pleas- hobby. From the time when, little than a baby, he cried over a en-winged Canada goose he found e edge of a pond, David Bendick loved all birds, but especially the rl, frightened wild things that every man's gun hand against et.

He was doing diversified farming on scenic acres in the Saskatchewan ly when he first coaxed a few prairie itens and wild ducks into domestic- y. He found them so interesting that xpanded his hobby until his farm aright with pheasants, Canada wild ee, prairie chickens, ducks, and ey variety of wild northern bird. It re to be the stopping place for mi- ory birds, and as time went on alien rs were imported. The beautiful edly fowls, usually exclusive in e choice of acquaintances and visit- gplaces, became so numerous and ir that to keep them from running w with Grath Side farm and all its el s, gardens, meadows, and barnyard ntry, the owner found it necessary ll a few ducks and geese. Imme- ia ly the demand for the wild birds re in captivity became so great that Mr Bendick abandoned all other ra ches of farming and devoted him- elentirely to raising wild birds. He imself is as much surprised as anyone o nd that an unplanned, untried in- dustry has jumped to such commercial importance, while the farm still looks much less like a workaday proposition than it does like an unglassed, unguarded aviary.

Long-tailed pheasants strut vainGloriously through his willow groves as casually and as much at home as the Light Brahma chickens. Wild ducks raise their broods in the sloughs on the farm with less anxiety than they had in the days when they shrieked and swam away from their nests on the shores of wild lakes to mislead the occasional interloper. Wild geese take their daily swim on his ponds with loud clatter and come to their master's hand to be fed.

There has been no introduction of incubators at Grath Side and for little orphaned eggs the Buff Cochin bantam hen has been found to be the most kindly and conscientious of mothers. She must often be as amazed at the spectacular children faring forth from the shells in her nest as was the mother duck in the Danish poultry yard that unwittingly hatched an ungainly little swan.

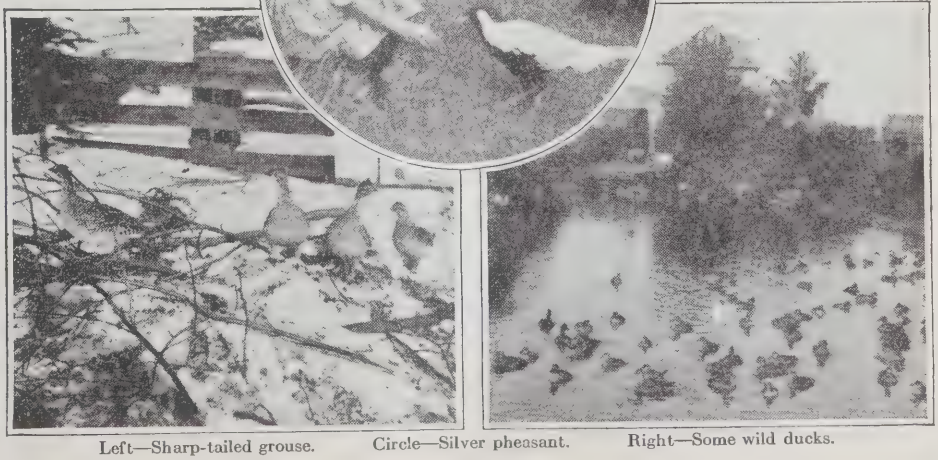
There is a big market for wild birds at fancy prices, according to Mr. Bendick, and while he raises many hundreds it would require thousands to meet the market demand. He has shipped birds to Hawaii, Australia, England, and Holland, but sells most of his birds in the United States. The canvasback duck, wood duck, and various members of the grouse family have proved most popular and profitable.

Grath Side farm now has more than sixty varieties of birds. Of these there are twenty breeds of ducks alone. There are twelve kinds of geese, ten varieties of grouse, quail, partridge and wild turkeys; eleven kinds of pheasants, five of doves, and cranes, sheldrakes and swans.

D. H. Bendick and his wise old owl.

Grouse bring higher prices than quail or partridge, and wild turkeys sell as high as eighteen dollars a pair. The highest-priced ducks are the Ruddy ducks at forty dollars a pair. The blue goose leads its clan at thirty-eight dollars a pair, and the rarest bird of them all, the Manchurian Eared Pheasant, brings ninety dollars a pair.

Birds are delivered alive to purchasers, so there is no grief at Grath Side farm, and safe delivery even to the far markets, is guaranteed. In spite of the fact that Grath Side has been commercialized to a profit beyond any dreams its owner may have dreamed in its days of wheat, barley, cattle, and garden truck, it



Left—Sharp-tailed grouse. Circle—Silver pheasant. Right—Some wild ducks.

remains to him more of an interesting hobby than a business venture, and he has close friends among the grouse, geese, and ducks, to say nothing of his wise old owl.

Four varieties of domestic chickens share the home of the wild birds, and among the feathered tribe, four antelopes are very much at home.

For love of the wild birds, before any commercial consideration, the owner of Grath Side, who has no other family, spends most of his time with the birds. But even the proud Manchurean Eared Pheasants are not permitted to interfere with his flower garden, and the pompous wild turkeys respect the rights of the tennis court.

While the raising of game birds is Mr. Bendick's chief pleasure, as well as his profitable business, he keeps his interest in it vivid and keen by slipping away frequently and running his car out into the far-away wild places. He takes with him on these gipsy journeys neither gun nor camera nor snare, but only his field glasses, to study the scenery which, across the great wheat fields west of Leduc, grow quickly into the grandeur that is the Canadian Rockies.

A Cathedral Crusade in Art

(*Concluded from page 15*)

dred and fifteen feet across at the transepts will greet the visitor to Washington Cathedral five years hence. The first of these designs has been transferred to the vaultings of the completed choir aisle. One thousand vaulting bosses will tell the story of Christianity, emphasizing the Nicene and Apostles' Creed. The west front will be an elaborate composition of figure sculpture. As an expression of religious principles, it will be a vital contribution to American art.

A modern Leonardo da Vinci is being sought for the mural paintings in the Chapel of the Resurrection just completed in the crypt of Washington Cathedral. Work may be started a few years hence, but the artist chosen must subordinate his personality to the Christian principles which the Cathedral will symbolize. That is the cathedral way. The Cathedral authorities believe that modern painting is often pagan in concept and execution, and they want the new Cathedral masterpieces to constitute a Christian rebuke to paganism.

Stained glass is distinctly a cathedral art. With the great windows which Gothic architecture made possible, painting was transferred from the flat walls to the transparent glass. Their color glowed in marvelous splendor. Such marvelous effects were wrought at Chartres and other cathedrals that modern glass workers almost despair at creating windows to equal it. Yet that is the aim of the builders of Washington Cathedral. It is likely that schools of craftsmen will be at work at Washington Cathedral for the next ten or twenty years, for although the fabric of the Cathedral itself might be completed in five years under pressure, stained-glass windows must all have the master's touch. There will be two hundred and twenty-five windows in Washington Cathedral—three great rose windows, thirty feet in diameter; forty clerestory windows, eighteen feet wide and twenty-nine feet high; eleven apse windows as high as forty-six feet; twenty aisle windows eighteen feet high, and many smaller windows like the windows in Bethlehem Chapel that now tell the story of the birth of Christ. Modern opalescent glass, so popular in some modern churches, will be barred.

An equally intense effort will be made to achieve the highest possible art in music, wood carving, ironwork and in everything the Cathedral attempts. The great oratories of the masters were intended for cathedrals. Music halls are makeshifts.

By acquiring sixty-seven and one-half acres of ground the founders of Washington Cathedral made certain that enough ground would be available to provide a proper setting for the great Cathedral. The effectiveness of many monumental buildings is marred by crowding them into a mass of miscellaneous buildings. Washington Cathedral will be surrounded by the woodland of Mt. St. Alban with enough space between the Cathedral and the city to insure its dominant position four hundred feet above the city. The work of the landscape architect will make the Cathedral Close a paradise. Plantings of the last twenty-five years include such famous historic plants as the Washington box, Dolly Madison box, Thomas Jefferson box, Cedars of Lebanon, Galstonbury Thorn and Canterbury Ivy. Nature in all its loveliness will have an opportunity to develop gracefully, unmarred by the extreme formalism of the Italian garden type of landscape architecture, or the imprisoning of flowers in exact geometric designs which has characterized so much American gardening.

Its length of five hundred and thirty-four feet will make Washington Cathedral rank among the largest cathedrals in the world. The idea of a National Cathedral originated in the early days of American history. Major L'Enfant, working under the general direction of George Washington, planned "a church for national purposes" in the Capital of the United States. The site was to have been where the Patent Office is now.

Today, more than a century after Washington dreamed of a national church, Washington Cathedral is a living institution. Schools have been established, the apse of the great Cathedral has been built, work is under way on the choir and transepts, all foundations have been laid and preparations have been made to interest the nation in completing the American Westminster Abbey during the next five years.

TO HIM whose elastic and vigorous thought keeps pace with the sun, the day is a perpetual morning. It matters not what the clocks say or the attitudes and labors of men. Moral reform is an effort to throw off sleep. Why is it that men give so poor an account of their day if they have not been slumbering? If they had not been overcome with drowsiness, they would have performed something. The millions are awake enough for physical labor; but only one in a million is awake enough for intellectual exertion, only one in a hundred millions to a poetic or divine life. To be awake is to be alive. I have never yet met a man who was quite awake. How could I have looked him in the face?

CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

The last of the three banks which have been doing business in Hugo, Oklahoma, closed its doors May 6 leaving the merchants of a town of 6,000 population with only the money in their cash registers on which to operate.

An egg was fried on Pennsylvania Avenue, Washington, D. C., during the recent hot period, by an inquiring reporter who placed the egg on the asphalt at 12:42 o'clock. At 12:51 the egg was done to a turn.

Singapore has begun the manufacture of banana flour. The article will be used in the making of certain pastries, chocolate confections and cocoa beverages.

Vraic, a brown seaweed which grows in Japan, is rich in potash and makes an excellent fertilizer.

Secretary of Agriculture Jardine says that motor trucks are not hurting the railroads by taking the short-haul business from them, as it never has paid the railroads.

The National Board of Fire Underwriters announces that fire destruction in this country in 1894 amounted to $548,810,639—the largest total ever known. This means a daily loss of $1,500,000.

During the visit of the British police chiefs to this country, Sir Robert Peacock, head of Manchester's police, pointed out that in England, Scotland and Wales, with a population of 38,000,000, there were only 71 murders last year, while almost five times that number occurred in New York City.

Brule, a Frenchman, is said to have been the first white man who ever saw the Great Lakes. In 1616 he returned to Quebec after three years spent in Western exploration and spoke of a "great inland sea."

Who's Who in America contains 25,357 biographies. Of those whose importance in the life of the country entitled them to admission to its pages, 25.9 per cent were born on farms; 24.5 per cent in towns of less than 8,000; 24.8 per cent in small cities; 20.6 per cent in cities of over 50,000; 4.1 per cent in suburbs of large cities. Sons of clergymen made up 11.1 per cent of the total, which means that, in proportion to population, they composed 28 times the average number of notables.

The great-grandfather of Tom Mix, the movie star, translated the Bible into the Osage Indian dialect.

Major Julia C. Stimson, America's only woman major, is superintendent of the United States Army Nurse Corps, says that our country sent 22,000 women to the Great War as nurses and that there will be several times that number in the service if there should be another war.

At Buckfast Abbey, South Devon, a community of Benedictine monks are building an abbey on the site of the old abbey which dates back to 904 A. D. The abbey is sacred to man, and the only woman permitted to enter is the Queen.

The home of Mrs. Hamilton Fish, on Fifth Avenue, New York, will be razed and an apartment house will take its place. Mrs. Fish will receive an average annual rent of $50,000 for the property, the lease running for 84 years at an aggregate of approximately $5,000,000.

The Director of the Budget has reported to President Coolidge that we have 65,000 government employes.

Washington and New York City are conducting drives against obscene magazines.

E. J. Eckert, a radio amateur of Philadelphia, picked up a message from Dr. Alexander Hamilton Rice, explorer, sent from the upper waters of the Amazon River for transmission to his wife in Paris, France.

John Walker, an English chemist, made the first friction match in 1827.

O. P. Van Sweringen, who is trying, with the aid of his brother, to put through a billion-dollar railroad merger, was once a Cleveland newsboy. J. J. Bernet, who is operating the Nickel Plate system under him, started life as a blacksmith.

Cats, dogs and other household pets, will not be abandoned by New York City vacationers this season. The S.P.C.A. has 17 ambulances which will be used in transporting the animals to a place where they will be properly cared for during the vacation period.

According to a recent report of the United States Public Health Service, the average length of life in the United States is 56 years, an increase of fifteen years since 1870. In the sixteenth century, human life averaged between eighteen and twenty years.

The United States Mint at Carson City, Nevada, is to be transformed into a Federal prison, according to government orders.

Canada is to have a flag of its own soon. A red ensign bearing the Canadian arms is at present flown over Canadian buildings abroad. Although it has never been authorized, this flag, or the Union Jack with the Canadian arms in the center, may be decided upon, or an entirely new design may be arranged.

Gold has been discovered in the Cassiar district of British Columbia.

During 1924, Palestine received as immigrants 11,851 Jews.

Five thousand watches are pawned every day in New York City.

According to an estimate of the Bureau of the Census the manufacturing machinery, tools and implements in use in the United States were worth $15,783,260,000, in 1922. In 1912 the figures were $6,091,451,000.

Change of Address

1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue

Mr. Ford's Page begins this week a discussion of the quent question, Is a man better off in business for iself, or working as employe with a large organiza- n? This week's Page deals with a neglected fact. 11)

It may be that you are the "bird" that Mr. Benson es about. (p. 3)

Two Army officers play big in our pages this week. of them, Brigadier General Mitchell, has been minently before the public for some time. But this cle, by Professor Jerome Davis, of Yale University, sents the army aviator's case more vividly than ever re. Now that the atmosphere of personal controversy passed, the principles at issue may be quietly valued. 4)

The other Army officer is General Butler, who has e a different problem in hand. General Mitchell ies the country to be safe n invasion. General Butler a been trying to make one rican city safe from the s of crime. It appears the moral defense of adelphia presents more aling problems than the itary defense of the United es. Anyway, General ler has had a hard time, has once admitted defeat. be his defeat will be ded to revive the sodden, gged moral conscience of rican citizens. (p. 13)

The only true and growing speranto, or Universal Lan- ge, is the English language. 's quietly making its way the world. The two usand Anglo-Saxon words have conquered human ech are here discussed in teresting fashion by one knows and loves words. p.3)

You may travel at home this number. A yacht its you on the cover, with flying spray and gulls a-wing, and an interesting article by one who knows. Yachting used to be considered the sport of men with money; boat clubs, however, have made it the sport of anyone who loves the water. The question whether Americans are seamen can be answered, not by exclusive examination of a mercantile marine, but by observance of any sheet of water near any town or city. (p. 28)

If you would go to a pretty English village that Studdert Kennedy remembers, turn to p. 2.

If you would know how much older than Egypt is our own Mexico of the Pyramids, and feel something of the romance which attends the life of a Scot explorer who is working in the levels of prehistoric ages, there is a pleasant few moments waiting for you at p. 21.

No more penetrating glimpses into the human life of Africa than that offered by Henri Galland has come to us. The articles last week and this lead up to interior intimacies of African thought and habit. Together, they will comprise a valuable series. (p. 18)

As far afield as ancient Baalbeck, the city of the Sun God, our travel tour extends this week. Hal Walker, on his pilgrimage to the cradle of religions, found material to satisfy the "visiting mind" of readers. (p. 32)

There is a propaganda abroad in the country to change our American system of weights and measures. The people are not aware of it, but compulsory legislation on the subject has almost slipped through Congress on several occasions. THE DEARBORN INDEPENDENT will publish articles touching various aspects of the subject, as a matter of important information to the plain citizen. The first article will be found on page 6.

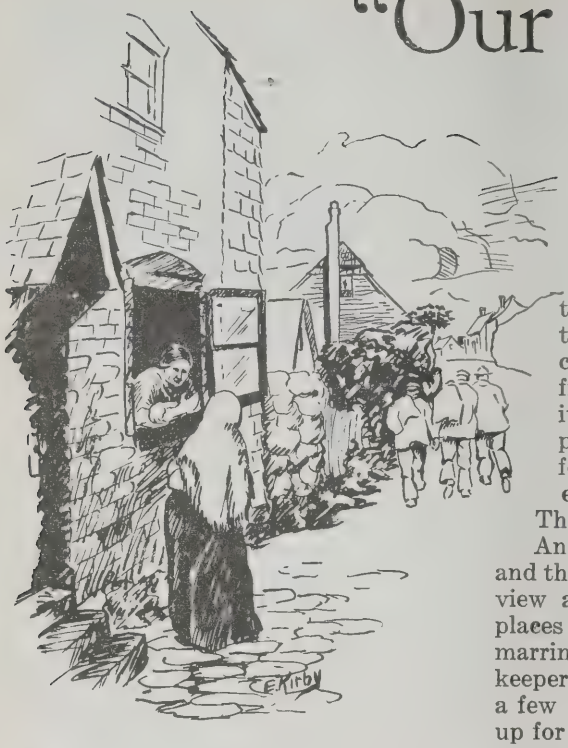
"Our Village About Now"

By HUGH A. STUDDERT KENNEDY



THERE has been so much in the papers during the past few months about the decay of country life in England, that those of us who have been over there recently are constantly met with the strange query if it is "too late to visit England."

To this there is but one answer—England is still very much England. True, change has been busy. Statistics are remorseless things and statistics show that many of the old estates of England are changing hands, that the work of land management, so long restricted to one class, is passing to other hands, that the modern plumber is invading even the village inn, but anyone who knew and loved the English countryside of years ago can go back today without fear, and renew his faith. "Our Village" is still our village, and our village is still—almost anywhere in England.

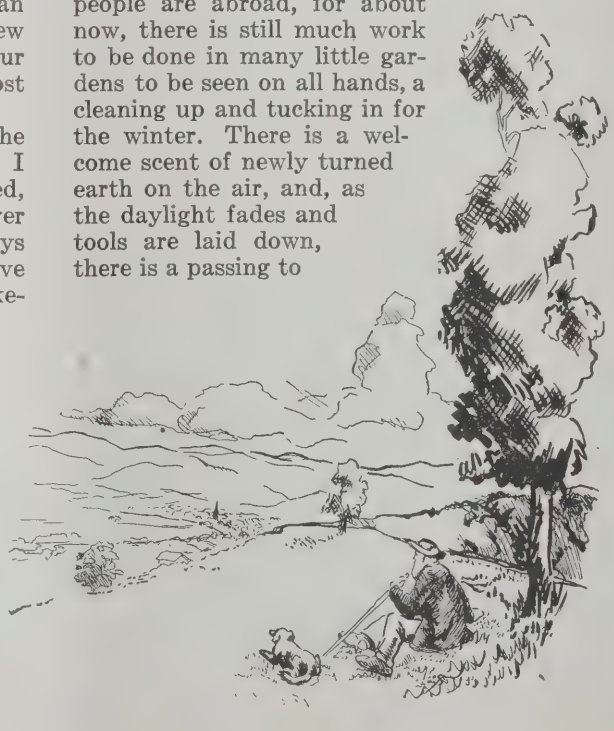
Those who have ever taken the open road, preferably on foot as I did last summer, and have wandered, preferably with no fixed intent, over the highways and through the byways of the country cannot fail to have noticed what a wonderful family likeness there is among all villages, especially the older ones. Materials differ of course, the cottage, the church and the parsonage grow out of the soil. There is the red stone of Cheshire; the gray stone of the fells in Lancashire and Yorkshire; the dull red brick and the tiled roofs of the East Riding; the "black and white" of Worcestershire and Warwickshire and the wonderful creeper-covered glories of Surrey. But everywhere it is the same gathering together, and to those who live there it is just "our village."

Who was it that said that he always seemed to see the things he wrote about most clearly when he was far away from them? Well, no matter who it was, it is true enough for many people. Writing out here in California our village seems, somehow, especially clear to me.

The saddler and the parson
And the man who keeps the inn,

and the long line of worthies come into view as welcome memories, changing places and changing villages without marring the picture. Not a few innkeepers, not a few postmasters, not a few "oldest inhabitants" go to make up for me, as for many others, my recollection of an English village.

And about now when a misty red and gold spreads itself over the great trees around the glebe farm, when the days are drawing in, and the nights are drawing out, when the yews in the churchyard begin to stand strangely dark against the old red brick of the tithe barn, is a good time to pass that way. The village is always welcome and welcoming at every hour. But it is especially good, about now to get there toward evening. The sun is sinking behind the low hills away to the west; there is just a trace of mist in the hollows and about the willows on the pool by the sawmill; and the lattice windows of the village inn catch the warm glow of the setting sun. It is a time when most people are abroad, for about now, there is still much work to be done in many little gardens to be seen on all hands, a cleaning up and tucking in for the winter. There is a welcome scent of newly turned earth on the air, and, as the daylight fades and tools are laid down, there is a passing to and fro, up and down, the village stre Now one, now another, will linger some open window, a common attr tion in the country to hail a friend a discuss with him or her matters church and state.



And so, one goes along the m street, the only street, past the i with its familiar sign, fashioned by artist whose name is shrouded welcome oblivion; past the little gro of thatch-roofed cottages, perched suddenly on a bank above the ro and so on down the dip toward stream, which convention has alw regarded as the boundary of the villa And here, hard by a little stone brid is the oldest house in the village. two windows on either side of the ing nook give a view, one way, all alo the village street, the other, up hill along the road to the market to some miles away.

Now, it is from the top of this h where stands an old farmhouse, a lan mark for many miles around, that view of our village commends it most generously. And so, one cros the bridge and climbs the hill.

By this time it is growing du an evening star hangs like a jewel the sky, and, if the time be well chos a crescent moon will be rising abo the tall larches which cover the h at the other side of the valley. Fr here our village lies spread below. The beauty of the design a shifting colors thrill the onlook the stream, the brid the white road, winding do the hill and on through high street. All color is mer into varying shades of mi blue and purple, checkered h and there capriciously wh points and patches of lig And, the dearest thing abou all is its familiarity and the w in which, in spite of seem change, it never really chang Night after night the sa lights are seen in the sa places, and, if there is a mo the gracious outline of chu and cottage and barn show bravely in the pale light.

Oh! dream of joy! . . .
Is this the hill? is this
kirk?

Is this mine own countr So felt the Ancient Mari about it, and so—well so d feel about it. And so m everyone who has learned o love such pictures still t about it. For such pictures n England are still to be se and still to be loved.

The Bird That Had Nothing on Its Mind But Its Feathers

BY ALLAN L. BENSON

YOU have seen a bird sitting on a telegraph wire. Forty other wires on the same pole. Perhaps eight messages passg along each wire at the same time. l kinds of messages, including some at might have something to do with e food-supply and general comfort birds. But our bird, having nothing its mind but feathers, heeds none them. It does not even know that ey are passing through the wire at its feet clutch. It is a bird.

What are you? What am I? What most of the other members of the man race? We sit on a wire that has nehow become rolled up in a coil l is called the earth. Millions of ces play upon us, the forces of ure, the laws of nature. Some of m, if we knew what they were and w to use them, would be of trendous service to the human race.

Marconi talked to me about this en he was here three years ago. light is power. But it is power ned wrong side out. Sunlight is ived from electricity. We know w to convert electricity into light we do not know how to convert t into electricity.

Marconi believes sunlight can be verted into electricity, only he, the rest of the human race, does know how. When we learn how do it we shall have power without it—except the sun's limit, which is te some. We shall not have to dig more coal with which to make t or steam. We shall not have to ed any more newspaper articles but men entombed in coal mines. shall not even have to take any re power from falling water—t will be too insignificant to ther with. We shall have so ch power that each man will able to produce many times re than he now produces.

You may not realize what this ans. An Indian, when he is ting, uses no mechanical wer, and a thousand acres of d are required to support him. armer with a team of horses n live on forty acres or less. e reason that the American kingman is, on the average, re productive than any other kingman in the world is that has more power behind him. e average American works with en mechanical horsepower. e average Englishman has but ee and a half. Workingmen of er nations have less.

A million other forces besides wer are playing upon us of which we are no more conscious than is the bird of the messages that pass under its feet. What we *don't know* is wearing us out, killing us before our time and making life poor and mean as compared with what it might be. We have to do many things over and over again because we do not know how to do them better.

We lose $300,000,000 a year because we do not know a cheap method of preventing iron and steel rust.

We lose a billion and a half in wages each year—so the doctors recently gathered at Atlantic City told us—because we do not know how to prevent colds. The average American is laid up three days a year with a cold. And we die absurdly young because we do not know what to do—and what not to do—to live longer.

What is the matter with us? We are suffering from *what we do not know.* We are birds on a wire. Have we anything on our minds but feathers? We hope so. If we have, the most important thing we can do in this world is to find out what is going on about us. That is what scientific research means. It is the job of all jobs that needs to be done. In importance, nothing else compares with it. A first-class fact serves to the end of time. Every discovery adds to the permanent wealth of the world. That is what makes scientific research so important. Its achievements are not for today only, but for all the days that are to come.

Why do we not make a great systematic drive for knowledge? Why do in a disorganized, slap-dash way what should be done in the most orderly, energetic way? Take another look at the bird on the telegraph wire. That is the answer. What is wasted on rust would finance the most tremendous research laboratory we could manage and still leave millions to spare. The billion and a half that colds annually cost us would pay the bill several more times. What is wasted by those who have money they do not want would pay the bill again.

The United States now leads all other countries in scientific research, but that is not because we are doing so much but because others are doing so little. And what we are doing is being done in a disorderly way. Sixteen different groups, for instance, are trying to find a cheap method of making iron and steel unrustable. What a way to go about this or any other similar task! These groups would be more than sixteen times as efficient if they were combined into one. In the operation of human minds there is such a thing as cross-fertilization. If all of the members of this group were in daily conference, any member of the greater group might, at any time, make a chance remark that would set some other member to thinking. You know, we are often told things by those who do not know they have told us and who, paradoxically, do not know the thing themselves. One man simply says something that clicks into some information that another man has and gives him an idea. To place into sixteen thought-tight compartments a great body of men each of whom is trying to discover the same thing is to make certain that the discovery will not be made as early as it might be.

That is the way, however, that scientific research is being conducted in this country and throughout the world. The United States should change this. The United States should have a scientific research laboratory that would associate, coördinate and energize the best scientific minds of America for generations to come. It should be, from the moment it opened its doors, the leading institution of the kind in the world, and it should remain, until the end, the leader. It should seek to discover, ponder, digest and apply to some human requirement, every possible fact in connection with the properties of matter and the operation of natural laws. It should seek to collect and (*Concluded on page 24*)

"The world is more interesting than it ever was before, but it is still a very dull place in comparison with what it soon will be."

Is Our Navy Out of Date

Brigadier General Mitchell Discusses This Question

Brigadier General Mitchell, former Assistant Chief of the U.S. Air Service, showing Air Service trophies to Brigadier General James E. Fechet (left), the new Assistant Chief of the Air Service and successor to General Mitchell.

In an interview with
JEROME DAVIS

A SILENT revolution has been taking place not only in the life of America but throughout the world. Most of us have scarcely sensed the transformation nor do we begin to realize its vast implications. The airplane is going to be produced cheaply. It will make a place for itself as the auto has. It is economical. An all-metal plane carrying five passengers costs less than a cent a mile for fuel. It means the shattering of real estate values. A business man can live sixty miles out in the country and yet reach his office in thirty minutes. It will result in still further competition for the railroads. It means the scrapping of old military principles, indeed the virtual abandonment of what used to be called the "Science of Warfare." It necessitates the formulation of a new military technique based on the air. This spells the doom of the naval battleship.

While most of us have been peacefully slumbering engrossed in dreams of things as they are, a few Americans in nearly every branch of social and economic activity have recognized the dawn of a new day.

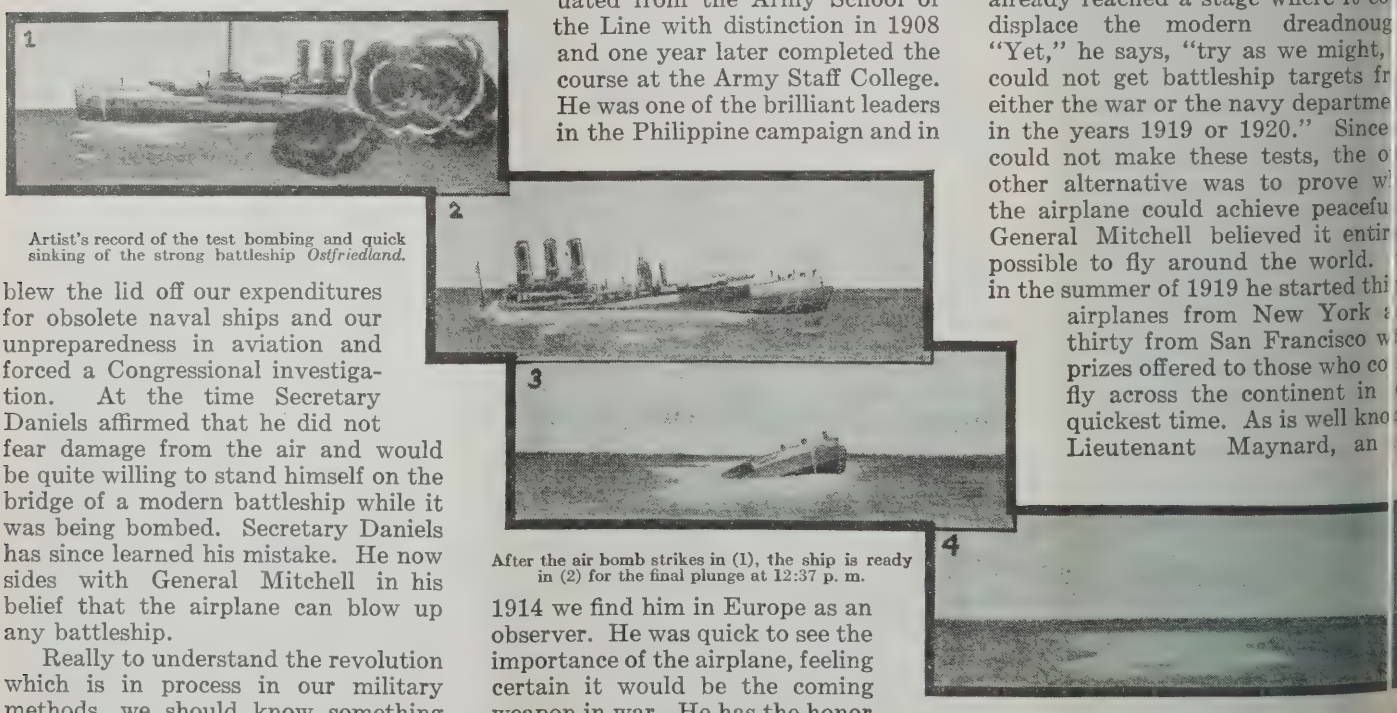
Among our military men there is perhaps no one who has done more to modernize our thinking and practice in the industry of air flight than has Brigadier General William Mitchell. Indeed he might be called the prophet of the air. It was General Mitchell who blew the lid off our expenditures for obsolete naval ships and our unpreparedness in aviation and forced a Congressional investigation. At the time Secretary Daniels affirmed that he did not fear damage from the air and would be quite willing to stand himself on the bridge of a modern battleship while it was being bombed. Secretary Daniels has since learned his mistake. He now sides with General Mitchell in his belief that the airplane can blow up any battleship.

Really to understand the revolution which is in process in our military methods, we should know something of the life of General Mitchell. Who is this revolutionary General of the Air?

Although not yet fifty years of age, he has not only participated with signal distinction in every war in which our country has been engaged since he was born but he has pioneered in the development of our air service, challenging the supremacy and value of our naval forces, causing several Congressional investigations and proving his contentions to have been accurate. Strangely enough he was not born in the United States but in France of American parents. He took his undergraduate work at George Washington University and while still in college had become a first lieutenant. Within four years after graduation he had completed the construction of the Alaskan telegraph system. He graduated from the Army School of the Line with distinction in 1908 and one year later completed the course at the Army Staff College. He was one of the brilliant leaders in the Philippine campaign and in 1914 we find him in Europe as an observer. He was quick to see the importance of the airplane, feeling certain it would be the coming weapon in war. He has the honor of being the first American to fly over the enemy's line and h already won the Distinguish Service Medal, the Disti guished Service Cross, h sides a host of foreign mi tary honors including t Companion Order of S Michel and St. George and t Commander of the Legion Honor. By 1917 he h risen to the rank of a Colo and in 1918 was promoted be Brigadier General a Assistant Chief of the Arm Air Forces of America. H still looks remarkably you and has the constitution an athlete.

Since the war he has startl America by the statement that t world stands on the threshold of t aeronautical era and that the na today is obsolete. One of his sta ments is, "The surface ship, as a mea of making war, will gradually disappe to be replaced by submarines that w act as transports for air forces a destroyers of commerce." He te America that "aerial torpedoes, wh are really airplanes kept on th course by gyroscopic instruments a wireless telegraphy, with no pilots board, can be directed for more th one hundred miles in a sufficien accurate way to hit great cities."

Just how General Mitchell arri at these startling conclusions is part the romance of the air. At the beginn of 1919 little was really known ab the dependability of the airpla General Mitchell believed that it h already reached a stage where it co displace the modern dreadnoug "Yet," he says, "try as we might, could not get battleship targets fr either the war or the navy departme in the years 1919 or 1920." Since could not make these tests, the o other alternative was to prove w the airplane could achieve peacefu General Mitchell believed it entir possible to fly around the world. in the summer of 1919 he started thi airplanes from New York a thirty from San Francisco w prizes offered to those who co fly across the continent in quickest time. As is well kno Lieutenant Maynard, an



Artist's record of the test bombing and quick sinking of the strong battleship *Ostfriedland*.

After the air bomb strikes in (1), the ship is ready in (2) for the final plunge at 12:37 p. m.

One minute later it begins the final plunge (3), and is down at 12:39¾ p. m.

United States anti-aircraft guns in action.

Baptist minister, won the race and nearly all the contestants finished successfully. In 1920 General Mitchell proposed to establish an airway from New York through Canada to Alaska. Captain Street took four machines from New York to Nome, Alaska, in fifty-four hours of actual flying time and returned here as quickly with no accidents or delays of any kind.

In the fall of 1920 General Mitchell tells us he was able "to announce definitely to Congress that we could destroy, put out of commission and sink any battleship in existence or any that could be built." At that time the Army Air Service was using one thousand pound bombs of TNT timed to explode under water so that whether they actually hit a battleship or not they would immediately make the vessel useless by damaging the propellers and rudder, if they did not indeed cave in its bottom. This statement itself landed as a bombshell in the ranks of conservative naval leaders who retaliated with the most emphatic and indignant denials. The Secretary of the Navy sided with the naval officers. The verbal explosion had one result of lasting significance, however. Congress passed a bill introduced by Mr. Anthony in the House and Mr. Wadsworth in the Senate authorizing the President to designate warships to be used as targets for explosions.

The first permission to make a concrete trial occurred on June 2, 1921, against the ex-German submarine *U-117*. Three airplanes flew out over the water to the attack armed with one hundred and eighty pound bombs. Inside less than three minutes the submarine was on its way to the bottom and even the naval boat which was directing the target practice one and one-half miles away had her condenser system so badly affected that she steamed into port that night at only three knots an hour.

The next trial occurred on the ex-German torpedo boat destroyer *G-102*. This time the airplanes used four hundred pound bombs and the destroyer met a fate similar to that of the submarine. The cruiser *Frankfurt* was the next victim and six hundred pound bombs were used. At the first direct hit fragments were hurled for more than a mile. At each of these tests naval men were astounded to witness results which they had before thought to be impossible of achievement.

The supreme test of the airplane as a military instrument was given in the attack on the dreadnought *Ostfriedland* built for use in the North Sea against England. She had been specifically constructed with every device known to science to make her impregnable. She was completely divided into water-tight compartments and had three separate skins to her bottom. In the Jutland battle she had been hit by two mines below the water line yet had made harbor under her own steam. To make the work of bombing more difficult, the navy department demanded that the target should be one hundred miles from the air dome. The boat was also anchored in one hundred fathoms of water where the bombs striking the water would have less effect. The first trial was made with 1,100-pound bombs which immediately put the boat entirely out of commission and could have sunk her had not the navy ordered the attack to cease. On the next day 2,000-pound bombs were used and the boat sank in a few minutes.

One further final test was afforded the air service when they were allowed to bomb the United States Battleship *Alabama*. The first two thousand pound explosive sank her in thirty seconds. On each and every trial General Mitchell accompanied and directed the bombers in his own airplane. By the end of 1921 he had demonstrated to the world his statement that "should a nation control the air it could more nearly master the earth than has ever been the case in the past."

During 1922 he was rewarded by seeing the air service in America capture all the world's air records including speed, altitude, long distance, and hours aloft. In 1923 our airplanes flew across the American continent from daylight to dark and in 1924 American airplanes were the first to encircle the globe.

In spite of the concrete demonstrations that a revolution had taken place in our means of locomotion, the military forces of America refused to make the necessary changes in their tactics, programs and appropriations. Great Britain realized this necessity at once and has made her air ministry co-equal with her army and navy. Indeed she has legally declared that the air force is "the first line of defence."

To summarize the effect of this revolution in the air on our military forces I asked General Mitchell the following questions and reproduce his replies just as they were given. Every American citizen ought to study them carefully.

Would our surface fleet be an asset in time of war?

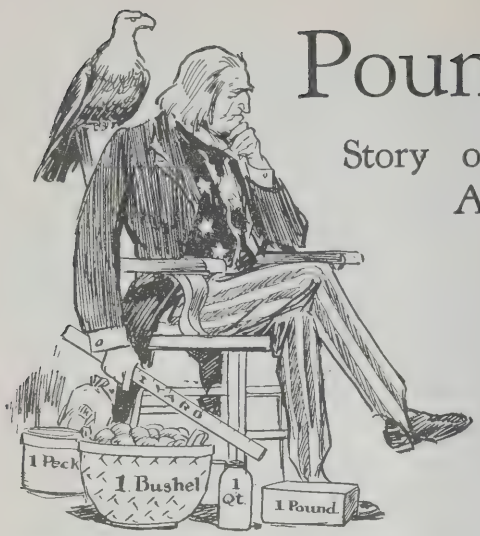
> "It would be a very doubtful asset in war and probably a great liability. Our navy is powerless to resist attacks from an insignificant flock of aircraft. It is at the mercy of any third-rate navy equipped with seagoing air forces. I think it is my duty to say so."

How much could be saved if money now being wasted on our navy were withdrawn?

> "This is very difficult to answer. Statistics show that up to 1920 we had spent on our shore stations alone $1,303,233,547.42. The information concerning actual expenditures of shipbuilding program, accessories, and ordnance is not available. I would suggest that you get this information from the navy."
>
> (In 1923 we were allotting $629,672,000 for our army and navy. If General Mitchell is right a large part of this was wasted.)

How much money would we need adequately to equip our air forces?

> "The last estimate of the Chief of Air Service as revealed in testimony before the Congressional Committee was $25,000,000 per year for a period of ten years adequately to equip the Military Air Service. It is my opinion that if the Servi es were combined under one administrative head with one system of procurements and supply (Concluded o page 31)



Pounds or Kilograms?

Story of an Active Attempt to Abolish American System of Weights

IF YOU glanced at your speedometer and found that you were going 96.54 kilometers:

If you ordered a quart of milk and was told that you could have a liter—which measures less:

If your *yard* of dress goods became a *meter*, at a higher price:

If your No. 16 collar became a No. 40 1/2 collar, centimeter:

If your grocer said he could not sell you a *pound* of butter at 45 cents, but would gladly sell you .454 kilogram at 99 cents a kilogram:

If the lady's No. 4 shoe became overnight a No. 25½ shoe:

Then we should have what Bills in Congress, Committee Reports and other forms of propaganda are determined that we shall have.

For there has been for years a movement on foot to change American weights and measures to the European system. It is an aggressive movement. It has won influence in the government itself. It has worked itself into a position of importance, and the American people are still ignorant of its existence.

How did it begin? It goes back to the French Revolution. It included a plan to abolish the calendar and make a new one in which the *Year One* should be the year of the Revolution. The seven-day week was to be abolished, and a 10-day week substituted. The month was to be three weeks of ten days each. The names of the months were to be wholly changed.

This change was established by law, but was never observed by the people, and the law was repealed in 13 years.

Origin of the Metric System

Along with these changes went a new system of weights and measures, as illustrated above. There was some excuse for this in France, since many systems were used there and it is desirable that a country have a unified system for the convenience and honesty of trade. The new system, known as the Metric system, like the week and the month, was based on decimals, or the system of ten. The basis was earth measurement, a *meter* being the measure of length equal to one ten-millionth part of a terrestrial meridian contained between the north pole and the equator. It was an attempt to discover a scientific measurement based on an unchangeable natural fact.

Later it was discovered that a circle on the earth's surface (meridian) passing through the poles is not a "constant" and that furthermore an error was made in estimating the length of the quadrant. Thus the meter is a mere arbitrary unit of length and in this respect holds no advantage over the yard which is also an arbitrary unit.

But there is something stronger than the ideals of academic scientists, and that is popular custom. Most of the French people used a system closely approximating the English system of inches and pounds. When the new metric measures were established by law the people clung to their old system and it was not long before they were legally permitted to retain their old measures under the name of the "Systeme Usuelle"—a name which clearly indicates how strong a hold the old system had.

The "Human" System of Twelves

That is one-half of the story. In the meantime the Anglo-Saxon peoples of Great Britain and America were living under the system of pints, pounds and inches, the most ancient and most nearly universal of all human devices in weights and measures. These peoples were destined to become the commercial and industrial leaders of the world, and they did so under the use of pints, pounds and inches.

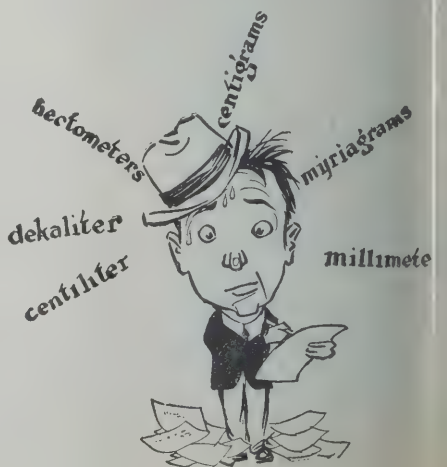
The difference between the French system and the English is that one is artificial and the other is human. It is not a system of *tens* but of *twelves*. There are twelve hours on our clocks, twelve months in our year, twelve men on our juries, twelve units in a dozen, twelve inches in a foot, twelve twelves in a gross, Twelfth Night—and so on back to the Twelve Disciples of the Lord and Twelve political tribes of Israel. Twelve is a number ingrained in the history, experience and customs of the Anglo-Saxons.

When France invented the metric system she was not a manufacturing country. None of the nat ons on which the French imposed their system was engaged in manufacturing. The sole motive, at the time, was to standardize the various provincial systems of weights and measures which existed at the time.

One of the countries impressed by France in favor of the metric system was Germany. But even Germany was not yet a manufacturing country. But the time came when she forsook h fields, built factories and competed f world trade. She made great strid among the South American countrie As part of her trade war she push propaganda for the metric system, b cause German goods were made a cording to that sort of measuremen Germany succeeded in securing offici sanction for the metric system in mo of the countries of Central and Sou America. The intention was to sh out Anglo-Saxon goods because th were made by the system of pin pounds and inches. But althou Brazil adopted the metric system 1862, Argentina in 1863, Chile in 18 Ecuador in 1856, Mexico in 1862, Pe in 1862, Venezuela in 1857, and so through a list of twenty Latin-Ame can countries, the fact remains (ascertained by the American Institu of Weights and Measures) that in no of these countries has the metric sy tem become the system of the countr Government and customhouse run the metric system, but the people car on their business on the "syste usuelle," that is, the usual syste which approximat that of pint pounds and inch

Metric System Unnecessary in Foreign Trade

In the meantir Britain and Am ica were flooding the world with sorts of goods, made without referen to the metric system. American a tomobiles and English soap and Can dian wheat went broadcast regardl



the metric system. These two peoes controlled the trade of the world, ithout hindrance from metric measrements, and control it still today.

Yet, because some South American overnments were induced *politically* decree a system of weights and easures which their people have never cepted, the United States is being ked to change its system, change it terly, to standardize this sysm in America. The manufacturg world at large, the greater portion it, is asked to change its entire sysm to conform with an idea of the ench Revolutionists foisted by German fluence on non-manufacturing peoples in Latin America.

Confusion Caused by Metric System

The introduction of the metric system into South America did not ify nor standardize the system of ights and measures, but created two stems, made confusion worse confnded, because the people would not cept the new order. And the United ates is asked to add to the confusion creating the same condition here.

Great Britain, the United States d imperial Russia, as governments, gether with the plain people everyere, have stood out against the ench system.

A diligent canvass among all classes American business disclosed no instence from any part of the world at American manufacturing methods changed to the metric system. The quiry covered more than 800 lines of siness engaged in international trade, erything from Airplanes to Zinc, and owed that it was American goods, nt the metric system, that the nans of the world were buying from us.

If the case could be proved that we re losing business because of our systn of weights and measures, it would l for consideration. Nothing of the kd is shown by any investigation that hs been undertaken. The German r against American manufactures, i which the metric system was the apon, never had a chance to win, d now is definitely lost. And yet in se United States the struggle goes o to change our whole system and ow our manufacturers and people no endless confusion. The attempt, ifsuccessful, would have the same rest as in other countries—the authorits could pass as many laws as they lied, the people would simply go on nking pints, pounds and inches.

The American people, it is believed, pfer a foot, a yard, a pint, a pound, millimeters and hectometers, centiters, and decaliters, myriagrams and ctigrams, and all the other terms ich call for the use of Greek and Ltin prefixes.

The propaganda for the metric stem finds its parallel in the propagda against the English language, i favor of French, or German or Eperanto. The English language admtedly is difficult, in some respects irregular, and an irritation to those who were reared in other tongues, but the fact remains that English is rapidly becoming the universal language, the true Esperanto, and that the industrial and commercial business of the world is being done in English. For the sake of unity with the rest of the world, shall we abandon English in favor of French? Then why abolish pints, pounds and inches for liters, grams and meters? Both propositions stand on the same basis.

Again it is said: If American and English weights and measures were in the minority, if the major part of the world's business were being done under another system, the situation would call for serious examination. But when we go to South America, in all the Latin-Spanish countries, we find a system point for point like the English and American. Officially, the government may be on a metric basis, but actually the people are on the English basis. The Spanish pound (libra) has 16 ounces (onzas). The Spanish ton (tonelada) has 20 quintales (twenty hundreds, or 2,000 pounds). The Spanish foot (pie) has 12 pulgadas (inches), and three pies (feet) make one vara (yard). The table printed with this will illustrate the other measures. There is then no need of a metric system to bring unity of practice in the Americas.

Spanish Weights and Measures used in Latin America showing their identity with the English system.

MEASURES OF WEIGHT

16 onzas . . .	1 libra (pound)
25 libras . .	1 arrobas (quarter)
4 arrobas .	1 quintal (hundred)
20 quintales . .	1 tonelada (ton)

MEASURES OF LENGTH

12 pulgadas . . .	1 pie (foot)
3 pies . . .	1 vara (yard)

As for the rest of the world, what do we find? In Russia, linear measures are based on the English inch. In China, 16 Chinese ounces make one pound and 100 pounds one picul. The Chinese foot is a mere half-inch longer than the English 12 inches. In Japan, he common foot in use is just seven one-hundredths of an inch shorter than the English foot. And, of course, throughout British possessions everywhere round the world, the pints, pounds and inches system is in common use.

The "Foot" is a Unit the World Over

If the interested reader will consult Vol. III of the Century Dictionary, under the article "foot," he will see at a glance how in ancient and modern times the "foot" of the great peoples has always approximated the foot which we use.

The metric system came too late; it has missed all the human rootage; it has not captured any people that has maintained its place in the world; and the demand that the world should surrender to it is somewhat premature.

One point which all the students of the question seem to avoid is the question what the adoption of the metric system would do to the people and to the cost of living.

Place a meter and a yardstick alongside, and the meter is about 10 per cent greater in value than the yard. In selling dress goods by the meter would the price be likely to rise only 10 per cent? Would we be likely to be paying yard prices for meter measurements? None would say so who has had experience of prices.

Place a liter beside a quart, and the quart has between two and three tenths greater value than the liter. In selling milk by the liter would the price be likely to drop two or three-tenths? Or would we be paying quart prices for liter measurements?

Place a pound beside its equivalents in kilograms and the latter must be represented thus, .45359. For the easy figuring which the metric advocates so earnestly desire, would it not be "easier" to "figure" the kilograms at .50, and let the housewife pay the difference?

Profiteering Dangers of Metric System

These questions are practical and they have been illustrated by actual practice. Under the metric system the present range of prices would have to be changed. Dress goods at 50 cents a yard would sell at 54.7 cents a meter—for how long? It would be "easier" to "figure" on 60 cents a yard, or meter under the new system, would it not? All the canned goods would be changed to convenient sizes under the metric system, not to the advantage, one may be sure, of the consumer.

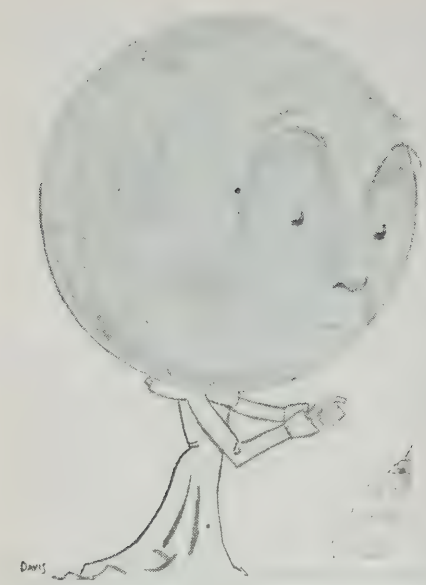
In 1911 there was considerable discussion about the variety of sizes of berry boxes used in this country. In some states the dry quart was the only unit of measurement for berries, and in others it was not. So, assisted by experts and the produce men, Congress framed a bill which included this passage: "Provided, that nothing in this Act shall prevent the sale of such small fruits and berries by weight or by liter, half-liter, quarter-liter, or multiples of the liter."

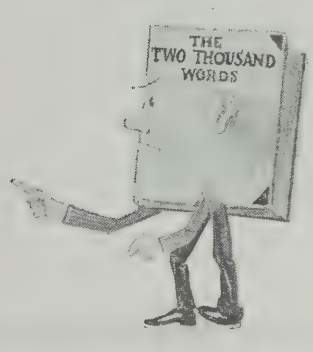
This was one of the occasions when the metric advocates came near being successful. BUT an investigation revealed that the produce men were behind the experts in providing for the liter because the liter is 10 per cent smaller than the dry quart. The Bill permitted them to sell liters for quarts. And when finally the law was passed in 1916, the metric provision was omitted in the interest of the people.

Our weights and measures are established by standards as infallible as any on which the meter is based. The standards are visible, tangible and present in the custody of the Government. They are the outgrowth, not (Concluded on page 30)

Two Thousand Words Conquered the Worl

Today's Foremost Language Built Around Old Angles' Lispin





By DUNCAN MACCONNEL

THERE is a New England. It was christened with this name in 1614 by Captain John Smith, because the summer-verdured shores of Cape Cod looked to him so much like the rising lands back from the beach of Devonshire. The name hides pathos, and reveals the homesickness of those who seemed to see their last views of their native island reappear in the first landscapes of an uncharted coast.

Thus the name New England points back to Old England, which Captain John carried in his heart. On his map of the unknown American shore he marked familiar British names, among them Plymouth, where later the history of Massachusetts began in a gray winter dawn.

The Naming of New England

New England has been made familiar to all dwellers in North America, because of history and tradition brought down through successive sages, writers of books. And likewise we have some familiarity with that Old England on the other side of the sea, and we feel that familiarity with Old England, though we may never have stood before its crackling Yule logs or felt the April scent of hedges of hawthorne blossom. For these things are part of the race-memory, the indestructible home-memory, of the far-scattered British family, truant in many lands.

The name New England was given in illusion, for it seemed like Old England though it is very different—and it seemed like an island though it is a part of the unbroken continent. The illusion has gone, yet we hold the name. And we, like the Pilgrims, call a certain wild thrush by the name of robin though it is not a robin, and refer to a trailing blossom as an arbutus when it is not an arbutus.

And just as there was an Old England before New England, there was likewise an Oldest England before Old England.

An English race made war and peace, taught law and justice, in an English speech of power and action, when the only races dwelling in Britain were Romans and Celts. To that Oldest England—to that original Englaland—must we go back, to hear the first faint lispings of the language which today is loudest on the tongues of men, and which seems to us, as we said in a previous article, to be prepared for the office and dignity of a Universal Language.

There are two inlets of the Baltic Sea, on the coast of Schleswig in Northern Germany, one known as the Schlei, and the other as the Flensborg Fiord. The little district of 338 square miles has now a population of 38,000 souls. Many a traveler passing through—for there are not many who stop among these meadows—have noted the appearance of flowering hedges like those of Kent and Surrey. This is a link which today still unites the district of Angeln, the old home of the Angli or Angles and the Oldest England, with the Old England after which our New England was named.

Yet this was England before Southern Britain was England, and in its time this was the only England. It never seemed, even in the beginning of history, as if the race of the Angles would remain fixed upon this soil. For the Roman historian Tacitus speaks of them as devoted to the worship of an ocean goddess whose shrine was upon an island off the tempestuous coast. And the oldest of English poems, the epic of Beowulf, is a tale of heroes sailing abroad for superhuman conflicts, to conquer and rule on other shores.

The Tenacity of Anglo-Saxon

Does it seem impossible that the speech of a tribe on a county of rocky coast can have significance for us? By that speech we are born, we grow, we serve God, we make love, we fight to lose or win, we are wedded, we have children, we die. *Every word in this last sentence is out of that speech,* and the heart of all our elaborated langua is that English heart. Dignified ritu ordain imposing ceremonial, villai and chicanery foist cant and sla upon the vernacular, but when feel deeply and strike hard in word deed we speak the tongue of Old England.

We speak it, we in America, thou we are not all racially English, or ev racially British.

We hear, and we expect to hear, old Teutonic in the words of the M flower Compact, written down by Pilgrims after they had sailed fr Holland toward Virginia, to find a place where they might maintain th faith as they had maintained it Holland, and retain their language they had retained it in England. I the Teutonic words ring out as wel the greater utterances of Negro car meeting hymns from the old Sou The Saxon "round-up" prevails o the Spanish "rodeo" in the wild w Closer to us than any living Europ nation is that nation of the Ang long merged and blended in their la

Vanished Angles Speak in Us

England, our England, with S on and Jute, D and Swede, N man and Celt, blended on this side of the ocean in Africa and Australia with ot bloods. Today the nations of pres Europe speak to us and of us, w the vanished Angles speak in us.

No one would claim that we to speak entirely the language of Angles. We are very far from speak it in the manner of the Angles. there were in the original tongue the Baltic tribesmen about two th sand words which covered many of vital relations of life, and these thousand words we still speak. have obscured other words of the seafarers' vocabulary. We h adopted many terms outright from the tongues of the earth, to rep the Teutonic compound words w picturesquely presented equiva thoughts. Under the pressure of a vocabulary and the demand fo large intelligibility the elaborate gr mar of the original Englishmen been simplified and tamed, as the feasts of Beowulf are reduced to shining orderliness of a modern lu eon.

When Is a Dollar $1

WE ARE coming along. The value of the dollar is becoming better understood. Newspapers are saying week by week something like this: "The purchasing power of the dollar amounted to 62.9 pre-war cents, against 62.7 cents the previous week."

In May, 1920, our dollar went down to 40.5 cents in purchasing power.

In January, 1921, the dollar was worth 58.8 cents.

On January 30, of this present year, the dollar was worth 60.8 cents, while on May 1, it was worth 64.9 cents.

The first week in this present month of July found the dollar worth two cents less than in May—the value being 62.9 cents.

In fact, our dollar values fluctuate like gasoline prices, and with as many fractions.

Barney Baruch and the Profiteers

WE DON'T begrudge Johns Hopkins University the quarter-million dollars, but it is to be hoped that Mr. Bernard M. Baruch, who admits that he had more power than any other man in the Great War, will accompany his donation with personal testimony as to the extent of profiteering in war times. This will greatly increase the material of the course of study which his money is founding. The United States Government started to do what Johns Hopkins proposes in this field, but politics stopped it.

There is one suggestion which will not come amiss in American thinking at this time. It is this: the Barney Baruch interest, together with others, has pretty definitely planned the communistic state which will come into being here immediately upon proclamation of the next war.

According to the plans now tentatively and cautiously being put forward in various quarters, and put forward on the assumption that they are already approved and accepted, it will not be necessary for communists to stage a revolution here, it will only be necessary to force patriots into a war. Upon the commencement of war, out come the blue prints, and the United States goes under communism in one day.

Mr. Baruch explained at length to Government committees a few years ago the super-government of wealth and material which he was able to erect in this country, and which he had previously planned at a time when the people of this nation were ignorant of it. He truly said that his power exceeded that of any other man. But his power was puny compared with that proposed for the next war.

Instead of one thing menacing us in war, now three things menace: first, war itself; next, the attempt at establishing communism as a war measure; third, the possible resistance of the American people in the circumstances.

The master mind which has wrought havoc in agricultural concerns, which is devitalizing important institutions like the Federal Trade Commission, may well be studied in its other operations.

China's Righteous Protest

THE trouble in China traces directly to industrial greed and thus offers fertile soil for that form of propaganda which lives by pretending to be the savior of the working masses. The industrial offenders, according to reports, are British and Japanese. Both American and British people have long protested against the conditions which exist in Chinese industry, and now the Chinese themselves are protesting even unto violence.

It should be understood at once by authorities whom the outbreak will force into action, that Right will prove the only right solution. It is not a case for denunciation or domination, but for firm compulsory education. The Japanese, who are the worst industrial offenders perhaps, are not to be blamed. They have no modern industrial philosophy. They have not created an industrial method that includes the benefit of the employe. They have imitated the worst faults of Western industrial methods. Their industrial structure reflects the most glaring defects of the worst period of American industrialism. Industrial malpractices which we have largely abandoned as self-destructive, are still received in the Orient as the shining secret of our greatness, when in truth their continuance would have been our economic ruin.

The British industrialists in the Orient have the same limited vision. And not only in the Orient, but also at home, for even British statesmen now admit that English unemployment is largely the product of mismanagement. Industry that is not built upon the principle of the worker being made also a buyer is doomed. It may endure awhile, as

British industry has endured, but its end is disastrous and bitter. And it involves even those who seemed to be most successful at the height of the false prosperity. The sins of the fathers are visited on the heirs and estates.

A China that is fed into foreign-managed mills and hardly paid enough for meager food is degrading to foreigners more than to Chinese, for the Chinese will revolt in time, but who can restore the foreigner's self-respect?

It is almost too simple for diplomats to consider, but the settlement of China's difficulty depends entirely on the introduction of the new-era principle in business. The little that is immediately gained by outworn labor methods will be overwhelmed in the immense loss which will follow China's long, long memory of the foreigner's treatment of her working people.

Pity for the Chinese is swallowed up in wonderment at the stupidity of the industrial policy which dividend-snatchers pursue in backward countries.

Why We Demand Payment

AMERICANS should realize, without being told, that our Government's insistent demand that foreign war debts be paid is not an indication that the United States is a rapacious creditor.

Such a view of our Government is held only by those who wish deliberately to misrepresent the American people, by those who wish to drive a wedge between Government and people, and by those who read but never think.

Let every American put it up to himself what *he* would do if *he* were sitting at Washington and knew how certainly the Old World is working itself into a state of war, and doing so with money that might better be employed in paying its debts. What would *he* do?

He would do his utmost to prevent the calamity, of course. And how? By giving Europe something else to think about. By reminding them that old wars should be paid for before new wars are contracted. By insisting that sound national financing consists in paying honest debts instead of buying unsound wars.

Sometimes when children are cross and quarrelsome we adopt means to change their state of mind. We send them out to look at the stars, or to count the roses on a bush, or to chop some kindling, or to run to the store. If the United States of America, choosing the only effectual method open to it, attempts to change Europe's war-mind by bringing sharply to its attention the cost of the war, is it to be charged against us as greed, or as good will?

Americans may be certain that greed does not motivate the Government. There could be little doubt that for Peace, the United States would gladly cancel the whole debt. The fact that cancellation has never received approval by our Government indicates that it regards the debt as the greatest peace-card we could play, and that cancellation would but release the war-mind to its pernicious activities again.

It is not a sign of superior intelligence nor of "international-mindedness" to criticize and denounce our own Government in its debt policies. There is more intelligence and international good will in our willingness to understand why our Government acts as it does.

Let the Doctors Talk and Write

TRADITION is an excellent guide when it is founded in principle and not in interest. Too much tradition, however, represents narrow interests of wealth or caste or profession. The British Medical Association still feels the chill of outraged propriety when one of its members writes on medical or health subjects for the people. It is a tradition that the profession should keep itself cloistered so far as the arts of publicity are concerned. But that it should be forbidden to share its saving knowledge with the public is quite another thing.

In America we have shot that hidebound tradition to pieces; or, to state it more elegantly, we have outgrown the state of mind which it represents. Medical knowledge is given freely to the public through the public prints, and if an occasional charlatan like Abrams gets in, the fault is not with the practice but with the news agencies and newspapers which neglect to certify the standing of the man whose name they carry. Much of the most interesting reading to be found in newspapers and magazines is based on expert medical men's observations of life in sickness and in health. The Henry Ford Hospital has long followed the practice of permitting its staff physicians and surgeons to give weekly radio talks on medical and health topics of general interest and usefulness.

It is reported that the forthcoming visit of some 500 members of the British Medical Association to America is to be used as the opening wedge to gain a like liberty for British medical men. Sir Arbuthnot Lane, whose article on cancer was lately carried in THE DEARBORN INDEPENDENT, is one of the sponsors of the new medical liberalism. The usefulness of popular medical literature, as it may be observed in America, should serve to broaden the somewhat narrow tradition at present restricting British doctors.

MR. FORD'S PAGE

IS A MAN better off working with a large industrial organization, or conducting a business of his own? The question is often asked, and a snapshot answer is expected. But the matter is not so simple as that.

To begin with, the assumption is that a larger proportion of people are employes of others than are working for themselves. Upon this assumption is based the charge that initiative is being lost and men are being forced into subordinate positions, that opportunity is being steadily limited until it consists in nothing more than the chance of a job under someone else's direction.

This assumption is by no means to be accepted. It is extremely doubtful that, in comparison with one hundred or even fifty years ago, the proportion of those employed for themselves and in their own business has decreased. It is extremely probable that the proportion has increased. Instead of opportunities for separate business careers being decreased, it will be found that they have enormously increased.

A glance at any community is sufficient to provide the principles upon which an opinion is to be reached. Certainly, to every 1,000 of the population, stores have increased, and the vast majority of stores are owned by the men who manage them. Not only have the number of stores increased but also the number of kinds of stores. Where fifty years ago one merchant carried many lines, now we have specialty stores—groceries, meats, hardware, shoes, pharmacy, dry goods, cooked foods, men's clothing, women's clothing, automobile accessories, oils and gasoline—any four blocks in any enterprising community, compared with fifty years ago, will show a great extension of privately owned business, and a far greater proportion of private owners than would have been thought possible fifty years ago.

Not only stores where goods are sold, but business places where skilled service is rendered, have greatly increased, not only in numbers, but in proportion to the population. Compare the old blacksmith shop with the modern garage. Each garage represents a man in business for himself and the number of them with reference to the population is greater than the proportion of blacksmith shops ever were. The same may be said of workers in wood and stone and iron.

This form of inquiry may be run through all the trades. Though we have seen the arrival of the big industries, we have seen also a more than proportionate increase in small industries; around every big industry, scores and hundreds of smaller industries spring up to do business with the large concerns.

Most professional men may be said to be in business for themselves. The increase in dentists, physicians, lawyers, architects, construction and consulting engineers, and scores of other lines of special service, must be counted with the increased proportion of independent individual effort at present possible and actual in the world.

IT IS flying in the face of facts to assume that because modern industry has grown to large proportions and employment has so greatly increased, the avenues to independent business careers have therefore diminished in extent and decreased in number. It is drawing a false picture of modern life to say that opportunity has grown less in any direction. In proportion to the population there are more persons in business for themselves than ever before. Large business enterprises have increased the number of smaller enterprises, instead of shutting them out. Every success is the mother of countless others.

This is not offered as a complete answer to the question asked above, but as a challenge to the tone of triumphant assertion which often sounds through it. The situation is not at all as it is assumed to be by the reformers and critics who asked the question. There are now a hundred avenues, where once there was one, by which men may become their own masters and work for themselves in their own business, if they wish.

One has only to read the list of incorporations daily issued in every state to see how many men go into business. Also the list of failures and dissolutions to see how many men go out of business again. The thousand roads of free opportunity are crowded all the time with persons going and coming. And these official lists represent only a small proportion of the number of persons who are entering the field of business for themselves. From peanut stands up to substantial commercial and manufacturing institutions, the proportion of people engaged in their own private business concerns is not only greater than it ever has been, but is increasing all the time.

It is useless to attempt an answer to the question as to which is better for a young man to do, work for others or go into business for himself, until it is made clear what ways are open to him. But certainly it is only leading him astray to assume that there is only one way for him to take and that it is less desirable than some other way might be. There are more ways open to him than ever before.

So, in later Pages we shall consider other elements of the matter. But for this week let this important fact of widened opportunity be made a matter of observation and thought.

Two Thousand Words

(*Continued from page 8*)

The historian records how Angles and Saxons and Jutes and Frisians conquered Southern Britain. But from the first there was preëminence for the Angles. Saxon kings like Alfred traced their ancestry to chieftains of Angeln, Saxon writers spoke of their language as English, the Saxons of Europe gave to the Teutonic invaders of England the hyphenated name of Anglo-Saxons. For many years scholars treating of the old language of England followed this name and called it Anglo-Saxon. Of late years they have returned to the use of the writers in this language, whatever their dialect and whatever their tribal relation, by calling it English or Old English.

Two thousand words have conquered the world of speech. They have first conquered all the other languages which contended for control in the speech of the British people. They have now extended with the extension of the speech of the British people, so that these two thousand words are known to more ears and are familiar upon more lips than any other two thousand words ever given utterance. By these two thousand words and the other English words which range around them in the 250,000 items of an unabridged dictionary, a large part of the thought of civilization will be ruled for centuries to come.

The Adequacy of These Words

This can be shown. It cannot be shown by academic argument on the relative beauty, strength, expressiveness or other merit of languages.

The English language, the tongue of the Angles, started far behind in the race for preëminence. It was written in an obscure Runic alphabet when older nations had adopted more efficient letters.

More than a thousand years after the conquest of Britain Lord Bacon wrote his greatest works in Latin because he could not be sure that English would continue to live. The English language was never selected by a primitive league of scholars or league of nations. It was never fashioned or refashioned by forerunners of the creators of Volapük and Esperanto. But it grew, and we can see from this distance how and why it grew. Therefore, we can look forward from this point and see how and why it will expand and increase still more. The mother-tongue of the largest linguistic group must become the second-speech of all other groups, as the first world-wide international language.

English Ends the Esperanto Idea

The square-sailed ships with many oars which brought the first Teutonic invaders to Britain bore men with the names of four races: Angles, Saxons, Jutes, Frisians. Historians have tried painfully to study out the differences between these first three races, and the intermingling of the Frisians among them. Yet from the first some prestige of power and dignity belonged to the Angles. As we have said, King Alfred the Saxon claimed royalty by descent from English chiefs in Angeln. The writers of Saxon and Jutish regions called their language English.

What about Communism in Russia? What about the worker in Russia? Stanley High, in our next issue, gives us a realistic description of conditions as they now exist in that once prosperous city, Leningrad. Smokeless factories, unpainted houses, broken windows, rat-infested streets, ragged workers! All bespeak the result of seven years of war, revolution and famine.

Thus it was clear from early times that the moral primacy of the English would have recognition in the name of the country, and in the name of the language. Yet it was not evident from the first, nor for several centuries, which form of the language would set a standard for the others. Various dialects of the language existed. Various spellings were adopted when letters were more widely disseminated. Different regions were differently affected by Celtic neighbors or Danish invaders. Pronunciations varied from town to town.

But here also no body of scholars decided on the superiority of a given dialect. No league of kings or statesmen urged one dialect above the others. The most powerful group or tribe found means to express its will, and it became important to the people round about to follow this leadership in language even as they followed the same leadership in war or statecraft.

A Sign of Leadership

The periods of Anglo-Saxon or Old English literature, as found in the records, are also periods of Anglo-Saxon politics. At first the land was divided into a number of small kingdoms. The first rulers to extend their local power to the point of leadership over all England were the kings of the region north of the River Humber, the Northumbrians. In that region also literature first developed, a literature whose dialect lingered in fragments in all North British literature to the days of Burns. It was in the seventh century that the Northumbrians gaine preëminence over British kingdom To that century belong their writer the poets Caedmon and Cynewulf, an the unknown transcriber of the En lish version of Beowulf.

The Northumbrian supremacy w overcome, and with that the supremac of the dialect perished. In the Saxo kingdom of Wessex arose Egbert i 802, King Alfred the Great of Wesse made his kingdom paramount in En land, and Winchester an Englis capital. Now a new literature develope in a language still called English, b in the dialect of the West Saxon kin dom. King Alfred's reign was the fir golden age of English literature, b in the distresses of the next few ce turies, fewer books were written England.

England did not know, indee whether it was to be "Saxon or No man or Dane." The Danish Ki Cnut ruled England and Scandinavi And when finally the Germanic royal was restored in Edward the Confesso it was not a restoration of Engli literature nor a triumph of Engli speech, for the restored king w Norman in training and Norman language.

The court-and-palace conquest the English language by the Norm French was begun before the Norm Duke, William the Conqueror, a tempted the physical conquest of t nation.

The Anglo-Saxon Kings Depart

The Duke Normandy and l nobles, once in p session of Englan spoke French. Some Normans despis the speech and the people of Englan William the Conqueror himself soug to learn the idiom, but failed befo its difficulties. At this time Engli was again at a great disadvanta among languages. The French w spoken in many kingdoms and und stood in many others, and linked Latins in the gay chivalry of the Sou A jury of learned men of that d looking for an international spee would never have chosen English any development of English.

The French, in one or anot form, seemed destined to conqu And it might have conquered, if t English kings had retained all th holdings in France, and had det mined to unite both lands in Ga speech. For while the total number Norman invaders was few, and wh the English language was admitte prevalent in the island, the langua of law courts and schools, the langua of castle and palace, was Norm French. And to some of these t center of the realm may have seem to be in Normandy and not in Englan though William, ruling on the Contine as a Norman Duke, (*Concluded on page*

Gen. Butler's Clean-Up

A Club Has Replaced His Sword

by CHARLES ALBERT COLLMAN

DIRECTOR Butler told me that one of the most unfortunate features of Philadelphia's night life is at young girls of good families e tempted by sportive companns to visit resorts where illicit quor is sold; not infrequently ey are arrested by detective uads. Then the father or mother pears in the office of the Public fety Department in City Hall:

Indignant parent: "You've arsted my daughter. It's an outge!"

The Director: "Where did this ppen?"

Parent: "There was a raid on e Café Blank."

The Director: "Why that's an derworld cabaret, with immoral ncing and indecent shows!"

Parent (horrified): "Goodness, y I had no idea—"

The Director: "Why do you let ur daughter go to such places?"

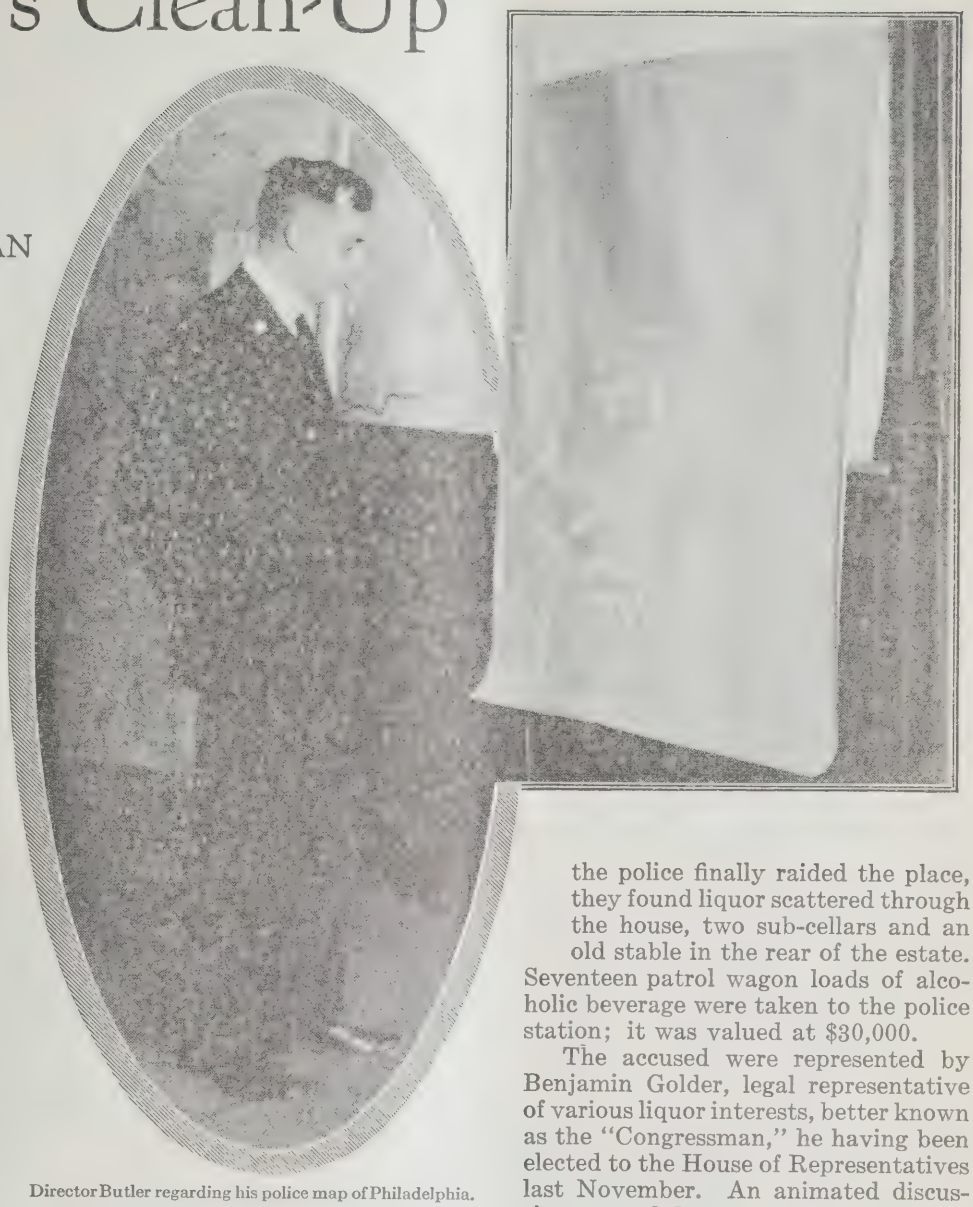
Parent (decidedly): "I'll see that e never goes there again."

Certainly to the superficial eye, iladelphia is a clean and wholesome y; that is the impression of the ranger arriving from Chicago, New ork or Baltimore, who makes comrisons as he traverses Market, Broad, ch or Chestnut streets. But an inection, also, of Callowhill, Franklin, oble streets, all the old Tenderloin m Sixth to Twelfth, from Vine to irmount avenue, tells its own story.

The Common Pleas Courts of Philelphia, still distinguished by criers d tipstaves, are presided over by od judges, acutely interested in the y's welfare; in the Municipal Courts, is sentiment is not quite so emphatic; deed, one of the judges is a member a league opposed to the Prohibition w. Among the 28 police magistrates, ere is less sympathy with the cleang up of the city.

On December 19, 1924, Governor nchot named the first woman agistrate to obtain that office Philadelphia, Mrs. Violet Fahnestock, president of the iladelphia County Women's ristian Temperance Union, o is active in many civic, urch and women's organizaons.

Both from the nature of her ice and the principles which e represents, Magistrate hnestock has ever since been



Director Butler regarding his police map of Philadelphia.

a storm center about which rage the anti-Prohibition and anti-reform elements of the city. One morning I attended a session in her court. The hearing concerned itself with the arrest of two men who lived in an ancient mansion at Wissahickon avenue and Abbottsford Road, in one of the old residential sections of Germantown. Police Inspector Holton, it seems, had received an anonymous letter, informing him that large quantities of liquor were stored in the 31 rooms of the old building; an investigation followed, which consumed two weeks. When the police finally raided the place, they found liquor scattered through the house, two sub-cellars and an old stable in the rear of the estate. Seventeen patrol wagon loads of alcoholic beverage were taken to the police station; it was valued at $30,000.

The accused were represented by Benjamin Golder, legal representative of various liquor interests, better known as the "Congressman," he having been elected to the House of Representatives last November. An animated discussion ensued between Golder and the magistrate, while the latter was interrogating a youth of 18.

The Congressman: "You can't question my client on that point."

The Magistrate: "Can you prevent me?"

The Congressman (dictatorially): "And you can't question me."

The Magistrate: "You're a fine attorney."

The Congressman: "And you're a fine judge." He insists upon the discharge of his clients, arguing that a stable or a garage is part of a private house, and therefore the police had no right to seize the liquor.

The Magistrate: "I shall hold the men for trial."

The Congressman (in a loud voice): "You've committed one wrong by permitting the raid; now why commit two by holding these men?" He directs a grin toward the bootleggers present in the little courtroom; then he edges over the railing and partly leans upon the magistrate's desk, adopting the air of truculence

A NEW FORCE IN AN OLD CITY.

Governor Pinchot declares that Butler is a refreshing change for "corrupt and contented" Philadelphia.

Joseph Pennell, the artist and acrid writer, says that drinks are openly served at the bar of a great club near City Hall. Samuel Vauclain, the locomotive builder, is dubious about it all. What do *you* think?

usually assumed by men of his race in police courts. "The Supreme Court has never rendered a decision in a case like this," he insists. "Listen to me; you're taking a chance."

The Magistrate: "I'm willing to take the chance."

The Congressman (menacingly, as he shoots his underjaw out in front of Mrs. Fahnestock): "I've given you my law, now you give me yours. Tell me what you base your position on. Let me know it," he demands.

It must be confessed, he displays little chivalry in his demeanor; he is trading on the new magistrate's inexperience.

The Magistrate (viewing the lawyer through her glasses—she may be inexperienced, but she is unperturbed): "I hold them each in $2,000 bail; *prima facie* evidence has been presented by the police."

The Congressman (shrugging his shoulders contemptuously): "Oh, what's the use!" He stalks out of the courtroom with his clients.

Mrs. Fahnestock is next confronted with a group of men and women who were arrested in a raid on the Pandora Café. Several of the young women are dressed in the latest mode. One of them explains that they were merely celebrating the engagement of one of their companions.

"That's a fine way to celebrate a marriage engagement," exclaims Mrs. Fahnestock. "The Lieutenant has testified that liquor was found at your table. Shameful! You would do better starting in life with only a loaf of bread and a Bible under your arm."

The antithesis to the above proceedings may be witnessed in the courtroom in which presides Magistrate Edward P. Carney, who is an avowed defender of personal liberty.

This morning the magistrate enters the police station with short, brisk steps; he wears an important air, and a conspicuous sapphire and diamond stickpin in his striped necktie. He is about to hear a case that appeals to his fancy. Detectives called at a house in Stanton street on information that a still was being operated there; it was a false tip, and now the offended house owner, his family, relatives and neighbors are on hand to complain of the overofficiousness of the police. He assumes the bench with a frown at the group of reporters and cameramen on his right, and fixes their attention with an upraised finger.

"You tell the truth about me," he warns, "or I'll put you all out of this place. I had one reporter fired from the *North American* this morning, and I'm going to put two more men out of their jobs.

"As for this policeman who made the raid, I'm going to hold him in $800 bail. When Director Butler sends 18 plain-clothes men into one café in a single evening, you can't blame the police department for having a hard time. While those 18 men were looking for liquor evidence in that one café, bandits and other wild characters were roaming the streets. I won't settle this affair until Director Butler gets a report of this hearing and has a chance to take some sort of action. If he doesn't act, I'll hold the policeman for the Grand Jury on a perjury charge."

The magistrate next holds four city detectives each in $800 bail for a hearing in connection with charges that they raided a private home. He complains that the warrant should have borne the signature of Magistrate Fahnestock, and he ostentatiously threatens to arrest his fair fellow magistrate. "I hear," he begins ominously, "that Mrs. Fahnestock says she won't appear before me in this case. I want to say now that I'm going to subpoena her next week, and if she fails to appear, I'm going to issue a warrant for her arrest and charge her with obstructing justice."

Bang! goes the gavel.

All these pleasant interludes are directed against the Director of Public Safety; they are subdued pin-pricks to which he is hardened. But openly, as a matter of fact, a truce has been declared between General Butler and the "organization."

General Butler talks in short, quick phrases, delivered with a toss of the head; he has decided views, and no hesitation in expressing them.

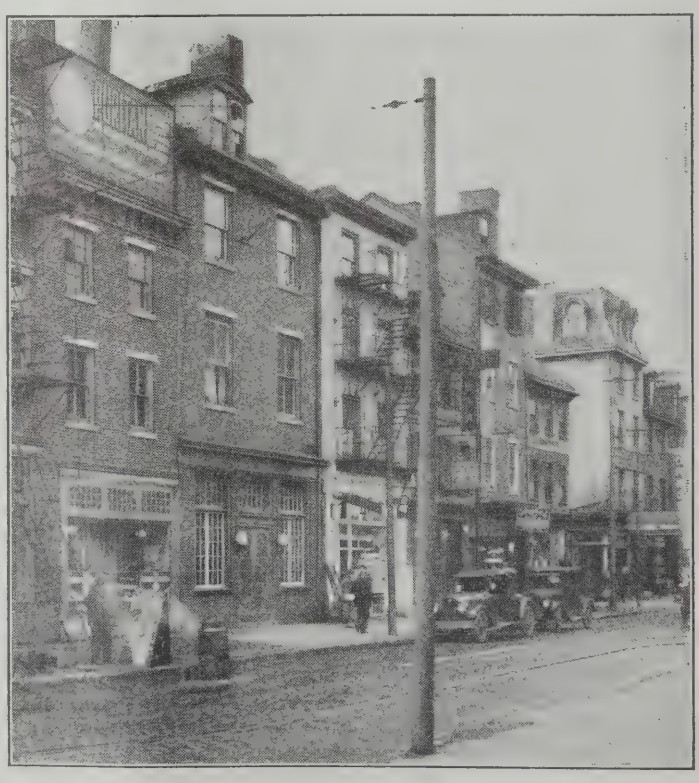
"A public official has got to be backed by public sentiment. The people of Philadelphia are peculiar. When I first came here they accepted me without question, probably because I am a Pennsylvanian, or maybe because I am the first Pennsylvanian to attain general rank since the Civil War. They knew my record and believed in me, and I'm convinced that they've still got faith in me. But they're ultra-conservative. From surface indications, one would suspect an absence of public spirit; but once aroused, Philadelphians can be most formidable. In 1905 they marched on the City Hall with ropes in their hands and threatened the Councils. One month after my appointment, while I was under an avalanche of attacks, ministers representing more than 500 churches protested to the Mayor against my removal or interference with my work. But they are reluctant to come forward in the work of cleaning up the city. In a way you can't blame them the moment they appeared in public they would be attacked by men like Carney and Golder, and because of their views, they would be held up to scorn.

"A forceful public opinion is needed to sustain the situation; there's no health in cloistered virtue. I've been devoting some thought how it is to be made possible for private persons to come forward in expressing their views on social questions without being molested by demagogues and agitators. I have thought out a way in which I believe it may be done. The thought came to me when Bishop Garland, of the Episcopal Diocese, invited me to preach from a pulpit at the Church of St. John the Divine, in Overbrook. I realized then that citizens could be induced to express their public views without fear or annoyance through the medium of the churches. there it is expedient for hundreds and even thousands to sign favored petitions, and these would have a telling effect upon men in public life."

"Do you consider that the underworld crowd has been eliminated from Philadelphia for good?" I asked the Director.

"Those people?" he exclaimed. "The moment law enforcement is relaxed they'll be back at once. They're boasting about it."

Grand juries are notoriously reluctant in handing down liquor indictments. While I was in Philadelphia I had an opportunity of witnessing the methods of Director Butler and his men



Types of Philadelphia cabarets which figure in General Butler's campaign.

in trying to overcome this obstacle. The April Grand Jury had earned the name of the "Wet Jury" through having ignored more than 100 liquor cases. When Lieutenant Charles Beckman, of the liquor squad, appeared before it, one of the jurors, Thomas Barrett, Sr., manifested reluctance to listen to his testimony in the police case against the Hotel Stenton. When Beckman suggested that a certain detective be called before it, Barrett said impatiently, "Oh, we don't want to hear him. His testimony is the same as yours."

Mrs. Violet E. Fahnestock, Philadelphia's woman police magistrate.

Beckman reported to his superior, Police Inspector Caleb J. Brinton, and the latter sent an account of the circumstances to Director Butler, accompanied by the police record of the juryman in question. Director Butler, accompanied by Edwin M. Abbott, counsel for the Public Safety Department, immediately went to court, where Judge Audenried was presiding at a trial. "Your Honor," said Mr. Abbott, "I wish to call your attention to a matter of great public importance concerning a member serving on the Grand Jury."

The Judge sent a court officer for the members of the Grand Jury, who filed into court, led by their foreman. Mr. Abbott now began a public examination of the juror, Barrett, who was an inspector in the Bureau of Weights and Measures, and a member of a political club in the Second Ward.

The lawyer: "Isn't it a fact that on October 26, 1912, you were arrested for selling liquor on Sunday and without a license; and that on February 10, 1913, you were convicted; and that three years later, February 4, 1916, a new trial was granted and the case was *nolle prossed?*"

The juror: "I was discharged."

The lawyer: "You were convicted?"

The juror: "I was discharged."

The Judge (leaning forward): "Is it a fact that the jury passed on your case and said you were guilty?"

The juror: "Yes; but the judge granted me a new trial."

The lawyer: "Weren't you arrested November 8, 1921, for assault and battery on a woman? Weren't you arrested October 17, 1924, for assault and battery by automobile?"

The Judge: "Well, Mr. Barrett, don't you think it would be better if you didn't serve in the administration of criminal justice?"

The juror (belligerently): "No sir; I never was convicted of anything."

The Judge (emphatically): "Well I do. You are discharged from service on the Grand Jury."

Judge Audenried then discharged a woman juror who had been seated beside Barrett. It was said that a motion for ignoring 56 liquor indictments in a single day had been made by the two retired jurors.

The difficulties with the grand juries are continuing. When the May Grand Jury refused to return many indictments in liquor cases, because, as its foreman declared, its members did not believe in the liquor laws, the admission brought a hot denunciation from Judge Monaghan. He told the jurors in effect that they had not done their duty and dismissed them without thanks for their services, an omission for which court veterans could find no precedent.

In charging the June Grand Jury in Philadelphia, Judge McDevitt told its members that grand jurors who permit their prejudices to sway their decisions were "traitors to the sanctity of their oaths." "We are being harassed on all sides," said the Judge, "by a wave of unprecedented lawlessness, disrespect for the law, disregard for authority and contempt for an oath. This is not the time to advocate mitigating the rigors of the punishment of a criminal. This is the time to inject common sense into the treatment of the willful violator of the law, the persistent desecration of the temple of justice."

His Honor, Edward P. Carney, known to Philadelphians as "The Dancing Magistrate."

Philadelphia is distinctive; it has been calmed by age, perhaps by the charm of its own tranquil streets, and the influence of a people who never, even in moments of folly, have lost the saving grace of sanity. But the exploiter seems always to find it both expedient and profitable to victimize such sedate and quiet communities. Philadelphians discovered this truth something more than a decade ago, and in the best reform movement their city had ever known, they chose Rudolph Blankenburg as Mayor; he had high courage as a leader, but nevertheless he failed, despite his splendid example, to rid the city of its incubus. Seven years after his term ended, in 1916, Philadelphia found itself worse than ever in the toils. It was the old, old story; a closely knit organization controlled its city departments and used them in deriving revenue from the Tenderloin, its disorderly cafés, its houses of assignation and, above all, its liquor traffic. In some ways it has grown the fashion to accept the inevitability of such a situation; but Philadelphians are a peculiar people.

The city for years had been a beehive of laboratories, of manufacturers of drugs and chemicals, of distillers and rectifiers; this may explain why, since prohibition, it became a head center for the illicit manufacture of low-grade alcohol. In the two years ended June 30, 1923, the amount of specially denatured alcohol produced in Philadelphia increased from less than 800,000 gallons to more than 5,000,000 gallons. An overwhelming proportion of alcohol, withdrawn for apparently legal manufacturing purposes, was packed in freight cars, under false labels, and shipped to cities west, south and north, for beverage purposes. "Judging from the amount of alcohol withdrawn, enough perfumery and toilet waters were manufactured in Philadelphia every day to supply the whole world with such luxuries for a week."

The noble city, whose State House Bell had once rung out to the world its message of Liberty, had become known as "the paradise of bootleggers." More than 1,300 saloons flourished, their traffic undisguised. Hold-ups became common and even several policemen were convicted of complicity in robberies. Throughout the country, the trials of criminals began to tend toward the City of Brotherly Love.

In November, 1923, the Philadelphians, with a majority of 285,000, elected W. Freeland Kendrick as Mayor, and announced that they stood behind him as a community in an effort to remake the city's municipal government. Mayor Kendrick requested President Coolidge's permission to engage the services of Brigadier General Butler as head of the Department of Public Safety, and Governor Pinchot joined him in the request; in this they gained the consent of the President.

General Butler is in the middle forties, and cut on the pattern of a cavalry officer, although he is in the Marine Service, member of a famous corps, with a fine record in many lands; twice winner of the Congressional Medal, he holds many other military honors.

Romantic Rascals

John Law, Financier, 1671-1729

(Seventh of Series)

By CHARLES J. FINGER

WOOD BLOCKS CUT BY PAUL HONORE

(Copyright, 1925, by Charles J. Finger)

BEAU LAW was very rich indeed, and his father had made him so without the least effort or self-sacrifice, he being a goldsmith and a banker without opposition. For three years the lad worked in the bank, learning something of the mystery of money, then at the age of seventeen retired from business to seek less monotonous ways. Then came a series of short cuts to fame and, before his vivid history ended, he had succeeded in bringing more men and women to ruin, and dragging a pall of misery over more households than any one man in history before or since his time.

After leaving the bank, John Law, of Lauriston, Scotland, shone as a beau. Jessamy John, his neighbors called him, because of his smirking and parading, his spending hours at his mirror, his paying of compliments and all that sort of thing. He was a youth tremendously concerned about his coats and ruffles, his ribbons and buckled shoes, his powders and perfumes and gold embroideries. He appeared as a dancing, primping, affected puppet moving among hard-faced and robust Scots. When his father died in 1688, it was thought that John would buckle down to business. But John thought otherwise. Without a word to anyone he disappeared, and when next heard from, he was in London.

It was a London of coffee-houses, of bear-baitings, of prize-fighting, of high gambling, of public executions, of pillories, of narrow streets and mud and filth, but for the young Scotch dandy a haven of glory. At first he patronized the coffee-houses, mildly amused by the verse-makers and pamphleteers he met, but the impecunious and out-at-elbow fellows soon wearied him. So he flew higher, meeting men of note and talking national finance, his hobby. Once he met the queerly inquisitive and gossipy Samuel Pepys who knew something about naval finances, several times the great John Dryden at Will's coffee-house, now and then the elegant Joseph Addison and his friend and patron the Earl of Halifax. But, after all, they were dull fellows without the glitter and sparkle that Law loved. So he took another step and moved into a house westward of Charing Cross where lived those who held with Ethrige that it was a fashionable man's duty to dress well, to dance well, to fence well, to have a talent for love letters, a pleasant voice in a room, and to be always amorous but sufficiently discreet. For the world of fashion affected the French manners of the day, and selfishness and recklessness were marks of superiority, especially the recklessness of the gaming table. And there young Law shone, for he loved the sound of clinking coin and the subtle fascination of gold and jewels. To lose or to win four or five thousand pounds in a night was a delight. He flung away money, wagering heavily not only on cards and dice and basset, but on such trivialities as whether one raindrop would reach the bottom of a windowpane before another, or which of a couple of flies would take wing first. And to pass nights when there was no heavy gaming there was the company of roysterers who went about in noisy parties destroying statuary, pricking citizens with swords, seizing old women and rolling them down Snow hill in hogsheads. All that John Law found very charming and delightful until the crash came, and one night he went to bed with his estates heavily mortgaged and a duel on his hands because of some silly flirtation. In the duel he ran his opponent through the heart, was arrested for murder, and, being found guilty of manslaughter, was taken to the King's Bench prison.

How he escaped from prison was never known, but escape he did, and though there was offered a reward for his apprehension, he found his way to Amsterdam where he was soon known as the premier gambler. For fourteen years he wandered about Italy, France, Germany, Holland, known at every gaming house and at every fashionable resort; sometimes he was under suspicion and sometimes under arrest. Three times he was expelled from cities by the magistrates as a dangerous character—first from Venice, then from Genoa, then from Paris. But wherever he went he made it his business to call upon men interested in finance, setting before them a scheme to establish what he called a Land-bank. He wanted to be in charge of the institution and to have the right to issue notes backed by the value of the land of the state. All financial ills, he held, would be dispelled with the proper use of paper money. Notes should be coined, for no nation could expect to thrive on a metallic currency. He harped on his idea everywhere, wrote pamphlets about it and succeeded so far as to get the Scottish parliament to discuss the project. But meanwhile, so far as his own affairs went, he fell from bad to worse.

Suddenly a tremendous vista opened and the ruined gambler at forty years of age leaped into glittering light. France became his unexpected field. It was France financially deeply diseased and disorganized, a France with a population crushed by taxation, a France with a government in a perilous state because of the unwisdom and extravagance of her rulers. It was a France in which a babel of nostrums were dinned into weary ears, and where men were vehemently working out cross-purposes and discordant projects. The Duke d'Orleans, then Regent, listened to Law, resolved to give his plan a trial and, in 1718, Law opened his first bank in Paris with permission to manage the royal revenues and to issue notes upon landed security. Immediately there was confidence everywhere, not that anything had been done or that anyone paid any particular attention to what was to be done, but because everyone imagined that something wonderful would be done. Law was a mighty physician

public eye, one able to cure eco-
ic disease with a magic wand, so
rywhere was admiration, exultation,
piness; in every head a vision of
ional resurrection. Before a year
passed, Law's notes rose to a
nium of fifteen per cent and there
e branches of his bank in Lyons,
helle, Tours, Amiens and Orleans.
To obtain a monopoly was Law's
t step and the Regents granted
the exclusive privilege of trading
he province of Louisiana, and on
Mississippi River. But it was an
lly imaginary country that was to
exploited, one in which gold and
er and precious
es were com-
n. Law issued
k in the Missis-
i company and
sold readily.
n the Regent
led trading
ts in the East
es, in China
in French
a and again
issued stock.
n in a week
two everyone
t mad. Rich
poor scram-
l for shares

park of thirty
s was fitted up
stock market.
nediately the
e was noisy
the voices
tools of a
sand men. A
e city of tents
booths ap-
ed, gaudy, flimsy structures, and
the rents exacted, a sum equiva-
to a hundred thousand dollars a
th went into Law's pocket. Law
like a man beseiged by people
sting riches upon him. Vast estates
me his in exchange for worthless
k. He was the owner of mansions,
ces, country seats, valuable jewels
were heirlooms. Neither his
lth nor his power could be esti-
ed.

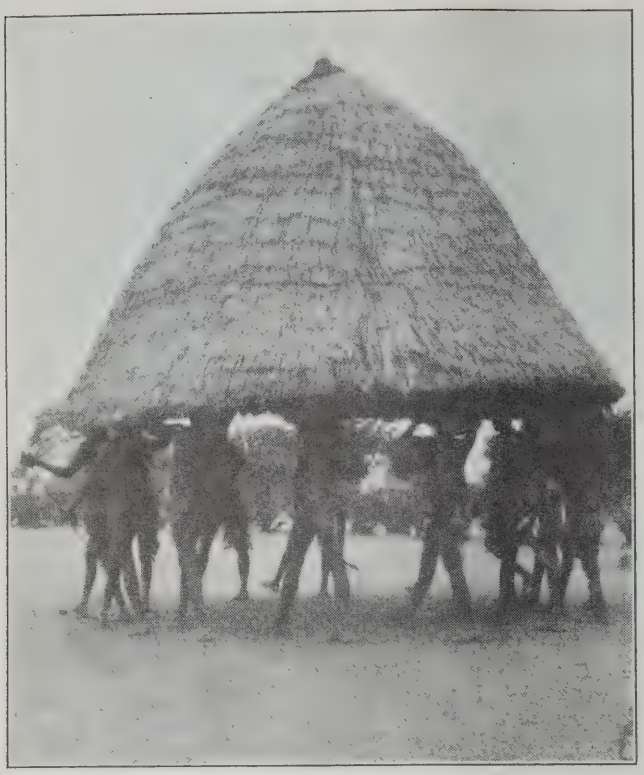
From all over France, and from
ign countries, too, people came
ring. To accommodate them great
ls were built and an army of workmen marched on Paris. Wages leaped higher and higher, workmen dressed in fine clothes, wore jewelry, bought and talked stock, built for themselves fine houses. Those who had land sold it for what it would bring and bought stock with the proceeds. Artizans sold their workshops and tradesmen their businesses and flew to Law with the money, some bribing his servants to intercede for them until they too grew rich and invested their gains. Mississippi stock leaped daily and the higher the price, the fiercer people fought. Up, up and up went the tide; daily the paper money increased, all original restrictions upon its issuance forgotten. Meanwhile the wheels of sound industry ran slower, for men had no liking for sober work when thousands of livres a day might be had by the purchase and sale of stock, and with the relaxing quality of industry, there were higher and higher prices so that the most sober joined the stock buyers.

Meanwhile royal personages sought the favor of Law, were eager to make marriage alliances with his daughters, offered him the entire management of their affairs. He gave away thousands of livres, literally dropped money when he went about in his carriage, and his progress was between lines of cheering and shouting people hailing him as the hero who had abolished poverty. Law was king of the world, the master of money, the glittering center of a vast rainbow-colored bubble blown to its utmost tenuity and he knew that at a touch the flimsy thing would vanish.

That touch came when he refused the Prince de Conti the shares that he wanted in India stock, at the price that he offered. In revenge, the Prince demanded payment in specie for his holdings, notes and stock, and sent three wagons to the bank to carry away the silver and gold. The contagion of that was inevitable. To ward off swiftly approaching trouble, the hard cash was ostentatiously loaded into the wagons and carried away under guard, six stout horses straining under the load. Before the day had ended, two-thirds of the cash was back again in the bank, redeposited under the order of the Regent. But that did not stay things. There were timid folk who tried convertibility. They were paid in copper money and had to refuse the tremendous burden. Vermalet the stock jobber was wiser, effecting his exchange in distant villages secretly by means of agents, getting out of Paris at last with a sum equal to half a million dollars in gold and silver, carrying it away in a farm cart, the money hidden under manure and himself dressed in a dirty blouse as a carter.

He got out of Paris with a sum equal to half a million dollars.

With the spreading of the cash-hoarding mania, paper was looked upon with suspicion at first, then flatly refused. Men saw their fancied fortunes melting. Everywhere was swift approaching bankruptcy. Trade and building activities slackened, then ceased entirely, and hundreds and thousands were unemployed. The life current of industry dried up and close-fisted money lenders seized upon those who were sane (Concluded on page 31)



Carrying the roof of a hut.

The African Negro

Intimate Glimpse of His Daily Menu

(Second Article)

By HENRI GALLAND

"WHY do you eat the flesh of snakes?" That question which I once asked the members of my caravan who were sharing pieces of a huge python they had killed in a termite-hill which it had turned into its refuge, brought me that other question: "Why do the white men eat the flesh of the water-snake (the eel)? You eat the snake that swims, we eat the snake that crawls; each has his own way of feeding!"

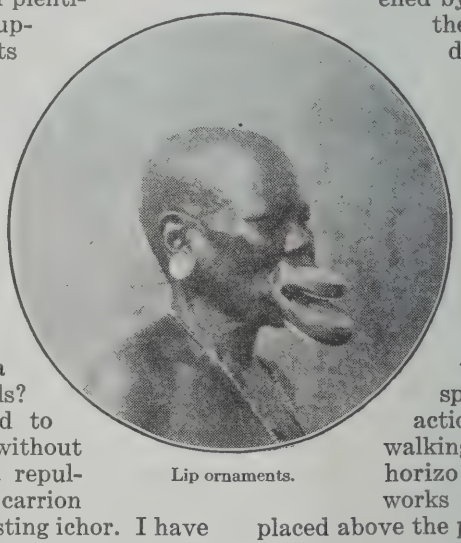
There is obviously no lack of logic in such a rejoinder, and nothing proves that the flesh of the snake is not as substantial as that of the eel. It is none the less true that the way of feeding of the black man can in no way be compared with that of the white man.

In the African highlands, in Angola, in Ruanda, the Kivu districts, on the spurs of Mount Kilimandjaro, in the country of the Masai, wherever cattle-breeding is possible, the black man is endowed with greater powers of physical resistance. But in other places, where the tsetse fly bites men and beasts, where it is therefore impossible to breed cattle (unless it be perhaps small cattle) the Negro is in a most wretched physical state and he easily becomes a prey to the diseases which are constantly waiting: sleeping sickness, tuberculosis, smallpox and similar diseases.

He does live, indeed, on the produce of his plantations. He even occasionally sacrifices a chicken or a kid, but, generally speaking, only in exceptional cases; for those animals are mostly or solely used, with many tribes, for commercial and matrimonial transactions. And if we bear in mind that many crops and fruits considered as native have in fact been imported by earliest white travelers, or even by the Arabs of Northern and Eastern Africa (manioc, maize, earth-nut, orange, lemon, etc.), we must conclude that the Blacks formerly lived on the produce of the savannah and of the forest, of their hunting and fishing, as the Negrilloes, with whom we dealt before, do even today.

Gradually, as they settled on the soil, agriculture became for them a necessity, but while, since that remote era, new processes have constantly been improving our own system of cultivation, has *their* system changed?

But for a few local variations, which were fortuitous, we may give a negative answer and state that the native agriculture is standardized and remains in the same stage of development. The black man acts only by routine and the whole of his philosophy rests on the principle that one must exert oneself as little as possible. He has the utmost contempt for agricultural work, well aware that his plantations, which he leaves entirely to the care of women and slaves, will provide him with his scanty fare. And then, has he not the forest and the savannah, those everlasting and plentiful storehouses, to supply him with fruits and animals, big and little, even the most loathsome of which delight his taste—rats, grasshoppers, caterpillars, palm-tree worms, etc., and the river, too, with its fishes of so many different kinds, some of which may reach a weight of 200 pounds?



Lip ornaments.

Anything is good to him. He will cook, without feeling the slightest repulsion, decomposed carrion covered with a disgusting ichor. I have seen paddlers jump into a river to get some half-rotten fish left on the bank by eagles. And if the black man is asked how he can swallow such putrefied flesh, his sure reply is that he does not eat the smell! What is essential to him is that he should be sufficiently fed, or if the reader will excuse a mo realistic phrase, "that he should full."

I mentioned hunting and fishing two of the means used by the bla man to get his food. Whether he liv in the savannah or in the forest, t Negro is passionately fond of huntir hunting is indeed for him the time pantagruelic feasts, for those feasts meat which often make him sick w indigestion, those repasts moisten with countless calabashes of palm-wi of which we haven't the slightest co ception.

In the savannah, when the season is nearing its end, the gr *battues* take place. Each village ow its hunting-ground, but this is always respected by the neighbo which is sure to cause quarrels, murd and even wars. Fire hunting is most commonly practiced; women a children take part in it; by th shouts and a deafening din they b down the maddened game tow narrow paths, contrived in such a w that the game cannot but go into th and fall in nets 30 feet long and feet high, where they are killed men who lie in wait.

Every year, innumerable antelo of all sizes are thus butchered. As buffaloes and elephants, they are compassed with a wide circle of f When the beasts are made blind the thick smoke which rises up fr burning bushes, and are frig ened by the crackling fla the hunters can ea draw near them a destroy them eit with their jave or their flint, percussion m kets.

They use a the same weap that, as we h seen, is emplo by Negrilloes; vertical mace, p vided with an i spear that is put action by the ani walking under it. horizontal mace, wh works in a similar way placed above the path and kills sma animals.

Nooses are used for hunting monk and birds, on the banks of rivers. T tall standing poles, tied the one to other by many lianas made into sna secure the catching of many migrat birds or even of those huge b

nmonly called flying dogs (*hypingutus nstruosus*) who attain a size of two t six inches long, and whose taste Negroes find delicious.

It is hardly necessary to add that ps, pits, lime-snares, etc., are comnly used for catching huge or small sts.

In the Gaboon's forests the Fangs Pahouins manage to draw the phants in inclosures made with big nks of trees where they can easily ghter them.

Some tribes breed dogs with a view eating them. Duarte Lopez, whose ount, translated by Pigafetta, was lished in Rome in 1591, already ed that in Angola the natives prefer h of dogs to that of all other animals l that they are especially fond of iled snake.

Again, large rivers and oks are for the Blacks rich res of food. All the fishing ices are made use of: nets, res, spillers, trawls, weirs, e feet high and four feet in meter; hoop-nets, huge den weirs extending from bank to the other with, e and there, very long bow s into which the fish become angled and are unable to l their way out.

Leaves, or their juices, serve in many districts to son and intoxicate the fish. People living on river banks t the hippopotamus by ans of a barbed spear which, le thrown from the handle, ains tied to it by a long e. To the rope they fasten uoy, which tells the place ere the pachyderm has k. Severely wounded, the popotamus sinks and gets wned, and only reappears the surface when its body putrefied. The beast is wn on the banks of the river, in spite of its loathsome smell, s immediately cut up by a troop of n who unhesitatingly fumble among stinking viscera. It is then cooked eaten with a gravy made of the test spices and outrageously salted n salt extracted through lixiviation n the ashes of certain plants. The t lasts for several days. Then ing comes, or even dearth, until ther feast is forthcoming.

It is on account of those periods of ing and of dearth that the program ducation for the youth includes a wledge of all that the forest, the annah and the rivers can yield. h some foresight the black man d easily manage to feed in a normal . He does, indeed, now and then, are smoked meat or dried fish. such provenders have for him an istible attraction, and they are n as soon as they are ready.

Among tastes peculiar to black s, cannibalism is worth serious sideration. The earliest travelers revealed the existence of that odious practice among many tribes of Central Africa. The custom, it may be confessed, is extant nowadays, but the strict penalties enforced upon those who practice it will soon cause it to disappear altogether.

I have stated that the physical wretchedness of the Negro was caused by his bad food. I must add also, by his want of hygiene, for it is a fact that the black man is unacquainted with the most elementary principles of hygiene. The child is brought up without any care. If child mortality does great havoc among the Blacks it is because during their suckling time (which lasts for four or even five years) children ingest from their earliest infancy the most dissimilar and ill-assorted aliment.

Sample of a fish of the Congo River.

In the native village the child is left to itself. It may be seen rolling about in the ashes of the fireplace, in the dust of roads, thus covering its body with a thick layer of dirt that will not be washed off until several days elapse. The same thing may be said as regards grown-ups, who wash very seldom. The only exception is perhaps the people who dwell on the banks of a river. Everywhere else, on the highlands where water is scarce—such as the boundless tableland known as that of the Batele, which extends northeast of Brazzaville—the natives do not wash. They think that filth protects them against sunburn during the rainy season, or against the biting colds of the dry season.

Often, too, the Negro will add to the filth that covers him a layer of reddish wood dust mingled with palm oil; on other occasions, when he is in mourning, for instance, he will paint his body white or ochre, and trace the most varied drawings on his chest. A *suibeneris* smell is produced by such an extraordinary mixture, which is for the Negro the proof of the most perfect hygiene.

His mouth is perhaps the only part of his body of which he really takes care. We all know that the whiteness of his teeth is a remarkable feature of the black man. After every meal, although he has drunk very little or not at all, he usually washes his mouth and rubs his teeth with a small piece of wood; that operation will often last for several hours and he performs it almost without being aware of it.

The custom of pulling out their teeth or of cutting them into a pointed shape is very common among them. Sometimes, the two upper incisors, sometimes the two lower ones, are thus taken off. Or else both incisor and canine teeth are given a pointed shape. Those different operations are accomplished by percussion and not, as is generally believed, by filing. But such details belong to the esthetic life of the black, which will be studied later.

Shall we mention their hair, the adornment of which reveals some artistic taste and which is always attended to by women with minutest care? When they are in mourning, however, the fine structure falls down and they agglomerate their hair in balls plastered with soot or reddish wood-dust mixed with palm-oil.

Their dress is most primitive. Of course, in the cities where European influence is felt, the black man dresses more fully; but with what rags does he deck himself! Clothes and shoes are in honor, however worn they may be.

Is it surprising that the black man, living under such conditions, should be a prey to diseases of all kinds? Does he even try to protect himself against them? I have seen, more than once, natives whose toes were falling to pieces, gnawed as they were by the chigoe (*pulex penetrans*). Yet the chigoe could easily be destroyed. It is a small flea which lays its eggs in the sole of the foot or under the nails.

The cure of broken bones, wounds, ulcers or of more dangerous endemic or epidemic diseases is intrusted to the fetish-man, a personage to whom I shall recur in another article.

Last of all, let us mention their dwellings. The huts are of different shapes and sizes, according to districts, but they are everywhere stuffy and ill-smelling. True centers of infection that serve as refuges for all kinds of reptiles, gnawers and insects. There the natives sleep, free from all care, sometimes with their hens, their kids or their pigs.

William Niven

A Scot Explorer and Excavator in Mexico

BY WILLIAM L. STIDGER

ILLIAM NIVEN is a Scot and a proud one, and yet he has spent the last thirty years of his life in Mexico avating the ancient ruins of buried es.

He is small of stature, wiry, with a le like the rising sun, as brown as one the Mexican peons who digs with , because he has spent most of his out-of-doors.

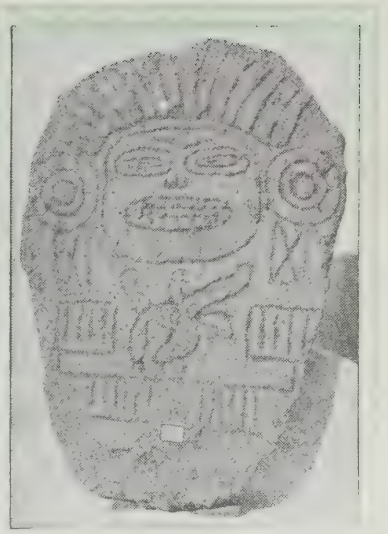
He has never been employed by scientific organization, and has ived little financial help from any- y. All of the 22,000 pieces that he excavated from the dark deeps of xican soil he has unearthed his own expense with the ateur's enthusiasm, work- from daylight to dark, year and year out, making a ger living from the few a curios he has been able ell, after he had given his pieces to the National seum of Mexico City, and er museums scattered all r the world.

He has lived intimately n civilizations ten thousand rs old, and the relics of a lization that existed five sand years before Christ e passed through his hands by thousands, after being unearthed by his excavator's pick.

I have seen him uncover these strange finds, and have seen him dig with a feverish and yet careful anxiety, when he felt his pick strike against the volcanic rock of a plaque that had been undisturbed for untold centuries. I have been his guest on several of these digging excursions in Mexico and have watched his Scottish eyes leap with light, and heard him laugh aloud like a boy at play, as he has made some glorious find. He granted me the privilege of digging with him when Mr. Morely of the Carnegie Institution of Washington, D. C., was inspecting his ruins and his work.

To the everyday man Mr. Niven's explorations come with a thrill of adventure because we are told that the work that he has done has revealed civilization on the Mexican plateau that dates back as far as 10,000 B. C.

Perhaps William Niven's most startling discovery was the so-called "green skull," a story of which was published in THE DEARBORN INDEPENDENT more than a year ago. This skull was covered with wrappings of maguey paper, was green in color and was likely the skull of a priest. This is indicated by the care with which it was preserved and by the sacramental implements with which it was surrounded.



Red and yellow tablet of diorite.

Mr. Niven discovered this green skull within five feet of the surface of the earth in a deposit of black volcanic ashes. In this same pit many bones, of hands, arms and feet were also discovered and, in one corner, the bundle containing the skull.

The second great discovery that Mr. Niven has made is that of a partitioned skull. This skull was thirty feet under the surface. This partitioned skull, which created a great sensation when found, is reported to be the only known specimen of its kind. However, since this discovery was reported in this magazine two years ago, Mr. Niven has unearthed several skulls of the same type.

Starting from the center of the forehead within the brain cavity there is a long slanting

ove—Tablet of diorite and andesite, red and red and yellow in color. Below—Some Mongolian figures which Mr. Niven says are the most perfect he has ever found.

piece of bone joined to the forehead which runs back to the rear of the skull. From the peculiar curve of the eyeball socket Mr. Niven feels that these skulls are of the Mongolian race.

The third discovery is suggested by the second, that of the Mongolian civilization, which undoubtedly came over from Northern China, found its way down along the Pacific Coast until it reached the high plateau of Mexico and remained there because of the delightful climatic conditions.

Just a few months before this article was written Mr. Niven invited the secretary of the Chinese legation of Mexico City to examine his collection of archeological finds.

Before Secretary Tao was through he was convinced that there was a Mongolian civilization in Mexico. He found not only the Mongolian features like his own native land, exhibited in the clay and volcanic figures dug up from the excavations, but he also noted many implements and touches of workmanship similar to those of his own country. Three mortars of baked clay, one painted red and the other black, were examined and declared to be identical with similar objects in China. They are found in temples, are used for worship, and are known as "Tings" in Chinese.

What is believed to be a primitive calendar, 40x27x18 centimeters in size.

Red is the color used in all adornments of the temple altars, in incense pots, just as red is the dominant coloring found in all of the drawings, carvings, and implements of incense in Mexican excavations.

The use made of these implements in Mexico is exactly the same as the use made of them in China, according to Professor Mena, the leading archeologist.

In China the number three has special ritualistic significance, and it is noted by Mr. Tao that most of the implements of worship dug up in Mexican ruins, thirty feet under the earth, from a period 10,000 years back, are three-footed vessels, the same as the Chinese.

Mr. Tao, when shown a collection of heads with the headdress displaying a bird, and informed that these were of Toltec origin and Aztec elaboration, stated that the bird was undoubtedly a quetzal, or hteri, or sacred one, with all of its characteristics showing in these Mexican Toltec figures. But the Chinese noted and mentioned the fact that not all of the Toltec figures had the topknot, nor the long, slender feathers. Therefore, if they should be peacocks, there would be a great resemblance to a passage in an old popular Chinese book of the ancient classics entitled "A Journey Westward," in which it is told how in 627 A. D., during the Tang dynasty, an Emperor sent the monk Chen-Youan-Tehuan on a journey to India in search of Buddhist bibles, and that during his travels there he came across a statue of Buddha whose headdress was adorned by a peacock.

Then Mr. Niven called the attention of the Chinese ambassador to the fact that this peacock style of headdress was not at all uncommon in these Mexican excavations, and that hundreds of small figures were being dug up with this adornment. Mr. Tao when shown a headdress with flowers also noted a distinct resemblance to the Mongolian type. This was also true of certain types of Mongolian helmets and military headpieces which were absolutely of the Buddhist type.

Referring to one of the paintings on the volcanic stones he said that it was almost identical with the writing of the Chinese word for "money," and that another little bit of baked clay representing a flower with four petals, with a little central circle, strongly resembled the Chinese word for "plum."

Mr. Niven is not a scientist, but the greatest scientists fully recognize his splendid contribution to archeology.

This old sun-bronzed Scot is a well-known figure on the streets of Mexico City, and has been for nearly half a century. He has survived many revolutions, and has as one of his workers a man whose life he bought for ten pesos, by persuading a general not to execute him for desertion. The peon was to be shot at sunrise, but Mr. Niven interceded for him, paid the general his money, and promised to keep him at work in the excavations. Mr. Niven's plea that Philipe was worth while to him saved his life.

Mr. Niven has seen Mexico City bombarded time and again. He has had to retire from the city for weeks. He has seen the streets run red with blood.

Any day he may be seen with his canvas bag, his old straw hat, his archeologist picks, and his faithful peons, down in a trench, amid the many little mounds of Atzcapotzalco, digging away as if his very existence depended upon it—which it does not.

A rare soul, whose children are now begging him to rest on his laurels and live with them the remainder of his days.

Gen. Butler's Clean-Up

(*Concluded from page 15*)

He has been a member of the Mari since the Spanish-American War; h seen service in Cuba, the Philippin in China during the Boxer Rebelli in Vera Cruz, and is known as the m who cleaned up Haiti. He is known "The Fighting Quaker," although Marines privately dub him "Old Gi let Eye." General Butler is used action, and when he was drafted the hardest job in the country, he i mediately accepted; he realized th was a situation in Philadelphia that b fighting, and action was promised.

Philadelphia now had the prom of a new deal in city government: lentless war for law enforcement. I the Ring that had so long control it was cynical; it had destroyed reputations of so many men, that challenge of a new arrival merely p duced skepticism among its memb

In City Hall, January 7, 1924, G eral Butler took the oath of office, s wearing the uniform of a Briga General; thirty minutes later he arrayed in a specially designed b uniform as Director of Public Safe He then called the bureau chiefs i his office and demanded their resig tions. "If you do your duty," he s "everything will be all right, and resignations will be torn up and thro into the waste basket. This admi tration will go up or down on its po force; that has been the history of city as I understand it; the people Philadelphia have no confidence in police force, absolutely none whate Since I have been in this town I h heard of people moving out of cert police districts because they w afraid to live in them." Leveling finger at the assembled chiefs, the Director continued: "There are police districts in this city; I h officers responsible for what goes o their districts. They must please or I shall reduce the offenders on si That goes from the lieutenant strai down the line. You have 48 hour which to clean up; no more gambl bootlegging or other forms of vice. your police lieutenants that I s take the best man from the ra and make him a lieutenant if I hav do so. Don't worry about polit influence. I know the majority of men will be straight if they have right backing. My policy is t What has been done is forgotten; stand or fall by what you do under

A series of "48 hour offensiv raids and sudden attacks followed, certain types of offenders hurriedly the city. But while bookmakers, g blers and criminals generally had t great extent gone under cover or fle other cities, those who had prof from the operations of this class fo many years were not idle, meanwh in efforts to frustrate or discredit campaigns of the New Director.

One day in September, Gen

tler marched with the Holy Name iety in Washington, and caught a ere cold which developed into a eat of pneumonia. While he was l up, a definite statement was made t the Mayor was about to ask for resignation. Immediately there ne a storm of protest from the law-ding portion of Philadelphia. The w Jersey Methodist Episcopal Con-nce praised the Director's record; ic and business organizations urged yor Kendrick to retain him in his ce; nearly 500 churches adopted olutions calling for his retention. e Law Enforcement League organ-l a mass meeting in the Academy of sic; the auditorium was filled with athering that registered its objection he Director's removal.

Whether or not it had been in the id of the Mayor to remove his Di-tor of Public Safety is not clear; how-r, the real or imaginary differences ween them were smoothed over, l as the General's leave of absence n the marine corps was on the of expiration, Mayor Kendrick ressed the hope that he might ain.

As a distinct warning to criminals, police now appeared upon the ets of Philadelphia wearing Sam wn belts, their holsters grimly dis-ying the handles of Colts or 38-bre Smith & Wessons. Five bandit es were established, in each of ch were stationed ten motor cars, ays manned and ready to pursue oers; a dead line was thrown about banking and commercial district, n Arch to Locust and from the ier to Nineteenth street; 75 banking guarded 170 monetary institutions; gnal system was put in force, with 0 signal lights and alarm boxes at ortant intersections, for the imme-e report of hold-ups and robberies. In one year's service as Director of lic Safety, General Butler suc-ded in convincing law-abiding Phil-phia that a fearless, energetic head he Police Department, having no tical axe to grind, could work won-in rehabilitating the police force checking crime and lawlessness. city of more than two million in-tants, highway robberies and hold-had seriously diminished; 1,049 rderly houses had been closed; 2,566 keasies had been wiped out and 0 alcohol stills confiscated.

The progressive nature of improve-et was shown by the first four ths of 1925; highway robberies, h numbered 309 in the months n January to May, 1923, had sunk mber to 90 during the same period 25. The Director of Public Safety d truthfully say at the close of pl, of the present year: "We have finished the best month in the re-r years of Philadelphia's crime rec-d." There had been 111 hold-ups highways and in stores in April, ; in April, 1925, these have been 24 in number.

Baseball of the Old Days

Interesting History of Our National Game

By ZETA ROTHSCHILD

BASEBALL, the only game born and bred in this country, first saw the light about 1843. A group of young men in New York City were playing a game with bat and ball that, though reminiscent of several old English games, had characteristics all its own. These young men, who called themselves the Knickerbockers, first played in an empty lot, later to be the site of Madison Square Garden.

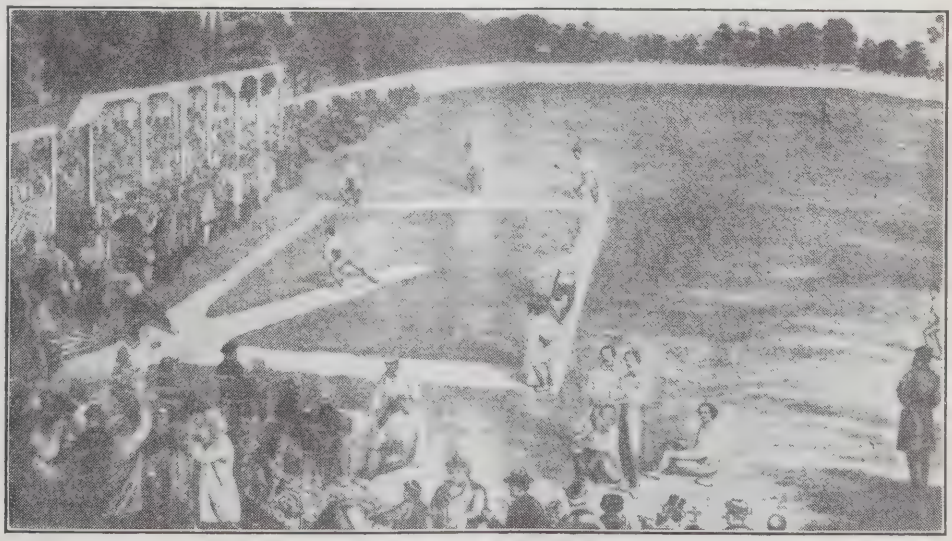
A few competitors came into being during the next decade and several games were played between them and the Knickerbockers. By 1860, there were sixty-two amateur clubs actively engaged in baseball. Then came the Civil War and though the war itself broke up the playing in and about New York City, it, on the other hand, did much to spread the game throughout the country. The players found themselves at the front and there, in their leisure hours, they had their nines and, it is said, played it before Fort Fisher. They played it in the Confederate prisons and thereby sold baseball to the South. Union men from the west saw the game and took it home with them and by the end of the war there were baseball fans from coast to coast.

And when in 1866 a baseball convention was called, two hundred and two clubs answered!

The Cincinnati Red Stockings, the first professional baseball team, was organized at this time under the leadership of Harry Wright, and made a national tour in which they never lost a game. Wright is said to be the first baseball club owner and it is interesting to note the salaries paid this championship team. Harry Wright, center fielder, $1,200; George Wright, shortstop, $1,400; Asa Brainard, pitcher, $1,100; Waterman, third baseman, $1,000; Sweasey, second baseman, $800; Allison, catcher, $800; Cal McVey, right fielder, $800; Hurley, utility, $600.

Baseball was popular at the time of the Civil War, and regimental nines played on the parade grounds.

One of the illustrations accompanying this sketch shows the field during a game between the Atlantics of Brooklyn and the Athletics when these teams played for the championship in Philadelphia before twenty thousand persons.



Second Championship Game between the Atlantics of Brooklyn and the Athletics of Philadelphia, 1866. From a contemporary photograph.

The Bird That Had Nothing on Its Mind

(Continued from page 3)

classify such a mass of information as has never existed upon this earth.

It should do far more than that. It should study special problems that, for the moment, seem pressing, and focus all of its faculties upon their solution. Right now, for instance, if enough brain power were applied to the task, a cheap synthetic rubber could be evolved that would save the American people hundreds of millions of dollars a year. The time may come when a cheap synthetic motor fuel will be needed to replace gasoline. Without doubt such a fuel can be produced—but we don't yet know how to do it. We don't know because enough trained ability has not been applied to the task of finding out.

Scientific research pays the biggest dividends in comfort and happiness of any material thing in the world. What would be the easiest way to go back to the Dark Ages? Forget a few things that we have learned. Cut off the dividends that are coming from our knowledge. Forget that power may be derived from compressed steam and falling water. Forget these two things and every factory and every train in the world will stop. Not even electricity could start them. Electricity is not power. It is merely a means of conveying power. Forget how to use steam and falling water and we should have a world without factories and trains. We should have to go without or make by hand all that is made in factories.

Forget how to make a high-speed internal combustion engine and every motor vehicle in the world will stop. The motor industry, with all that it implies in modern life, is due to the fact that men learned how to explode certain fumes from certain oils in a certain way. It is perhaps a small bit of knowledge, but it has had tremendous results. Who knows how many other such small bits of knowledge may be lying about the universe?

One of the most astonishing facts about scientific research is that every new fact learned may vitalize a thousand other facts that we already knew but could not use. What good would it have done, a thousand years ago, to have known that gasoline fumes, exploded in a cylinder, would create power? How could the fumes have been exploded? The solution of this problem required a knowledge of electricity.

Benjamin Franklin and all the other early students of electricity were really working on the automobile, though they did not know it. They were working on the radio, too. So were the men who learned how to blow glass. No glass blowers, no tubes; no tubes, no radio except crystal sets. It is just as simple as that. The radio is possible today because its fundamental facts fit into a number of other facts already known, without which it would have done no good to know all that is known about super-heterodynes, reflexes and all the rest of it.

That is why the world seems to be moving along so much more rapidly now than it ever did before. We are gradually accumulating a stock of facts into which later facts may fit. This is the sole explanation of the unexampled progress of invention during the last hundred years. There is no proof that human intelligence is greater now than it was two thousand years ago, but there is abundant proof that we have more tools with which to work. Facts concerning the operation of natural laws are tools.

Men have wondered whether we can keep up the pace. Men have wondered if there will ever be another century that will produce so many scientific marvels. They need not wonder. The pace will not only be kept up but accelerated. The greater our stock of facts concerning the operation of natural laws the more rapidly we shall proceed. This stock must steadily increase.

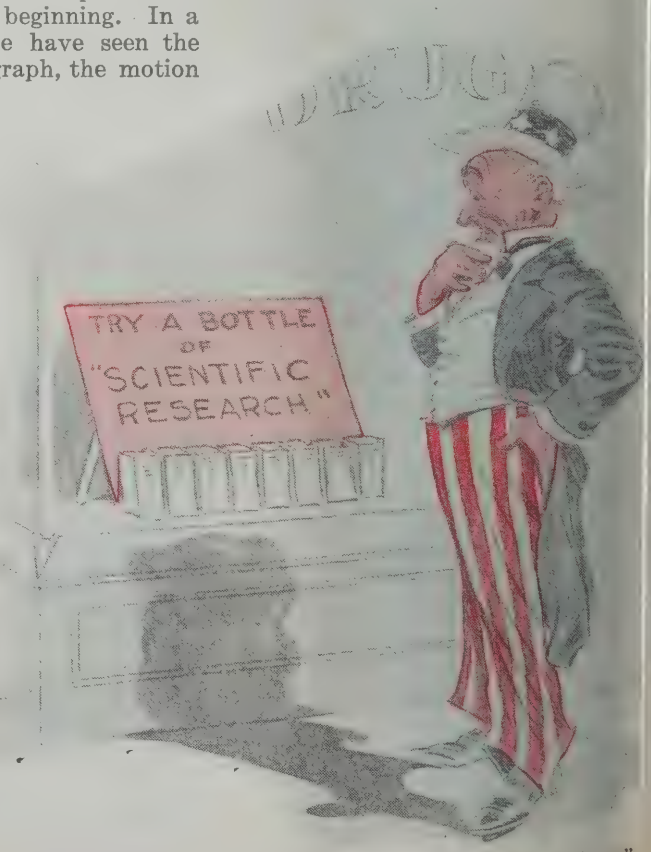
We are now in a state comparable to popcorn after it has been over the heat long enough to make the kernels begin to move about uneasily. Beginning with a few sporadic "pops" there is soon a volley of explosions. What heat is to corn, facts about natural law are to the mind of man. The "popping" of inventions has already passed through the sporadic period and the real fireworks are beginning. In a short half-century we have seen the coming of the phonograph, the motion picture, the electric light, the development of devices for the generation and transmission of electricity, the automobile and the radio.

We are beginning to learn how to use a few of the forces that play about us. We are also just beginning to use our inventive faculties. Edison looks forward to the time when the achievements of himself and others will seem to have been the antics of so many boys with building blocks. He feels that man is about to strike his stri and do some inventing worth wh His idea is that the machinery of t future will be largely automatic a that each machine, instead of makin part of a thing, will make it all. is all a matter of brain-power," said. As an illustration, he said t he believed a machine would be b that would spin cloth, make it i clothing, pack it in a box and set down ready to put on a merchan shelf.

The world is more interesting n than it ever was before, but it is s a very dull place in comparison w what it will soon be. From now things like the automobile and radio are going to come to us at c stantly shorter intervals. Men a women now living will see the ti when getting a living will be the smal part of the troubles of the human ra

It is because scientific resea means so much to the world that writer has long wondered why it left to proceed among small gro that are not in touch with each oth

Whatever we learn now comes us only because some manufactu has an interest in finding it out. T is a good reason, as far as it g but it does not go far enough. Ma facturers do not always find it advis to seek what the world needs m Take power, as an example. Proba cheap power would do more to impr the conditions of human life t anything else. (Concluded on pag



"What's the matter with us? We are suffering from what we do not know."

Selling Books by Auction

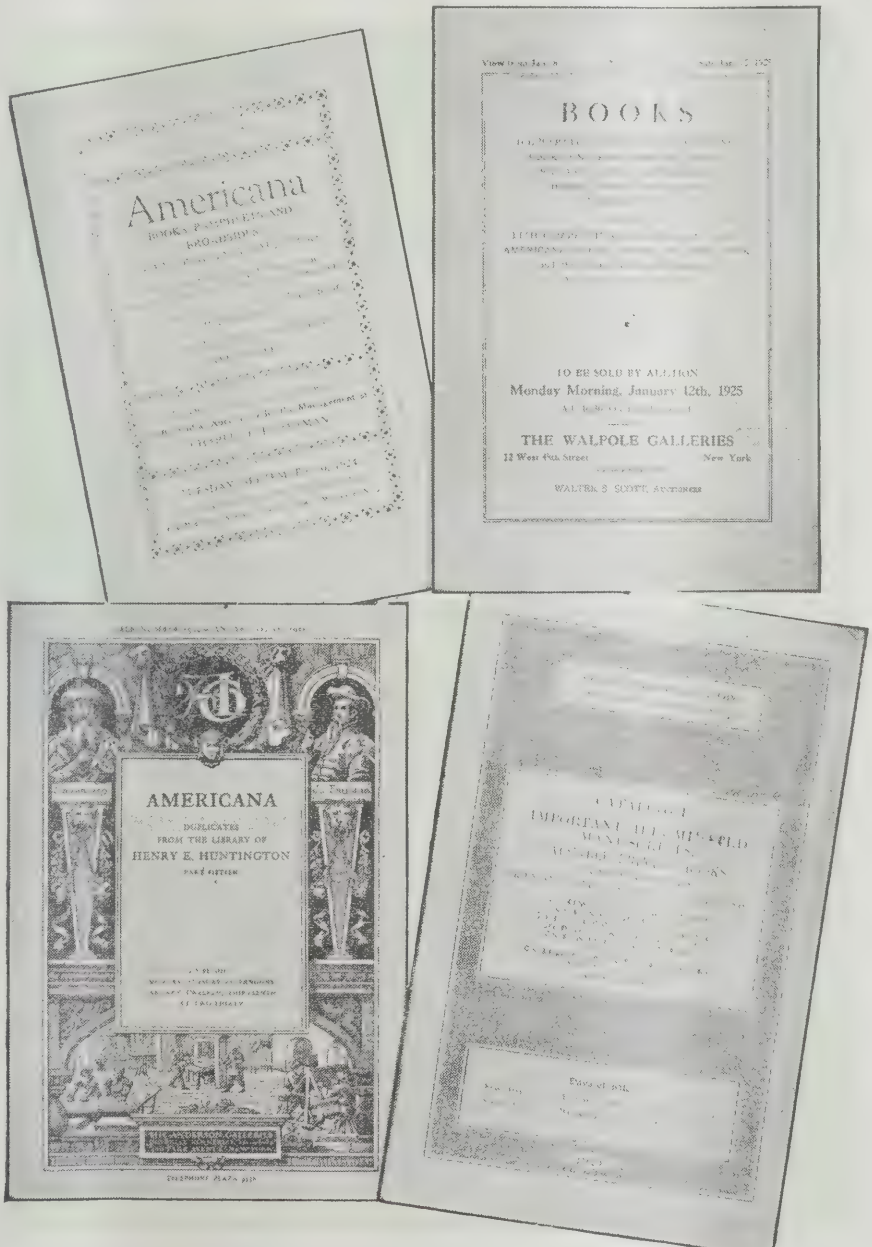
Many Rare Finds Are Made by Those Who Know Book Values

By LOUIS C. KARPINSKI

THE bookseller and the book-buyer are equally indispensable to the printer and publisher of books. In the early ys of printing and to a large extent en today the printer and publisher also as bookseller. New books much like any other article of trade h fixed prices and a fairly regular rket. Antiquarian books, not to the vulgar designation "second-nd," require, how-r, particular treat-nt, especially in case of rare and hly desired works. The earliest book tion on record was sale of the library Philip van Marnix, rd of St. Aldegondi, ose books were d in Holland on y 6, 1599. The t English sale was d by William Coo- in London, Octo- 31, 1676, and from t time on the prac- was common in gland; of these ly sales it is re- ded that they gave eat content and isfaction to . . . buyers, and no couragement to sellers."

The most engag- personality in the ly book-auction m was John Dun- who became con- ted by marriage h Daniel Defoe l Samuel Wesley, ner of John Wes- On one venture 698 Dunton took argo of books to blin and sold them auction for about 500. American oksellers owing n £500, Dunton k, in 1685, a cargo f ooks to New Eng- d but in a terrible ssage of four nths books to the ue of another £500 e lost and on arrival in Boston he as welcome to the booksellers there sour ale in summer," so he later te. Dunton placed an agent in em but the net result of his venture to keep him "within doors for ten nths" to avoid the sheriff. America not then a good market for books.

The rare book in English literature or in American history is sought today by a hundred collectors and by many great libraries. The bidding against each other of agents representing these buyers frequently disposes of the book at a price far higher than would be realized by private sale. At the same time the advertising of the sale brings new and unknown buyers into the field.



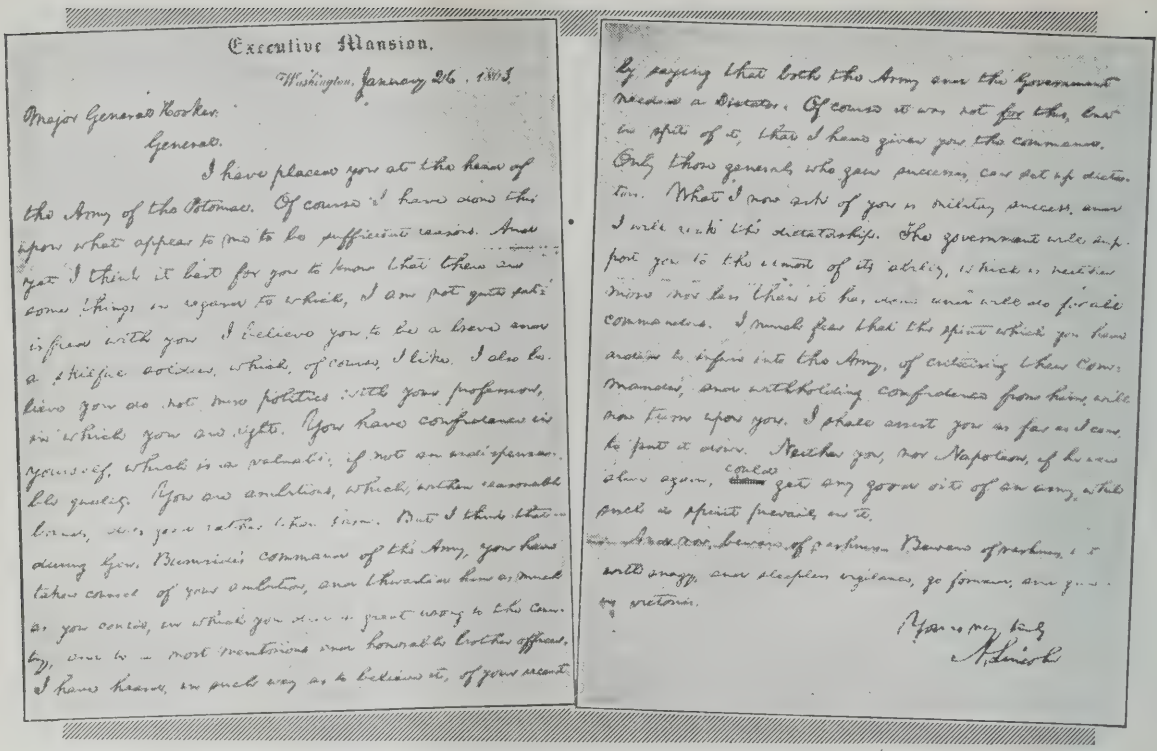
(1) Heartman's in Metuchen, N. J., an American center. (2) The Walpole Galleries, well-known New York auction house. (3) The Anderson Galleries in New York. Sale of duplicates from one of the most famous libraries in America. (4) Sotheby's, London. Probably the oldest book auction house in the world, founded by Samuel Baker in 1774.

In America there are today five active book auction houses where books, manuscripts and prints may be sold by auction. Three of these houses are located in New York City, the greatest center of book collectors. In Philadelphia there is one auction center and at Metuchen, New Jersey, Mr. Charles F. Heartman holds sales largely of items of American interest, *Americana*, which are attended by many booksellers and representatives of the great collectors of America.

It is necessary to have the books or manuscripts cataloged and described, with some indication of their significance in literature, art, or history. This work is done by the experts connected with these auction firms. Commonly the owner of the books pays for the preparation and printing of the cataloging and also 15% upon the price realized at the sale. With rare books and manuscripts this generally nets far more than could be realized by selling the articles privately. The well-known collectors do not, in general, appear in person at an auction but are represented by some dealer in rare books. In fact, some dealers consider it a breach of courtesy for the collectors to appear in person, depriving the dealer of a commission, but the more modest collectors frequently have the pleasure of personally bidding at the sale.

A book is placed on view, the number in the catalog is given, and the bidding starts. Frequently good but not rare books go at a song and frequently, too, some item brings a price beyond the fondest expectation of the seller. With supposedly ordinary items fifteen or twenty may be sold as a lot. It was in such a lot that the first book printed in America, the "Bay-Psalm Book," was bought for a few shillings many years ago by an English dealer whose knowledge of rare books gave him a fortunate "hunch."

The American Book-Prices Current (priced at $15.00) is a publication which lists the sale prices of rare books;



Executive Mansion.

Washington, January 26, 1863.

Major General Hooker.

General.

I have placed you at the head of the Army of the Potomac. Of course I have done this upon what appears to me to be sufficient reasons. And yet I think it best for you to know that there are some things in regard to which, I am not quite satisfied with you. I believe you to be a brave and skillful soldier, which, of course, I like. I also believe you do not mix politics with your profession, in which you are right. You have confidence in yourself, which is a valuable, if not an indispensable quality. You are ambitious, which, within reasonable bounds, does good rather than harm. But I think that during General Burnside's command of the Army, you have taken counsel of your ambition, and thwarted him as much as you could, in which you did a great wrong to the country, and to a most meritorious and honorable brother officer. I have heard, in such way as to believe it, of your recently saying that both the Army and the Government needed a dictator. Of course, it was not for this, but in spite of it, that I have given you the command. Only those generals who gain success can set up dictators. What I now ask of you is military success, and I will risk the dictatorship. The Government will support you, to the utmost of its ability, which is neither more nor less than it has done, and will do for all commanders. I much fear that the spirit which you have aided to infuse into the Army, of criticising their Commander, and withholding confidence from him, will now turn upon you. I shall assist you as far as I can to put it down. Neither you, nor Napoleon, if he were alive again, could get any good out of an army, while such a spirit prevails in it. And now, beware of rashness. Beware of rashness, but with energy, and sleepless vigilance, go forward, and give us victories.

Yours very truly,

A. Lincoln.

Executive Mansion,
Washington, Jan. 26, 1863.

Major General Hooker:

General—I have placed you at the head of the Army of the Potomac. Of course, I have done this upon what appears to me to be sufficient reasons. And yet I think it best for you to know that there are some things in regard to which I am not quite satisfied with you. I believe you to be a brave and skillful soldier which, of course, I like. I also believe you do not mix politics with your profession, in which you are right. You have confidence in yourself, which is a valuable if not an indispensable quality. You are ambitious, which, within reasonable bounds, does good rather than harm.

But I think that during General Burnside's command of the Army you have taken counsel of your ambition and thwarted him as much as you could, in which you did a great wrong to the country and to a most meritorious and honorable brother officer. I have heard in such way as to believe it, of your recently saying that both the Army and the Government needed a dictator. Of course, it was not for this, but in spite of it, that I have given you the command. Only those generals who gain success can set up dictators.

What I now ask of you is military success, and I will risk the dictatorship. The Government will support you to the utmost of its ability, which is neither more nor less than it has done and will do for all commanders. I much fear that the spirit which you have aided to infuse into the Army of criticising their commander and withholding confidence from him, will now turn upon you. I shall assist you as far as I can to put it down. Neither you nor Napoleon, if he were alive again, could get any good out of any army while such a spirit prevails in it.

And now beware of rashness—beware of rashness, but with energy and sleepless vigilance go forward and give us victories.

Yours very truly
A. Lincoln

although now a volume of 916 pages, only books which have sold at $7.50 and above are listed. England supports two such publications, Book-Prices Current and Book-Auction Records.

At a recent sale in Philadelphia a notable list of rare manuscripts of fundamental importance in American history were placed upon the auction-block. These items are worthy examination, as their like will not soon be seen again in the open market.

In the year 1682 William Penn granted to the people of Pennsylvania a charter of liberties giving the people of that province the right to choose a Governor and a Legislature with power. To this notable document of American history William Penn affixed his name and his seal. This manuscript came into the possession of Sir John Fenn, prominent among the great English collectors of historical manuscripts. From Fenn the precious manuscript passed into the hands of the Dalton family, to William Dalton, to Henry H. Almack, of Milford in Sussex, England, to Dr. Edward Maris, and then into the hands of the late George C. Thomas, former partner of J. P. Morgan. This charter was sold in Philadelphia recently to Gabriel Wells, of New York, the well-known collector and dealer, possibly acting as agent for some wealthy collector.

Some of the sections of the Charter, with the Laws, follow:

"TO ALL PEOPLE, to whom these presents shall come. WHEREAS king Charles the Second, by his letters patents, under the great seal of England; for the consideration therein mentioned, hath been graciously pleased to give and grant unto me William Penn (by the name of William Penn, Esq. son and heir of Sir William Penn, deceased) and to my heirs and assigns forever, all that tract of land or province, called Pennsylvania, in America, with divers great powers, preheminences, royalties, jurisdictions, and authorities, necessary for the well-being and government thereof: NOW KNOW YE, that for the well-being and government of the said province, and for the encouragement of all the freemen and planters that may be therein concerned, in pursuance of the powers aforementioned, I the said William Penn have declared, granted, and confirmed, and by these presents, for me, my heirs and assigns, do declare, grant and confirm unto all the freemen, planters and adventurers, of, in and to the said province, these liberties, franchises, and properties, to be held, enjoyed and kept by the freemen, planters and inhabitants of the said province of Pennsylvania for ever."

Among the Charter provisions the twelfth is worthy of special mention.

"Twelfth. That the governor and Provincial Council shall erect and order all publick schools, and encourage and reward the authors of useful sciences and laudable inventions in the said province."

"LAWS AGREED UPON IN ENGLAND.

"Thirty-fifth. That all persons living in this province, who confess and acknowledge the one almighty and eternal God, to be the creator, upholder and ruler of the world, and that hold themselves obliged in conscience to live peaceably and justly in civil society, shall in no ways be molested or prejudiced for their religious persuasion or practice in matters of faith and worship, nor shall they be compelled at any time to frequent or maintain any religious worship, place or ministry whatever."

At this same sale other notable and precious documents in this Philadelphia

(Concluded on page 30)

Two Thousand Words

(*Concluded from page 12*)

led in London as an elected English
ng.

The question of England's language
as settled by the course of public
airs. It fell to the lot of English
bles to decide the succession of
veral English Kings. This gained for
ngland and the English the affection
Henry the First and others. But in
04 came a heavy blow to the mon-
chy, when King John lost sway over
ormandy. This monarch was the
st to take the title of King of Eng-
nd instead of King of the English,
owing the centralization of his do-
main in the island.

Norman Conquerors Adopt English

French was still a potent speech in England, used in courts and schools, t the time was near when great ues would be determined in English. thin 50 years after the loss of ormandy royal proclamations were ued in English as well as Latin and ench. Still more significant was the t that Edward III, who began the ndred Years' War with France on a im to the French throne, opened a rliament in English. The politico-igious controversies roused by John yclif found expression in the English gue. Then came that group of ets, Gower, Chaucer, Langland, all ferent, but all using English in the st-remembered portions of their rks. Chaucer is still studied, be-use he wrote the life of his time in language of the capital city, and dialect of the educated classes of ndon has been the standard English r since.

Neither Chaucer nor the later ters of standard English made the guage. They took the form they nd current, and by the excellence their matter they helped to fix that m. But Chaucer became a great t of all England, instead of being a at dialect poet, because he used kind of English used in the capital. ere were many poets under the rman Kings who wrote in French, l whose writings today are not embered at all by English readers. is not that their language was not ellent, but the political march of nation was away from French to English.

The Influence of Chaucer

After Chaucer comes a strange perio of four centuries in the history he English language. Many books e forth, many of them manifestly ered with immortality: the Eliza-han dramatists, the Elizabethan ts and historians and translators, King James Bible, and all that owed—but in century after century scholars and poets still expressed their fears that English would perish! Bacon had this fear. It was the terror of Milton and the dread of Dryden. Many urged an academy to standardize and thus perpetuate the language. Many mourned that the language showed no sign of the permanence of Latin or the flowing vitality of Greek.

But English grew, despite even the pessimism of those whose writings lifted it to heights of glory. It grew, but not by academic merit or the force of theories. Therefore, theories of language and estimates of merit cannot now affect it. It grew because the English-speaking men, Angles and Jutes, and also Welsh, Cornish, Irish, Scotch, and Manx, were like the devotees of the ocean goddess, and like the adventurous hero Beowulf, seeking glory abroad.

In Britain, English drove back Gaelic into the Highlands and the isles, silenced Cornish, and made Welsh second in its own principality. In the wide outside world the English mariner was not always first, but he and his successor the English settler lingered longest. Portuguese might have been the prevailing European language of India, Spanish of Africa, Dutch of Australia, French of Canada, but all of these lands and many more have been swept under the political or commercial influence of English-speaking nations. The island kingdom which is one of the smallest of European states has upon every other continent the largest vassal dominion.

An Island Rules an Empire

And every extension of vassal dominion has been an extension of the sway of language. The British and American nations, different in many respects, have singularly paralleled and reinforced each other in the extension of the English speech. When Great Britain gained the Dominion of Canada by the treaty of Paris of 1763—and when, forty years later, Jefferson purchased the Louisiana Territory from Napoleon—the policies were different, but the two acts combined to establish English instead of French throughout the great domain from Quebec to New Orleans. When the United States purchased Florida or the Danish East Indies, when Texas or Hawaii were annexed, when the Philippines or California came as war prizes—territory was added to the English language, as when the Bahamas, or Hong Kong, or South Africa, or Burma, became British.

The English-speaking nations have not sought or attained the physical or political conquest of the world. What they have attained is what the Angles had among the Teutonic tribes which invaded England. Their language is preëminent, and undisputedly preëminent, with a vast distance in numbers between English and the language with the next-greatest number of speakers. There are Siberian regions where Russian is unknown, Tibetan steppes where Chinese is unheard, but the English-speaking nations carry to the ends of the earth their interest in education, and education carries English to the last frontier town of the last province of empire.

Colonies and Their Languages

Among languages, English now reigns not yet crowned. It has more foreign students than any other language, more than all the artificial international languages combined. It is the basis of every type of "pigeon-English" or any other "inter-racial" dialect now in use. It is the language actually used in a number of international papers published on the continent of Europe. There is not a race of men nor a great nation which is not in intimate and direct contact with some land or province or colony of the English-speaking nations. Therefore, there is not one nation to which English is not a necessity of life, as well as an instrument of culture and knowledge.

Five things have made languages powerful in the past: political power, commercial activity, diplomatic eminence, moral prestige, literary grandeur. All these elements reside in the English language and the Anglican peoples. The union of them was never found before.

We have not tried to make an argument for the prestige of English, but merely a record of it. We have merely announced that English is already an international language, and its recognition and use as such are certain to extend.

A Natural International Language

The language meets all the needs of internationalism. Its vast growth has not stifled any other speech, nor prevented a wholesome revival of the old Celtic dialects of the British Isles, nor hindered the wide extension of French and Portuguese. But while the language serves the greatest number as a mother tongue, it stands ready to serve all in intercommunication. To all races and languages this is a high service. To the users of English it has a thrilling significance, for he who uses English today comes more nearly than any man of any former generation, more nearly than any man since the building of Babel, to speak to all mankind as if they were of one language and one speech.

White Sails on Silvery Seas

Yachting, a Fascinating Sport for Every Man, Comes Into Its Own

By PAUL MACDONALD

THE skipper of the trim 30-footer sat astern, his legs dangling over the side of the sleek racing craft. It was morning, the skies were clear, the wind favorable and he had a few idle hours ahead.

"Well, why shouldn't they?" he asked and puffed his pipe before supplying his own answer:

"Why shouldn't people take to yachting? The land is all taken over. You can't do anything in comfort any more. There is no longer any privacy. I can see no sport in going out to gather recreation and bumping into people at every turn. And, after all is said and done, where can you get better sport than you find in yachting? And where is there more exclusive sport? The big wide open spaces of the sea, as the novel writers put it, beckon you and take it from me that once you handle one of these boats there is nothing on land that will ever win you from the sea. If you doubt that it grips you look at all of the boats along here. Just look them over and decide the matter for yourself."

Swaying slightly in the light breeze were boats and boats and boats. They were unlike those sailing boats that we see in old prints; unlike the sailing boats that the mind pictures when sailing boats are mentioned. These boats were something else again, slim and trim things, sleek whippets of the sea. They had what horsemen describe as "class." And this "class" could be discerned by any layman whose home was far removed from tides and breakwaters.

There was something about these boats that caught the eye and filled it and held it. Had these boats been humans you would have looked twice and again and concluded they were people of breeding, probably nobles, at least aristocrats. They had that appearance. Sleek and trim. They had the lines. They had what would be called bearing in the human race. They looked the part of being something else again.

Yachts! And then many more yachts. Not the toilers of the sea but the racers of the sea. There were yachts of various lengths, yachts of various descriptions, but all designed for speed and sport.

Probably you who live between the oceans or below the Great Lakes have decided that yachting has declined. I have been told that by a number of persons and that is why I went along the Atlantic to find out.

Sometime ago there was published a book on ships. It dealt with the ships that sail the high seas, the ships of commerce. In this book it stated that there was more sailing today than ever in the history of the world.

C. R. Patterson, the greatest living American authority on sailing, replied to this:

"The actual facts are that there were over one hundred times as many sailing vessels twenty years ago as there are today."

Commercial sailing has been dying out. In a few years from now it will be extinct, except for coastwise trade. But while commercial sailing has been going out yachting has been coming in.

The passing of commercial sailing is readily explained by the increasing number of engine-driven craft and the facilities they afford. Shipping in these vessels is quicker and safer. It is just as cheap in the end, if not cheaper.

But, while commercial sailing is going out, sailing for sport is coming in. The trim racing yacht is gaining popularity every year. There are toda along the Atlantic seaboard alon more than two hundred times as ma yachts of various sizes as there we forty years ago. In this we include a yachts that are used for recreation an competition. Then, consider the i creasing number of yachts on the Gre Lakes and the Pacific Coast and yo can get an idea how the sport is gro ing.

I asked one veteran yachtsman Boston just how he accounted for th rise in popularity. In asking t question I advanced this argument:

"All of the men in sport that know tell me that this is an age speed. I am constantly informed th we are an up-and-doing people, th what we want is dash and go and p and spirit and all that sort of thin In track athletics, for instance, excel in the sprints where sudden a brief bursts of speed are demande On the stage the pieces that are t big hits are the musical shows or revu that have snap and dash and vim a speed and go. We cannot take time f anything, even in sport and amus ment. Everything has to be done in hurry, a dash and a scurry. The how do you account for the increasi interest in yachting? If this is all tr in sport and amusement, and it a parently is, how does it come th people do not al' go in for mot boating? In motorboating you sure find the qualities that the Americ people seem to crave and it is equal evident that they do not find them yachting."

He waited only moment to answer:

"Motorboati and yachting are ju as different as t spoken drama and t motion pictures. Bo belong on the wat as the spoken dra and the movies bo belong on the sta and both are boa but there the semblance ceases. T sort of people th care for motorboati do not care for yac ing and I can s safely that the yach men do not care motorboating. The is no sympathy of o for the other. Th really have nothing common. The one engineering and t other is craftsma ship. One is mechan

International six-meters at Larchmont Regatta.

d the other is sport. That is my inion and I dare say that every real chtsman will give you the same swer. I have heard dozens express emselves in like manner.

"What is more I believe you are wrong about this speed and dash d go and hustle and bustle and vim l whatnot business. I believe that American people are getting out of That seems a broad statement to ke but I have been a keen observer the last five years and I am of that nclusion. I believe that the American come to realize that the making of lars is not the only thing there is in s life and he has decided that he is ng to get some kick out of living ore it is too late. I see evidences of very day, out on the water and if could spend a week with me I uld prove it to you. More and more tired business man, and the business n who is not so tired, is getting the it of doing less work and living re, making less dollars and adding s to his life. And where can he get re real recreation than out here on water? He gets the salt breeze, pure air. He finds quietude, com-te rest. There is everything out e that is needed to recharge his ve batteries, to replenish the fuel his system. No other sport will do or him as completely as yachting.

"When you get right down to it, w many real sports are left to ericans? How many honest ama-r sports have we outside the select ege field? You can mention four—nis, golf, polo and yachting. One them, polo, is prohibitive. Tennis its limitations. Golf is expensive. re remains yachting."

I told him that as far as I have ever rd yachting was more expensive n golf, but this he denied. He orted me along the dock and in-duced me to a number of yachtsmen he repeated my remark to them they laughed.

Yachting, it seems, can be made ensive or inexpensive. It is like ing a home, or owning a car, or a , or pictures. Yachting, like these ngs, depends a great deal on how r taste runs.

Last year a yachting enthusiast, ett by name, designed a sailboat, asuring not more than 18 feet over-ll with a 12-water line perfectly sea-thy. This t was built \$350. His was to make ing possible men of ordi-ary income. No ner had the sign of this new e become wn than rs were re-ied. The ship-uding com-pany that builds this craft has been unable to fulfill demands. On June 1 of this year there were 67 boats of this type alone at Rye, New York.

Some men own three and four yachts, others own two and three. It all depends upon the purse and preference for type. There are numerous boats of different types and new types are being introduced constantly. Around New York there are twenty-two classes of racing yachts in competition. This list of twenty-two includes four divisions of miscellaneous types that have gone out of general use but of which a few still remain.

There is always the desire to introduce a new type of racing craft. Nathaniel Emmons, of Boston, brother of one of the skippers of the *Resolute*, recently imported a "Hoogar" from Holland. This "Hoogar" to Americans is a queer-looking craft, of such shallow draft that to keep her headway the centerboard is replaced by outriggers. She is rigged with gaff and most of the American racing boats are discarding gaff. No one can guess what new type of boat will come from this "Hoogar."

There is constant progress made in boat-building. The numerous changes in rigging attest to this.

In the East the 30-footers are the most popular type of racing boat. The Long Island Sound Racing Association alone lists 231 boats of this class and more are constantly being added. Many eastern yachtsmen who were racing larger craft have gone to the 30-footers. They seem best to answer the demands of yacht racing and furnish the most desirable sport.

The highest prices ever paid for racing yachts are being paid today. An indication of this increase is found in the Stars, a popular class. Stars are being sold today for from 35 to 45 per cent more than they cost originally.

On the east coast there have been added this year sixteen of the new cruising type of schooners, each boat costing \$20,000 and upward.

When it was decided to hold an international race for 6-meter boats, this class came into favor and this summer 30 boats of 6-meter type were competing in the East.

Two of the American 6-meter boats are being taken to Scotland by Clinton H. Crane, the architect, and Sherman Hoyt, of Corinthian fame. They will try to lift the Seawanhaka Cup, won at Marblehead, Massachusetts, last year and to be raced for on the Clyde this summer.

It was expected that an international race for the Lipton Cup would be the leading yachting event of 1926, but this is not definite. There have been various rumors that the Sir Thomas Lipton challenges have lost favor in the East. Sir Thomas, always pictured by the daily press of this country as the smiling and ardent sportsman, is also a keen business man and in the inner yachting circles of the East the impression has grown that the visits of Sir Thomas in the rôle of challenger are not as thickly associated with sport as the American public has been led to believe.

"Sir Thomas is an Irishman by birth but he appears to be a Scotchman by training," a leading yachting enthusiast on Long Island told me.

It is strongly suspected that the challenges of Sir Thomas, while apparently those of an ardent lover of yachting, have an underlying business motive. Sir Thomas is an astute business man, as those who have had dealings with him will testify. He is likewise an extremely clever publicity getter and while an international race may cost Sir Thomas a million dollars, as the public is led to believe, he gets a few million dollars' worth of advertising out of the venture, and since Sir Thomas does an extensive business in the United States, this publicity is not unwelcome. It is, to say the least, extremely desirable from a business standpoint.

There is a belief among yachtsmen that those at the head of yachting would give a more sincere welcome to a challenge from any outsider than would be extended to one from Sir Thomas. They believe that he mixes business with sport and the thought is disagreeable to them.

"The charm of yachting," one of them told me, "lies in the fact that it is utterly separated from business and the trade. It is pure sport and its future attractiveness rests in keeping it in that state."

It has always been thought that international competition whets the appetite for any sport but yachting, with no outstanding international event on the summer's program, has been winning new supporters each week.

Yachting is thus giving American sportsmen a fine opportunity for recreation and competition.

Pounds or Kilograms?

(Concluded from page 7)

of a French Revolution, but of the peaceable evolution of human affairs rom the earliest times. Perhaps that 's one element in their unmovable strength. Our very terms are deeply rooted in human experience. Twelve inches make a *foot.* The original *foot* was the length of a man's foot. We still use the term *hands* in measuring horses; a horse, we say, is twelve hands high, the hand being a handsbreadth of four inches. We say *yard* to indicate three feet. What is a yard? It is a term which maritime nations use to indicate a spar swung cross-wise to a mast -the yardarm of the p rate tales. The arm swung out from the body makes a "yard." In other times the length of the arm from the center of the chest was the mercantile measure for a yard of cloth. Some of us have seen in country districts as late as twenty-five years ago the dry-goods merchant measure cloth from his chest to the finger-tips of his outstretched arm. The legend goes that when men's arms were found to differ in length, the king's arm was made the official standard of the "yard." The weight of three barleycorns was once the standard of an ounce. The penny was once the weight of thirty-two wheat corns "in the midst of the ear"—that is, the full-grown grains, not the smaller, undeveloped ones near the top of the ear. The term "grain" still remains in use for fine measures. Carat, the measure of gold and diamonds, is another term going back to the use of grains as weights, and comes from "carob," the Arabic term for bean. The carat has since been standardized, however, as 1/200th metric grain.

A most fascinating study awaits the inquirer into the human origin of our system of weights and measures. And if the insistent propaganda to overthrow it continues in the future as it has in the past, we may expect to see a rather widespread interest created in feet, pints and pounds, their origin and their meaning, and the consequences that might ensue if they were changed.

Selling Books by Auction

(Concluded from page 26)

This letter brought ten thousand dollars. Who would dare to place a value upon the document?

Notable also was Grant's famous message: "I propose to fight it out on this line if it takes all summer." Fifty-three hundred dollars it brought, and the message was worth as many millions.

Thomas Jefferson wrote a touching letter, concerning a love affair, which is not quite so pathetic when we realize that it was not his only affair of the heart:

"If she consents, I shall be happy; if she does not I must endeavor to be as much so as possible.

"The most fortunate of us all in our journeys through life frequently meet with calamities and misfortunes which may greatly afflict us; and to fortify our minds against the attacks of the calamities and misfortune should be one of the principal studies and endeavors of our lives. The only method of doing this is to assume a perfect resignation to the Divine will, to consider that what does happen must happen; and that by our uneasiness we cannot prevent the blow before it does fall, but we may add to its force after it has fallen."

Most amusing in this sale whose like will not soon be seen again was the controversy concerning the gold pen with which Lincoln signed the Emancipation Proclamation. Three pens are now known which have some claim to the distinction. The Massachusetts Historical Society which possesses the pen with the best history denounced the pen offered for sale as a "fake" yet it brought one thousand dollars, coin of the realm.

It is reported that the New York Collector and Bookseller who bought the Penn Charter offers it to the state at this purchase price, without any profit. This action is characteristic of American dealers and collectors of rare books who are generally interested in the preservation of historical documents and in placing them in the appropriate places.

Bird That Had Nothing on Its Mind

(Concluded from page 24)

Every manufacturer is interested in cheap power, but he is not interested in a plan that he might not be able to develop for a good many years.

It would seem also to be worth while to make such a drive as has never yet been made to learn what is best to eat and, generally, how to live the longest. We know next to nothing about food, except that it is expensive and most cooks do not know how to prepare it. Yet what we don't know we can learn. It is all a matter of going after it in the right way and persisting in the search.

This writer hopes to live to see the day when there will be in operation a great national research laboratory in which will be conducted, not alone great drives for specific knowledge, but a search for every fact that can be wrested from nature. Whatever is learned should be published to the world. Moreover, manufacturers should be encouraged to tell their needs and have their problems, if of sufficient importance, studied without cost.

Enough financial power is going to waste in America to conduct a scientific research laboratory that would be of incalculable benefit to the world—not for a day or for a year but throughout all time.

"I Read *in* the Papers

I read in the papers that Ohio spe more money upon its state gove ment during the year ending June than in any year of its history. Besid it seems inevitable that the taxpay will have to pay still greater sums i the local and state treasuries, beca the last legislature passed—over governor's veto—an act to reappra real estate values throughout the sta These values are reappraised only to increased—every fool knows tha and the purpose is to increase tax Ohio has a beneficent law which fi the maximum tax rate. Politici evade it by leaving the rate as it and reappraising the citizen's prope values. This revaluation process just another application of the immor public finance doctrine of Colbe "get the greatest amount of feath from the geese with the least amount squawking." The taxpayer will informed that the rate of taxation not been increased and that therefore is being treated quite fairly.

If Government had to be sold the people on the basis of the b service at the lowest price—if th were tax reductions as an evidence increased administrative efficienc would politics be more promising, wonder? Or is our Government serv really worth all that we pay for it— wonder? Maybe it is. Maybe not.

I read in the papers that the once mous and wealthy Tom Lawson is clared by his relatives to have died "wi out a five-cent piece." It is a singu illustration of the failure which fin ciers make of their own finan affairs. Lawson was once wo $20,000,000 and handled millions commonly as others handle nick But he produced nothing, and th fore by the law of compensation retained nothing. The secret of decay of fortunes is that they go law back to their source because t represent not production but explo tion. Effort is frequently made prove that what is here called ploitation is really a productive serv Maybe so, maybe so, but when takes a squint at real production then at this other thing, one ca help but feel there is a fundamen difference. Anyway, people do look to the future as much as they In the last generation, people away for a rainy day, as they said against old age. That doesn't seem worry people so much today. T feel young for a longer time. maybe that has its useful side. there was a virtue in prudence thrift which would serve us very today if we could bring it back.

Romantic Rascals

(*Concluded from page 17*)

ough and enterprising enough to ke an attempt at honest trade.

Then came an effort to straighten tters by edict. It was enacted that person should leave the country h money, that no one should pur- se jewelry or plate or precious nes, that no family should have re than a hundred dollars in the ise under penalty of fine and con- ation. To insure the bringing of guilty to light, informers were mised one-half of the amount found excess of the allowable sum. At e there was nation-wide espionage. rkmen spied on their employers. glars operated under the cloak of law. Men invaded neighboring ilies and the privacy of the home at an end. Suspicion was enough. one could get out a search warrant any accuser was believed. Al- ther it was a France whose con- on was very grievous, very full of l, and everywhere were com- nts, recriminations, forebodings, isations.

For Law there remained nothing empty-handed flight. His invest- ts were all on French soil, he was ched, there were threats of assassina- . By back ways and in the dark of t he got out of Paris, out of France, into Copenhagen. There he dis- ered that a pardon had been granted his killing of his opponent in the and he was allowed to sail for Eng- in a ship of war. Because of that, e was a debate in the House of ls with Earl Coningsby furious that enegade who had forsworn his lion and country and had thrust a on in misery should be treated with courtesy at all. But the noble lord ndered idly, for Law's spirit was hed. The magnificent crash had him a wreck. He went to Venice there died in poverty.

But the fever he had created did die in France. It touched England, gh Walpole stood out against dangerous practice of stock- king" which would divert "the us of the nation from trade and stry." For eight months visions nillions danced before Londoner's and, as the ballad has it:

'Stars and garters did appear
Among the meaner rabble;
'o buy and sell, to see and hear,
The Jews and Gentiles squabble."

Prince of Wales cleared $200,000 ne day and others followed suit. k was sold for companies "to ae boards out of sawdust," to "trade air," to "extract silver from lead," carry on an undertaking of great ntage, but nobody to know what i' and knavery gathered its harvest he stupidity suffered. Then in nland, as in France, the nation had t and shiver by the ashes while a e1 financial structure was being f nded.

Is Our Navy Out of Date?

(*Concluded from page 5*)

and one system of training for personnel, that the expenditures now for Army, Navy, Marine Corps, Postal Air Services, and other Governmental establishments, would be very materially reduced."

How effective are anti-aircraft guns?

"I could take a target up and let anti-aircraft guns shoot at it all day. Only one-tenth of one per cent of all the aircraft across the battle line were lost from anti-aircraft fire in the recent war. The average hits in this country is one in 30,000 shots."

Why does not the navy agree to try the effectiveness of bombs by a test on the battleship *North Dakota*, which has to be sunk anyway under the treaty?

General Mitchell did not commit himself as to just why the Navy Department was unwilling to make this test but he did very vigorously assert, "It is my opinion that if this experiment is attempted the *North Dakota* will be sunk in less than ten minutes after the bombing planes reach their objective."

How many airplanes does the United States have now?

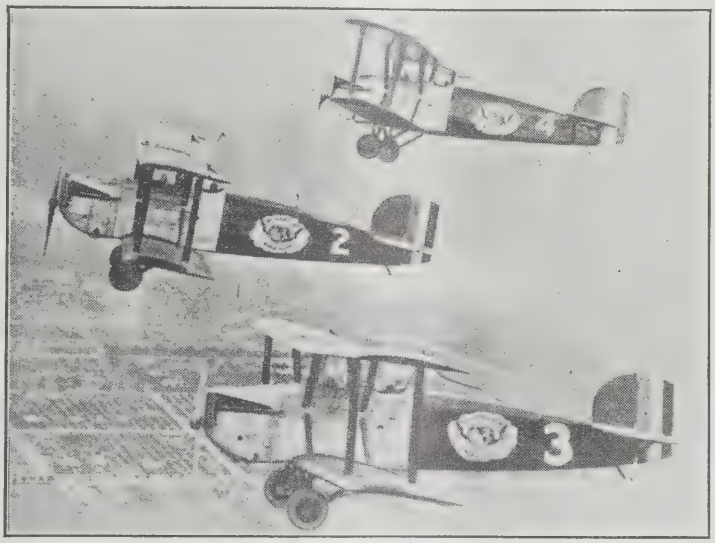
"The United States has only 19 modern pursuit ships equipped and ready for action. She has probably 25 bombardment planes equipped ready for action. These planes are the Martin bombers which are now more than three years old. Our observation planes are DH4B type that were built during the War. However, the Army Air Service, as you have seen published in the newspapers, has let the contract for 100 more modern planes."

The air forces of the nation are on an entirely different basis from almost any other form of military activity because they can be efficiently employed in time of peace for constructive tasks. Hence it comes about that even the pacifists endorse our air mail service, for example, although these same planes could in time of war be used with more deadly effectiveness than many battleships. Knowing these facts, I asked General Mitchell how a military air force could be used in time of peace. He replied, "An Air Force can be used in time of peace for forest patrol, surveying and mapping, air mail services and the training of regular services, as well as for the organized reserve and National Guard."

In conclusion, I asked General Mitchell what methods could be employed to secure an enlightened public opinion on the subject of airplanes. His reply deserves wide circulation.

"I think that the best way to educate the American public in the possibilities of airplane travel and the importance of aeronautics in our plan of National Defence is to reveal to them through publications and through public schools and colleges, what is being done in foreign countries. A system of air lines, over which aircraft are operated commercially whereby the people come directly in contact with Air Service personnel and Air Service equipment, will reveal to them the importance of the industry. Also such projects as the around-the-world flight, the dawn-to-dusk flight, the non-stop transcontinental flight, the Porto Rico flight, the proposed flight to Hawaii Islands by the Navy, and the International Air Races, all bring Air Service activities directly to the people.

"Anything that can be done to get the people in general to thinking and to talking about the possibilities of Air Service leads to a further education along these lines. It is a comparatively new development and is somewhat foreign to the routine education of American people. They must be brought directly in contact through reading or through experience to realize its vast importance."



The American World Fliers over California after encircling the globe.

Apple-Green Tint Explained

Opposite Buckingham Palace is to be found the Victoria Memorial. This beautiful piece of workmanship is particularly remarkable for the clear, delicate green of the water in its marble basins. The secret of its coloring and translucency was revealed recently when two workmen were drawing a large sack through the water. The sack was filled with a substance which prevented the growth of weeds and gave the water its apple-green tint.

Ancient Baalbeck, City of Sun Goo

Auto Busses Replace Caravans in the Heliopolis of the Greco-Roman World

By HAL WALKER

NINETY kilometers from Beyrouth lies the most wonderful ruined city in the world—Baalbeck. No one knows its origin, or its builders, but it is generally conceded by modern engineers and scientists that no race now upon the earth could have erected the giant columns which remain intact as the monument to a vanished race.

It is possible to reach Baalbeck from Damascus and by automobile in about three hours over the desert, but as it fitted our plans better we made the visit after circuit of the north. It may be that General Gouraud kept this wonder city as the final sight which would open eyes already almost surfeited with strange scenes in his domain. If this was his intention, it met with huge success.

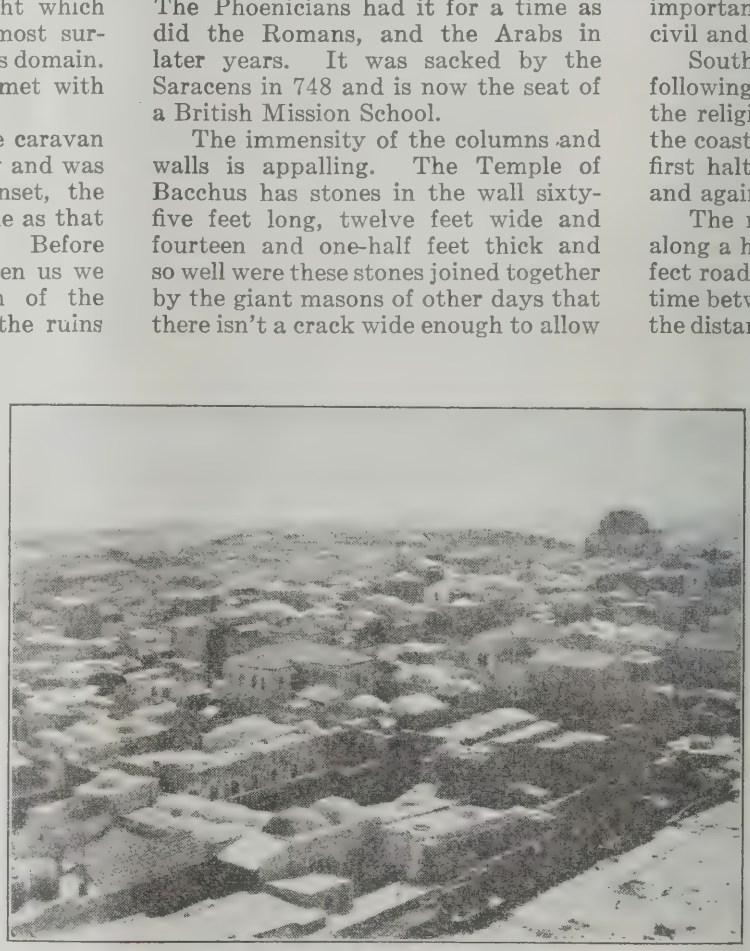
In the afternoon early the caravan of automobiles got under way and was in Baalbeck long before sunset, the road for a time being the same as that followed toward Damascus. Before having the real sensation given us we visited the remount station of the French forces, and then at the ruins of Baalbeck we had the explanations of M. E. de Lorey who is the chief of archeology for the French Government in all Syria, and the head of the museum in Damascus.

Awe-inspiring is an inadequate word to use in trying to describe Baalbeck. These ruins dwarf the Parthenon at Athens, so that may convey some idea of their immensity. Picture stones fifty and more feet long, ten and more feet broad and thick, weighing hundreds of tons and made into buildings somewhere near the dawn of creation. One stone in the quarry from which the building material was brought was never finished and transported—its end is still attached to the ledge—but this one stone hewn out is 69x16x14 feet and must weigh a thousand tons. How was this mammoth to be transported to the site of the buildings, unless with the use of mastodons, as some authorities believe?

There have been many theories as to the origin of these temples which are believed to have been the first structures in the world. The Arabs say that Cain built the city about 133 years after the Creation as a refuge from Jehovah's curse after murdering Abel, and that he peopled it with giants who were drowned in the Flood. Some authorities agree that the stones antedate the Flood and that they must have been transported by some huge animals long extinct as the race which raised them into place.

Another theory is that the city was built by Solomon as a caravan center, and that the temple to Baal was built to please the Queen of Sheba, according to the Arabs. The walls of the city are between two and three miles in circumference and it has seen many conquerers since the time of Solomon. The Phoenicians had it for a time as did the Romans, and the Arabs in later years. It was sacked by the Saracens in 748 and is now the seat of a British Mission School.

The immensity of the columns and walls is appalling. The Temple of Bacchus has stones in the wall sixty-five feet long, twelve feet wide and fourteen and one-half feet thick and so well were these stones joined together by the giant masons of other days that there isn't a crack wide enough to allow a blade of grass to grow. The ordinary stones in the walls are thirty feet long and weigh 400 tons each.



Jerusalem—view of the Jewish quarter.

I have known men and women to travel two thousand miles just to see the Pyramids by moonlight, but to see Baalbeck under the same moon would be worth traveling many times that distance. And we had a special entertainment among those ruins with the dancing of children clad in white in folk dances of the Syrians. These dances were arranged by the Touring Club of Syria, and so the pigmies danced while other pigmies looked on in the shadows of the structures built by the giants which we could not understa

The next morning we started back Beyrouth through the fertile Bekaa a at night had our final official dinner the palace of General Gouraud in setting truly oriental. The walls of huge salon were decorated with troph the host had collected through ma years of colonial service in North Afri native Syrian soldiers were the gua at the door—and the dinner would ha done credit to the most select restaur in Paris. Then followed a reception board the flagship of the French admi in command of the French fleet in Near East at which were present all important men and women in Beyrou civil and official.

Southward along the sea we sped following day bound for the cradle the religious world, Jerusalem. Al the coast we stopped several times, first halt at Saida, the ancient Sid and again at Acre.

The road for the last ten miles along a hard beach which makes a p fect roadway of hard-packed sand a time between half and full ebb tide, a the distance was covered at a faster p than we had been able make at any time dur the day. Haifa is northern terminus of railroad to Cairo and policed with true Brit efficiency. There is a g hotel at Haifa, or at le what is called good in East, and we stayed night in a town where th was more English spo than I had heard several weeks.

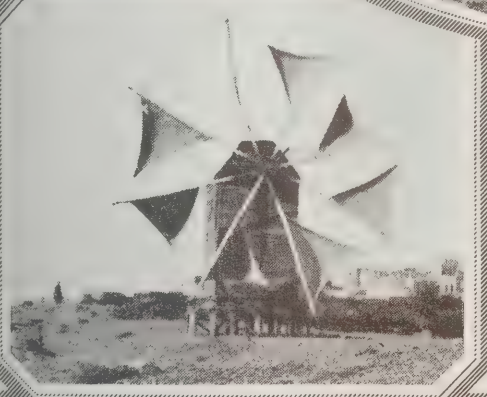
The heat on the tr ride from Ludd to Je salem is something tha shall always remem like that coming fr Aleppo a few weeks earl However, there was m comfort in the Jerusa run because the cars w full-size and not miniat which gave a better circulation of although this was nothing to boast abo

Winding between the rocky wall low hills rising on each side, the tr crept along at a snail's pace a gre part of the distance with long stop small stations where there was onl hut for the station agent.

We finally reached the station were met by the French consul.

Out from the station motors c popular American make were awai us and we sped over the long white to the gates of the Holy City twentieth century comfort instead plodding on foot as true pilgrims to t cradle of Christianity should do.

The beach at Sidon.



Upper left—Baalbeck columns standing alone.

Center—Saida, the Sidon of old, from the sea.

Left—Windmills on the Syrian coast.

Right—Baalbeck, part of Temple.

Porte de Damas—The Damascus Gate.

URBANA ILL

"THE right to think, to know, to utter," as John Milton says, is the dearest of all liberties. Without this right there can be no liberty to any people; with it, there can be no slavery. When you have convinced thinking men that it is right, and the humane men that it is just, you will gain your cause. Men always lose half of what is gained by violence. What is gained by argument is gained forever. Let us believe that the whole of truth can never do harm to the whole of virtue . . . The last lesson a man ever learns is that liberty of thought and speech is the right of all mankind; that the man who denies every article of our creed is to be allowed to preach just as often and just as loud as we ourselves.

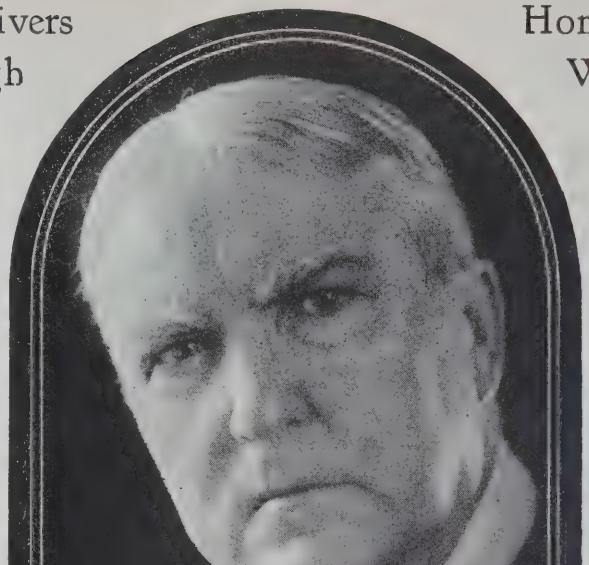
A Preacher Who Delivers His Sermons Through the Newspapers



DR. FRANK CRANE.

His Editorials Read by Twenty Millions

By DIRK P. DE YOUNG

MEET Dr. Frank Crane, preacher, lecturer, journalist, who writes a corking editorial daily for 200 large newspapers, published in many countries, with approximately 20,000,000 readers. He has been writing for the past fourteen years. He was a minister for 25 years before that.

But I had never met Dr. Frank Crane in the flesh until this week, when I called at his office in New York City, for the purpose of interviewing him. I expected to wait a long time before I could be admitted to his sanctum, which I imagined would be filled with books and paintings. I was shown in at once, and instead of finding the Doctor engrossed in the task of composing his daily essay or reading the classics, he was working on a cross-word puzzle. And his editorial studio has a smaller number of books in it than a stockbroker's office in Wall Street. Moreover, the walls thereof were as thinly hung with portraits and paintings as the kitchen of the average home.

Dr. Crane was so deeply engrossed in solving that cross-word puzzle that he did not hear me walk nto the room. His greeting was cordial, but there is a very noticeable reserve about the man. Not uppishness, but the reserve of the student of philosophy; it is mental rather than physical. He is not a backslapper, in other words, although his ideals and his sympathies and his thoughts are of the popular brand.

Although he was a noted preacher for a quarter of a century, he does not look like one. Neither does he look like a lecturer, nor like a writer, nor a college professor, nor any of that class of persons. At the age of 64, with graying hair, tending slightly to portliness, his movements rather quick and decisive, he reminds me of an elderly business man, who is just about ready to retire on a competence. He puts on no airs, has no striking mannerisms. When I put to him the question of style in writing, he referred me to something he had said on the subject before, which reads:

" 'Nothing to that writer except his style,' you say. Bless your life! that's all there is or ever was to any writer, or painter, or musician, or man.

"Everything else in the world we have is common property with everybody else. Our style's our own.

" 'Anne hath a way,' wrote Shakespeare of his Anne Hathaway. And that is all any woman hath. Have not all others arms, nose, hands and teeth, even as our dearest? But it's that little way of hers!

"The good of an apple is its taste. And yet, remove the flavor, and the finest scales in the world will detect nothing gone.

"It makes little difference (that is, of course, when hearts are trumps) what you say, what you do; it makes all the difference in the world how you say it and how you do it.

"Style, flavor, aroma, personality, are they elusive? Not so. They outlive temples and kingdoms. The fact mongers of Greece are dead and dust. Old Homer's sonorous fancies will never die.

"The Roman Forum is a cluttered hole in the ground. The proud emperors, millionaires and conquerors that trod it are gone. There was one man who walked there who amassed no useful information, 'did' nothing, all he had was a little way of saying things; his name was Horace, and it is evergreen.

"Heaven and earth shall pass away, but personality shall not pass away.

"There is only one thing your race cares for from you; it is yourself.

"Style is the one thing that never gluts the market. You can have too many potatoes, too much wheat,

Homely Philosophy Won Him a P Among Common

too many farm labore there never was half enou liarity to go around.

"Better have a style be born rich. Why do and Tetrazzini and Ga no end of money a min the artist who can sing well' has hard work to g money? Answer: style. little way.

"What made Jefferso field, Irving, Terry, C Bernhardt, Rachel? Oh, to speak of, just a way t

"Why does not Sha go down with the yea Dryasdust's Works conta more facts and much mo information, and are f Again, nothing; only a n charm of saying things. he is the eternal rose of lite

That is not quite all t that splendid little essa Crane on style, in which sentence of it sums it a the words that a man's his soul, but what he about style in our intervie up with the above. Thi do with his own style, style of others.

"I put the gist of my in the first sentence," plained. "And every word t lows hangs directly upon that many bricks are laid on a fou

"I try to make every thoug out clearly, using simple wo simple illustrations. I neve more than one point in an e Every word, every sentence paragraph, contributes to the of the idea I am expressing. have thrown out the theme story, I race to the conclusion, only of how it can be made as day in the fewest words. Onc ceive an idea for an editorial, t ten in five or ten minutes. Bu spiration is a slower proces thought may come to me i neously; and it may grow on me

"Although I embellish my by drawing on the classics, I ga ideas largely from the doings masses of today. The rank an humanity know more than the who try to teach them. I obser the Smiths and the Joneses ar ing about and give expression views, rather than tell them think they ought to do. Eve reform has started with the people, not with the élite. Chri itself began that way. The sense of the world reposes in th of the average folk. I merely drift of popular

ewer Farmers a Good Thing for Farming

In 1824 There Were 97 Farmers Per 100; in 1924 Only 30—Cause: Greater Efficiency

By ALLAN L. BENSON

OBODY has ever got rich by farming. Farmers who have become wealthy have done so by buying cheap land and ıg for the pressure of population crease its price. There is some- money in that. But producing ıas never made a big fortune for ody. In the old days it was be- nobody could produce much than he had to consume. Now production has enormously in- d, conditions are better, but rs still work hard and feel that, mparison with the rest of the ation, they are getting the worst

rm conditions are not bad, how- for lack of advice from the city; ould they remain bad if advice the city were any good. It is a ay when somebody in town does ll the farmer what is the matter im. The feeling in the city seems that farming is unlucrative be- of lack of laws. The logic of this sion is, of course, more legisla- Moreover, even the farmers have e convinced that this is true and amoring for help from Congress. w these few remarks will be upon the assumption that what matter with the farmers is *not* f laws, and that legislation has wer to get at the real cause. If easoning be correct we at least an explanation of the failure of m legislation enacted up to this

Ike the facts as we find them in 07, and they point to a conclusion. e our first census was taken, in 0 of each 100 of our population 97 engaged in agriculture. They food *for themselves* and *for three* in the cities, with none for ex- t. They could not raise more be- they worked under disadvan- es Part of their time was spent g land and shooting Indians. Having no machinery, they did everything by hand. Wheat was cut with a sickle or a cradle and threshed on the barn floor with a flail. Each 97 farmers did pretty well to raise enough for themselves and three others in the cities.

Very different conditions existed when the census for 1920 was taken. Only 30 persons out of each 100 of our population lived on farms and the other 70 lived in cities. Each group of 30 farmers was able to produce enough food *for themselves*, and *for 70 others* in the cities *and still have a considerable margin for export.*

What had happened during these 130 years so enormously to increase the productivity of the farm worker? Two things—agricultural machinery and the use of mechanical power. Flails gave way to threshing machines driven by steam engines. Gasoline tractors began to be seen in the fields, each doing the work of more than twenty horses. Binders, mowers, hayloaders and a long procession of other machines had come into common use. Power farming!

With what result? With the result that each worker on a farm produced more than any farm worker had ever produced before. Thirty farmers can now raise more than the 97 farmers who could only raise enough to feed themselves and three others in the cities.

When more men are on a job than are needed to do the work, somebody has to go. As machinery and power moved on to the farms, human beings had to move off. Why? Because there was not work for them. We thus have an explanation of the movement from the farms to the cities that began more than half a century ago and is continuing to this day. This movement was accelerated, of course, by other forces, but the basis of it was lack of work on the farms, due to the fact that machinery and power had enormously increased the productivity of the farmer. Chief among the accelerating forces was the call to the city—the lighter work, shorter hours and the increased opportunity to get in touch with life in the cities. Human beings crave companionship. Farm life was once rather lonely.

Each farmer who removed to a city not only took a man away from the farms but he placed a man in the city for some one on a farm to feed. Thus was agriculture helped in two ways—by decreasing the competition among farmers for employment, and by increasing the demand of the cities for farm products. But more machinery and more power increased the productivity of the farmer more rapidly than emigration from the farms helped him. As more machinery moved on to the land, still more men moved off. And now only 30 men out of each hundred are engaged in agriculture and they are producing all the food we can eat and all that we can sell abroad.

This analysis seems fairly sound, but here is the proof of it. *What would result if 97 per cent of our population moved back to the land and thus restored the conditions that existed in 1790?* What should we do with all the food they could produce under modern conditions? If the present 30 per cent can produce all we can eat and all we can export, what would happen if three times as many were to be engaged in agriculture?

Now comes a harder question: with 70 per cent of our population living in cities and towns why is farming still unprofitable? Too many men are still engaged in agriculture—that is the answer. Machinery has more than kept up with migration. Make all the necessary allowances for lack of or-

ganization in agriculture, the fact still remains that our present relatively small agricultural population is more than large enough to do the work. Is not this proved by the fact that we always have not only enough but an abundance of food? We never have a year in which there is not enough. We never have a year in which our farmers are not looking for foreign markets. Whatever faults may be attributed to the farmer, the fault of neglecting to produce enough food has never been brought against him.

Some say that the farmer should organize his business and cut down production. They cite the fact that small crops oftentimes bring the farmer more money than large ones. As an example, the corn crop of 1924 was 20 per cent smaller than the crop of 1923 but brought $200,000,000 more. But this would be reducing production in a dangerous way. It would be wiser to reduce the number of farm workers than to reduce the productivity of our farms. The economic unsoundness of trying to solve an industrial problem by permitting men who are not needed on a job to remain and produce less, is apparent to any mind. In the long run, we get only what we produce and if we don't produce, we do not long get. Everybody should be usefully employed. Loafing on the job is not the right way to remedy the defect of too many men on the pay roll. Everybody is needed somewhere. The thing to do is to find the place.

The truth is that the farmer has been caught in the great evolutionary development that began with the invention of the steam engine and the introduction of machinery. The same thing has occurred in the cities, but with perhaps a more rapid adjustment to the changed conditions. Power and machinery have vastly increased the productivity of city workers, but for the city worker's products there is no fixed limits to his markets. The man who was quite comfortable without an automobile before he ever heard of one must have one now. By buying a motor, he gives employment to those who make it. *But there is a very rigid limit to the market for food.* One can eat so much and no more. He may eat food that is better prepared and pay more for it, but the excess that he pays goes to the chef and the management, not to the farmers who produced the beef, wheat or other ingredients. As a man becomes more prosperous, he can buy more of the things that industrial workers make, but he does not appreciably increase his daily number of loaves of bread, potatoes, or other of the farmer's products. The size and the capacity of his stomach were fixed a million years before he was born and no amount of money in the bank can greatly change them.

The thing we next see is that the farmer, without any advice from the city, has from the first been doing the right thing by quitting the farm. Readjustment was what was needed and he is readjusting himself. The process of readjustment is still going on. Migration to the city has not solved the problem because the forces that make migration necessary are still in operation. A state of equilibrium will not be reached until all the machinery and power that can be used on the land are there and all the farmers that are not there needed are elsewhere. In a country like America which, agriculturally, is still so far from developed in comparison with countries like Denmark, equilibrium may not be reached for a long time. Evolutionary processes usually move slowly. But it seems that the worst is over. Farm machinery has come generally into use. Power, as expressed by gasoline and electri

NEXT WEEK

In 1870 the twelve-hour day was common. Now wage-earners work less than ten hours, most of them eight.

The table set by our people in 1880 would not satisfy the average citizen today; bread and meat, gravy and molasses were then the staples.

The majority of divorces in the United States are procured by wives. The causes are usually economic.

Read what the Commissioner of the United States Bureau of Labor Statistics has to say on this subject that touches every one of us. His interview with Mr. Ulm, our Washington correspondent, is replete with interesting information.

he Rats of Leningrad

Drill Grounds, Idle Factories; Poverty Over All

By STANLEY HIGH

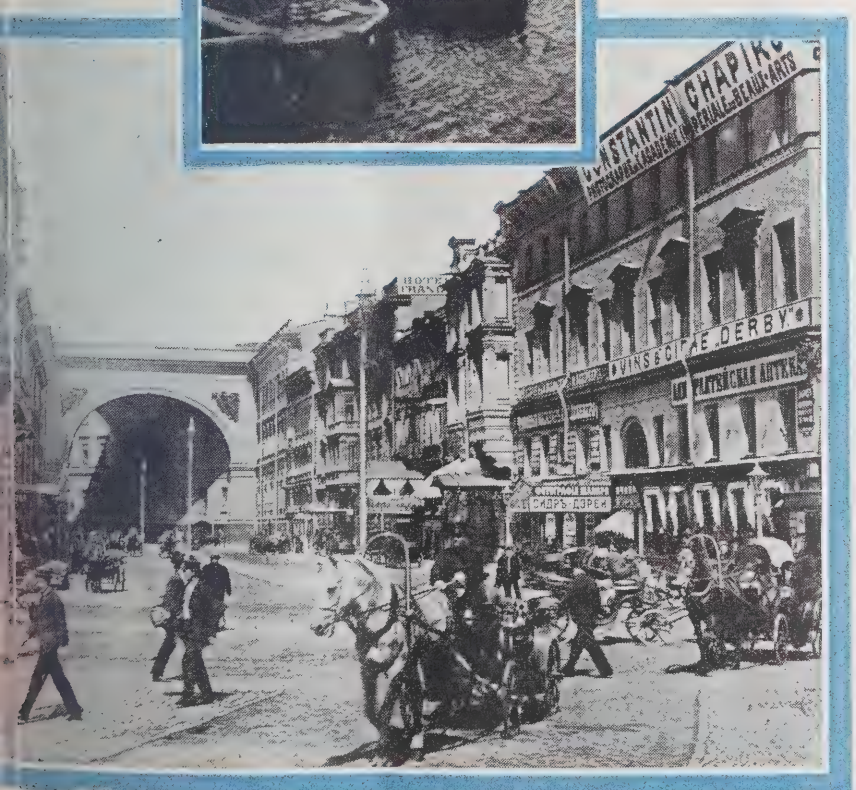
HIRED a cab in Leningrad. It was like the city. The paint—pre-war paint—was scaling off. The wheels ed uncertainly over the cobbles. battered horse and its more ed driver were both relics of r days, when royalty lived in eat palaces along the Admiralty t. Petersburg was the capital of npire.

e driver, in fact, illustrated, well, the history of the city's n years. We hired him in the lace, because, of all the army lf-starved drivers that fought ir patronage at the Leningrad he seemed the least belligerent. ace rattling off into the city he e suspicious. Evidently I ap- too pros- for starv- ningrad, and ewriter case as though ht house an al machine. r first fifteen s my inter- sought to at that my in Lenin- was wholly itical; that I did not represent the Kremlin; that, in fact, I had come from that Seventh Heaven of aspiring Russians—the United States.

Once convinced that I was not a member of the secret police and our driver was a changed man. He sat sideways in his seat, with only half an eye for his horse and the traffic, and related, in Russian dramatic style, his story and his plaint against the Communists. In his golden age our cabbie was coachman for one of St. Petersburg's numerous Grand Dukes. Seven years of war, revolution and famine had landed him atop this wobbly cab. We drove out through Katherine street, near the Neva, and past the deserted palace which was the scene of his former glory.

"There," he said, waving his whip toward an open court, "I exercised the Grand Duke's horses. Look at the place, now. Look at me!"

The front of the great stone building was shell-pocked with the rifle fire of the 1918 revolution and the windows were broken in. The iron gate to the court hung open. The entire length of the street—one of the most imperial among Europe's pre-war streets—was deserted. Two rats scurried out from the palace steps into the street and back again. The driver cracked his whip at them.



let—Looking across the Neva, Leningrad. Below—Bolschaya Morskayo, a busy street of old Petrograd.

Canal of Peter the Great.

"That's Russia now," he said, "broken windows, deserted houses and rats—rats everywhere," and he wandered off into a violent tirade against the Soviets who had driven the Grand Duke into exile, set his liveried coachman driving a dilapidated cab for a few kopecs a day and turned rats into the palace.

Our driver, however, wasn't quite so positive when I asked whether or not he wanted a return of the Czars. He shrugged his shoulders in silence.

"But if the Czar came back," I said, "you might have your old job with the Grand Duke."

"That's right," he said, "but then the trouble is there's a lot of people in this city and everybody couldn't be a coachman."

Leningrad has gone through many of the same experiences that fell to the lot of our cab driver. No city in Europe, before the war, wore richer liveries than St. Petersburg. No city in the world, today, is more frayed out in appearance and down-at-the-heels in spirit. Only the rats, apparently, thrive in the old capital of the Czars.

St. Petersburg, itself, was an artificially constructed city. On the map its commercial location appears ideal. Actually, however, the land on which Peter the Great built the capital, which was to serve him as a "window" through which he could look out to the west, was a vast marsh. In 1700 Peter began his wars with Sweden and victory in his efforts to drive the Swedes from the river Neva led him to lay the foundations for St. Petersburg. In 1703 he erected a humble log

hut, Peter's cottage it was called, and there, away from the luxury that he despised, he directed the first work in the erection of the new capital of Russia.

The glory of the city that finally was completed is rather dimmed by the fact that its foundations were laid upon the suffering and sacrifices of the Russian people. Hundreds of thousands of workmen, through a long period of years, were forced into labor battalions and brought into the vast swamps to further the work of construction. Disease was rampant. It is said that 200,000 workmen died in the building of St. Petersburg. Even many of the Russian nobility opposed moving the capital from Moscow to this new city on the borders of the west. But Peter would not be dissuaded and the work that he began was completed by other rulers.

From the very first St. Petersburg was a city of soldiers. Monuments to soldiers rise in every square. Barracks and drill-grounds are on every hand. The architectural design—along the main thoroughfare of the city—is distinctly European, in striking contrast to the oriental construction in Moscow and other Russian cities. The streets are wide and a few of them are well paved. There are frequent parks, laid out in western design. The stores along the Nevskii Prospekt—pride of pre-war Russia's streets—are less like the cluttered shops of Moscow and more European. Beyond these main streets, however, one meets up with the oriental influences. The paving comes to an abrupt end, and the familiar cobbles begin. The wares of the tiny shops overflow into the street. There are bazaars of all sorts, where men and women in an assortment of costumes jangling over prices make a confusion that is typically oriental.

Idle factories near Leningrad.

But Leningrad shows clearly the effect of the chaos through which Russia has passed. Before the war St. Petersburg's population was over 2,000,000. Today it is only a little above 500,000. The Soviets turned out the Czar and his government and there were none to take their place. Riding along through the streets one has the impression that the city has just passed through a siege. Coming from Moscow on the Moscow-Leningrad express, I counted over fifty idle smokestacks in the industrial suburbs of Leningrad which, before the war, contributed considerably to the industrial life of Russia. Along the principal streets of the city whole blocks of shops were boarded up. In many of the most important sections where the business of the present day is transacted only the first floors of the buildings are occupied, and the upper stories are left vacant—walls falling into disrepair, and the windows still shattered with the gun fire of the revolution.

Along the Nevskii Prospekt the stores were open and business proceeded in a desultory fashion. But there was none of the bustle and activity that one found in the new capital of Moscow. No one in Leningrad, apparently, has anything to do that cannot, and probably will not, be postponed. There are even fewer automobiles than in Moscow and the army of battered droshkas is not so large. People stroll in Leningrad as though every day were Sunday afternoon.

Out in the Admiralty Shaya—now left to the rats—the streets are practically deserted. This nobility section resembles a modern Pompeii, uncovered for purposes of exhibition. Many of the palaces, in fact, are converted into museums. The Soviets, apparently, take pleasure in utilizing every building which can be fitted up with a coat of mail or a picture, for a n

ower of Wings

A Study in Flying Birds and Insects

By S. F. AARON

Comparative wing structures, showing invariable rigidity of anterior portions and flexibility of the wider posterior extensions. The little brown bat, a burrowing bee, the great albatross, a swallow-tailed butterfly, the ruby-throated humming bird, a bee fly. The bee and bee fly are the swiftest of all flying creatures.

ROM the viewpoint of constructive fulfillment and the extreme of application to a most difficult acquirement, ower of flight is perhaps the most y specialized development in Na-

Leg support and motion were rally and simply developed to teract gravitation and friction a supporting surface. Swimming n a heavy medium probably pre- l dry land locomotion. But so letely, easily and skillfully to over- the determined influences against eavier-than-air mechanism seems another matter, though it has widely and quite variously de- ed.

Whatever the limitations of nature has been an abundant and lerfully varied evolution, progres- and amplification adequate for survival of thousands of species, power being the most essential ective attainment. No creature out wings can be as sure of es- g all enemies and of obtaining its as the birds, bats and the winged ts.

More than half a century ago the *nal* of the Smithsonian Institution shed a treatise on the method of al flight, by Marey, who had bly given the subject considerable , his deductions being often ed and never questioned. He very debatable explanations figures, supposed trajectories ng tips, et cetera, that the observer can hardly help nging.

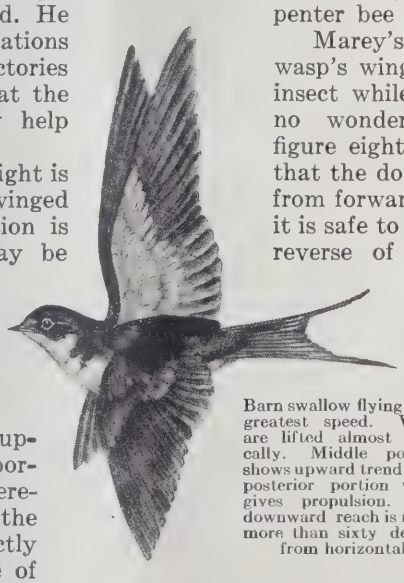
he simple method of flight is sely the same in all winged ures and its explanation is rom difficult. It may be best, of course, by s.

he overcoming of ty requires the ut- muscular effort st a medium offer- o little comparative sup- und this is of first impor- . It will be observed there- that by necessity the e of the wing is directly ght angles to the line of , or, in other words, when the creature's body is horizontal the stroke is always vertical. Pro- m is secondary and depends en- upon the wedge principle as elled by the shape, the variable ance and the attachment of the .

o put it in another way yet per- a little less succinctly because of detail: the directly downward stroke of the wing lifts the flying creature's body and maintains it; the direct attachment and relative greater resistance of the anterior part of the wing and the more flexible posterior portion attached only to the anterior part compels the air to be driven backward as by the blades of an airplane propeller and therefore, against this resistance, drives the body of bird, bat or insect forward.

This is the sole means of propulsion and never, under any circumstances, is the stroke of the wing backward, as Marey and many others have stated directly or implied, the idea often being taken quite for granted. The most casual observation of the flight of any larger bird, particularly that of a pigeon, crow, heron, gull or pelican, will at once fix this in mind; also the method of flight may be ascertained by closely watching a swallow, grackle, kingbird or other species that move their wings not too rapidly, or by noting the blur or glistening haze of the wings of the humming bird, the sphinx moth, the hovering sand-hill hornet, the Carolina grasshopper, the male carpenter bee or the syrphus fly.

Marey's trajectory of a wasp's wing was taken of the insect while held captive and no wonder it indicated a figure eight. It was assumed that the downward stroke was from forward to backward but it is safe to say that it was the reverse of this, the air resistance to the stroke driving the wing of the captive insect forward. And the upward stroke, quite for the same reason, would be the reverse of the downward stroke.



Barn swallow flying at its greatest speed. Wings are lifted almost vertically. Middle position shows upward trend of the posterior portion which gives propulsion. The downward reach is rarely more than sixty degrees from horizontal.

As a matter of fact, the wing motion is in relation to the speed of the flying creature and its trajectory is therefore to be expressed by the figure of a series of waves, the height being the extent of the upward and downward reach and the length governed by the difference of strokes per second from the distance traveled in the same time. For instance, if a bird made six strokes of its wings per second and traveled six feet in that time each stroke would represent an upward and downward motion one foot long, the crests of the waves being just that apart, there being no difference between the angles of progression of the wave strokes both up and down.

When a flying creature wishes to increase its speed it merely strikes the air harder or more swiftly. When hovering the wing is flattened, or better, the posterior portion is held rigid with the anterior portion and with such nice adjustment that the air is only driven directly downward, the body lifted evenly. The best way to ascertain this is to get a side view of a sparrow hawk hovering as it watches for field mice. The vertical motion of the wing may be easily seen and when the bird starts on again there is an instant change in the position of the long primary and secondary feathers.

The general mechanism of all wings is remarkably similar; Nature has adopted one scheme, as has been said. The bones of the wings of the bat and bird, the veins in the wings of insects show a construction singularly adapted for rigidity forward and pliability backward and this is essential not only in the propelling downward stroke where the upward "give" is not too great, but also in a non-resistant upward lift where the downward bending is governed by the resistance. The attach-

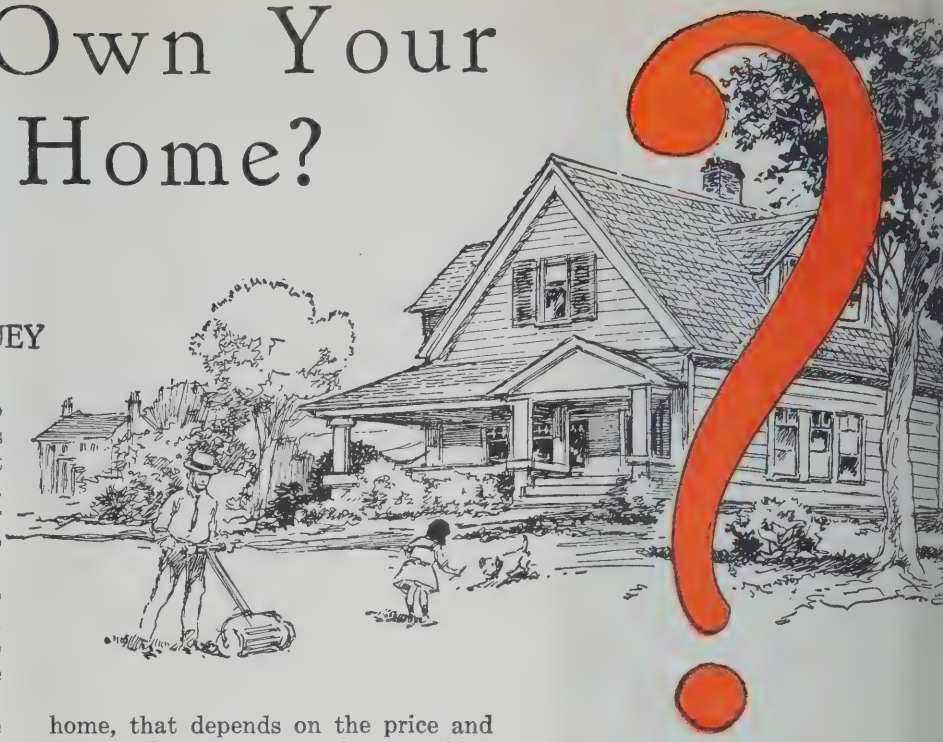
Do You Own Your Own Home?

We Do—Partly!

By MARY WILLIS SHUEY



THERE are some people who think that everything that is theirs is just a little bit better than any other like it. Their egos extend unto the least of their possessions, and everything related to themselves is magnified.

But we are all like that about two things: our *homes* and our *children*. They are the things that really have to BELONG to us before we appreciate them.

Our friends' children? They may be the dearest, most attractive children in the world to their own parents, but there is no especial thrill in them for the rest of us. Rather plain, everyday children, anyhow. Dozens a lot like them. But our own? That's different! We try not to boast of it, but we can't help knowing what superior children our own are!

Our friends' homes? Some of them have very nice places. We'll even go so far as to admit that they are larger and cost quite a bit more than our own. But when it comes to the little things that make a place individual, ours has it all over the rest of them! We never do care very much for our friends' tastes in some things, you know.

A House and a Home are two very different places. A House is a dwelling, a structure, an edifice—whatever your cross-word puzzle defines it. It is an inanimate, soulless thing. But a Home is alive. It is a house that has had so many plans and memories in it and around it that it has become a vital thing.

Just say "Home" yourself. It doesn't mean the apartment you are renting. The chances are that if you are not living in a home that you OWN your thoughts go back to your childhood home.

Yes, a cross-section of the Human Heart shows a strong streak of sentiment for Home. There is no place like ours—until someone comes along and offers us enough profit to really pay us to look for another one!

Homes and children do not belong in the same category after all, for almost every one of us has in the back of his mind the exact figure that will induce him to sell his home. Just this morning we were offered within $300 of OUR price, and I'm divided between hope and fear that the offer will be raised.

As to whether it pays to SELL a home, that depends on the price and the family. There are homes which have been in families for several generations, and they have come to stand for something definite in the minds and hearts of children and grandchildren. They cannot be replaced. They have character, and it takes time to build that in wood, or trees, or furniture. There are not many of those places in cities, however. Growth and changing residential sections, with encroaching business districts, rarely let families live several generations in one house. We find them in the country and in small towns, and as a rule they are not listed for sale.

To some families moving is an actual uprooting. They feel the strain and stress, and a move means a complete readjustment to a new set of conditions. It would take a large profit to make a family move when moving means an upheaval.

Some of us move easily, and do not object to the excitement of change if we have a larger house, or a larger equity in the new one, in exchange for our trouble. I know people who have made several moves actually buy substantial homes. They feel that it has paid them well to take profits on each house.

Your disposition and your financial code will determine whether it pays you to SELL a home. But there is little question in my mind as to whether it pays to BUY one. We are confirmed home-owners—even if the home isn't entirely paid for!

It pays to buy a house because it is much easier to make a home in property that we own than in property we rent. Any place CAN be home, but a home usually IS where we are working to make it ours. Not long ago I looked over some "Better Homes" definitions, and the one that had the truest understanding was written by a little boy. It ran like this: "A Better Home is one my Father is glad to work for, Mother is proud to live in, our frie enjoy coming to, and we children happy to grow up in." That hom usually an *owned* home. Any pl that can give gladness in work, pl in living, enjoyment of friends happiness of children is a mighty g investment!

Home-owning pays in money, t Saving in most cases is a purely quired habit, and it takes both incent and plan to make us do it. Buyin home furnishes both. The incentive own a place that is OURS is so str that we sometimes wonder if it is a fundamental trait. The plan furnished by the building and l associations, or the banks, and as a r it does not take a large cash paym to buy a home. Granting that the p chaser uses fair judgment in the pr paid for a home, there is almost chance of losing. We can always f pessimists who predict a rapid decl in property values, but we haven't s it in good residential property. T one per cent of the loan a month, wh is the rule of most home finance pla plus taxes, insurance and repa amounts to just about what the rent the house would be. In about years the home is completely paid During all that time the purchaser had the pride and joy of home own ship, and the chance for a profit on and at the end he really has the hou

Not only is it paid for, but it been improved. A rented house may to pieces, but an owned home is kept good repair, and little improvements added each year. Perhaps we va those improvements above the amou they add to the house, but who does think the porch HE screened or flowers SHE planted increase value? We may overestimate th personal touches, but (Concluded on page

EDITORIALS

The New York Point of View

NEW York is an alien island situated off the eastern coast of the United States. Between it and the Republic no passport or immigration restrictions exist. Hence the overflow of America with the New York point of view. Just now critics are hailing the coming of the American novel from Wisconsin or the prairies, and a prize has been given for a novel with a Scand-American setting. But it reeks with the New York point of view. Main Street was not Main Street at all, but Broadway suffering boredom on Main Street. Reports of the Tennessee trial were anything but Tennessean: bright young Jewish gentlemen, from New York, interpreted the proceedings to the majority of newspapers, with all Broadway's good-natured contempt of Christian concern for religion. Even our Washington news comes through the New York prism. Our "liberalism" is mostly Newyorkese for cynicism. Our "drama" is the reflection of New York's repudiation of the Ten Commandments. But with all its success in controlling the vehicle and channels of ideas, it would greatly surprise New York to know how little its point of view is accepted by the nation.

The Northwest Burgeons

THE near Northwest is perhaps the most prosperous region of the United States today. Business is not only exceeding 1924 records but also disproving the tradition that a slowdown is natural during the summer months. June building activities, for instance, are ahead of May and far in excess of 1924. The volume of sales recorded and actual movement of commodities have not been equaled since the decline of 1920 occurred. The price of farm land and the number of sales at profit-taking figures indicate that agriculture, the basis of Northwestern life, has turned the corner. At the same time the Sapiro-inspired coöperatives in that region are going into a sad decline. These quack remedies that burgeoned during distressful periods either have been failures or the people are unwilling to continue the agencies that membership salesmen asserted would cure every trouble. Coincidentally such widely different publications as the *Nation* and Mr. Curtis' New York *Evening Post* have paid their respects to the breed of coöperatives for describing which, in terms that the farmers and others would understand, THE DEARBORN INDEPENDENT braved initial criticism.

English Criticism of Coolidge Speech

NO TWO peoples have the right to discuss their mutual concerns more frankly than have the United States and Great Britain. Americans are accused of assisting in the war because they felt that the ruin of the Empire would endanger the security of the public. If that is true of war perils, it is equally true of peace perils. What weakens Great Britain weakens the common interests of civilization. American interest in peace problems may, therefore, be as useful as her war assistance was.

It is therefore unfortunate that British papers should have conceived President Coolidge's Fourth of July speech as offering gratuitous and impertinent advice to the King's government. The speech itself was one of the most refreshing discussions of George Washington's character and the causes of the American Revolution ever given by an American statesman. No character is so little known as Washington, and historians have played hob with the facts underlying the Revolution. The President made a speech which indicated an appreciation of facts not seldom met in Fourth of July orations, and a judgment infrequently found in politicians.

But even that seems not to have prevented British sensitiveness being touched by certain passing paragraphs which plainly were not integral parts of the main speech, and yet were considerations which the President could utter with perfect propriety.

What the British public should understand is that tens of thousands of American citizens return from their annual tours abroad more critical than any official would confess to being of British stupidity. Or it may be not stupidity but stunnedness in face of the problems that confront Britons. The spectacle of The Dole, a premium on idleness, when the country itself cries out for public works, is something that no American has been able to comprehend. The millions and tens of millions that foster pauperism and break down by wholesale the character of British workmen are sufficient to repair, rebuild and enlarge the entire public works system (which would be an incalculably valuable financial return) and also maintain the self-respecting character of the British workingman, which is a national asset not to be measured in the most extravagant terms of wealth.

But, with all her wisdom, Britain has not seen it. Has even shrugged resentfully when

Americans have tactfully asked if such a course has ever been considered. And at last breaks out peevishly in the Press, asking us to mind our own business.

Our business is England's business. It was so in 1917. It is so in 1925. England seems to be slowly falling back before a more powerful enemy than Germany ever was. We would help her if we can. It is not a good temper that resents practical counsel merely because one feels the humiliation of being in a predicament where counsel is necessary.

Busybodies

THE country grows more normal all the time. We are recapturing the state of mind in which good work is done with little tension. One excellent sign is the protest that is going up everywhere against "drives." Another is the protest against the over-organization of "welfare" activity, to the exclusion of helpful old-fashioned charity that had a heart in it. Another hopeful sign is the wholesale withdrawal of support from all the busybodies who print long letterheads full of important names, naming Committees and Commissions and Boards and Investigations, which really accomplish nothing at all except the payment of the Secretary's salary.

American Youth and Religion

THE United States offers a fresh religious field, in that millions of her citizens are as ignorant of Christianity as any jungle dwellers are. It is not entirely a disadvantage. When religious teachers are reduced to repeating the same old sayings to people who know beforehand what is coming, the result is deadness. When, however, religious teachers are faced with the task of winning a Christian nation back to an understanding of Christianity, the challenge is heroic and the possibilities are great. Teaching gets a meaning under such conditions.

Dean Walter S. Athearn, in his recent book, "Character Building in a Democracy" discusses the general question of religious or ethical education from a very evidently wide experience, and together with excellent counsel gives some very startling statistics.

He says that there are over 27,000,000 American children, nominally Protestant, who receive no religious instruction whatever, who are unattached to church or Sunday school. He says there are 8,000,000 American children, nominally Protestant, under 10 years of age, who are growing up in homes that have no contact with the church.

Of the 8,676,000 Catholic youth of the country, under 25 years of age, he says that only 1,870,000 are in religious schools, although in these figures it must be considered that most of the others received religious training and instruction previous to their confirmation. Still, his figures show 6,806,000 who forsake instruction through middle and later adolescence.

There are 1,630,000 Jewish youth under 25 years of age, of whom only 87,000 are in religious schools, and 1,543,000 are not.

He thus concludes that 19 out of 20 Jewish youth under 25 years receive no religious education; three out of four Catholic youth under 25 are receiving no religious education; and two out of three Protestant youth of the same age group receive no formal instruction.

On the whole, it means that seven out of ten of the youth of the United States are untouched by organized religious instruction.

Of course, the figures are not all one-sided. There are 15,000,000 youth enrolled in the Sunday schools of one religious group alone. But nonetheless the adverse figures are impressive, especially when laid alongside those which show that the bulk of the crime is committed by youth under 25.

Is it the fault of the young people? Is it the fault of the church? Is it the fault of the method of instruction? Is there lack of reality in the kind of religion offered? Surely a truth that is true and vital should have resources of strength within itself to make its way to men's minds.

Narcotic Use Is Decreasing

THE public is justified in doubting the claims of the liquor forces that prohibition has made America a nation of drug users. This evidence of interest in the welfare of humanity by the friends of the booze business is very touching, but in this instance, at least, misplaced.

The Foreign Policy Association announces that the claim that drug using has increased since the Volstead Act is untrue. The Federal Public Health Service and the Federal Narcotic Division both declare that the drug habit has decreased since prohibition. The Surgeon General, backed up by the pharmacologist of the Public Health Service, declares that drug addicts are fewer than a number of years ago.

Dr. Alexander Lambert of Bellevue Hospital in New York City states that prohibition has not only not increased drug addiction but that drug addiction has appreciably diminished during the years of prohibition.

Comment is needless. Statements about the personal damage wrought by the inability of the public to buy liquor freely are mere propaganda to be rejected.

MR. FORD'S PAGE

DAILY observation refutes the theory that modern industry has narrowed men's opportunity to go into business for themselves. The openings toward private business are more numerous than they ever have been. It is just a matter of inclination and initiative. The effect of big industry has been to increase vastly the number and kinds of lesser business opportunity, as anyone can see.

Statistics confirm the observation. We hear much about there being fewer farmers than before. But there are more farmers in the farming business for themselves. Between 1910 and 1920, farmers "on their own" increased by nearly 250,000. On the other hand, farm laborers decreased by more than two million. Modern power machinery increased the number of farmers working for themselves and decreased the number of farmers working for other farmers.

This increase is general in all lines. But it is not emphasized by writers on the subject. It is the one fact avoided by those who oppose industry on the false supposition that it deprives men of their independence. Reformers talk constantly about "the employed class," wholly blind to the fact that in this country there are immense numbers whose nature and initiative will permit them to work for no one but themselves, and that opportunity for this independent effort is so numerous that when a man accepts employment from another it is al-almost proof that employment is what he prefers.

GOING into business for oneself was once the only way out of the rut. But employment as a career has become a strong competitor with private business for the favor of young men. Where there was once only one way up, there are now two—and employment is one of them, just as luring to ambition as the other. For the average man, private business cannot offer the extent of opportunity and the assurance of success that modern employment can. Nor the same freedom to use his natural powers, combined with the certainty of livelihood. A Job is now a bigger business than some businesses are.

The reason for this widespread self-employment, or being in business for oneself, is found in the nature of the people who make this country. All of us are descendants of nations who saw in private business the only opportunity to advance their fortunes. Thus was England called a "nation of shopkeepers," and thus does the Italian immigrant set up business with a two-wheeled cart.

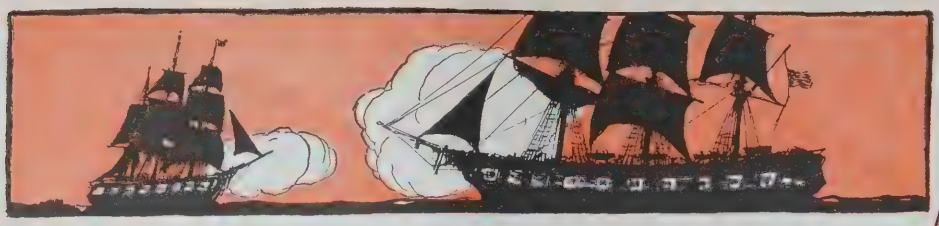
It is only within comparatively recent years *that employment offered a career*. This is the element which students of the problem have generally overlooked. The fact is not that opportunity to go into business for oneself has decreased (it has increased, as we have seen) but that employment is now offering a career of such certainty and extent as to constitute a genuine competition with the other method as a means for self-advancement. As long as going into business for oneself was the *only* way to improve one's condition, ambitious persons chose that way. But now that employment offers *another* way, the people's range of choice is wider.

Employment as a career competes with private business in a field which reformers seldom realize. That is the field of creative effort. A great deal of nonsense has been written about the freedom of the workman under the old system. Much untrue description has been given of the ideal conditions supposed to have existed under the old-time guild system. The union rules and repressive traditions of that system weighed heavily upon independent business man and employe alike, and led to little satisfaction for the individual and to no widespread prosperity for society.

The urge to create has never been so heartily encouraged, nor its field so widely extended, as in modern industrial employment. Take the world of design, as only one example: the best the past has left us in industry was its designs, but the world of design has expanded illimitably since the arrival of industry with its extension of service and its encouragement of individual effort. Where there was one designer set free to do his natural work, there are now hundreds. And even if some modern designs are not the best, neither were most of our forbears' designs of any account; but most modern designs are better, and even if they were not it is better to have a people designing, even if the result be poor design, than working forever and uncreatively with the designs of a previous generation.

While it is a fact that opportunity to go into business for oneself has greatly enlarged, and the number of those who have embraced it has been greatly increased, it is also a fact that the ratio of employment is greater still, and that the activities that afford the largest employment form the basis of all the rest.

This would indicate not only the wide choice of employment that has been made but also its appeal to the faculties of the individual. To intimate that this is due to pressure is merely to sneer; the range of free personal choice of economic action is wider today than at any time in human history. Men associate themselves with business and industrial organizations which they have neither hope nor desire to own, because of the freedom of range which large endeavors give them. Instinct and common sense move them toward it.



Stories Old Log Books Tell

By WILLIAM JOHNSTON MADDOX

AT 2 p. m. got under way and proceeded down the harbour of Boston with a fresh breeze from the W. N. W. As we passed Long Wharf and the private armed brig, *Neufchatell*, they cheered us from both places. At 4 h. 30 m. passed the lighthouse in safety, discharged the pilot and made sail for sea; no ships or cruisers in sight. Unbent cables, stowed anchors, cleared the batteries, gun deck, and such chores, making everything ready for the night.

"Latter part fresh breezes with much sea, cold, cloudy, and light snow; nothing in sight."

So runs the log of the *Constitution* for Sunday, December 18, 1814—and the American frigate most dreaded by the English had taken to the seas again. For seven months an English squadron had held her bottled up in Boston Harbor. But for once their vigilance had relaxed, and she had not been slow in seizing the opportunity to scamper out for what was to be her last fighting cruise, and probably her most gallant.

Word was immediately passed along to English shipping that *Old Ironsides* was free again and that they had better look to themselves.

The *Constitution* had never been in better trim. During the seven months in Boston Harbor she had been thoroughly overhauled. The brown, patched sails, reminiscent of the *Guerriere* and the *Java*, that had made her so marked a figure on the seas, had been replaced by new ones. A complete refitting had been given her, and when she dropped down the harbor that December afternoon she was the best equipped and best ordered ship of her class that ever answered helm.

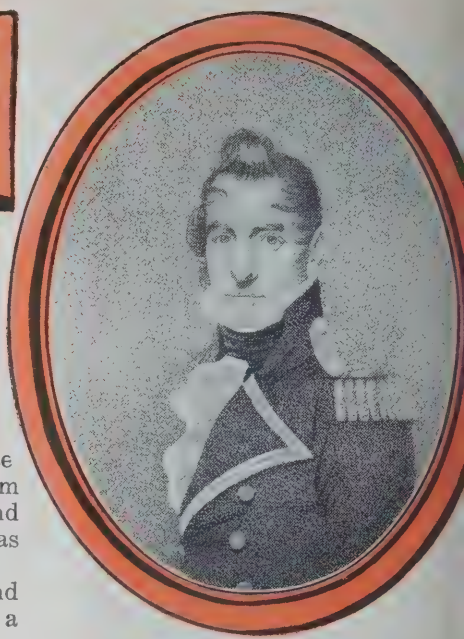
On her quarter-deck was Charles Stewart, a commander of singular ability, whose popular fame unfortunately has not measured up to his deserts. Since the age of thirteen, when he left home as a cabin boy on a merchantman, Stewart had followed the sea. Twenty found him in command of an Indiaman, with the offer of a commission as lieutenant in the United States Navy, which he accepted. He served with distinction in the Mediterranean. When war broke out in 1812, he was thirty-four and commander of the *Constellation*, a 36-gun frigate Upon the return of Bainbridge from his victory over the *Java*, the command of *Old Ironsides* fell to Stewart. It was the most coveted post in the Navy.

At the time Stewart took command of her, the *Constitution* had achieved a reputation that was unique. She was the most talked-of ship of the day on both sides of the water. The English made no bones of their respect for her, although the papers there spoke of her as "the dangerous nondescript." Many an English commander displayed a peculiar tenderness for his reputation when he recognized her high freeboard and saw her enormous flag unfurled. It was thought no disgrace to avoid a fight with her single-handed. The British Admiralty had ordered its frigates to cruise in pairs and 18-pounder frigates were forbidden to engage those of 24-pounders if it could be avoided. A number of its ships of the line were cut down in an effort to make them more of a match for the *Constitution* and our other heavy frigates.

Having gained the sea without even catching sight of the enemy, Stewart shaped his course southeast by south, heading for his favorite cruising ground, the high seas east of Bermuda. On the twenty-third he encountered heavy squalls, and the next day came upon an English brig, the *Lord Nelson*, in distress. Taking possession of her, he placed a crew aboard, and set out in search of her convoy, from which she had parted. Through some misconstruction of his orders, the *Lord Nelson* was scuttled.

On New Year's Day, Stewart notes in his log, he "boarded a brig under Spanish colours from Cadiz bound to Amelia Island. Permitted the officers to send letters by her." The next day he "took the trade winds with fine weather," being somewhat south of Bermuda. On the fourth he "gave up the pursuit of the convoy and hauled on a wind to the northward."

It was an open season for chases, and Stewart didn't overlook a thing that carried sails or looked habitable. Nearly every day saw him in pursuit of some sail. He was out for Englishmen, but each stranger, whatever her nationality, had to give an account of herself before he permitted her to continue on her way.



Charles Stewart, Esquire, of the United States N

Sunday the eighth, having drop farther southward, found him "v studding sails out in chase of a schoo which appeared to be a cruiser. 3 p. m. fired on the chase, our s falling short. Carried away one of studding sail booms; took in the s At 3 h. 30 m. the chase hoisted Am can colours; made the signal of the to her which she answered; made signal to speak with her and shorte sail, of which she took no notice continued her course. At 5 gave the chase and hauled to the eastw under easy sail."

The latter part of the month unusually productive. On the twenti he overhauled a Portuguese brig; t two days later a French one, with anot of the same nationality on the twe fifth. Two more Portuguese brigs w boarded, on the twenty-sixth and fifth of February respectively. On eighth he brought to a bark ur Hamburg colors from Cork, which formed him that peace had been sig at Ghent between the British and Ar ican commissioners. The afterno though, found him in chase of w turned out to be a Russian brig, wh had papers on board confirming report of peace having been conclu

Cape Finisterre was sighted on tenth, and three days later Stew fired upon and brought up a Portugu frigate. On the sixteenth he sigh the Rock of Lisbon. The next day took possession of the British s *Susanna*. Putting a crew aboard, sent her off for the United Sta His next chases were a Russian an Portuguese brig.

Stewart then bore away to the e ward to see what he could find in waters about the Madeira Islan He had not far to go, and what found served as a fitting climax to notable career of *Old Ironsides* a fighter. His log for Tuesday, twenty-first, written himself, gives story of this famous action in

phic, terse style of a seaman. Like good logs, there's a word first about weather.

"First part moderate breezes and udy with a little haze. At 1 p. m. ail in sight to the southward and stward. Hauled up for her and gave se; set staysails, etc. At 1:15 made out a large ship.

"At 1:30 discovered another ship the westward of her, both standing se hauled toward us under a press sail with their starboard tacks on rd.

"At 3 the weather ship made signals.

"At 4 she bore up making signals the ship to ward and firing ns;—bore up er her and wded all sail chase. Set er, topmast, gallant, and al studding s.

"At 4:15 the ship tacked he southward.

"At 4:30 car- l away our in royal mast.

"At 5 fire on chase from the t gun 1st divi- n and the chase on the fore- tle; our shot ling short, sed firing; the ship tacked to northward.

"At 5:40 they ed, passed within hail of each other, rtened sail, hauled up their courses, appeared to be making prepara- ns to receive us.

"At 5:45 they set staysails, hauled ard their tacks and endeavored to wind us.—5:55 they shortened sail formed on a line of wind at half a le's length from each other.

"At 6 sent up our colours, they sting at the same time red English igns.

"At 6:05 ranged within 300 yards n the starboard side of the stern- st ship and invited the action by ng a shot between the two ships, ch immediately commenced with exchange of broadsides. In about en minutes their fire became slack; ered our batteries to cease firing il the smoke cleared away; finding selves abreast of the headmost gave her our broadside, backed after yards and closed with the nmost ship under cover of the ke. The action was renewed with itional vivacity on both sides and tinued until 6 h. 35 m., when their again slackened, and we discovered headmost ship bearing up. Filled after sails, shot ahead, and gave two broadsides into her stern; the nmost ship was then discovered e waring. Wore short round after her. She luffed to on our starboard bow and fired her larboard broadside; luffed to on her larboard quarter within 50 yards, when she struck her colours, hoisted a light, fired a gun to leeward, and yielded.

"At 6 h. 50 m. took possession of His Britannic Majesty's ship, *Cyane*, Captain Gordon Falcon, mounting 34 carriage guns and two swivels. Got out all the officers; put fifteen marines over her prisoners and gave her in charge to Lieutenant Hoffman with a small crew.

"At 7:45 filled away after her consort, and at 8 discovered her with

The action between the *Constitution* and the *Cyane* and the *Levant*.

damages repaired and topgallant sails set standing toward us.

"At 8 h. 40 m. passed on opposite tacks within 50 yards to windward of her. Exchanged broadsides, wore under her stern and raked her. She made all sail and commenced running. Set the courses, spanker, and flying jib in chase.

"At 9:30 opened fire upon her from our chase guns. At 10 finding escape impossible she fired a gun to leeward and yielded;—took possession of His Majesty's ship, *Levant*, Honble. George Douglass, Captain, mounting 21 carriage guns. At 11 all hands employed repairing damages, securing prisoners, etc., etc.

"At 1 a. m. the ship was put in good fighting condition."

The surgeon reports 12 wounded and 4 killed. By way of contrast the loss on the English ships was 77 men.

So much for Stewart's simple, ungarnished account of the day, written in a hand as legible as copperplate save for the faded ink and discolored paper. But it relates a brilliant series of maneuvers. Naval critics have given him unstinted praise for the able way he handled his ship and fought her against two such resourceful antagonists. For the force engaged, it is rated as one of the most brilliant actions in naval history. Not once was the *Constitution* raked by either of the enemy, although she raked them repeatedly and to disastrous effect.

There was no mistaking the eagerness of the English for the engagement. As the three ships closed, the crews of both the *Cyane* and the *Levant* burst into hearty cheers. On the *Constitution*, all was silence—but there was a reason. With two ships to fight, some of the men complained that they should have a double ration of grog. An old quarter-master heard the grumbles with disgust.

"Shame, messmates," he cried, "we need no Dutch courage on this ship!" And springing to where two buckets of spirits stood ready to be served out, he kicked their contents into the scuppers—which evidently gave the men something to think about besides cheering.

The defeat was a bitter pill for the English captains, and they made no attempt to hide their feelings. Stewart notes in his log for the twenty-fifth:

"The prisoners orderly except some of the British officers, of whom this ship's ward room officers complain that they did not conduct themselves below like gentlemen, being in their language indecent, vulgar, and abusive to each other."

Stewart treated Douglass and Falcon as honored guests, permitting them to eat with him in his cabin. One evening over their wine the two defeated captains got into an argument, each abusing the other for the result of the action. Their host listened for a while; then, rising gravely, said: "Gentlemen, there is only one way that I see to decide this question—to put you both on your ships again, give you back your crews, and try it over."

Taking the ships was one thing, and getting them safely to the United States was another. Of the two, the *Cyane* was destined to be the only one to make it. And the reason is related by Stewart in his log for Sunday, March 12. Stewart had made for the Island St. Jago,

Arab Versus Jew

An American Looks Into Zionism; Finds the Native Palestine People Decidedly Opposed to It as Unfair

By REV. RALPH STOODY

An interview with Jamaal Husseini, General Secretary of Palestine Arab Congress.

"THIS Zionist movement will die," said Jamaal Husseini, General Secretary of the Executive Committee of the Palestine Arab Congress. "It has within itself the seeds of its own disintegration. Our strenuous opposition is not out of any fear of its ultimate success. We are simply seeking to prevent injustices to the Arab population during the period of experimentation which will eventually demonstrate its failure."

I had come to Palestine knowing little about this movement which would fill the Holy Land with Jewish colonists, but rather kindly disposed to the idea of "giving the country without a people to the people without a country."

My first jolt came when I found the first part of this euphonious slogan to be utterly false. Palestine is in no sense a "country without a people." In reading the official government handbook I learned that there is a population of 80 to the square mile, which, when adjusted by the fact that much of Palestine is waste land, becomes a very much larger figure. In the same book the estimate of Moslem population gives them 77 per cent, though the Arab Executive claims to represent 91 per cent. No census has been taken, but whatever the true proportions are, there is no doubt that the Arabs outnumber all others eight or nine to one. This convinced me, in defiance of the slogan, that Palestine has a people and the "people" are the Arabs.

I was next amazed to find that practically all of the foreigners with whom I talked were of the opinion, in varying degrees, that the native population possesses certain rights which seem to be imperiled by the government's paternal fostering of Zionism. They said, in substance, that the Arabs have a case, and their protests cannot, either fairly or safely, be laughed out of court.

Without attempting a balanced presentation of arguments pro a con, I wish to relate my findings in attempt to understand the Ar grievances due to the inrush of Jew Through the good offices of one of t leaders in a great humanitarian ent prise in Jerusalem I was introduced two brothers, Christian Arabs. O is a druggist in the city, a graduate the American University in Beir while the other has just returned fr Yale University Engineering Scho As an example of what the Arabs l lieve to be discrimination against the this native of Jerusalem who has ju returned after four years in Ameri was readmitted to his native la only after long delay and endl red tape, while at the same ti Jews, who in contrast to this educat gentleman, may never have been Palestine and may be almost outca from the countries from which th come, are not only welcomed, b sought after as immigrants. Af talking in general terms about t situation these gentlemen, seeing r eagerness to master the Arab vie point, arranged an interview for with Jamaal Husseini, whom th regard as the best authority in Palest on the subject.

Mr. Husseini, a very alert man less than forty, is a member of t Husseini family which claims desc from the Prophet Mohammed. member of this family occupies t position of *mufti*, the Mohammed patriarch of Jerusalem. Socia religiously, financially, and, apparent politically, the Husseini family belo to the Arab nobility.

Jamaal Husseini, a univers graduate and lawyer, has been spokesman for the Executive Co mittee of the Palestine Arab Congr in its appeal to the President of Council of the League of Nations. I talked to him in the men's apa ments of his Jerusalem home I that underneath his oriental gen manliness, there was an intense bitt ness which sometimes showed it in spite of his effort to discuss the A cause impersonally.

"With the continuation of spiri resistance to these impositions u the Arab population I believe t Zionism will see its end in a decad he said. "Were we to cease our opp tion it will take forty or fifty years the experiment to fail conclusively, d ing which time our people would su very serious economic oppression."

When asked to give his reasons the firm conviction which he ho concerning the ultimate failure of "National Home for the Jews" id he developed four lines of argument

1. *Palestine is an agricultural country and the Jews are not agriculturalists.* The only agricultural colonies which have been successful in making money are those which are devoted to orange culture, and these find it necessary to employ Arab help.

Within the past few days I have returned from Palestine. While there I became intensely interested in the feud between the Arabs and the Zionist Jews.

As a Christian minister I went there in a neutral attitude but through Bible study and Christian tradition rather predisposed in favor of the Zionists.

I found Englishmen and other foreigners quite sympathetic with the Arab grievances, and I sought to discover the nature of their case against the Jews. It was my good fortune to obtain an interview with Jamaal Husseini, who is the brains of the organized Arab movement.

The inclosed article is the result of that interview. It does not pretend to be an unprejudiced presentation of the subject, but does seek to set forth the case of the Arabs against the colonizing Jews, and their resentment against the favoritism of the Palestinian Government in furthering their nationalistic ambitions.

This is as I wrote it in Jerusalem.

2. *The Jews will not stay after the subsidies to the colonies stop*, and it is certain that this philanthropy on the part of wealthy Jews will not always last. When Jews like Sir Edmund Rothschild discover that colonies will not become self-supporting, as long as there is any disposition on the part of anyone to subsidize them, they will become convinced of the unfeasibility of the plan. He mentioned one colony which has been receiving outside help for forty years, and is not yet self-supporting.

3. The Jews are eager for opportunities which give large monetary returns. *These do not exist in Palestine.* To substantiate this Mr. Husseini referred to American Jews who have abandoned the Holy Land and returned home.

4. The antagonism of the surrounding Arab states to Jewish expansion will be sufficiently strong to be a political and economic handicap to a successful Jewish nation. In this connection he noted the treatment of Mr. Balfour by Arab sympathizers in Damascus.

When questioned about the new niversity recently dedicated in cere-onies in which Lord Herbert Samuel nd Lord Balfour participated in April, Ir. Husseini said that the Arab ttitude was quite skeptical.

"It is a gesture," he said. "You re, of course, aware that *this is the ird time that it has en dedicated.*"

He raised the ques-on as to whether ade-uate support could be btained for it, owing o the enormous sums hich wealthy Jews re constantly being alled upon to give for ne subsidy of the col-nies and the support Zionist propaganda.

One practical fea-ure which promises ne downfall of the niversity is, to the ind of this Moslem ader, the policy of sing the Hebrew lan-uage for all instruc-on.

"If this is not anged, it alone will om the institution," said. Mr. Husseini ade clear the diffi-lty involved by a ference to the experience of his own alma mater, the American University at Beirut. Here, he said, it was the original intention to confine the instruction to the Arabic language alone. Within a short time the faculty discovered that, though textbooks could be translated and published at great expense for the recurring subjects of study, that unless they trained their lawyers and physicians and other professional workers in a language in which the journals and current literature of their callings could be read, they would doom their graduates to be "has beens" very soon after completing their courses. *They therefore adopted English as a medium for teaching.* If this was necessary in the case of Arabic, which is a living language, the medium of millions of people, and in which each day books and magazines and newspapers are being published, reasons Mr. Husseini, how much more will it be the case with Hebrew, a dead language!

The desire to make Hebrew the national language, revealed by signs posted everywhere, "Speak Hebrew," is interpreted by the Arabs as good evidence that the nation which they hope to establish will give scant attention to the interests of the 600,000 Arabs who have occupied this land for the past twenty centuries.

The impression is incorrect that the present strife is religious.

"Our grievances are wholly economic," said Mr. Husseini. "We lived in harmony with the Jews before their ambition to achieve nationality drove them into such solidarity, and before their aims were furthered by the government."

The Arab leader traced briefly the official utterances which have led to the present dissatisfaction. Going back to the time that Turkey entered the war he told how Sir Henry McMahon, then High Commissioner of Egypt, notified King Hussein that Great Britain was prepared to recognize the rights and independence of the Arabs. For the sake of the independence thus offered, the Arabs turned against the Turks, their natural colleagues in tradition and religion, and coöperated heartily with the Allies.

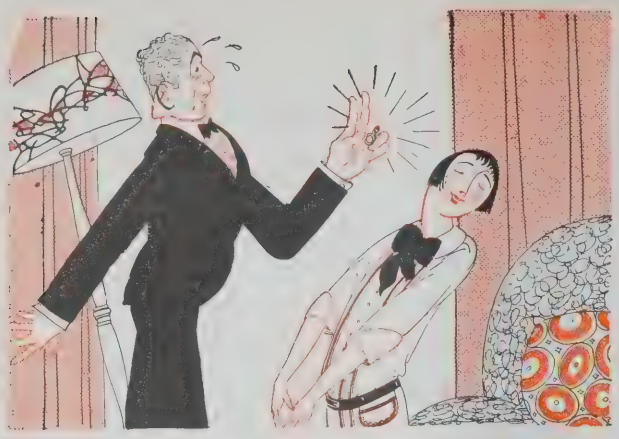
The next encouragement which the Arabs received was when General Allenby, entering Jerusalem in 1918, declared that its occupation by the Allies was only to rescue the Arabs and to give them a voice in their government.

In 1919 Lloyd George, in the House of Commons, stated that the pledges which the Arabs had made had now been fulfilled, and that the time had come for the British Government to fulfill its obligation. Winston Churchill, then Colonial Secretary, in 1921, made similar statements.

To the followers of Mr. Husseini the Balfour Declaration in 1917 seems entirely contradictory to the foregoing assurances. Mr. Husseini attached particular significance to the fact that this declaration was made to Lord Rothschild in a personal letter, containing the salutation, "dear sir," a phrase not common in state papers. When asked if his implication was that the declaration was part of an effort to secure the support of certain wealthy Jews to the war, Mr. Husseini replied laconically: "England needed money and the Jews

(Continued on page 26)

Wilderness of Judea.



"The happy result depends entirely upon your ability to express yourself."

Expressing Yoursel

A Study of Phases of Self-Expression

By THOMAS L. MASSON

ILLUSTRATED BY W. O. FITZGERALD

SELF expression! There is no salesman so humble who does not seek constantly to attain it; no artist so exalted who does not give it his complete attention. It enters into business, art, music and literature; many schools are dedicated to it; it occupies a large part of the thought of all business men; without it in some measure, we should hardly be able to do anything; yet how misunderstood it is, even by those who practice it most!

I was one day discussing this question with a bright young salesman, and in speaking of another young man just starting out, I remarked that it was doubtful if he succeeded.

"He can't talk," I said.

"Well," replied my friend, "that may be an advantage."

Indeed, there is all the difference in the world between self-expression and self-explosion.

Charlie Chaplin has acquired a great reputation and made a wad of money, by expressing himself through his feet. He is said by those who know him to be a very intelligent man of studious tendencies who leans toward socialism—whatever that may mean. If he had tried to express himself through his head, however, instead of his feet, he would probably never be heard of.

Self-expression breaks out from the inside of any individual through places where the pressure is greatest. Margot Asquith (nee Tennant) is the wife of a former British Prime Minister. She came from a notable family, and as a girl was headstrong, indeed wild. Eventually she married Herbert Asquith. The war came on. In 1920 she startled the world by publishing her diary; later she came to this country and lectured. What she wrote, what she did, what she said, were all startling, if not shocking. No American woman, so far as I can recall, has ever talked about herself and her husband in public as Margot Asquith did. Why did she do it? She was perfectly frank in stating her reasons. She said her husband had spent a large part of his fortune in being Prime Minister. They needed the money, and so she went out to get it, by expressing herself.

The shocker form of self-expression is by no means new. In the seventh chapter of Matthew it is recorded of Jesus that when he had ended his sayings, "the people were astonished at his doctrine; for he taught them as one having authority." Socrates shocked the Athenians and they also killed him for it. Caesar's "I came, I saw, I conquered," still holds good as a form of self-expression. Woodrow Wilson's "Peace without victory" still rings insistently in our ears. Before that, Theodore Roosevelt's "mollycoddle" and his big stick—which was a kind of materialization of his habit of self-expression—held the center of the stage. Lincoln's "You cannot fool all the people all the time," with its proper prelude, still remains as a firm rock in the foundations of our political thinking. The relationship of self-expression to restraint offers a grand field of speculation for the student. Roosevelt, in his strenuous way, left behind him a string of expletives. His "You're a liar!" has scarcely lost its novelty. Apparently reckless in his volubility, he yet succeeded in striking home, his sincerity and Americanism carrying him through. But think of the difference between him and President Coolidge, with whom self-expression seems to be a form of silence! All writers on style have emphasized this restraint, Art being commonly defined as knowing what to omit.

Let us now suppose that you are engaged in an occupation, or are confronted by some problem, the successful outcome of which requires all of your courage, skill and experience, and that you suddenly come to realize that the happy result depends entirely upon your ability to express yourself. This is a common problem. We mu say the right thing at the right momen We must be silent at the right momen We are quite positive that if we ca make ourselves understood, the thin we have in hand will go through. It highly essential, therefore, that w should see just what the elements a which go to make up the power of sel expression. We can say of every su cessful man, no matter in what d partment of life he has succeeded, tha there is something about him which individual. Also, when we want get a certain thing done, we look abou us among the men we know, and f upon the right man for the job in han by a knowledge of the combination qualities he possesses; and we kno all this because he has been able express these qualities to us in his ow manner.

There is another importa thing to be noted right here. A for of self-expression may be very imperfe and yet it may produce the exa result intended. Awkwardness, equal with other restraints, may be valuab Self-expression is therefore not a matt of technic; it cannot be practiced itself; yet it must be practiced co stantly in connection with the thing be expressed, and this is what makes t understanding of it so important. Se expression is the result of hidden, invisible forces which must have outlet somewhere, and in this respe it may be compared to a steam-heati plant, where the heat is generat through some unknown workman, w seems to take a secret pleasure piling on the coal when the weather warm, and in suddenly withholding in a cold snap. If there is a modera uniform pressure, then we move alo quite comfortably, wasting a good d of heat, it is true, but still witho

"Nowadays there exists in certain quarters a phase of self-expression running into all forms of jazz, crime, divorce, e

ch disturbance. Some people are ing somewhere all the time, from the ssure. Some blow up every once in hile. Some have enormous pressures imes but have contrived automatic ty valves, so the steam is turned off ough harmless channels. There are -pressure people and high-pressure ple. The majority express themres through work. When this work one in large groups, it is automatic, individual self-expression would ear to be either unnecessary or . It is rare because the majority e small imagination, but it is easily sible. Many cobblers have been ts, and good ones. If a man has an gination, it will work itself anyre under any conditions; so autoic motion may not be so bad for it r all. If a man has small imagina, and it is uncultivated, then his acity for self-expression takes contionalized form.

For example, a group of manual kers, when they are released m their regular occupation, all do about the same thing, express themselves. They will y cards, go to the movies or do tever is convenient for the majority. asionally one will move off by self. He will walk in the woods, he be "different."

There must be satisfaction as the l result of self-expression; if there ot, the victim frequently goes mad. tzsche, the great German phipher, expressed himself in his great ks, perhaps the greatest being us Spake Zarathustra." No results owed the publication of his works. re was no process of sublimation, Nietzsche's mind gave way under pressure. Sublimation is a modern d, used by the psychoanalysts to lain the release of certain forces ough some new channel.

To continue our steam illustration, us suppose that, with a high pressure team, all the radiators in a steam plant suddenly turned off. Something has to break. But if, through some new let, the steam is permitted to blow, would be a process of sublimation. urring experiences, some of them entures with the shock element, are stantly crowding into the mind. y sink down into what is termed Unconscious, and create pressures re. Then, again, there are desires ch, being repressed, sink down into Unconscious and form pressures. en all the radiators are turned off the steam keeps forming, there is, peat, likely to be an explosion somere. We hear of boys and girls ning away from home suddenly, of g all sorts of queer things, often inal things; that is because they e been repressed somewhere; there been no process of sublimation. ts simplest form, we see this law king on the nursery floor, where a l will burst into tears over a broken but will smile again when another—aps quite different—is presented.

There must be an outlet, but here again a very important factor enters, which must be duly considered in its relation to one's total self-expression.

This is the factor of control. There are, as I have indicated, and as we all know, people of high pressure and people of low pressure. Let us suppose there are two persons of equal pressure, and one of them blows up and the other doesn't. How do you account for this? By the measure of self-control induced in the latter. If you study your steam-heating plant, learn all about it, how to adjust all the stop cocks and to make the pressure uniform throughout at critical periods when the gauge rises, then you go right on without disaster. We are much too likely to blame the unhappy victims of these explosions, when the fault lies elsewhere. Consider the pressure brought to bear on many poor girls who run away from home.

"A form of self-expression may be very imperfect and yet it may produce the exact result intended."

We have come to know what another word used by the psychoanalysts means, namely, the complex. A complex is an unexpressed desire for something. Think of Romance as a complex! Think of all the things which Romance has meant down the long ages! Knights in armor, milk-white steeds, strange lands and heroes with strong arms. Romance is a great beckoner, and beckons none the less forcefully in an age of machinery. Then there are all the other repressions of family life, and no proper understanding on the part of parents. Well, then, what do you expect? Nature cannot be thwarted. But the educators who know most and are wisest tell us that if habits of self-control are formed very early in life, then this process of sublimation can be managed with the greatest results. We know this to be so through countless examples. The prize-fighting phrase, "a glutton for punishment," is often worthy of a higher mark. A boy who is taught to take punishment learns to go over the radiator valves, to hold the pressure until such time as he can blow off steam and thus make his proper noise in the world. Success comes by a series of minor adjustments, each one seemingly slight. Some people call it luck, when it so often depends upon the kind of parents one has selected. Still, we must not, also, forget this interesting fact: that those who blow up often come down on their feet, and later on, come into their own, in spite of everything previous. There seems to be no rule for women like Margot Asquith or Sarah Bernhardt. Or Shelley. Or Burns. The worst of this is, however, that so many young ones think they can write poetry like Shelley's just by blowing up.

Considered as a distinct quality by itself, self-expression has three aspects, or it can be roughly divided into three groups. In its simplest form it is merely work; it is a man expressing himself automatically, through certain movements which bring him in his sustenance. Such a man, as I have indicated, now has growing leisure thrust upon him, and so he is being aroused to sublimate his desires during this leisure. He is the majority.

The second aspect of self-expression is still largely automatic, but also individual. It is more than this; it is imitative and the imagination is awakened. We see it in actors, salesmen, professionals of all sorts and in a large proportion of writers. To understand the line of demarcation between this group and the one higher up (the third) one has only to witness an actor making a speech in response to a curtain call. Playing his part, his form of self-expression is built on undoubted talent, plus long practice. We understand his individual contribution, we credit him with the second best form of self-expression. But the highest form is, of course, the creative.

There is still another aspect of self-expression which should be noted, although it does not appear to me to be distinct enough to be put in a group by itself; that is the emotional. We are slowly coming to recognize that, as a form of self-expression, mere emotion is unproductive; it gets us nowhere. The soul progresses, not by means of acrobatics, but through slow agonies.

The wear and tear upon his organism seems to receive no compensation which is adequate to keep him balanced. By this I mean that the creative output generally leaves the victim sapped out.

Can you express yourself? When we Americans, each in his own bailiwick, come to examine this question for ourselves, in the light of our practical everyday life, we shall soon discover that our capacity for self-expression is the greatest asset we have; that the understanding of it, and its intensive cultivation, are of supreme importance. How then can it be (*Concluded on page 22*)

Perigord—the Truffle City

Delicacy Dug From the Earth for Epicures

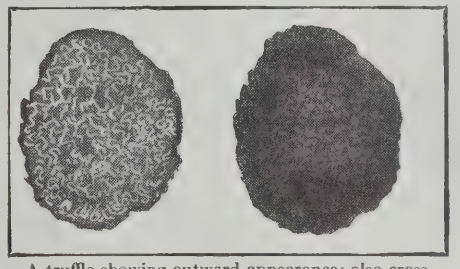
By ANDREE PRATOUCY

View of Perigord Cathedral from St. George's bridge.

WITH its thick, scented cloak of golden gorse, its evergreen oaks and fig trees wrapped in the soft hills, its luminous and fertile valleys, its artistic glades and large horizons, Périgord has been praised by nature lovers as one of the most original and attractive southern provinces of "*la douce* France." There bleak solitudes skirt splendors and the sun swallowed by the deep glens seems to weave its beams with every drop of water which then gushes out into dazzling waterfalls. Kingdom of vivacious rivers and wooded highlands, it was once the cradle of the human race along the Vézère River, the happy hunting ground for epicurian Romans who romanized the Celtic capital Pretocorium (actually Périgueux) into the "cité" Vesunna. Its people proudly trace their own lineage back to the Cro-Magnon man of the glacier period, and ethnologists take them to be a sturdy, intelligent though obstinate race, with unusual artistic feelings, sharing in the legendary wit and humor lavished on the south by the sun of Gascony, and intensely keen for liberty. The legend tells us that Hughes the First, first king of the Capetian dynasty, trying to yoke down the "will-o'-the wisp" Aldebert, Count of Périgord, sent him an emissary with the sole words, "Who made thee a count?" And back went the emissary with the answer, "Who made thee a king?"

Ever since the days of Aldebert the province has been honeycombed with lords. Crumbling dungeons are familiar scenery in the Périgord landscape, and even now medieval chateaux are still inhabited by most of the remaining nobility, who transformed into mere "*gentil hommieres*" the bristling fortresses of past ages whence sprang forth a particularly brilliant host of poets, litterateurs, philosophers: the "troubadour" Bertrand de Born, Brantôme, Montaigne, Fénelon, Maine de Biran.

But it is not to the genuine beauty of its valleys nor to the fame of its artists that Périgord owes its greatest popularity and renown. Most people ignore it on the map who welcome it on the menu, for there are indeed few banquets worthy of the name which do not boast of any truffled fowl or dish "à la Périgord." Few also, it may be said, are dishes "à la Périgord" really including the very reason of their qualification, the black, tough, round, much-sought-after, perfumed little ball, diamond of the Périgord soil, the truffle.



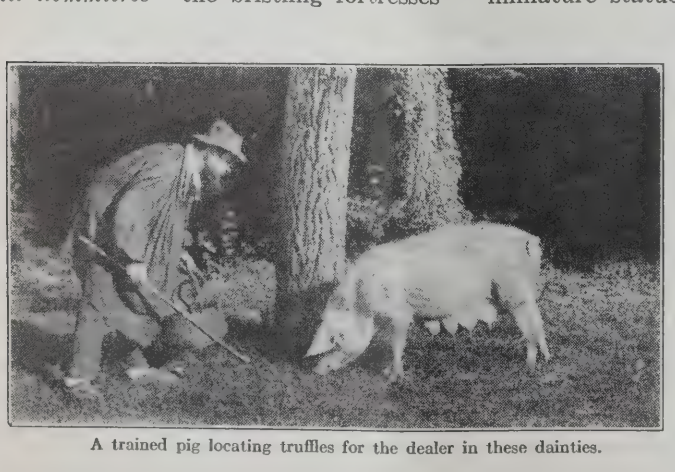
A truffle showing outward appearance; also cross-section.

Buried in the ground under or around oak and sometimes elm trees, truffles vary from the size of a nut to that of an apple and, when dug out, are so intimately plastered with earth that they look like little balls of clay ready to be modeled into the rough cast of some miniature statuettes. When carefully washed and brushed, their surface presents a quantity of small protuberances forming a rough, black skin. The inside is dark purple, a smooth, hard substance checked with delicate white veins. Subterranean as they are, they often form a treasure which remains unknown to the very owner of the land. Marauders have an easy time as they go r bing invisible goods which will br them good profit in return, for truff being scarce, are in great demand on market.

The mystery of their birth a growth adds to their popularity. W is a truffle? A root or a mushroom? self-made vegetal or a parasitic pla Aristotle's disciple, Theophraste, lieved it to be a "rootless vegetal eng dered by autumn rains and thund Plutarch and Juvenal considered "product of thunderbolts and storr and as late as the fifteenth cent "sky-fire" seemed to be the only t fle seed. Modern science brought r methods of research but it appears t every mode of experimentation a another theory to the controversy.

Theophraste and Juvenal's opir is still shared by some Périgord p ants, who will tell you with firm as ance that clods of earth are made i truffles by the magic power of m stars, flashes of lightning, thunder, r Too good to be true, indeed, but fact is that truffles are in greater ab dance after stormy weather and t autumnal rains add to their volu perfume and quality. Some more vanced "*trufficulteurs*" suppose t truffles are engendered by a sort exudation of the fallen leaves and b ches, little by little, buried at the of trees. Others believe the roots, the leaves, to exude a honey-like s stance which eats up the root and h ens into a truffle.

The more scientific "gall the gathers many partisans. Should walk over the truffle ground on s sunny winter's day you would obs an odd little blue fly seeming to p out from under the ground to be fri ened away at any noise. Dig up abandoned clod and you will su find a truffle, ex-dwelling of the insect. From that observation s scientists draw the conclusion that truffle is but a gall, result of the sti ing of the oak roots by the "*mo*



A trained pig locating truffles for the dealer in these dainties.

ffigene." A keener observation
ves the "gall theory" to be false.
ly the fly is related to the truffle,
only when the tubercle is ripe and
n the insect uses it as a ready-made
ng room for itself and its larvae.
h an inhabited truffle is not worth a
on the market.

The last theory most commonly
epted and supported by the Acad-
of Sciences includes the truffle in
mushroom family. A strange mush-
n, indeed, without stem or head, a
hroom which has to breathe through
to twenty centimeters of earth and
ally never gets to the open air be-
the gathering. But it shares with
mushroom many peculiarities, such
he physiological phenomena which
ide over the functions of
r organisms. Their chemical
position is alike. Both of
n lack leaves. Both of them
e carbonic acid as the result
their respiration. Both of
n have a sudden growth—
eeded for the truffle by a three
ix year preparatory stage.
Then the truffle is a fungus
possesses as a fungus mycelia
spores. Its very fragile my-
um is composed of a mass of
thin, brown threads four to
millimeters long quivering
er the lightest breeze when
mined under a microscope. It
gs to rootlets, usually oak
lets, and is widely spread in
truffle ground. At the end
May, after the spring rains,
mycelium thickens into a
of felt. Then some little
nd corpuscles appear on its
face, white, gray and black in
n. When corpuscles reach
size of a pea the mycelium
mpletely absorbed and the
fle is left alone to find its own
sistence. How can it find it? How
s it assimilate it? There resides the
stery, for all the admitted theories
some important concluding point.
any rate the adhering earth contin-
wet around the truffle so that it
be supposed the tubercle gets by
osmose the nourishing elements out
ts own surroundings which are then
dered absolutely sterile to any other
etation. Truffles "burn" the ground
the slow disappearance of briar,
se, thistle or any other grass in a
piece of land gives almost a certi-
e as to the formation and patent
tence of the subterranean wealth.
For the truffle is very exclusive in
riendship and very odd in the choice
site. Its most congenial roommate
he oak, the roots and shadow of
ch are necessary implements for the
elopment of the tubercle. But what
egenerate specimen of an oak it has
emain its life long! Not more than
to seven feet high, stunted and
ly looking, it bears nothing in its
appearance which can relate it to the lofty king of the nearby woods. Indeed it is more a shrub than a tree and the stony truffle ground, red with iron or white with chalk, is more a bare bit of wildness than a cultivated land. The truffle spurns cultivation as it is understood for other vegetals and a deep plowing would cause its death.

However difficult it is to cultivate truffles, that has been done. When phylloxera had passed over the country blowing destruction through vineyards and poverty into the peasant's cottage, the planting of properly selected oaks, the transportation of "truffle earth" into the devastated sectors together with a careful chemical treatment of the soil to favor the development of mycelium, all these efforts were crowned with success in the creation of artificial truffle grounds. But it takes three to seven years of constant tending before an ordinary land can give its first harvest.

Natural or artificial ground, that does not affect the quality of the "*Truffe de Perigord,*" the real black *Melanosporum,* with its firm, marbled flesh, its characteristic genuine flavor. Does it know that Christmas and New Year "*reveillon*" want it on the table, perfuming gravy and stuffing geese? It is ripe right on time, at the end of November, and provided Jack Frost be clement enough, the crop lasts all winter long. Odd crop, indeed, which has always appealed to humorists. In the research of the truffle lode, man's precious intelligence is deeply handicapped and has to be helped by animal instinct. Owing to its acute sense of smell, the sow wins the prize. It is a rather peculiar but very common sight to see man and sow going side by side, one dragging the other. Very fond of truffles, the animal goes straight to the hidden tubercles, digs them up with a quick "push and pull" of its snout, and would eat them promptly should its master permit it. But the heartless master slightly strikes the sow with a stick, gives it some crumbs or corn on the side and throws the find in the basket he wears by a strap around his neck. Things do not always go so smoothly. Should it believe it is cheated, the sow goes on a strike and absolutely refuses to move on. Because of this bad temper dogs are sometimes preferred, although their scent is weaker. They are also excellent helpers of marauders, for it is much more easy and innocent looking to walk with a dog than with a sow; much more easy, too, to run away when discovered.

Truffles are to be found also in Provence, Burgundy, Dauphiné. But the quality of the real *Melanosporum* brought such fame to the tubercle growing in Périgord land that wherever it may come from it is always labeled "*Truffe de Perigord.*" As for the boundary-fixing of the Champagne vintage, the question has been raised to know whether that fraud could be permitted—and has been settled in such a manner that one can read on cans of preserved truffles:

Truffe de Perigord, de Villiers le Duc, Bourgogne. That elegant fashion of turning the law does not prevent Périgueux from being the truffle capital. Tubercles are sold there for millions of francs every year, mostly for export, and the truffle perfume is well known to any traveler whose train happens to stop at the city station for a few minutes.

Before the war any modest household could feast with a truffle-flavored chicken, for truffles were then worth five to ten francs a pound. And although peasants in blue blouses, women in checked headkerchiefs, have not changed an atom of their provincial attire, nor the queer little market place its old-fashioned, roughly cut wooden boards, something has changed today. It is no longer ten francs that sellers ask in their peasant patois—it is sixty francs a pound. The "*menageres,*" going home from the vegetable market, seem to ignore the well-known fragrance. They don't stop. No "*pate de foie gras,*" no "*poulet truffe,*" no "*boeuf a la Perigord*" this year in the province—the truffles of Périgord go to the English turkeys. Owners of truffles do not complain, nor do English owners of turkeys. Do consumers sigh in both countries? Perhaps, but—oh, well—who cares for consumers nowadays?

Midsummer

The butterfly and bumblebee
Come to the pleasant woods with me;
Quickly before me runs the quail,
Her chickens skulk behind the rail;
High up the lone wood-pigeon sits,
And the woodpecker pecks and flits.
Sweet woodland music sinks and swells,
The brooklet rings its tinkling bells,
The swarming insects drone and hum,
The partridge beats its throbbing drum.
The squirrel leaps among the boughs,
And chatters in his leafy house.
The oriole flashes by; and, look!
Into the mirror of the brook,
Where the vain bluebird trims his coat,
Two tiny feathers fall and float.

—*John Townsend Trowbridge,* 1827-1916.

Mapping the Great Northwes

Fake Records Made by Unscrupulous Cartographers Claiming New Lands.

By LOUIS C. KARPINSKI

THE great Northwest successfully eluded any complete and definite exploration until the nineteenth century in spite of the efforts of many nations who hoped to colonize there. The approach from the west was made by the English, from the south by the Spaniards, from the southeast by the French and Spanish, from the east by the French and from the northwest by the Russians. But all of these efforts proved unsuccessful and the region remained a prize for the Americans, the one large section of the United States explored and placed upon the map by native sons.

Two jokes upon cartographers of this region were successfully played by paper explorers and were reflected upon the maps even into the nineteenth century. The desire for a water passage from the Atlantic to the Pacific led two unscrupulous adventurers to satisfy that desire by invention. A great Bay of the West was the fabrication of a Spaniard, Juan de la Fuca, who placed his imaginary explorations of 1592 in the vicinity of the present Bay of Vancouver. The River Long was the addition of Lahontan whose entertaining mixtures of truth and fiction enjoyed a wide popularity from 1703 for nearly a century; his river appears upon many maps of the eighteenth century.

The first attempt to reach our Northwest was made by the Spaniards from the west. The voyages to the western coast of South America had proved so fruitful of gold and silver that the progress northward was by contrast unattractive. However, in 1542 to 1543, Juan Rodriquez Cabrillo made a voyage northward as far as the present southern Oregon line. In 1579 Sir Francis Drake swooped down upon the unsuspecting Spaniards on the western coast of South America and extended his plundering voyage as far as the western coast of Oregon. Upon a map of 1587 Drake's exploit is commemorated by the name Nova Albion, New England, thus applied first to the region of the Northwest Territory.

Neither the Spanish voyage of Cabrillo nor the English expedition of Drake had any further effect upon exploration of the Northwest Coast nor were there any successors for more than a century and a half.

"From Purchase Ho Pilgrimes."

In 1596 a Greek named Juan de Fuca met the English geographer Michael Lok in Venice and there related to him an amazing tale of his voyage made in 1592 on the West Coast of America. From Lok the story passed to Samuel Purchas who incorporated the account in his book of voyages. "Also hee said, that . . . The said Viceroy of Mexico sent him out againe Anno 1592, with a small *Carauela*, and a Pinnace, armed with Mariners onely . . . for a discovery of the same Straits of *Anian*, and the passage thereof, into the sea . . . And that he followed his course in that Voyage West and Northwest in the South Sea (the Pacific), all alongst the coast of *Noua Spania*, and *California*, and the *Indies*, now called North *America* (all which Voyage he signified to me in a great Map . . .) vntill hee came to the Latitude of fortie seuen degrees and that there finding . . . a broad Inlet of Sea, between 47. and 48. degrees of Latitude, hee entred thereinto, sayling therein more than twentie days."

This fictitious voyage of Juan Fuca made an interesting story and century and a half after his pretend voyage other navigators looked for strait and applied his name to t strait, at the entrance to Puget Sou which Juan de Fu never had seen. T Great Bay of the W was delineated upon t map of 1750 and even to 1800 by French geog phers who relied upon t old narrative. Strange say the great bay was r adopted early in the spre of the Juan de Fuca f tion, but appeared up the maps just before t Russians and the Engl and the Spanish and nally the Americans w demonstrating the fal hood of the delineation

During the period fr 1600 to 1725 the Span were penetrating the sou western portion of United States and French were making pr ress westward from St. Lawrence and northward along Mississippi and Missouri. As early 1641 the French had reached L Superior and in 1659 two adventur Frenchmen, Radisson and his broth in-law Grosseillers, had penetrated yond the Mississippi to the Gr Northwest. Returning loaded with f from a second expedition to West these intrepid explorers w fleeced by French Gover with the res that both fo time gave th services to E land. Under th inspiration Hudson Bay C pany was org ized in 1670 continued nearly two c turies to play great part in development the Northw Country.

The defi discovery in 17 of the Mississ by Louis Jo and Père Mr quette was l lowed about years later colonization p jects under LaS

nton, China. Here an
onishing demand by
e Chinese for furs some-

what accidentally acquired during the voyage opened up new vistas of trade in the Orient. The English began this fur trade on the Pacific Coast of North America and Yankee ships and traders from Boston soon participated independently in the enterprises, by interest largely aroused by the accounts of the American Ledyard, graduate of Dartmouth College, who was with Cook on the voyage of 1776.

The fur traders of the Hudson Bay Company of Adventurers of England entered upon American activities in 1670 and exerted for more than two centuries a profound influence upon the development of Canada and our own Northwest. Rival trading companies also played no little part in this exploitation of the American fur resources. Among these traders were inevitably many with the love of adventure and discovery. The Arctic Ocean via Coppermine River was reached by one of these intrepid traders, Samuel Hearne, in 1771. Eighteen years later a Scotchman, Alexander Mackenzie, repeated by another route the trip to the Arctic arriving there by the Mackenzie River. Four years later the dream of Cartier, the dream of LaSalle and the dream of LaVerendrye was finally achieved by this same Scotchman who was able to paint in vermilion on a great rock on the Pacific Coast, the legend: "Alexander Mackenzie, from Canada, by land, the twenty-second of July, one thousand seven hundred and ninety-three." Thus the passage across the northern route to the Western Sea was finally found, but not an easy waterway for which the English Government as late as 1776 had hopefully offered a reward of 20,000 pounds.

Map of 1782 by Janvier, French Geographe. The mythical Bay of the West.

In 1787 a group of Boston Merchants fitted out two vessels, the *Lady Washington*, and the *Columbia*, to engage in the fur trade on the west coast of America. Of these two vessels the *Columbia*, under Captain Robert Gray, reached China, traded furs for tea, and completed the first circuit of the globe by an American vessel, arriving in Boston on August 10, 1790. Almost immediately the *Columbia* sailed again around Cape Horn and on to the Oregon coast. English and Spanish vessels were also at this time engaged in the coastwise trade.

The mouth of the Columbia River had been noted in 1776 as Entrada de Heceta, by the Spaniard Heceta in one of the voyages made between 1769 and 1779 to reëstablish Spain's claims to the western coast. The Englishman Vancouver in 1792 explored thoroughly and scientifically the western coast. Shortly before his vessels spoke the *Columbia* from Boston, Vancouver had noted breakers at the mouth of the Columbia River, but supposed the entrance not passable. The good ship *Columbia*, however, entered the river on May 10, 1792, giving the United States a claim to the region by priority of discovery. Within a short time Vancouver returned, learning through Spanish vessels of Gray's exploit, and made a more intensive exploration of the river than Gray had done.

Spanish, Russian, English and American claims were now somewhat hopelessly involved in this region. For many years Spain claimed the sole right to colonization on our western coast, but gave up the claim in 1792 on the threat of war by England. Russia also made extravagant claims, yielding to diplomatic pressure by England and America.

thought. Instead of telling people what they don't know, I tell them what they do know, in my own way, thus adding to their previous convictions and expressing clearly in print what the reader has long felt himself before. And they appreciate a writer who can express their thoughts.

"It is the workers of the world who keep things going. The loafers are the trouble makers. It is the masses, too, who are moral, and are otherwise sanely balanced. So far as history reveals, the magnificent ones of earth have never had a collective moral impulse. Happiness is a by-product of work. A normal condition of man is that he should labor for his daily bread."

The Loafers Are the Trouble Makers

The last paragraph, from Dr. Crane's most recent book, "Why I Am a Christian," which he pointed out to me during the interview, illustrates why he inclines to his views—that we should learn from the masses instead of attempting to teach them. It also gives us a clear line on the man himself, which Stevenson says is his own style. Dr. Crane is a democrat. He has mingled in all classes of society but likes the ideas of the common people the best. And he likes to work instead of loaf, as he says in this same book a little farther on:

"It is strange, the contempt of the world for work. I have even seen pictures of Hell wherein the abode of the damned was represented as filled with smoking factory chimneys, and the wheels of machinery, and I do not recall ever having seen a picture of Heaven in which any of the saints and angels were engaged in doing anything but loafing. And yet, to my mind, any continued existence would be repulsive unless the soul were to be engaged upon some worthy occupation, some service to the community, some wholesome labor that would give play to the normal faculties.

"My own notion of Heaven is that of Samuel Johnson. One evening when he and Boswell were strolling in the garden and viewing the starry skies, Boswell asked him what was his notion of the future life. He replied that to his mind the same laws that govern us here would continue to govern us there. So it seems to me that if any existence is to be continued beyond this earth, no heaven would be welcome unless there was in it some fit task, unless I could be occupied in subduing the forces of nature, studying the laws, and solving the problems incident to an intelligent life.

"In other words, I do not think I should want to go to Heaven unless I could find a job."

Having read Dr. Crane's widely syndicated editorials for so many years, there were many questions I wished to ask him, but it was impossible to get them all in. I wanted to know what he ate for breakfast, how he lived, and so on. And to make a long story short I will tell this in my own words.

Dr. Crane has prunes, toast, and coffee for breakfast. He goes to bed at 12 o'clock at night and gets up at 6 in the morning. He eats meat once a day and sleeps an hour after lunch, for which he goes to his home in uptown New York. He smokes cigars and exercises very little. He makes many rules for preserving his health but, like all the rest of us, is always breaking them. He gets hundreds of invitations to lecture, to speak at informal gatherings, to dine here and there; he belongs to clubs, organizations of all sorts, and his presence and his advice are much in demand. But the place he loves most is his home, with the wife of his youth, Ellie C. Stickel, of Hillsboro, Illinois, who took him for better or worse some forty years ago, when he was a struggling Methodist minister out in the Cornbelt. He likes his easy chair, his slippers, his cigar, the evening paper to mull over, more than he does the glitter of the formal world.

I wanted his opinion on other things. What about the world, as this brilliant journalist and ex-preacher views the passing show? Is it getting better or worse? Are children being brought up right? Are flappers flapping too much? Does the coming of women into man occupations mean the breaking up of the home? And so on, and so on?

On all of these points Dr. Crane is an optimist. The world is getting better; women in business make men more decent and they will continue to rear the children and preserve the home. There were flappers among our grandmothers, and children are better today, he says, than when he was a boy. And he illustrates his point by referring to his two grandchildren, whom he asserts behave themselves better than he did at their age.

"All the Religion I Have I am Using"

He also believes that the editorial has just as much weight now as ever, if the writer thereof is expressing public views. Newspapers, and the tone of journalism, according to Dr. Crane, are much improved over the old days. He speaks, of course, of the rank and file in all these matters; the heart of humanity is sound and the evolution of man is to a higher plane.

Dr. Crane was 50 years old before he began as a journalist. He was born in Urbana, Illinois, in 1861 and was graduated from the Illinois Wesleyan University in 1882, receiving its honorary degree of Ph. B. in 1892. Two years later t Nebraska Wesleyan University ga him a D. D. He was pastor of t Trinity and Hyde Park M. E. church of Chicago, 1896-1903, and became t pastor of the Union Congregatio Church of Worcester, Massachuse 1904. In 1909 he began to write the belief that he could reach a wid audience in that way than from t pulpit. In the last fourteen years has written an editorial every da never missing. These efforts are pu lished in daily newspapers in the Unit States, Canada, Japan, France, Norwa Sweden, Denmark, Hawaii, Englan and a few other places on the plan During that time he has also writt a number of books.

In his book, "Why I Am a Christian we get a good glimpse of Dr. Cra which corresponds with my "close-u of the man in this interview:

"All the religion I have I am usi I am carrying no extra baggage. I a not loaded up with a lot of beliefs th make no matter. What religion I ha is one hundred per cent practical."

Expressing Yourse

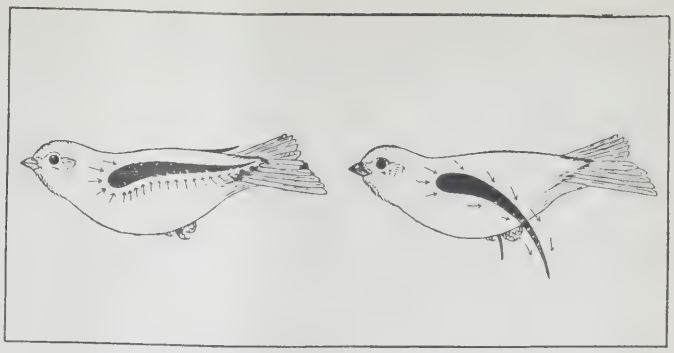
(*Concluded from page 17*)

done? We may belong to the fir second or third class I have defin but in any case the problem the same. We must learn to expr the truth in us. And that is ve difficult.

If anyone will examine the sta ments he makes during one day on he will be astonished to learn that m of these statements are founded hearsay. We are great repeaters. accept what we hear and, from habit of mental laziness, assimilate readily as our own, and deliver it gospel to the first man we meet. H many young men, starting out business, with something to sell, ta the word of someone else as to t value of the product they are selli Now in nine cases out of ten, t product may be exactly as represent but by getting their information seco hand, they lose out all along the li for without enthusiasm there is sm hope of success, and enthusiasm m be based on accurate first-hand kno edge. A list of the lies and scand which sweep through any communi in the course of one week and die c to be succeeded by others would pitiable reading. Self-expression, t keynote to success, must be based self-examination, and self-examinati must lead to the truth. Ask yours constantly, Is this true? Your pow of self-expression will grow, in prop tion as you learn to discriminate b tween what is true and what is false.

Power of Wings

(*Concluded from page 7*)



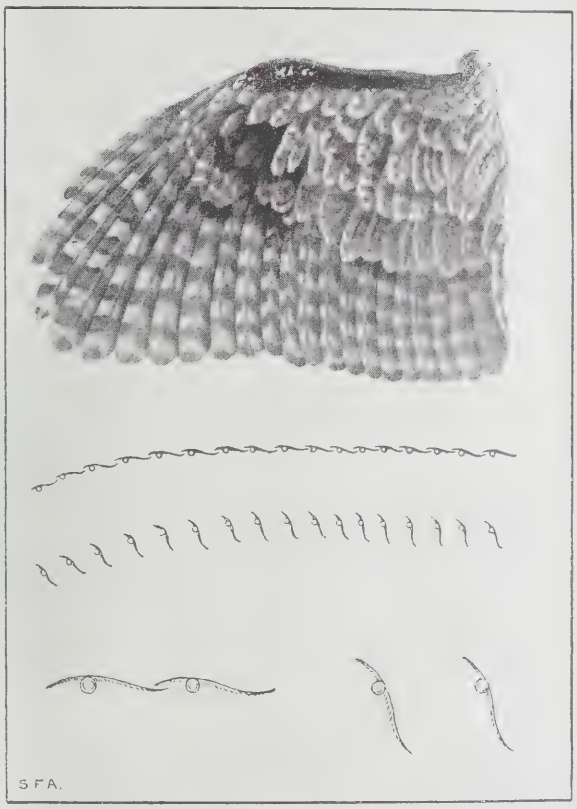
Method of flight. At left—Downward stroke. Right—Upward lift. Arrows indicate approximately the greatest resistance of the air.

nt of the wing to the body also icates clearly the necessity for dity in the downward stroke and bility for the lifted wing, the muscles ng the socket joint of the bones so as prevent twisting the posterior portion the wing up and over the anterior tion, but not preventing the decided necessary twist in an opposite ection, which permits the upward oke. With the insects this attachnt is remarkably effective for the pose; it may best be observed in the ger moths and the dragon s. With these a forcible sting of the wing in the dition of its essential rigidity dislocate it.

All flying creatures except birds possess membranous gs and the downward twist of posterior part is necessarily reme so as to carry the g upward edgewise to the air stance. The birds have thers and while the same bility in the uplift of the g is necessary, it is less so bese of the long primary and ondary feathers that extend kward and are the chief tors in both support and pulsion.

Each of these feathers in wing of a bird acts just as wing does in its entirety; quill, for this purpose nded, permits the twisting pivoting of each feather in fleshy socket. The shape of feather is such that in the nward stroke the wide web praced against the narrow, re rigid part of its fellow and the upward stroke it pivots n so as to permit the air to s through.

Yet with this obviously double adtage of the feathers and wing atnment the birds are no better s than those creatures with memnous wings. The humming bird not equal, in speed, tirelessness nor trol, the largest sphinx moths, metimes called humming bird hawk ths because of their manner of hovering before flowers (though the name hawk has never been explained). The little kinglets, the active wood warblers, the flycatchers and even the swallows can all take lessons in aerial agility from the bats, though for grace and poetry of motion the swallows far excel, which is not so much a matter of skill as a habit of flight. There is evidence also that the birds are more untiring than the bats which either indicates more muscle in the birds or less needed effort.



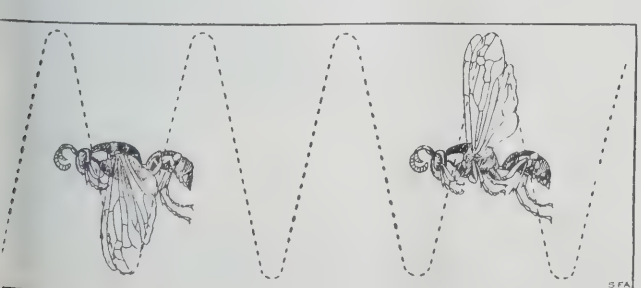
Wing of a screech owl. Sections of the primary and secondary feathers during downward stroke. Same during upward lift. These sections enlarged to show interlocking and pivoting.

It is not fair to compare the largest soaring birds with those insects that possess similar tendencies at times; because of the ease of overcoming gravity on motionless pinions we marvel at the vultures, albatrosses and ospreys. The larger-winged butterflies and the emperor moths (the latter seen only at dusk), drift along between wing flaps with more comprehensible ease, their wings not held horizontally but at an upward angle of about forty-five degrees.

There is especially among the larger flying creatures a very decided limit to wing power as a result of gravity and air resistance. Nature has not attempted anything like the airplane or the dirigible, never having developed a motive power apart from the weight-supporting wings and it is very evident that for both speed and carrying weight man's invention is greatly superior, though as yet never quite so sure. A vulture never has its engine go dead in the air, unless from such an outside source as a shotgun. The California condor and the great albatross are the extreme examples in nature of sustaining weight on motionless pinions, but surpassing these are the heavier migratory wild swans that attain high speeds over hundreds of miles. Compared to these the wild turkey and the giant Asiatic bustard are quite ordinary. The limits of speed are shown by the fact that few birds can attain over sixty miles an hour, though considering what momentum should do as an aid to continued rapid effort and how little resistance to the air can affect a smoothly feathered, stream-line body it is really surprising that much greater speed is not attained.

Some years ago we read of the observations of an ornithologist whose chief desire was evidently to announce wonderful discoveries rather than to state cold facts. He claimed to have timed the flight of many birds between measured points and he found that a rate of more than one hundred and twenty miles an hour was attained. The writer has carefully experimented in exactly the same manner, every condition for accuracy most carefully observed, a stop-watch playing the principal part and on days when there was no wind. A fellow observer stood at one point and signaled to me at another four hundred yards away when a bird passed a fixed point on a near sea river. Much patience was required.

A herring gull flying without soaring at an average rate of speed made a little more than twenty miles an hour for the distance. A black duck just start-



trajectory of a wasp's wing tip, when the insect is flying ten feet per second and the wing strokes are over one hundred per second.

ing did only a little better; another having gained good headway improved on thirty miles. A teal considerably exceeded forty miles. A great blue heron fell below a mile in four minutes. Shifting our ground to a like distance between inland hills we found that homing crows on a still winter day about equaled the above gull. With a strong wind they attained a mile in two minutes, but against a stiff breeze their speed fell to a mile in about three and a half minutes; against a hard wind, in which the birds were taking every advantage of hillside and woodland windbreak, they hardly flew at the rate of a mile in five minutes. The speed of the crow, with its long, deliberate sweep of wing, is surprising. A kingbird, martin or even a swamp blackbird can make a dash and easily overtake the black maurader, but on a long flight only the kingfisher, the flycatchers, the swift and the swallows, the smaller hawks, the plovers and snipe and certain sea birds, as the ducks, terns, cormorants, petrels and skimmers will exceed the crow in speed.

Most birds are surprisingly slow of flight; they by no means meet the common impression of exceeding power-driven wheels. Traveling in a train at about thirty miles an hour permits ready observation of comparative speeds of many birds that rise and fly with the train for even a short distance. Sparrows, grackles, meadow larks, shore larks, pipits, robins, all fall quickly behind. Most birds are loath to continue parallel with the train for any telling distance. Swallows and the chimney swift easily keep abreast even when their line of flight is many-curved and when they want to put on speed they instantly forge ahead, as does also the killdeer.

At one time we raced a frantic chipping sparrow that persisted in keeping between the car and a high, close embankment and for a time kept up with us at a speed of about twenty miles an hour; it then began to fall back and finally dashed into some overhanging vines.

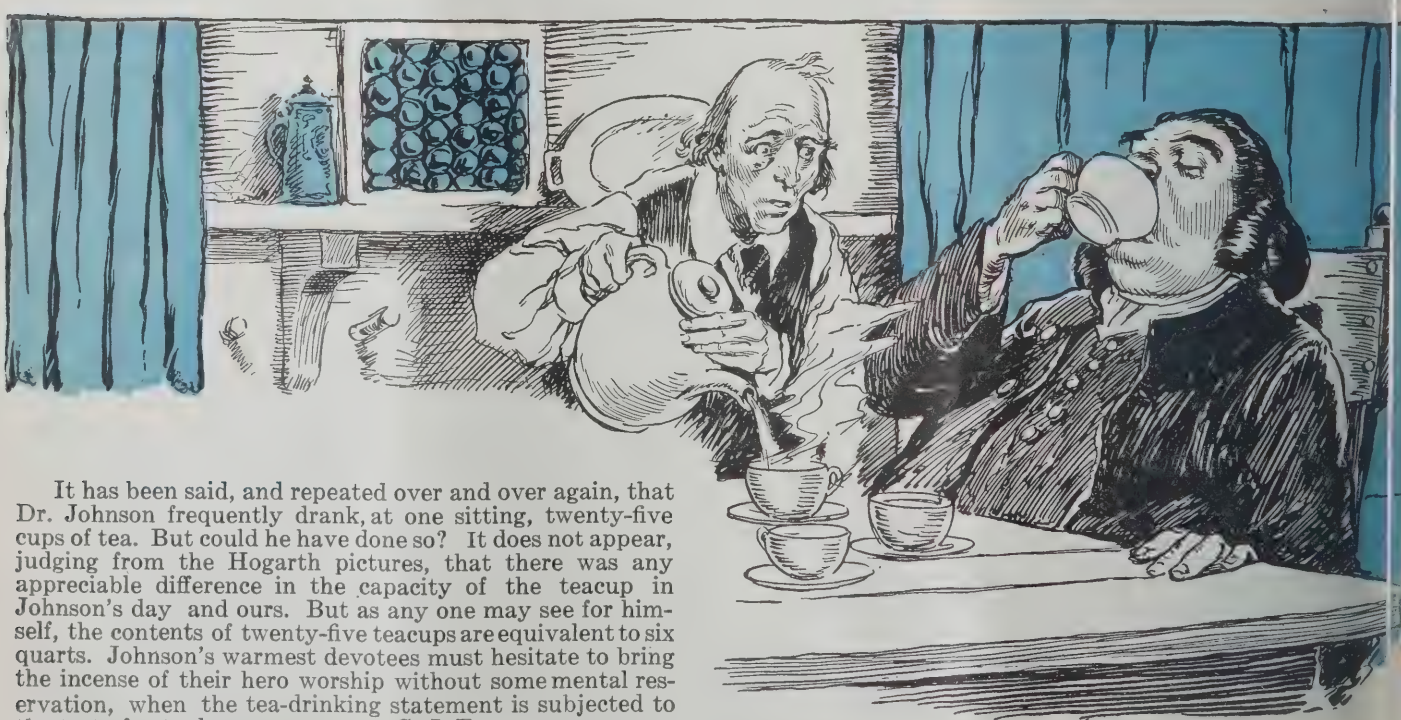
Once in an auto along a smooth, level stretch we raced with a sparrow hawk that was after English sparrows dusting in the road. The little falcon missed his strike, then dashed off, keeping one direction and gradually pulling away from us, though we were making about a thirty-mile speed. A friend whose word may be relied upon tells me that while traveling from Philadelphia to Atlantic City in one of the fastest trains they sighted a wild duck, species not known, that kept abreast of the train for several miles, then very gradually forged ahead until it went out of sight or veered off and it is possible that the train was making fifty miles an hour, or better. This was a case of continued momentum increasing the speed and it is certain that this enables migrating birds to reach a considerable velocity. Then, of course, varying speeds, as with the killdeer, which can loaf along or beat the swiftest hawk, the kingbird and the purple martin, which are very indolent fliers at times, make estimates somewhat uncertain. It is, however, safe to say that few if any birds—falcons, plover, kingfisher, man-of-war bird, swallow, swift or skimmer—ever attain a speed greatly exceeding sixty miles an hour and they never equal one hundred miles, as h been carelessly asserted. The swift undoubtedly the fastest of our la birds if not of all species.

Making allowances for the lesser influences of gravity and momentum, better, for proportionate weight compared to air resistance and mus we turn to the insects as examples extreme wing control. Observe bee flies and their close of kin syrphus, tachina and blowflies, all that two-winged, stout-bodied h that move their wings at the trem dous rate of several hundred beat second and that dash through the almost like shafts of light. Har second to them are the small, solita digging bees, the *Andrenidae*, the sc of their wings, indicated by the tun fork, making as swift a measure.

Watch dragon flies do stunts ove swamp or pond: rushing forward, st ping instantly to hover, drifting actua backward at times, pivoting about right angles or entirely turning, div downward or straight upward and with the utmost ease and a hardly p ceptible wing motion. These are l ture's biplanes, with the lower wi set behind and a little below the oth not directly underneath.

Keep your eye, if you can, upon sand-hill hornet dashing after a l bodied cicada that is hardly less s in flight. You may have as much task following a skipper butterfly larger-winged vanessa, a noctuid m or the male of the carpenter bee pl ing a sort of tag with his fellows aro the house. Here is speed, with limitations, of course, but it is diffi to determine what they are.

Tea Drinking Extraordinary in Days of Cheshire Chee

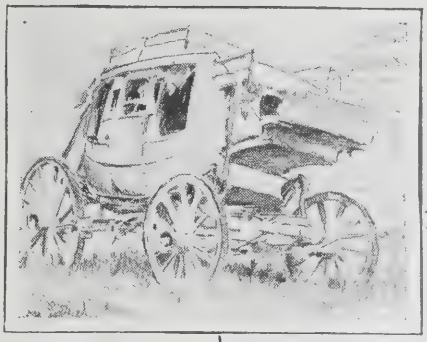


It has been said, and repeated over and over again, that Dr. Johnson frequently drank, at one sitting, twenty-five cups of tea. But could he have done so? It does not appear, judging from the Hogarth pictures, that there was any appreciable difference in the capacity of the teacup in Johnson's day and ours. But as any one may see for himself, the contents of twenty-five teacups are equivalent to six quarts. Johnson's warmest devotees must hesitate to bring the incense of their hero worship without some mental reservation, when the tea-drinking statement is subjected to the test of actual measurement.—C. J. F.

Gloucester—Old, Quaint and Curious

An Historic Seaport With Romantic Past

By MAY B. WHITING



Above—Relic of bygone days. An old stagecoach with leather springs.

Right—Half Moon Beach, where the blue sea laps the rocks and the yellow sands.

WINDSWEPT town with streets that curve and climb and narrow sidewalks that try to keep the pace but must netimes have recourse to a flight of ps, rows of colonial houses with ormous shells from the tropics in front yards, a modern city jos- ng and edging into the gaps of the , the tang of sea in the air and the ell of cod from the "flakes," and ays, over the tops of plants and rehouses that line the water's edge, spars of fishing schooners riding ide the wharves—such is Glouces- , quaint, time-honored, and with t a touch of the exotic that old sea- ts always have to landlubber eyes. Yet the town is typically American, tled by unusually hardy stock whose mes are still among the foremost izens. Gloucester was the first of Massachusetts Bay settlements, l her history begins long before that ne. According to the Saga, when the rsemen skirted New England in 01, they landed here and the Viking orwald was killed in a quarrel with Indians. But the first white man record authentically his visit was amplain who, in 1606, sailed into oucester Harbor which he christened Beauport. Then came Gosnold and ng and Morton of Merrymount and t hero of romance, John Smith, who med the cape Tragabizanda in mem- of the princess who had helped him escape from Moslem captivity, and islands at its point he called the ree Turks Heads for three Mussul- ns whom he had slain in single com- . But when Prince Charles came ng he rechristened the cape in more er fashion after his mother, Anne of nmark.

The first permanent settlement was 1623 when a company from Dorches- , England, landed at Half Moon ach, now a part of Stage Fort Park, l established themselves as a fishing nmunity. This enterprise was not a cess. The arable lands were few l some of the newcomers even com- ined of the "ill choice of the place for ing," and many returned to Eng- d. The "stage," or wharf, which y abandoned, became a bone of con- tion between new settlers and a com- ny from Plymouth. The doughty les Standish was all for trying it by ce of arms but the wisdom of Roger nant prevailed, and it was agreed t the men of Gloucester should keep "stage" and help build another for men of Plymouth. In 1632 a meet- -house was erected and a few years er a charter was given to the town der the name of the cathedral city in gland whence many of the later set- rs had come.

For many years the new plantation s a mysterious, out-of-the-way place. sorts of rumors were current about it, even that "lions were seen on Cape Ann." But in times of stress among the colonies her citizens were always in the foreground. They were with Pepperell when he stormed the citadel of Louisburg. Gloucester was especially interested in that enterprise because as long as the French had a stronghold on the island of Cape Breton her fishing boats were never safe.

One story of this expedition has been repeated many times and it is quite likely that you would not have to search very far today to find some aged grandam who more than half believes it. Two soldiers before departing called on Peg Wesson who was rumored to be a witch. They chaffed her in cavalier fashion and she became angry and promised that they would see her at Louisburg. One day in camp they noticed a crow circling above the tents and several soldiers shot at it in vain. Then one of the Gloucester men remembered that only a bullet of precious metal could harm a witch and he tore off his sleeve button, shot it, and the bird came fluttering to the ground. At that same moment Peg Wesson fell on the pavement with a broken leg, and when the surgeon dressed it a silver button fell from the wound.

There were other characters of like repute in Gloucester. There was Tammy Younger, "Queen of the witches," and her aunt, Luce George, who used to take toll of every cart that passed her door. If the driver objected she would bewitch the oxen so that they stood with tongues lolling out until she had worked her will. When a fishing boat was in she was always on the wharf where she claimed enough fish to last for several days. These two women lived in Dogtown, the mysterious hinterland of Gloucester, as truly a "Deserted Village" as the Sweet Auburn of Goldsmith's fancy.

Back from the city and extending in a wide area almost to the tip of the cape, is a strange, wild region where, on every hand, vast boulders are scattered or heaped one upon the other. This whole section is now known as Dogtown Common and is visited only by geologists to study the glacial moraine or by curious tourists who, in company of a guide, for it is not safe to wander alone in the bewildering waste, trace its almost obliterated ways. The disordered imagination of a Poe could not picture a more weird or desolate habitation for human souls. Why any one should ever have built there is a mystery, but the most plausible conjecture seems to be that, while the men were away fighting in the Revolution, the more defenseless part of the population withdrew from the shore, and, as the dogs were the only protection, the village was called by their name.

Gloucester itself has many houses built before the Revolution. In Center street there are at least a dozen, mostly without architectural features, for seaport towns are not given to paying overmuch heed to their dwellings on shore. The most noteworthy house is the Sargent-Murray-Gilman House, which has a fine stairway and mantel and a charming garden in the rear inclosed by a paneled wall of brick. Here, in 1791, was born Samuel Gilman, author of "Fair Harvard." The house was built half a century earlier as a gift to Judith Sargent on her marriage to the Rev. John Gilman, the father of Universalism in America.

There are, and always have been, many churches in Gloucester, but it took them a long time to learn to live in amity. Richard (Concluded on page 30)

Arab Versus Jew

(*Continued from page 15*)

had it." He referred to a sentence in the speech of Sheikh Suleiuman Faroukhy made in behalf of the Arabs to the Colonial Secretary a few days before: "We do not ask Great Britain why she made the Balfour Declaration, but we do say that it is oppressive. Great Britain gave the Balfour Declaration under certain economic influences."

When I recalled the failure of the Arabs to vote for representatives in the Legislative Council, proposed two years ago, I asked this question: "If you Arabs were eager for self-government, and if you outnumber the Jews something like ten to one, why did your Executive Committee advocate a boycott of the election which would give them a share in the government?"

Mr. Husseini's reply was a sharp reflection on the justice of the proposal. To his mind it gave every advantage to the incoming Jews. This Legislative Council, he said, called for the High Commissioner and eleven appointive members, together with twelve members to be elected as follows: Jews, 2; Christians, 2; Moslems, 8. Although this has an appearance of fairness, the Arabs, seeing the apparent desire of the government to foster the colonization movement of the Jews, feared that the appointed members of the Legislative Council would give them a majority.

"We would be ready at any time," said Mr. Husseini, "to entertain a proposal in which the Moslems would have a working majority, even though our population would warrant us in demanding much more than a majority. With 90 per cent of the people we are unwilling to enter into a plan which might enable 10 per cent to outvote us." Later the Arabs were offered participation, with a similar representation, in a so-called Advisory Council. "Naturally we were even less inclined to this than to the previous proposal," said Mr. Husseini. "The next proposition was the establishment of an Arab Agency, side by side with a Jewish Agency. This, of course, seemed to us even less tolerable, since it would put our more than half-million Arabs on an apparent parity with the less than 100,000 Jews."

Packing the Advisory Council With Jews

Recently Mr. Amery, the Secretary of State for the Colonies, replied to the deputation of Palestinian Arabs who came to protest, using, in part, these words:

> "In the opinion of the British Government there is no incompatability between Arab and British coöperation and the Balfour Declaration. The interests of the Arab population in Palestine were most carefully considered before the British Government committed itself to any declaration, and that part of the declaration referring to the interests of the existing populations is just as important as any other part thereof."

In the light of this reassurance, I asked the Arab leader to explain the fears of his party. His reply involved a practical denial of the good faith of the above statement.

Jewish-Inspired Gouging of Arab Farmers

"How can we feel that we are not being discriminated against when we see so many evidences of the deliberate attempt of the Government to bring about an economic situation for the Arabs which will compel them to sell out our land to the Jews?" he asked. In substantiation of this he cited several acts which the Arabs interpret as inimical to their interests and tenure in Palestine.

In 1920 there was an unusual crop. Palestinians rejoiced at the prospect of prosperity due to the high prices which the exportation of their products would bring them. Many borrowed on the probability of an augmented income. *Suddenly, when the crops were harvested, the High Commissioner shattered their hopes by placing a ban upon all exportation.* This ban had the immediate effect of bringing down prices to one-fifth of expectations, and succeeded in bankrupting many previously poverty-stricken Arabs who had borrowed on the prospect of a successful marketing. Whatever may have been the cause of this prohibition of exportation it would be impossible to convince Jamaal Husseini that it was anything other than a deliberate attempt to force land out of Arab and into Jewish hands.

A further attempt to accomplish the same purpose is seen by the Arabs in *reviving a dead-letter law of the Turks, which calls for the confiscation of land, which for three years has not been productive.* I suggested that this law must have been resorted to in order to secure the maximum of production. Mr. Husseini admitted that this was the ostensible purpose, but the injustice came in the fact, well known to the government, that the poverty of the people was so great that vast tracts could not be cleared or prepared for cultivation on account of the high costs. Thus they were thrown on the market for Jewish buyers, or, to save themselves loss, the Arab owners borrowed so heavily from Jewish usurers that they eventually lost their property.

A third evidence of collaboration between the government and the Zionists which Mr. Husseini took as a discrimination against the native population, was in the settlement of the affairs of the Ottoman Agricultural Bank. This institution was founded for the pose of extending credit to peasa The capital was furnished by an a tional tax of 2½ per cent above regular tithe. Following the depar of the Turks, Mr. Husseini said th was generally supposed that bec of the complete impoverishment of country these claims would not be vived, and the moratorium exten especially since the original ca had been collected directly from people. Much to the surprise of Arabs the government announced these loans must be paid. This t regarded as a further effort to force sale of land to Jewish immigrants.

Still vindicating his view that government has been fostering Je designs on Arab farm lands, Husseini referred to an excessive ta tobacco, which takes the profit ou that industry, leading to the b ruptcy of the growers. He repo further a feeling among the Arab unnecessarily enlarged expenses government, with *officials ten time numerous as formerly now being ployed.* This results in increased t tion which renders still more impos the economic situation of the Arab

Numerous other economic injust as the Arabs see them, have grown of *the awarding of concessions, wit public tender*, to Jewish capitalists, only depriving Arabs of the opportu to invest, but giving with the con sions great financial advantages the Jews at the expense of the na population. An example of this is

The Jewish Salt Monopoly

salt concession. Salt has been a governn monopoly in P tine. In 1923 present administration secretly gra to the Jewish Economic Board of Alfred Mond an exclusive conces to produce salt in Palestine to be to the government at P. T. (about $13.00) for a consider number of years. Although this cession is not signed, the concess aire is forwarding his salt in accord with these terms. It happened s time ago that a consignment of which was found unsalable was back by the government to the cessionaire, and the government up for public tender the purchas 500 tons of salt. An Arab merchan Jaffa delivered it for P. T. 210 (a $10.00) a ton. The salt was of best and the Arab merchant expre his willingness immensely to decr the price in case the governn wished to contract with him fo longer period and for larger quanti Owing to the existence of the Je draft concession his offer was refu Thus the government loses n than P. T. 55 a ton and the inhabitants, mostly Arabs,

a higher price and enrich a Jewish mpany.

The Rutenberg Jordan Concession vich provides a monopoly for 70 ars to harness the waters of that rer and its affluents for the purpose generating electric power to be used f all economic purposes in Palestine, luding also the exclusive right to duce for sale, electric power by any ier means than water, has brought its train a storm of opposition from te Arabs.

In the first place Mr. Pinhas Rutenrg is himself *persona non grata*, ing a Russian Jew who worked in the vernment of Kerensky as Chief of lice for St. Petersburg. The Arabs ject to his being called, as is done in te concession, *a Palestine engineer*. ey object to the granting of the conssion in secret, since it gives to the ncessionaire such a large measure of ntrol over the life of the people as a ole. They object to the complete oring of the existence of the Arabs o form the overwhelming majority Palestine, while the concession provides that "the memorandum and articles of association and constitution of said company . . . shall be subject to the approval of the High Commissioner in agreement with the Jewish Agency referred to in the mandate." They object to the rejection of *a prior application for this scheme* by an Arab capitalist of Bethlehem. Although there has been failure on the part of the concessionaire to fulfill the terms, the monopoly is respected as in force and several smaller schemes are thus being suppressed, even though recently this concession has been said to be still under consideration in the Colonial Office, London. This is due, in the opinion of Mr. Husseini, to the severe criticism which has come from many quarters over the secret award to this non-Palestinian Jew.

Arabs are not allowed to fly their state colors, while the Zionist flags are allowed to fly on notable occasions. Recently Lord Herbert Samuel, himself the most ardent Zionist, sent out a confidential circular to all higher officials whereby he asked them to stand up as a matter of courtesy when the Zionist anthem, "The Hatikva," is being sung. But when the Arab anthem is sung officials do not stand up as a "matter of courtesy." The Zionists have their national name for Palestine, ERETZ ISRAEL, meaning the "Land of Israel."

The Zionist High Commissioner gave formal recognition to the Zionist name by printing on stamps and other official papers the initials of Eretz Israel in Hebrew under the Hebrew name of Palestine. Quite contrary to the mandate is the use of this name, in the opinion of the Arab leader.

To those who have lived long in this land the encouragement of the government to establish the national claims of the Jews, in contrast to what seems to be a studied ignorance of the claims of the Arabs, is an evil which can be overcome only by the establishment of a National Constitutional Government in which the two communities, Arab and Jewish, will be proportionately represented.

Stories Old Log Books Tell

(*Concluded from page 13*)

tering the harbor Porto Praya. He ites:

"Commences with fresh breezes d thick foggy weather. At 0 h. 5 m. m. discovered a large sail through e fog standing in for Port Praya. 0 h. 8 m. discovered two other ge ships astern of her also standing for the port. From their general pearance supposed them to be one the enemy's squadrons, and from e little respect hitherto paid by them neutral waters I deemed it most udent to put to sea.

"The signal was immediately given the *Cyane* and *Levant* to get under y. At 0 h. 12 m., without topsails , we cut our cable and got under y, when the Portuguese opened a e upon us from several of their tteries on shore. The prize ships lowed our motions and stood out the harbor of Port Praya close under st point passing the enemy's squadn about gun shot to windward of em; crossed our topgallant yards and foresail, mainsail, spanker, flying-, and topgallant sails.

"The enemy, seeing us under way, ked ship and made all sail in chase us. As far as we could judge of eir rate from the thickness of the ather, supposed them to be two ips of the line and a frigate.

"At 0 h. 30 m. cut away the boats wing astern, first cutter and gig. 1 p. m. we found our sailing about ual with the ship on our lee quarter, t the frigate luffing up and gaining r wake and rather dropping astern us. The *Cyane* dropping fast astern d to leeward and the frigate gaining her fast, I found it would be impossible to save her if she continued on the same course without having the *Constitution* brought to action by their whole force.

"I made the signal at 1 h. 10 m. to her to tack, which was complied with. This manoeuver I conceived would detach one of the enemy's ships in pursuit of her, while at the same time from her position she would be enabled to reach the anchorage at Port Praya before the detached ship would come up with her; but if they did not tack after her it would afford her an opportunity to double their rear and make her escape before the wind.

"They all continued in full chase of the *Levant* and this ship, the ship on our lee quarter firing her broadsides by divisions, the shot falling short of us. At 3, having dropped the *Levant* considerably, her situation became from the position of the enemy's frigate similar to the *Cyane's*. It now became necessary to separate also from the *Levant* or risk this ship's being brought to action to cover her; the signal was accordingly made at 3 h. 5 m. p. m. for her to tack, which was complied with.

"At 3 h. 12 m. the whole of the enemy's squadron tacked in pursuit of the *Levant* and gave over the pursuit of this ship. This sacrifice of the *Levant* became necessary for the preservation of the *Constitution*.

"Set the royals and kept large from the wind. Sailing master Hixon, Midshipman Varnum, one Boatswain's mate, and twelve men who were absent on duty in the fifth cutter to bring the cartel brig under our stern were left on board the *Levant*, which ship they reached before she cut. Surgeon's mate Johnson, with the sailmaker and his mate, were likewise on board the *Levant*."

The *Constitution's* luck still remained with her, and another narrow escape was added to her long list. Putting in at San Juan, Porto Rico, Stewart learned officially of the declaration of peace. He made for home without further delay, dropping anchor in New York Harbor, abreast the Battery, on May 16. And the last fighting cruise of the grand old ship was ended.

It is estimated that during the war she captured property to the value of $1,500,000, exclusive of the merchant prizes she had sent back to the United States.

Shortly after the war a British officer chanced to be going over the *Constitution*, lying at Boston Navy Yard, where she had been newly fitted out for a cruise in the Mediterranean. She made a smart appearance and the American officer who accompanied him was pointing out her various features with pardonable pride. As they stood upon the quarter-deck, he asked:

"Well, what do you think of her?"

"She is one of the finest frigates, if not the very finest, I ever put my foot aboard of," responded the Englishman heartily, "but, as I must find some fault, I'll say that your wheel is one of the clumsiest things I ever saw. It is unworthy of the vessel."

The American laughed.

"Well, you see," he replied slyly, "when the *Constitution* took the *Java* her wheel was shot out of her. The *Java's* wheel was fitted to her to steer by, and, although we think it as ugly as you do, we keep it as a trophy."

Mapping the Great Northwest

(*Concluded from page 21*)

Jefferson sent the Lewis and Clark expedition to explore the Great Northwest and to find possibly an overland route to the Missouri and the Mississippi for the furs of the Northwest. By their heroic exploits the American claims to the region were much more definitely established and colonization projects put a seal upon the American interests in the region. Further, the geographical unity of the Oregon region with the rest of the United States undoubtedly had much to do with the reasonable attitude adopted by England in her long negotiations with this country.

In 1808 the American Fur Company was granted a charter by the State of New York, due to the activity of John Jacob Astor whose fortune had been amassed in the fur trade. In 1810 the ill-fated *Tonquin* sailed for Oregon and a post, Astoria, was established at the mouth of the Columbia. The *Tonquin* left colonists, and on the return voyage the ship was lost, the crew being massacred by Indians. An accompanying overland expedition from Saint Louis reached Astoria early in 1812, but the outbreak of war induced the abandonment in 1813 of the venture and the sale of the post to Northwest Company of Canada. An over-enthusiastic English naval officer seized Astoria in 1813, directly after its sale, and rechristened it Fort George. This action was regarded at the close of the war as an acknowledgment of American sovereignty over the Columbia. It must also be said that had the United States Government supported the Astoria ve ture the whole coast mig have been placed und the Stars and Stripes.

The Northwest in Mitchell's American Atlas of 1853.

In 1814 the Trea of Ghent had provid for the restoration of " territory, places and p sessions, taken by eith party from the oth during the war." Th included the Astoria te ritory on the Columb taken by the Britis In 1818 a treaty of Joi Occupancy of Oregon w signed. After the Spa ish claims in this regi had been transferred the United States, En land in 1846 by trea recognized the bounda of 49°. Many America were enthusiastic f claiming the boundary far as the Russian str whence arose the famo slogan, "fifty-four for or fight." However, one can read the histo ical accounts of discov ies and explorations wit out the conviction th only by great go fortune was the geograp ically evident boun ary of forty-nine degre established for t United States.

In our Pacific Northwest America may well take a just pride that nati sons first entered in the finest river this region, that native sons travers the upper reaches of the Misso and the Columbia. This region is t one large section of our country c own by discovery and colonization

The Borrowed License Plates

By M. L. HAYWARD

"I'M a stranger to you, but I've just moved in your town, and bought a house up on High street," the stranger explained. "I used to live in New Hampshire just across the state line, and I've got everything moved down except my automobile," but failed to add that he had been the champion borrower in his New Hampshire home town.

"Glad to see people coming into Massachusetts, and any time that you want anything in our line, we're right at your service," the garageman assured him.

"Well, I want a favor right now. My car'll stand to run down here, but it needs a lot of repairs and a thorough overhauling before I actually put it on the road. I've applied for a Massachusetts license, but haven't got it yet, and want to get the car down here to your garage without being held up."

"That's easy," the garageman suggested. "Take the license plate off'a that car'a mine over there in the corner, put it on your car and run it down here, and you'll have no trouble."

The new citizen acted on this suggestion, took the license plate to New Hampshire, attached it to his car, headed for Massachusetts, collided with a citizen of that state, and the injured party sought the garageman who had loaned the license plate, demanding that he pay the bills.

"Me? Why, I didn't know that you'd been smashed up till you told me," the garageman protested.

"But you lent him the license plate which he had on his car at the time of the collision?"

"Yes, that's true."

"Well, that makes you responsi for the damage he did."

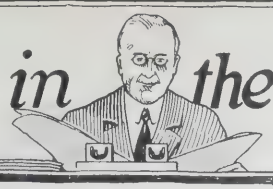
"Nonsense. Do you pretend say that if I lent a neighbor my g to hunt rabbits, and he shoots y dog, that makes me responsible?"

"I'm not talking about rabbits I'm arguing on license plates, and yo find that that's the law in Mas chusetts. I just came from a lawye office where I paid him $5 to find it ou

And the injured citizen was rig as the Massachusetts Supreme Co has decided in a recent case report in 136 Northeastern Reporter, 2 that if A lends B a license plate wh B attaches to a car, goes out on t road and injures C, then A is persona liable for the resulting damage.

This is the Massachusetts law, b cannot be depended upon in other stat

"I Read *in* the Papers"—



ead in the papers, Bob Washburn's lumn in the Boston *inscript*, a good story: We knew a young n who graduated h honors from a dical school, opened office and then pro- ded to starve to th. Had he seen the footprints a patient on his office door mat would have thrilled with the sen- ions of the derelict Crusoe when saw tracks on the beach. One there was a great noise on the eet. "The King of Pain" had arrived. took an adjoining office and was n trampled to death. One day the ig entered the office of our young nd. He said: "Young man, I have practice, you have an education. eed your counsel in a case which is ond me, as most are." "I will help t," the boy replied, "if you will tell why you, with no training, have ients and I, with much, have none." will," replied the King. "Come with to the window. See those ten men a group by the store door. How ny have common sense?" "One," lied the young man. "There is your wer," said the King. "He is your ient, the rest are mine." Since then have had a high respect for minori- s.

ead in the papers that a Negro in Maryland averted a passenger n wreck that would have thrown cars fifty feet down the mountain e. She noticed a tree that had en across the track and flagged a n rounding a curve a few yards from obstacle.

I also read in the papers that the lman Company for the first time its history has named a car after Negro porter, Daniels. He recently rificed his life while closing the door of his car to prevent steam from the locomotive of the wrecked train from entering and roasting the sleeping passengers.

And we all have in mind the heroic Tom Lee of the recent river disaster.

It makes me believe that, after all, the true opportunity of life is to be serviceable and heroic, and I know of no condition of life that deprives any person of it.

I read in the papers that the federal courts have been invoked to make examples of persons who have written their names upon Gettysburg battlefield monuments. This is a commendable move; perhaps the publicity will stir authorities elsewhere to deal vigorously with other vandalism of this variety. We are unworthy of the heroic deeds that inspired noble monuments if defacement of them is longer permitted. Thirty persons are named on the Gettysburg complaints. Of the thirty, all but one are alleged to have written their names on the 44th New York monument on Little Round Top, from which twenty-three names were taken and information laid before Commissioner Wible.

Photographs of the defaced tablets were made to be used as evidence.

Little Round Top is a favorite stopping point in the tour of the battlefield for visitors, and the 44th New York monument, the loftiest point on the knob, is annually visited by thousands of tourists. It was ordered closed until after the disposition of the fifty-three pending cases.

I read in the papers that the Commercial Law League of America representing business interests favors the payment of larger salaries to Federal judges. The League asserts that "while the payment of larger salaries may not always procure a better judge, still the salary should be sufficiently large to make it possible for the competent lawyer who has not attained a position of financial independence to accept the honor of a Federal judgeship without being worried as to how both ends are to be met."

Time was when the best lawyers everywhere eagerly sought these posts and the public obtained unequaled administration of justice; now Federal judgeships frequently go begging among well-qualified men. The public suffers through such stinginess. The courts, even more than Congress, constitute the cornerstone of the national confidence, and there is no dignity in our land more honorable than that of an upright judge.

"LUNATICS"

Nearly everyone knows someone who makes a hobby of "collecting." They devote considerable time and money to acquiring antique furniture, rare volumes, old coins, and such.

Sometimes we are wont to call them "lunatics." But should we?

A writer in the next issue upholds their "lunacy." He undertakes to show just why it is justifiable.

Do You Own Your Own Home?

(*Concluded from page 8*)

l things added to living comfort add preciably to the selling price too.

Budget authorities have different es as to the price of the house we afford to buy. One rule is that the use should not cost more than 2 to times the yearly income of the chaser. (This is for our old friends, l "average man" and the "moderate mes.") Or apply the rent basis ures to your monthly payments. budgets say that one-fifth of the me should cover rent, and that rth is the highest possible ure. You can go a trifle higher in ments on a home, but do not be so ried away that you forget that living enses go on just the same, and that ring a home should be a joy, not a den.

We have to live in keeping with our house after we buy it, so it is best for us to consider the standards that the house requires, as well as its first cost. We aren't hide-bound conservatives, but it is usually unfortunate to buy in a neighborhood where you do not live by the accepted formula. Now we live in a city of a little more than 400,000, in a two-to-three children, one-servant, $8,000 to $12,000 house block. It is perfectly proper in our neighborhood to sweep our own porches, or hammer and saw on trellises, or dabble in paints, if we feel like it. If you have an income of around $4,000 a year—a little more or a little less will not bar you!—you can safely buy in our neighborhood, if you budget at all wisely, and live as we do while you pay for your home and save a little money each year besides.

But don't buy around us if your back yard is going to be a *patio*, or a courtyard, or boast an outdoor living room, or any of those Home Beautiful ideas, for the rest of us have bought for the sake of a plain, boy-made BACK YARD! Swings, trapezes and tents have crowded out some of our flowers, and at various times we have dogs, rabbits, cats and pet chickens, with a squirrel or two for good measure.

We feel that the biggest advantage in our own home is freedom for our children, and a pride of possession. If there is anything in the theory of being rooted in the soil, our children have the privilege!

Once they told us that we had to be good to be happy. Now we are learning that we—especially children—have to be happy to be good!

Which may have little to do with owning your own home, but I think it has.

Gloucester—Old, Quaint and Curious

(*Concluded from page 25*)

Blynman was pastor of the first church. He was a learned man, and, it would seem, something of an engineer, for he planned and made the first excavations on the canal or cut which connects the Squam River with the harbor and makes Gloucester an island. But Blynman was not happy in his parish nor were his successors after him. Universalism was growing in favor and in 1774 John Murray was invited to the town. The first church suspended some of its insurgents, tried to tax others, and a mob threatened the new minister with violence. But Mr. Murray stayed and his followers drew up articles as an "Independent Church of Christ," and in 1870 erected a meeting-house.

The present edifice, built in 1806, is the oldest Universalist meeting-house in America. It is a beautiful church, its austere lines relieved by a wide avenue of elms leading across a pleasant park, making an entrance not unlike that of the Stratford church in England. Within are many objects of interest, a beautiful gilt clock of colonial days, Mr. Murray's desk, and an organ played by turning a crank, which was "taken" from a British ship by Captain Somes, privateer. No doubt it was intended for more festive uses for, in its repertory minuets outnumber psalm tunes ten to one.

The church of the first parish, on the same street, has its relics, too, among them a cannon ball fired by the British sloop-of-war *Falcon* which chased an American boat into the harbor and tried to take it captive. The bell in the tower set up a clanging and the captain, in a rage, ordered that the cannon be fired. The aim was not a bad one, but the bell was not silenced and the minutemen, assembling, forced the *Falcon* to withdraw, leaving behind her a tender and four small boats. The night of that exploit the bill for "likker" at Stevens Tavern, now the Ellery House, was a generous one.

But none of these things are Gloucester's chief glory. She was the pioneer among fishing towns, and up to within a few years, when Boston has taken first place, she was the foremost in the world. Now she claims to be the most noteworthy. Rudyard Kipling sailed in a Gloucester schooner and wrote "Captains Courageous," and Conolly's "Out of Gloucester" gives a still more accurate picture of the fisherman's life. The story of the fleet has been told over and over again but it is always new. About every vessel that sails down the harbor there is the glamour of mystery. Will she bring back a record catch or will she limp in with sails torn and spars broken or, like the *Esperanto* that won the first International Fisherman's Race, will she break on the reefs of Sable Island?

Gloucester is the home of several types of boats, notably the schooner. In 1713, Captain Andrew Robinson, son of an early settler, devised for himself a new type of vessel, with the luff of the sails bent to hoops on the mast. As she slid down the ways for her maiden trip a lad standing near exclaimed, "See how she schoons!" (*Schoon* meaning to skim over the water as a stone that is skipped.) "Good," said the Captain, "a schooner let her be."

A little bay, Harbor Cove, makes up into the center of Gloucester, almost within stone's throw of its main street, and, edging its shores, are the wharves. On the right, near Fort Square, are the Italian fishermen, and the odd colors of their cumbersome, but seaworthy, boats

Sargent-Murray-Gilman House.

of a type used for two hundred years, give a picturesque touch to the scene. On the opposite side of the cove there are always riding by the wharves some part of the Gloucester fleet, yacht-like vessels which are being unloaded or fitted out for a trip to Greenland, to Iceland, the capes off Virginia, or to George's or the Grand Banks.

These banks are the most famous fishing grounds in the world. They are formed, and are still forming, by the melting of ice floes, the earthy depo of which make a plateau over which fish swarm in great numbers. The sh water, however, makes them treac ous in storms, and the fishing indu has been a costly one. In one y alone, the stormy one of 1879, twe one vessels and 249 lives were lost f this port. Every year, in midsumm Gloucester holds a memorial service her sailor dead. From Blynman bri flowers are cast on the ebbing tide wh bears them to the open sea that engulfed so many of her children.

Of late years, with the impro type of vessel and auxiliary engine, risk has been greatly reduced. But occupation of fishing on a "Gr Banker" is one of the most strenu in the world. Breakfast is served ab half-past three, then the dories lowered and the men get into th with the trawls. A fairly large b will carry twelve dories with six " line tubs" to a dory, each line be about 300 feet long and equipped v eighty hooks. One man pays out line while the other rows. Then t go back over the course, hauling taking off the fish, and rebaiting. day the work continues until late in afternoon when a from the schoo calls them b After the fish are on board begins work of cleaning packing away in s If the catch is he it takes almost night.

A large part the shore industr Gloucester is the ing of cod, hali and herring. W the schooner arr in port the fish pitchforked to wharves where t are thoroug washed, then pac away in salt a until needed.

No other c munity in the cou can boast an dustry pursued 300 years and flourishing. To there are "d mented" at Gloucester more t 100 vessels of twenty net tons twice that number of fewer t And the Gloucester fisherman is ever young, for the caution of r dle age seeks a less hazardous occ tion on shore, and in his heart th must always be an echo of the old s

"A strong nor'wester's blowing,
Hark! don't you hear it roar, no
Lord help 'em, how I pities them
Unhappy folks on shore now."

Awakened India—Her Opportunities

Land of Sacred Cattle and Many Tongues; Its New Industrialism

By WILLIAM E. BARTON

ONE of the first things that impresses a tourist through India is that modern industrialism is here as everywhere, and has operated to make native life abnormal. The life of India is village life, but the villages appear dried up and decadent, while the cities are growing at perilous rate. Bombay is said to have a population of a million and a quarter, nearly 16 per cent of whom were born there. Bombay is itself an abnormality, the creation of western industry and commerce. It has grown by the swallowing up of innumerable people from smaller places—perhaps not quite innumerable, for the figures say that 1,050,000 of her 1,250,000 people were born elsewhere.

The Marathi Mission in India, an American mission, situated in Western India south of the center, checked up on its people in 1921 and found that of 10,466 native church members, all of them originally village people, one-sixth had packed up and moved to Bombay. In a decade the Maharas resident in Bombay increased 7 per cent and the Mahrattas, if you know who those rural folk are, about 300 per cent. This means a very considerable readjustment in the economic and social life of the native people of India.

Another thing which impresses a visitor is that the people in the cities of India are not prosperous or happy. A smile is not often seen. The ricksha men have incredibly thin legs.

"The poor benighted Hindu;
He does the best he kin do.
He sticks to his caste
From first to last
And for pants he makes his skin do."

He is fortunate that his skin can be made to serve as a substitute, for where else would get the trousers one can hardly imagine. The native people of India do not look very well fed or in any too good health.

Smallpox was epidemic in Bombay and also in Calcutta when I was there. The week before my visit to Calcutta saw 505 cases and 377 deaths. In the preceding week they had had 581 new cases and 451 deaths. They said singularly little about it. That number of cases in an American city would not pass without concern.

India is a country of men. One sees singularly few women. Whether in the temples or in the shops or on the streets, men constitute an astonishing majority. There are children a-plenty in India, but one does not see them everywhere, as, for instance, he does in Japan. There may be happy childhood in India, but it is not visible to the visitor.

Bulls at Warranget, a fine artistic work.

The cow is a very sacred animal in India. A man gets off the sidewalk for her, and she lies down if she likes on the steps of the Chartered Bank of India, and the financiers of the city walk around her. It is no wonder the Hindu looks forward in hope that in some future reincarnation he may be a cow. Most of the cows appear gentle enough, but one of them, most sacred of them, kept in a temple that the faithful may kiss her tail, is a vicious brute, and she came at me with lowered head and menacing horns. If she could read, I would write my opinion of her and send her a marked copy of this article.

The next thing one discovers is that religion is the soul of India. The extent to which India is split up religiously cannot be set forth adequately in description or in statistics, for even within the same religion the divisions are innumerable. Consider the matter of caste. The Rig Veda, the very ancient Hindu Scripture, recognizes four main castes—the Brahman or priest, the Kshatriya or warrior, the Vaishya or farmer and the Sudra or tradesman. The merchant caste is the lowest but below this are castes innumerable, and these are split up indefinitely. The Kammainan group, masons, blacksmiths, carpenters and leather-workers, pollute at a distance of 24 feet; toddy drawers at 30 feet, Cheruman cultivators at 48 feet and Pariahs, beef-eaters, at 64 feet.

According to the census of 1901 there were in India 2,378 separate castes. How many new ones have risen since then nobody knows. On the other hand, no one can travel on a train and be sure that he is always 64 feet away from a beef-eater.

Besides the castes are the other divisions, as, for instance, that between the Mohammedans and the Hindus, which, just between you and me, is the salvation of England's Raj or rule. Let there be in such a city as Calcutta a Hindu festival, with banners and music and a great procession, and let some infatuated Mohammedan, horrified by the grossness of the idolatry, rush out in front of the procession and stab a cow—more human lives will be lost than the newspapers will ever report, and the police will rush in and stop the riot. But after it is all over every sensible Britain will say, "So long as this continues, Great Britain's Raj will be supreme in India."

And so long as this continues, the rule of England ought to be supreme.

Just at present, Mrs. Annie Besant is in Bombay seeking support for a bill to be introduced in Parliament to give India its liberty of self-government at a single stroke. The English newspapers in India have much to say about it, which need not be repeated here. But suppose Britain wanted to give India the right of self-government, to whom would she give it? India has more nationalities than all Europe, and far more languages. How and to whom could she communicate the fact that she had decided to let India govern herself? And in what language could the six per cent of native Indians who can read, learn of England's purpose? Not, certainly, in any one of the languages of India. Only in English could these people learn of England's intention. And how would they inform the other 94 per cent that it was their duty and privilege to rise up and outvote the literate six per cent?

This whole problem is a difficult one, statistically, at least.

The truth is that slavery has not

yet been abolished in India. In this year of our Lord, 1925, it is officially announced that the Maharajah Tribhubana Bir Bikrem, absolute ruler of Nepal, and master of the fighting Ghurkas, the Rajputana race that controls Nepal, has ordered the gradual emancipation of the 50,000 slaves of that territorial division of a country that is nominally ruled by Britain.

Here is another complication. Service in India is increasingly unpopular in England. The young men of the universities have a deep and growing reluctance to go out to India, enduring the heat and the homesickness and to be frowned on in India and none too highly regarded at home.

"How do you like the view of the Taj Mahal?" asked a British official as we stood together looking at that entrancing vision. I told him how beautiful it appeared to me; I had never seen anything more beautiful.

"I can tell you what would appear more beautiful to me," he said, "a view of the breakwater of Bombay over the stern of a homeward-bound ship."

He spoke for many an English official in India.

If representatives of British Government are disturbed because young graduates of the universities of Oxford and Cambridge prefer careers that promise more of reward and less of discomfort, the educated young native of India has no such sorrow over that aspect of the situation. He begs leave to remind Great Britain that there are in India thousands of graduates of accredited schools who are willing and capable of fulfilling the duties of these offices. Indeed, these thousands of graduates are overcrowding the professions, especially the law. Let a man step foot inside the courthouse in any city in India, and there rush at him a number of native gentlemen who say, "I will undertake your cause; employ me." Ambulance chasers in the United States are a modest and backward set compared with these lawyers of India. If a man dies, and leaves five sons and four brothers, there must be nine lawyers, so, at least, I was told, and the nine lawyers are at hand and ready to undertake the cases, no matter how small. It is a happy day for one of these men when he can secure some kind of government appointment.

It is almost as bad in the case of physicians. A native doctor is more than willing to accept a subordinate's place in government service, for it secures him a dependable income. But every now and again he asks, "Why should my place be subordinate? Am I not as competent, as well educated, as my superior, who is a white man, and has no other visible mark of superiority?"

In general, I think, the English and American missionaries are disposed to sympathize very strongly with the demand for a native leadership in the native churches and to encourage it; but there are things to be said on both sides of the question.

England has been dealing with the difficult task of administering affairs among distant and alien populations. Kipling knew something of what he was talking about when, at the end of the war with Spain, he notified the United States that the time had come for her to try her hand at the game in Cuba and the Philippines:

"Take up the white man's burden, the
cruel wars of peace;
Fill full the mouth of famine,
and bid the sickness cease;
And when your goal is nearest,
the goal for others sought,
Watch sloth and heathen folly bring
all your gains to naught."

He who has been in Manila and seen the Filipinization of the service there at a rate all too rapid for the people's good, and an agitation there for complete self-government for which the people seem far from ready, has some measure of appreciation of what England faces in India. In sanitation and education we seem to have done better than Great Britain, but we have had vastly smaller populations to work upon, and we are not yet sure whether all our education has been wisely accomplished. Britain is conservative and has moved slowly, reluctant to disturb situations that did not require readjustment. But England has her troubles. The United States may w be thankful that she does not have problem of governing India.

An impartial visitor is bound to that in the main England has done w She has not been needlessly seve Her easy-going, good-natured tolera has helped adjust her method situations where the American wo be more likely to fret and use langua Certainly India is vastly better what England has done for her, though this is disputed by so editors.

Will there be a revolution? Th are native Indian leaders enough w want it, and who partly by passive sistence and partly by any other av able means are ready for it. It m come. But I do not see the signs of In the first place, it is almost impossi for any native to own a firearm India. A white man who buys a volver must register it, and describe and give occasional account of it, a have every purchase of cartridges corded, and if he sells it, there must a record of the sale and official proval of the person to whom it is so There are, of course, firearms possession of natives, and every Am can is warned that he will make hi self trouble if he enters India with weapon, for the natives have the i pression that some Americans mi possibly be induced to sell them volvers, but I have not learned of a instances in which this has occurr It would be very difficult to organ any military uprising in India unl it originated in the native regime themselves. But those native re ments have memories of the Sep Mutiny, and they know that the f tresses of India have enou British troops within the and more largely in the in fortifications, to prevent a general and successful uprisi

But even more to point is the fact that In has no unity of populat or language or of religion of aspiration. There mutterings and ominous si of discontent, but I do observe any basis for a be that India is likely to eff a successful union of Hin and Mohammedan, or a consolidation of the caste the Hindu population t could make them capable effective resistance to Brit authority. Meantime, Brit officials are frankly worri and many of them are s and tired of a job that bri them interminable annoya in India and exasperat criticism from Britain. Th are many of them to wh the Taj Mahal would seem a less beautiful object than a view of the breakwater f Bombay over the stern o a homeward-bound steamer.

Taj Mahal. A mausoleum of white alabaster, a mile east of Agra. It is the most beautiful seventeenth century edifice in any land, and the supreme achievement of Mohammedan art.

THE man who takes the oath today to preserve, protect and defend the Constitution of the United States only assumes the solemn obligation which every citizen . . . . . should share with him. The Constitution which prescribes his oath, my Countrymen, is yours; the laws and the entire scheme of our civil rule, from the town meeting and the State capitals and the National capital, is yours. Every voter, as surely as your chief magistrate, under the same high sanction, though in a different sphere, exercises a public trust. Nor is this all. Every citizen owes to the country a vigilant watch and close scruting of its public servants and a fair and reasonable estimate of their fidelity and usefulness . . . . . This is the price of our liberty and the inspiration of our faith in the republic. —*Grover Cleveland's First Inaugural, 1893.*

CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

Sepia is a rich brown pigment prepared from the ink, or black secretion, of various cuttlefishes of the same name.

"Speed Limit Through Nazareth 10 Miles per hour." So reads a sign on Mary's Well at Nazareth.

Women participated in French elections, for the first time, May 4.

As a surveyor, George Washington dragged his chain along the surface of the ground, up and down hills, without making any allowance in his calculations for the hills. Consequently, modern surveyors are having trouble checking up his old surveys in what is now Maryland.

Hired men on many western farms refuse to plow unless the farmer gives them at least twelve horses in a hitch. Twenty-horse hitches frequently pull six fourteen-inch bottoms.

Cortes' Spanish forces were in need of gunpowder at one time and as sulphur was a necessary constituent of gunpowder one of his officers permitted himself to be lowered into the crater of the Mexican volcano Popocatepetl where he obtained it.

Of 28,000 Christian missionaries working in foreign fields, 19,000 are from the United States, while American annual contributions to the work amount to $40,000,000 out of a total of $45,000,000.

From the fingerprints on file in the identification bureau of Scotland Yard, some 260,000 positive identifications have been made.

Among other dogs used by the Department of Agriculture to fatten fleas to test germicides was a bull pup that was found to be immune. As fast as the insects were placed on the dog they hopped off. Scientists are trying to find out the secret of his defensive armament.

Power alcohol is being distilled from the crushed prickly pear cactus of Australia.

The sun rises in the Pacific and sets in the Atlantic in the Panama Canal, because the east end of the canal points toward the Pacific and the west end toward the Atlantic.

Mark Twain always wanted the door of his writing room closed. He explained that "an open door did not let the cold in, but let the cosiness out."

Warts are supposed to be cured in Kishu, Japan, by touching them with a stick, the other end of which touches a tree. The stick is then tapped with the injunction, "warts, pass over the bridge." This is uttered three times. The warts are then supposed to pass into the tree.

Twenty-one million letters went to the Dead Letter Office last year.

Traffic increases a third every decade.

Water, land and air are now being used for traffic between Detroit and Cleveland.

Asiatics who served in the United States Army, Navy or Coast Guard during the World War are not entitled to naturalization, the Supreme Court has decided.

Documents, including a Masonic diploma from Washington Lodge No. 26, making Jonathan Cowdery a Master Mason, and two commissions engraved on sheepskin parchments, the first signed by President John Adams, and the second by President Thomas Jefferson, making Cowdery a surgeon's mate and a full surgeon in the United States Navy, has been found in a steel case hidden in an old brick wall of a house under repairs at Norfolk, Va.

The Sam Browne belt was invented by a one-armed British officer.

Rotten wood is used in the polishing of the fine parts of the highest grade Swiss and French watches.

Crop reporting by airplane observers is now being tried in North Carolina by the United States Department of Agriculture.

A trained bird dog has been retrieving, for his boy master, golf balls driven by players at a Chicago golf course. Players were puzzled by the mysterious disappearance of their golf balls until they caught the dog in the act of carrying the ball to the boy.

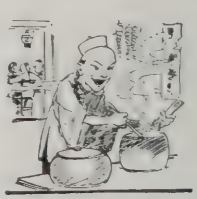
Many regions of Latin America have excellent hardwood timber forests far in excess of their own needs, so much so that in some instances they destroy them to utilize the land for agriculture.

The "busy bee" spends more time in the hive than she does outside hunting nectar. She only makes 31.65 trips during her lifetime and gathers only eight-tenths of a gram of nectar.

American gray squirrels, imported into England, have driven the native British red squirrel from the parks. In America the red squirrel is considered the best fighter of the two.

"Where the child doth well, let the master praise him, and say, here ye do well. For I assure you, there is no such whetstone to sharpen a good wit and encourage a will to learning, as is praise."—*Roger Ascham, 1515-1568.*

There are 6,500,000 farms in America, according to the *Christian Science Monitor*, and these use 4,200,000 automobiles and 670,000 trucks.



Women managing a restaurant in Canton, China, found cooks of their own sex incompetent and were compelled to "man" their kitchen. In China, the sphere of woman does not include housework.

Presented in This Issue

Mr. Ford's Page this week concludes the discussion, Private Business versus Employment as a career.

We should not be publishing this paper if we did not know that we are giving profitable information to our readers. We do not seek to duplicate other magazines. They are doing their own kind of work well enough. We are not suppressing any facts out of fear that they may ruffle some reader's mind. We publish information that will help our readers interpret what they read in the newspapers and what they see around them. Our principle is Truth, not Policy.

To have observed day by day, month by month, for forty years, the changes in the standard and cost of living, qualifies a man to express an opinion about it. A rather startling series of statements about our condition today, as compared with 1885, comprise the article which occupies three pages of this issue.

"Lunatics, By One of Them" does not relate to alienism, but to the fever of antique collection. Under the most placid exterior of the least suspected persons this guilty passion may lurk. Some of us who don't "collect" and who regard the habit from the outside, are at a loss to know what "collectors" see in it, until one of them tells us. This story communicates somewhat of the collector's inner spirit. (p. 12)

Sunday as an institution is one of the seven wonders of the world. The sun establishes the year and the four seasons, the moon the month, but where does the seven-day week come from, and why have all efforts failed to create a ten-day week? Yet, like all good things, the weekly day of rest has its enemies. For that reason we are giving a study of Sunday by an expert in the subject. All Americans should know the facts. (p. 14)

I have felt, and so have you, that if our personal finances were handled as nations do it, with their funding and refunding, the world would soon go to smash. Mr. Reeves conceived the notion of handling his plumber as the premiers handle each other, and his letter appears on page 8.

Our Chinese news comes from China, and there is no resisting the conclusion that a new era has burst forth in that country. People who have seen it coming, and how it burst, are writing for us. An article appears on page 5.

Health and religion have long been connected in thought and experience. The first temples were hospitals and the cure of bodies went with the cure of souls. The Ten Commandments as a health regimen are worth considering. A scientist has studied the Decalogue from the health point of view, with interesting conclusions. (p. 18)

Mr. Finger contributes this week another of his popular series, "Romantic Rascals." (p. 16)

Peter Schuyler is in New York but not of it. He is specially informed as to New York's theatrical life and his reports are useful in forming opinions. As long as we insist on accepting our plays from New York, the field and its occupants will repay observation. (p. 23)

"Jerusalem and the Jews," by Hal Walker (p. 31); "Sir Francis Dicksee and His Work," by W. Teignmouth Shore (p. 2); "Mapping the Northwest Passage," by Prof. L. C. Karpinski (p. 24); "The Long, Long Trail," by S. R. Winters (p. 21), together with Briefly Tolds and Editorials, comprise this issue.

An Editorial is devoted to The Scopes Case. (p. 9)

A Chat With a Famous British Painter

By W. TEIGNMOUTH SHORE

MAY is a festive and a beautiful month in London town; the parks, the squares and the gardens, the Embankment along the River Thames, all have on their gladdest clothes and flame with gay colors; lads and lasses, old boys and old girls are filled with the spirit of jollity; all the world is young! London is at her best, which means to all her true citizens that she beats all other cities hollow!

Among the first social functions in May are the private view of the Spring Exhibition of the Royal Academy, which is attended by a great many distinguished and by a few undistinguished men and women, and the Royal Academy Banquet, to which—oh, shame!—only mere men are invited. The exhibition opens to the public on the first Monday in the month.

Exactly what is the Royal Academy of Arts? Its name fairly fully expresses its aims. It was constituted by His Majesty King George III on the tenth of December, 1768, and has for its objects the conduct of a free school of art and the holding of an annual exhibition of paintings and other works of art, none of which shall have been exhibited elsewhere. The members of the academy, who acknowledge no controller save the reigning monarch, consist of forty Royal academicians and thirty associates, both being elected by the whole body of the members. Its funds are provided by the aforementioned exhibitions, one in the spring and another in the winter, the latter being for the most part collections of the works of old masters or of deceased British artists. These exhibitions were first held elsewhere in town, but now always in the rooms of the Royal Academy in Burlington House, Piccadilly, to which home they were removed in the year 1869. And so I might go along, handing out prosaic details. I will add this only that the first president was Sir Joshua Reynolds and that among the first batch of academicians, all nominated by George III, were Benjamin West, who became the second president; he was born at Springfield, Pennsylvania, in 1738; Thomas Gainsborough, Johan Zoffany, Francesco Bartolozzi, and two women—the first to achieve academic honor—Angelica Kauffman and Mary Moser; do you know these two? If not, it doesn't matter a bit, for they didn't either of them do anything worth remembering. Since those days there has been held this famous annual Spring Exhibition "open to all artists of distinguished merit, where they may offer their performances to public inspection, and acquire that degree of reputation and encouragement which they shall be deemed to deserve." Of course, those artists who have not been deemed worthy of encouragement have had hard things to say of the academy, alleging that it stands in the way of new men and new practices. But there, is it not to a certain extent the duty of an academy to be academic and not intoxicatingly or frivolously progressive or revolutionary?

Sir Francis Dicksee, president of the Royal Academy, and his home.

To the world of art in Great Britain the president of the Royal Academy stands somewhat in the same position as does the Archbishop of Canterbury to the Christian churches; he is the head of the community of the orthodox, and must not be without reasonable sympathy with sincere non-conformists.

This jolly afternoon in May, when the lilacs were all a-blooming and the hawthorns bedecked with red or white blossoms, and the air filled with their fragrances, I bethought me that it would be pleasant and advantageous to go up to Maida Vale. "Up," because it is a northern portion of London. Maida Vale; a pleasing name and quite a pretty place, where the houses mostly have spacious gardens. Why should I go there? Because therein dwells Sir Francis Dicksee, who in December last was elected president of the Royal Academy; a native of London; aged 71; a member of a family of artists. He first exhibited at the R. A. in 1876, was elected A. R. A. in 1881 and R. A. in 1891; and is as kindly and courteous a friend as the heart of man or woman could desire. It was many years since I had first met him and I was curious to see how time had been dealing with him. Much more kindly, alack, than it has done with myself! A tallish, slimish, well-set-up man he is; mustache, beard and hair a seemly gray and trim; eyes dark. Perhaps his most distinguishing physical gift is his singularly pleasing, soft-toned voice. As a whole, a very winning personality, to which Time has not dealt any uncouth blows.

The big studio was pleasantly cool to come into out of the hot glare of the sun. Old-fashioned in some ways, for the majority of artists today are more frugal in their decorations, probably because they cannot afford to be otherwise. For times are hard here with most of the painters of pictures; millionaires do not purchase futures, but prefer to invest their pounds or dollars in old established masters, whose works are rare and bring rare prices.

"It's dreadfully untidy," said Sir Frank—few call him Sir Francis—as we went down the stairs from the house.

So indeed it was, but I thought it a very proper untidiness; artistic litter. A lofty room, with splendid north light from the big, sloping skylight; rare and valuable tapestry upon the walls; bits of armor; a gilded (Concluded on page 26)

In 1870 the twelve-hour day was common. Now labor works less than ten hours, most of them eight

Lessons From Forty Years' Study of the Cost of Living

By AARON HARDY ULM
ILLUSTRATED BY W. O. FITZGERALD

"WHEN I started in this work," says Ethelbert Stewart, chief cost-of-living investigator for the United States Government, "one could buy eggs at from 6 to 8 cents a dozen; butter sold for 20 cents a pound; three pounds of round steak could be bought with a quarter of a dollar—and common laborers were paid only a dollar a day. Were those the good old times? That calls for a lot of discussion, but, to answer briefly, they were *not*—emphatically *not!*"

Mr. Stewart was appointed recently to succeed himself as Commissioner of the United States Bureau of Labor Statistics. It is a singular establishment in that, though governmental, it has no power, no authority, and never, since it was set up in 1885, has it sought any. Its duty is to discover and record *facts* about prices and wages and the cost of living and living standards and working conditions.

"If we had had power to demand the facts which we have had to get from private sources," says Mr. Stewart, "they would not have been given to us so fully and freely. Since we could only ask for them, not more than one in a thousand persons ever has refused to tell us anything we wanted to know."

Mr. Stewart joined the staff of the establishment—then known as the Bureau of Statistics—in 1887 and has been with it since that time. Hence he probably has studied over a longer period the subjects dealt with than has any other living person. What changes have come about during the nearly forty years' time which his pursuit has covered? The writer asked him about them, also their meaning.

"The cost of living, of course, has changed," he said. "But living itself has changed even more so. When I took up this work, the telephone was just being established. The horse-drawn street car still was operated in practically all of the cities. Apartment houses were unknown and even the word 'flat' as applied to living abodes had not come into use. City as well as country homes still relied on the kerosene lamp for artificial light. Tin cans were used very little as food containers. Less food per person was produced in the country than at the present time and fewer persons in the city got enough to eat. While they had less to eat, they had more living room than now. The size of one's house still had a lot to do with fixing one's standing in the community.

Our studies indicate that *the cycle as to housing has run its course, and we are going back to the custom of the eighties.*

"The food problem has undergone enormous change, mostly for the better. Forty years ago a large proportion of the working class of city folk didn't get enough to eat, of any kind of food, at all times to satisfy crude hunger. While some still do not get enough to eat, common hunger is no longer a factor or a threat of importance in American life. A lot of people, particularly children, are undernourished as school surveys and our studies of home economy indicate. But you will find these among the rich as well as the poor; it is due to errors of diet and not to lack of food. The sheer bread and meat problem, as it was when I took up this work, no longer exists.

"At that time food was, with a large proportion of city people, a matter mostly

The following figures on average family income and expenditures were derived from studies of the home affairs of from twelve to twenty-five thousand working-class families in cities of all sections of the country:

		SPENT FOR			
Income	Rent	Fuel and Light	Clothing	Food	Other Purposes
In 1901 $ 749.50	$118.40	$ 38.59	$ 94.99	$312.92	$147.37
In 1918 1,513.29	191.37	76.15	237.60	548.50	379.32
In 1924 1,584.41 (Estimated)	294.77	92.94	198.25	444.38	446.42

The last figures are for the month of December, 1924. Those for income are estimated and possibly are slightly high. They are based on statistics of employment and wages procured from employers and not directly from wage earners.

of bread and meat; particularly was this so during winter months. The per capita consumption of both bread and meat has fallen off, mainly because of the greater availability of other things.

"Take eggs. The average family consumed fewer of them in 1887, when they could be bought for ten cents a dozen or less, than in 1925, when they cost from 40 to 70 cents a dozen. Moreover, their egg consumption then was crowded into the summer months when the supply was plentiful. Only the rich could afford eggs regularly during the winter periods of small production. When we grow wrathy about the high cost of eggs even in spring and summer, we forget that this makes it possible for the average family to eat eggs in winter.

"The average family's table variety is due largely to cold storage and the tin can. In the eighties the consumption of canned goods by the average family was insignificant. Now it is large.

"Even as late as 1901, the average family consumed only $16.52 worth of fruit a year, and most of that in summer when local supplies were plentiful and cheap. In the cities, fresh vegetables were unknown among ordinary folk in winter. Barring potatoes, the only vegetables they got then were of the dried kind. Now the consumption of fresh or canned vegetables is spread throughout the year.

"When we first began to trail the cost of living, milk sold at from 5 to 6 cents a quart. But the only working class families that had it regularly were those that kept cows, then a common but now a rare practice in the cities. In many of the smaller cities, butter sold for 10 cents a pound. It was only 20 cents in Chicago in 1890; there was much excitement when the World Fair crowds sent it to 26 in 1893. Yet more butter is consumed now by the average working class family and it is better butter; for the Jersey or creamery kind, now general, was just coming in then.

"Take it from me, the average American would not now consider the sort of table set by the average family of the eighties as very appetizing. During much of the time it contained little except bread and meat—and the latter of the salt or preserved kind—and gravy and molasses.

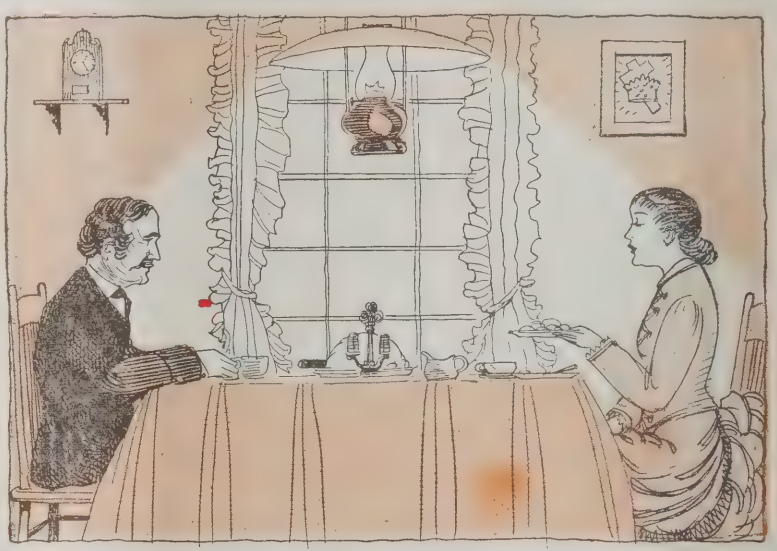
"Improvement owes, in much part of course, to increased purchasing power.

"When this office was established, the average worker's family had less than $500 a year for living expenses. In 1870, to be exact, average family expenditures among working people of the cities amounted to $497 a year. It increased only to $699 by 1901. Now it is $1,477.

"Purchasing power has not increased as much as the total of expenditures in terms of dollars. Most prices are around double what they were when we began recording them regularly.

"A few articles are as cheap or cheaper. Coffee costs less than in the eighties. Tea is about the same. Sugar is only a little costlier. Flour is only a little higher than it was in 1890, but in terms of baker's bread, not much used then, it is much higher.

"There has been an increase of purchasing power beyond what can be stated in figures. It lies in the wider range of selection and variety that now prevails. Even with the relatively same money a table can be set with far more palatable and healthful food than in the eighties.



The table set by our people in 1880 would not satisfy the average citizen today. Bread and meat, gravy and molasses were then the staples.

"Much of the increased cost of food is caused by a widened spread between wholesale and retail prices.

"When this office was established it took a minimum of 300 families to support a grocery store. Now there is a grocery store for about every 72 families in the cities. Amplified service, as illustrated by the greater use of package goods, also has increased retail prices.

"While there is no way of stating it statistically, I would say that average living standards in this country have increased by 200 to 300 per cent since we began to keep tab on them. The increase has been all along the line. Those of the wealthy have gone up as much or more than those of the working classes. We still have the contrasts of old but we haven't the old conditions. Far from it.

"Wages for all working classes have gone up in ratio to the figures on family expenditures. Before the World War the greatest gains in wages were made by workers in the skilled trades. While their money wages have increased much since that time, the earnings of skilled workers on the whole have not gone up as much as many people believe. They have not increased much if any more than living costs. The so-called unskilled worker who gained far less than the skilled prior to 1914, is the one whose condition was most improved by circumstances attending and following the war. His wages have trebled and quadrupled.

"Yet the common laborer type of unskilled worker is passing—and partly is because he is passing out that he is faring better. There always will be some drudgery calling for common labor of the pick-and-shovel type. But machinery can take the place of most of it and is doing it. Since immigration was reduced, many concerns have found that much of the kind of work that used to be loaded on the backs of men can now be done with machines and more cheaply and better. Our greatest wastage of men is now in the common labor realm. If you estimate it by what is done now where only reasonably good mechanical practice is followed, it approximates the daily toil of several million men.

"When we began detailed researches on the subject, the 12-hour day was common in American industry. The 10-hour day was the virtual minimum. Now a majority of the working people have less than a 10-hour day, most of them an 8 hour day.

"There was no leisure problem in the eighties, as we have found that there is now. The bureau has been studying the leisure problem with the view of setting forth the facts. To have made such a study even ten years ago would have seemed laughably absurd. But the question of what people who work may do with the leisure which millions of them now have on their hands is a quite real one."

"Has the internal economy of the home changed much?" Commissioner Stewart was asked.

"In some incidental respects, yes; basically, not a great deal.

"One of the first investigations that helped make for the bureau was a survey of divorces, the first inclusive one made in this country. The public was astonished when it learned from statistics we gathered that *the majority of divorces were procured by wives.* That has continued, along with an increasing rate of divorce. We no longer follow the subject, but I think a conclusion indicated by our report is sustained by later investigations. It is that divorce is essentially an economic problem. We found that wives left their husbands largely because they were not supported as (Concluded on page 2

China Protests Greed

Students and Strikers Agree

By INEZ MARKS LOWDERMILK

—Nanking, China (By Mail)

WHAT would happen in the United States if every student from the kindergarten to college should go on a strike, to make stump speeches? Yet this is what has taken place this past week in China and things have been happening which may have a powerful influence for weal or woe in the coming years.

China, with her four hundred millions of people sprawled halfway across Asia, has suddenly been seized with a spasm of patriotism as never before. The spark which lighted the flame in every city in China was the message: "FOREIGNERS SHOOT AND KILL UNARMED STUDENTS IN SHANGHAI" sent out as a circular telegram by the students union headquarters. Immediately every school closed its classes and mass meetings were held and campaign plans laid. More than a million students became hot with indignation and expression was given to the smoldering and accumulating grievances of the past.

The cause immediate—perhaps it is better to say, the *occasion*—of this trouble in Shanghai was the recent strike in the Japanese Naigai Wata Kaisha Cotton Mills. Let it be said at once that no place in the world has commercialism shown its glaring greed and wrongs as in Shanghai factories where there are no laws to hold it in check. Twelve to fifteen hours a day are required of women and children for a wage that does not even satisfy the call of hunger. Labor is the only cheap thing in China nowadays. Competition for work is so keen that fathers work unbelievably long hours for a pittance which forces his babes into the factories as soon as they can move their tiny hands.

No one blames the strikers for striking against the hideous grind in which they have worked to make factory owners immensely wealthy. The first blame lies with the Japanese owners who fired on some unarmed strikers, wounding ten and killing one.

On Saturday, May 30, the students from several of the mushroom colleges of Shanghai, which it is intimated are supported by Russian money for propaganda purposes, formed a mass group and entered the International Settlement (really British) to make speeches and agitate in behalf of the strikers, also against certain regulations which the municipal council had proposed for adoption. Another grievance was what they called taxation without representation. The municipal police arrested several of the students and lodged them in the Louza police station. This aroused all classes of students and they stormed the police station. They were ordered to disperse and as they refused, the police (sikhs from India) were ordered to shoot. Nine students and others were killed instantly and many were injured, some fatally. Thereupon the electrifying telegram "Foreigners kill unarmed students in Shanghai" was flashed to all corners of China, and this brought on the greatest strike in the modern history of China. Wise principals and college presidents did not resist the strike and in these institutions good feeling has largely been maintained. Where any opposition was given the result was disastrous for the school. St. John's, one of the oldest and largest in China, was closed in a bad way, the students and Chinese faculty taking a vow never to return to the campus.

Only a short time ago the idea prevailed generally that there could be no public opinion or concerted public action in China. The masses could not read or write and thus they could not be reached. That idea must be relegated to the past. More than one million students, with streaming banners, paraded in cities from the Pacific to Tibet and from Mongolia to Annam. They went into every section of the cities and towns and, mounting the proverbial stump and soap boxes, they made violently patriotic speeches and instructed the illiterate populace about the Shanghai affair and about the wrongs done to China by the foreigners. Tracts and banners were given out. The milder ones were: "Down with Imperialism"—"Get back the foreign concessions"—"Use only native goods"—"Boycott English and Japanese goods"—"Do away with unequal treaties." There were others more lurid and calculated to incite passion. In some cases Scripture was quoted in English—"They that take the sword shall perish by the sword" and one poor student got his English and Scripture sadly mixed when he wrote, "It is easier to see a stick in thy brother's eye than a BEAN in thine own."

Every child and coolie has had more patriotism pumped into him in this past week than any time in Chinese history. Public sentiment and knowledge of the masses, which was thought impossible to attain, has not only sprung up in one week but has developed into such proportions that hundreds of laborers in foreign firms have struck. The students are refraining from eating meat and abstaining from all luxuries, to feed the strikers in Shanghai and (*Concluded on page 28*)

Left—Students' Parade (a part of the students' parade of 25,000, Nanking). Right—Laborers' parade (making demands before the Japanese Consulate, Nanking.) About the Ancient Drum Tower, Nanking. Below—Students and labor strikers entering the auditorium of the National University at Nanking to discuss the Japanese and British boycott.

Fighting Philadelphia's Rum Ring

How General Butler Is Handicapped by City's Undercurrent of Alcohol

By CHARLES ALBERT COLLMAN

PHILADELPHIA is the principal center in the United States for the manufacture of illegal drink from denatured alcohol. This statement is made on the authority of Governor Pinchot of the State of Pennsylvania. It explains the tenacious persistence of the forces that are opposing General Smedley D. Butler's attempts to establish for good a "dry" Philadelphia; "easy money" is the strongest motive that men can have for breaking laws.

General Butler with Superintendent of Police William Mills.

Denatured alcohol, of course, is legitimately released for non-beverage use, and there are large legitimate manufacturers of the distillate; these have the best end of the business, since they can sell to permit-holders without danger. The largest concern, probably, is the Publicker Commercial Alcohol Company; its owners, the Publicker brothers, before prohibition, were small dealers; I am told their fortune is now estimated at $40,000,000; they manufacture alcohol from molasses shipped up from New Orleans, and have just constructed in the Quaker City the big Publicker Building.

In Philadelphia's Tenderloin they point out to you one-time "stick-up men" and gamblers, who are growing rich in making the volatile fluid, and even among the conservative financiers of Chestnut street the quick fortunes made in the upswing of the alcohol industry are the talk of the day. Men who, before the coming of prohibition, shone only in humble circumstances, or in capacities not so humble as they were surreptitious, now flaunt all the trappings and paraphernalia of ostentatious wealth. Among owners of numerous distilling and chemical concerns, ethyl solvents companies and industrial distillers' plants, one may note Max Hoff, known to his intimates as "Booboo," who has also an office for the promotion of the art of boxing in the Bankers' Trust Building. Another successful distiller is Nathan Klewonski, often called "The John," of Cobb's Creek Parkway; in the old wet days, so the story runs, he drove an ice wagon. Then there is Charles Spidelli, with an office in the Bankers' Trust Building and also a smaller one in Room 622, in the Washington Square Building; he was once familiarly entitled "The Turk" because of his strong right arm. The three Hamowitz brothers have also prospered in the industry; Charley was at one time a police officer at the old Third Police District, Fourth and DeLancy streets; Irving, despite his youth, is accredited with wielding considerable influence.

Other pioneers in the Quaker City's great industry are "Bus" Beirenstein, of Atlantic City; Pete E. Waxler, once a fight promoter; Philip Cohen, Harry Levy and Harry Shiekman, who, before the advent of dry, denatured days, was engaged in more hazardous enterprise.

Many of these prosperous distillers have the reputation of approximating millionaires; of possessing wonderful residences in the Quaker City and summer homes at Atlantic City; of going to Florida for their winter vacations, and sporting footmen and chauffeurs as they drive out in their motors and, in short, of leading the lives of well-merited happiness that accompanies success.

Prohibition has proved a good thing for the Chosen People.

There is said to be a $100,000,000 alcohol ring in Philadelphia; a few millions more or less don't matter, for the illicit trade and its profits require slight exaggeration. The increased production of alcohol is out of all proportion to the natural increase for industrial and other proper uses. There is no adequate system by which the enormous production and distribution of distillate can be checked by record effective in preventing its passage in huge quantities into the bootleg trade.

There were 151 manufacturers in November, 1924, who were authorized to make toilet waters, hair tonics and tobacco sprays in Philadelphia. They withdrew in the first ten months of 1924 more than 1,100,000 gallons of specially denatured alcohol, which is estimated to be enough to make toilet waters, hair tonics and tobacco sprays for the people of the entire world. Nine permittees claimed to have used and sold more than 185,000 gallons of denatured alcohol in tobacco sprays during these ten months. According to the formula used by the largest manufacturers of tobacco in the country this was tobacco spray sufficient to have treated twice over the whole tobacco product of the United States in 1924 and half the product of the entire world. Of these 151 manufacturers, 128 were found by state officials to be engaged in violations of the law or in crooked practices to cover such violations.

The Public Safety Department of Philadelphia is in possession of more information relating to the trickery in the illicit liquor traffic than probably any other police organization in the United States. Lieutenant Charles Beckman, head of the liquor squad who was recently promoted to that post by Director Butler because of the energy and success he has shown in pursuit of law violators, described to me the general system on which the trade in venomous distillate for beverage purposes is conducted.

Under the Prohibition Act, where a manufacturer of alcohol sells his product to a permit-holder, it is necessary for the former to deliver all his goods in bonded trucks, the barrels having serial numbers for purposes of identification; otherwise he is subject to a penalty of losing his right to manufacture alcohol. This safeguard instituted by the Government was displeasing to the manufacturers who wished to evade the law; so *through political influence* which they could exercise, a loophole was found which enabled them to do business with bootleggers without risk. The Govern-

nent was persuaded to permit a man o go into business who is known as a 'distributor"; there was thus created a 'cover house," or intermediary be-ween the manufacturer and the per-nit-holder. The distributor became, in ther words, a clearing house for al-ohol, and enabled the manufacturer to void his responsibilities in illicit sales f the distillate.

When the manufacturer of de-atured alcohol delivers his output to he distributor in bonded trucks, the atter may turn it over to any person vho has a permit in any old truck, vithout any responsibility on his part r that of the manufacturer.

The procedure is as follows: A ermit-holder in Philadelphia, known s the Sunny Day Company, financed y a man named Cohn, who is ostensi-ly a manufacturer of soaps, chemicals nd colognes, has the legal right to vithdraw 300 fifty-gallon barrels of lcohol a month. He can withdraw hat amount from, say, the Consolidated Denaturing Company, but in doing so, e would have to take every barrel nto his own place of business. He bjects to doing that, because he has nother, and more profitable plan in nind. Instead of that, Cohn notifies he Consolidated to deliver his monthly equisition to a certain dis-ributor. The cover house hen goes through the ormality of notifying Cohn, of the Sunny Day Company: "We have 300 barrels to deliver to you."

Cohn: "All right; hold t."

It would be foolish to bother with the manu-acture of soaps, chemicals r colognes. The permittee as an easier way to make is money. He consults is private list of boot-eggers and selects a name.

Cohn (over the tele-phone): "Say, Jake, what will you give me for my output this month?"

"The bootlegger: "I'll make it, say, $2.50 a gal-on. How does that suit you?"

Cohn (contemptuous-y): "Not enough, Jake; I can do better."

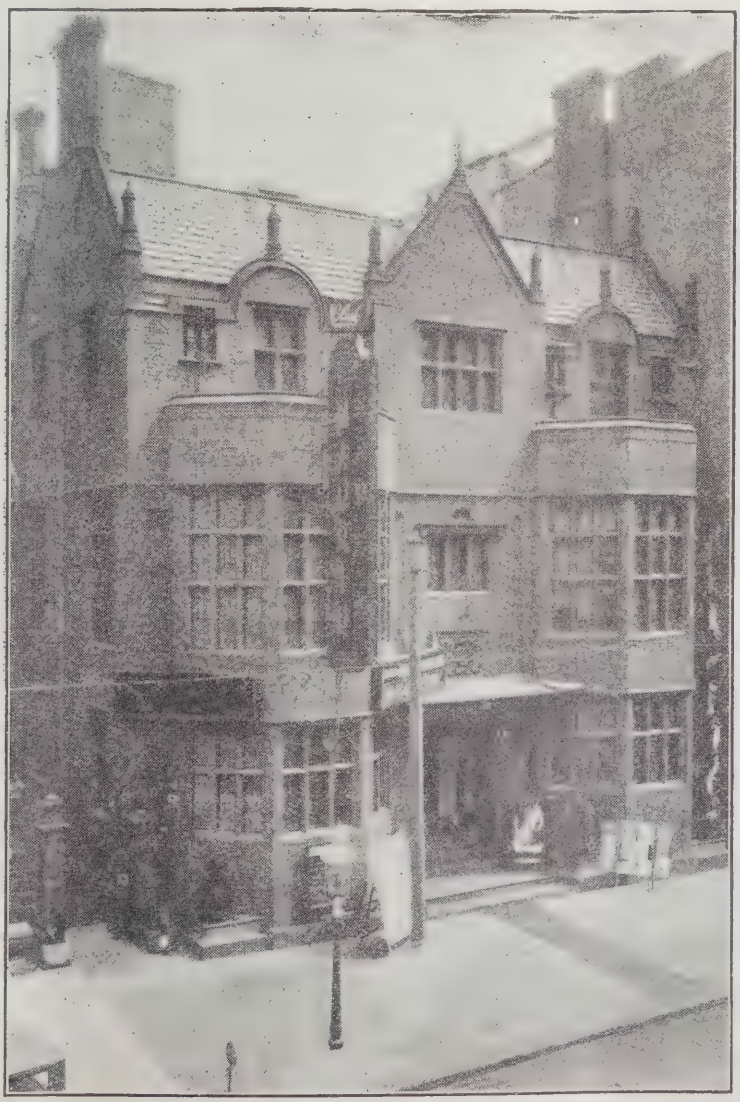
He calls up succes-ively all the bootleggers n his list. One offers him $3.00 a gallon; another bids $4.00. The highest bidder gets the prize. In he case of Cohn, the dis-ributor was paid $11,250 or 15,000 gallons of de-atured alcohol; he ob-ained from the bootlegger he sum of $60,000. The month's profit is $48,750.

The successful boot-egger, in possession of the permit, now sends his truck to the distributor; on the seat beside the driver sits a colored man, who is outfitted with a small metal scraper. As they reach the distributing plant, they observe a couple of police or internal revenue agents on the watch, in an auto, to trace the destination of the denatured alcohol. The distributor, however, coolly loads the bootlegger's truck with the barrels of distillate, each of which is marked with its serial number. The truck starts off, the trailer auto following to see whether the stuff is going to be delivered to a permit-holder. Just before the truck arrives at the bootlegger's re-distilling plant, the colored man creeps inside the truck and scrapes the telltale numbers from the barrels; the truck then shoots in-side the plant, and the door is slammed. Now should the still be raided, the raiders will find no barrels marked with serial numbers to indicate that they came from a denatured alcohol plant. The evidence is destroyed, and without a warrant, the detectives cannot ex-amine the contents of the barrels.

The bootlegger now re-distills the denatured alcohol, and "cuts" it with a quantity of low-grade whisky. He bottles and labels his product, and sells it in turn to the speak-easies with which he does business. The owner of the speak-easy retails the compound, which originally cost 75 cents a gallon, to his customers, the alcohol addicts, at 50 or 75 cents a "shot."

"The reason we are handicapped under the Snyder Act of the Pennsyl-vania Prohibition Law," said Lieuten-ant Beckman, "is that our authority ends at the doorstep. Under the Vol-stead Act, no persons except authorized Government agents are permitted to make an investigation of these dis-tilleries. Therefore we have to work on the outside and grab what comes under our notice.

"When General Butler first came to Philadelphia, we had at least 250 large re-distilling plants in the city. Today I don't believe there are more than one or two working in Philadelphia, but there are many working outside, in Chester, Camden, and the surrounding territory. Some of the denaturers *are powerful enough to go to Washington and reach certain people there who use their influence to force prohibition agents off the job.* It is reported that they give as much as $5,000 a month to a man to close his eyes, so that when a 'rough man' enters Philadelphia and begins investigating the alcohol dis-tribution game, they can go to Wash-ington and have him removed.



The Café Madrid, one of Philadelphia's cabarets.

"From 60 to 80 per cent of all specially de-natured alcohol which is distributed finally gets into the hands of bootleggers and is sold for beverage purposes. Previous to the arrival of our present. Director of Public Safety, nearly a million gallons of specially denatured alco-hol were placed here monthly; this amount of the illicit traffic has thus been cut down to about one-half; that doesn't mean that the balance is not now being distributed out-side of the city."

According to the Lieu-tenant, six large companies are controlled by a group of interlocking owners.

"They are all owned, controlled and operated by one concern and under one head," said Lieutenant Beckman. "Up to recently some of these firms were competitors, but some time in March the entire lot of concerns was incorporated into one company.

"The Consolidated Ethyl Solvents Company is the largest denatured violator. It is owned by 'Booboo' Hoff and Pete E. Waxler. Charles Spi-delli controls the Burling-ton; the Quaker is con-trolled by Harry Shiek-man and the Hamowitz brothers; the Swanson

Chemical is controlled by Nathan Klewonski, known as 'The John.' The Glenwood Distillery is controlled by Max Hoff, the 'Booboo,' and 'Bus' Beirenstein. The Beach Chemical is controlled by Nathan Klewonski, 'The John,' Harry Shiekman and 'Booboo' Hoff, they having just bought it from Boil and McGlynn. The Beach Chemical was completely closed up for more than six months, without sending out a barrel, and the people who owned it had to sell out to these six men.

"They've got a great pull. So great, in fact, that some inquiry ought to be made why certain concerns are still in business, and why they shouldn't be. We have had several permits revoked, some of them several times, but in all but two cases, they were restored. The Consolidated permit was also suspended, but the revocation was presently rescinded. We closed the McCarthy Chemical Company and its permit was revoked, but it was again restored by the Government and seven days later the plant was reopened. Again we had its permit revoked, and now it is finally out of business. We had the Philadelphia Alcohol Distributors, one of the largest of its kind, shut down, and it was compelled to go out of business.

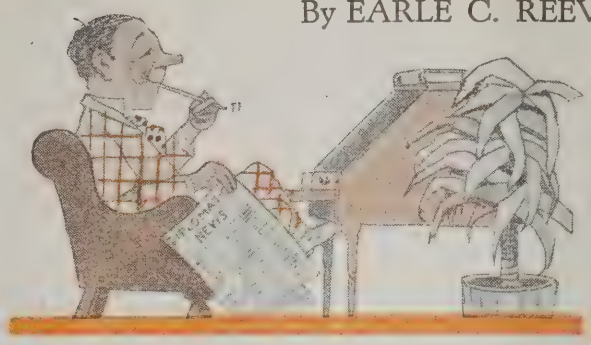
"The Pennsylvania Distributing Company is a distributor which controls most of the business that goes to permit-holders who are barbers, supply houses, and the like. It is an agent that gets rid of specially denatured alcohol. Its owner is Harry Levy, who, previous to prohibition, was a salesman of secondhand autos.

"We had the permit revoked of the Golden Ray Manufacturing Company, and after we confiscated a number of barrels of alcohol at the plant of the Sunshine Oil & Alcohol Company, it also went out of business. Then we closed the Euber Distilling Company, where we confiscated a 400-gallon still and another with a capacity of 200 gallons, besides a lot of alcohol. The Wagner Meal & Alcohol Company was owned by two brothers, 'Bob' and 'Jake' Feinstein, with offices in the Flanders Building, at Fifteenth and Market streets. We confiscated a 500-gallon still and 113 drums of alcohol, which no doubt came from the Burlington. The Burlington Distillers, it appeared, had ordered 100 drums of completely denatured alcohol from the American Distilling Company; after receiving them, they removed the denatured alcohol and filled them up with specially denatured stuff and sent them to this still. So we had to get in touch with the American to ask them why they sent specially denatured alcohol instead of completely denatured."

The foregoing examples explain some of the difficulties with which General Butler is coping in trying to suppress one form of law violation.

Treating My Plumber Diplomatically

By EARLE C. REEVES



RATHER thoughtlessly, as I now see it, I was about to send our sanitary engineer a check for $41.49. The fellow had been so pleasant about it.

But fortunately I read my newspaper, and on mornings when I am feeling a bit brisk I like to match my wits against those of foreign statesmen. I do not quite see why they are quoted at such length here, but perhaps it is because they are so clever. It is because they are so clever that I like to read them—when I am up to it. One needs to be bright and alert.

You start off like this:

By John T. King
Morning Profound's Special Paris Correspondent
Copyright 1925 by the Profound Publishing Company.
Special Cable to the *Morning Profound.*

(By this time—unless I am watchful—I have decided already that what the statesman is going to say must be very, very importantly right.)

PARIS—Premier Herraux in the Chamber of Deputies this afternoon contented himself with reiterating that France will not disavow her debts, but will loyally honor her signature.

At the same time he leaned halfway in support of Deputies This and That . . .

(Now this pair confounded me but a few days ago with arguments which—I hope they will forgive me—seemed a bit thick; but from long practice I am now not without some small degree of cleverness myself, and I think they were saying, "No.")

The formal announcement on the debt question follows in full:

So the dispatch continues. And do you know, it is the most curious thing—almost always the statesman completes his remarks on page one. They say genius is an infinite capacity for detail and I have often wondered if great European statesmen, weighed down by so many cares as they are, possibly could have given attention to such a small matter as how many words they can say and still remain on our page one over here. I am sure that it would annoy me so to have to hunt up the rest of it on page seventeen that I never would follo through my little game trying to see whether I c read one of their statemen and remain strong-willed the end, not agreeing wi *everything* they say.

It had not occurred me that this little intern tional game of mine h any practical application u til the figure $41.49 struggled through my Subconscious today.

"Why, of course," I said—and wro

"Here, Now.

"O. U. Dun, Esq.
Sanitary Engineer,
Here.
"Dear Mr. Dun,—

"I am confronted with the questi of the debts we owe, one to anoth in our village. I may not, with safet go into as long a discussion of t question as I would wish, because am not unaware of the fact that it one of no little sensitivity. Even we I to remark upon the most obvious facts, that this is a question whi should have a moral, as well as arit metical consideration, I would do not without apprehension lest ev this discussion upon a high and el vated plane be interpreted in a mo regrettable manner by yourself, t coal dealer, and the milkman.

"I can only repeat to you that have no intention of disavowing o debts, one to another. Not so long I live in this village will I disavow single one of them.

"Since you cannot now fail to und stand my position thoroughly let proceed to a discussion of the econom interdependence of all of us. Witho doubt you will have no difficulty following me when I say that t question of indebtedness cannot dissociated from the question of t

damages due from our careless, pro ertyless, and insuranceless fell citizen, Smithers, who crashed my c the other day. Nor can it be d sociated from the question of t sixty dollars owing to me from a mag zine now, I fear, expiring. You w no doubt understand (Concluded on page

EDITORIALS

William Jennings Bryan

AFTER the following editorial was on the press, the startling news came of Mr. Bryan's sudden death. In the midst of his multiplied labors, at the beginning of a campaign that promised to enlist all his brilliant energies, he died in his sleep. No small part of the surprise is due to the fact that he was comparatively young, as ages go these days—he was 65. Since that July day in 1896 when his eloquence overturned a convention and made him a Presidential nominee, he has been a constant public figure. For 28 years there has not been a single period when he was not to be reckoned with. He has been more praised and more blamed than any American political figure of his time. But the consensus of opinion has been that his influence was always strongly on the side of what is most wholesome and most protective of the people's character and welfare. He was undoubtedly of the race of prophets.

A more extended review of the man and his career will appear next week.

The Scopes Case

THE narrow liberals and the superficial fundamentalists have tumulted and shouted, and Dayton, Tennessee, resumes its placid life among the hills. Mr. Mencken was there, exploring at first-hand what he has long designated as "the Bible belt," and excoriating as "hill billies" and morons the most American stock in America. Mr. Haldeman-Julius also was there, fresh upon his publication of a list of "nuts" which included the name of Christ. The Reverend Francis Potter, who is soon to go to Antioch College, was there, fresh upon the Jewish press heralding him as a preëminent liberal because he proclaimed that Christianity was very rapidly changing into Judaism, which he seems to approve. Mr. Michelson was there and most of us in this part of the world read the trial through his eyes. Mr. Sam Hellman, who uses an alleged humorous article in the Sunday supplements to disseminate propaganda, joined the chorus and informed a gaping world that the Bible says the earth is flat! Mr. Lippmann wrote a poem deriding a certain distinguished American's reverence for the Bible. And behind it all was the organization which calls itself the American Civil Liberties Union, whose trail was frequently crossed in the investigations which this paper conducted on The Jewish Question. Mr. Darrow, late counsel for Loeb and Leopold, headed the defense. The defendant was a young teacher in his twenties who admits he knows nothing of Evolution beyond the textbooks. The plaintiff was the State of Tennessee. The issue was the teacher's innocence or guilt of the charge of instructing the youth under his care that mankind descended from lower animals, a form of teaching which is prohibited by the law of Tennessee. The teacher, having violated the law, was found guilty.

The principal result of the case to date is to warn the states what may be expected from New York if, in their own way, they take measures to conserve what they feel to be a valuable heritage of thought. Tennessee has been dragged around before the nation just as Georgia was in the Frank case, and by the same powers—this time, however, with respectable assistance.

The young teacher soon lost his importance in the duel between Darrow and Bryan. The Bible could have had a more learned defender and Evolution a better informed representative. On that side of the matter, the result of the trial is nil. But with this true, Darrow came off second best. He was not so successful a judge tamer as he has been in other trials. His vulgar objections to prayer in court, his sneer at Bryan's "fool religion," his lack of self-control when his tactics failed to overawe the judge, all of these showed him in a light which will enable America more accurately to estimate him. His selection as chief counsel was felt to be unfortunate by many friendly to his cause. And yet it illustrated what Tennessee means when it says that a certain kind of attitude toward science begets a certain antagonistic attitude toward religion.

The main questions are, Is the theory of Evolution destructive of religion, and so of morality? Has a sovereign State the right and power to regulate the curricula of its schools?

As to the first, the people of Tennessee, in common with Americans elsewhere, are not altogether unjustified in their feeling that some men calling themselves scientists and evolutionists have injected an anti-religious or an anti-Biblical emphasis into their work. They have prostituted science and especially Evolution as a weapon with which to attack religion. Of this, there can be no question. The attitude is not inherent in science, certainly it is not involved in the theory of

Evolution, but both general science and special theory have been utilized to give dignity and authority to an anti-Christian propaganda. There is no doubt about that. The expert in Evolution knows that the science of the subject is not what self-styled propagandists say it is. Science declares that "man has not descended from any known monkey or ape, fossil or recent" and that "man has a long independent, superior line of ascent of his own." These are the statements of Henry Fairfield Osborn, research professor of Zoölogy at Columbia University and president of the American Museum of Natural History.

To protect what they felt to be more important to the present life of human beings than any theory of his origin can be, the Tennesseans had two courses open to them. One, which properly belongs to the scientists, of cleaning out the pseudo-scientists who misuse neutral natural facts as propagandic weapons against religion, thus distinguishing between the true and false scientific spirit; and the other, to prevent the teaching of all modern scientific theories until the anti-religious bias observable in some of the methods of presentation had been removed. Tennessee chose the latter method. Schools belong to the people. They cannot be taken from the people. After seeing all their traditions driven from the schools at the behest of "liberals" until even the Bible was banished, the people have simply turned. They saw one theory of the origin of man driven out of the schools because it was "religion" to teach it. They have seen another theory of the origin of man introduced into the schools by men who are frankly irreligious—and the people drew their own conclusions. It was to be expected. The people of Tennessee have as much right to say what shall go into Tennessee schools as the American Civil Liberties Union has—maybe more. The League is not known to have defended one of the many teachers who have been flung out of employment because they could not conscientiously teach what they felt to be an unproved or unsatisfactorily stated or dishonestly emphasized theory of Evolution. No record of such defense can be found.

Whether Tennessee took the wisest course, we do not undertake to say. But it is an understandable course. These "hill billies" (as Mencken calls them) are not despicable because in the words of their Governor they would rather dispense with their schools than with their Bible. Their preference for the Bible is not a mark of ignorance. The Bible is not antagonistic to education. It is only in Bible countries that there exist the conditions which make modern education possible. Being the mother of education, the Bible promises to exercise a potent veto when education departs from its proper functions.

The Dayton incident calls for a revival of frankness in this country. The clergy can no more ignore a natural fact than the scientist can ignore a moral or spiritual fact. Religion must be honest in its distinction between faith and factual knowledge, and science must be honest in its distinction between fact and speculation. Truth is one, and is never destructive of itself. The church has failed in its duty of instruction, and the scientists have failed in their duty of instruction. As a result an uninstructed people, as much misinformed of the claims of religion as they are of the claims of science, are tossed about between the two, and get their education chiefly from the biased reports of the newspapers.

What probably will result is a fresh determination on the part of the intelligent masses to dig into the questions for themselves. It should be a period of great usefulness for the man who can explain the contents of the Bible as a book, for the man who can explain the basis of religion as an experience, and for the man who can explain the knowledge which has been gained concerning man's tenure on the earth.

The Ancient Reservoir of Oil

EVERY American farmer who moved his home nearer town by the use of gasoline, and every city man who was enabled to flee from dust and dirt to the quiet of a suburban home, has played his small part in putting Bagdad again on the international map. Since 1914 we have multiplied our annual production of motor cars more than six times.

The world thirst for oil and more oil rendered the land around the site of ancient Babylon a great pawn at the peace table—and it has been a world pawn ever since, because it is supposed to be the next great oil field.

Rhodes, if the tale is true, started a war; but the Yankee-behind-the-steering-wheel has had a better influence. "The Mesopotamia question" has not been settled by military aircraft and tank squads, but by a commercial agreement in which four national groups of oil companies participate.

Six weeks from Iowa, where there is a car for every family; two thousand miles from India, last outpost of European civilization; five hundred miles up the mighty Tigris, which is three feet six inches deep in low water season; in the Kingdom of Irak, geological surveyors this summer are deciding what oil territory shall be opened, and how. Engineers are dreaming of pipe lines to the Persian Gulf and of tanker transport to oil-burning vessels and thirsty carburetors.

Strange things indeed will be happening shortly in the "Cradle of Civilization."

MR. FORD'S PAGE

IS IT better for a man to take employment with another, or go into business for himself? The question is legitimate when asked in full knowledge of two facts: that there are more doors into private business today than ever before, and that employment has come to compete with private business as a career for any man

But when it is asked in a manner which suggests that opportunity to go into private business grows less and less and that employment as a career becomes more and more undesirable, it is a deceitful question.

Men are constantly passing from one of these fields into the other. In any large business may be found men who have been in business for themselves and have given it up. There may also be found men who hope one day to give up employment and set up for themselves.

The motives of those who leave business for employment is various. Some found themselves unable to bear the strain. They were fitted to serve, but not also to direct the services of others, or even adapt their own service to the changing needs of the time. So they took employment where they could serve under direction, certain of an income, and free to cultivate the other interests of their minds.

Others accepted employment because they saw in extensive modern business the widest and most inviting arena for their powers. What would take them a lifetime to build, they found ready at hand, built by another, and needing their service. Opportunity which only the utmost effort could secure, they found already secured by the efforts of others.

That is the appeal of modern business to the young man; he can begin with an organization whose crude experimental days are over and that stands able to do the thing it was organized to do, and greater things, because increased experience leads to greater and more successful experiment.

All the tools, all the brains, all the experience, all the money and means necessary to the development of his idea, are at the disposal of the young man who has an idea, when he enters a modern business concern.

In private business one enters an atmosphere of competition, whereas in large employment one enters an atmosphere of coöperation. A great modern industry progresses by the unified thought and energy of many men. Theirs is a coöperation not based on emotional agreement nor personal preference, but on common interest in the job to be done. The Work is their center. Men of many minds and tempers are all one in respect of the Work. So that in large employment it is possible to devote one's energies more unreservedly to one's chosen Work than if one were compelled to divide one's energies among the various demands of private business.

And the opportunities to acquire position and a competence are greater in employment than in private business, because there are more places to be filled, and the rewards are larger. Salaries in this country are greater than profits. Those who feel that business is jealous of the employe's progress are behind the times. Business can only live as it develops within its corps of employes the talent and the force which will carry the business along. Business lives by the vigor and brains of the men it produces. And every big business needs more and bigger men than many, many small businesses could possibly need. With this larger need comes larger opportunity.

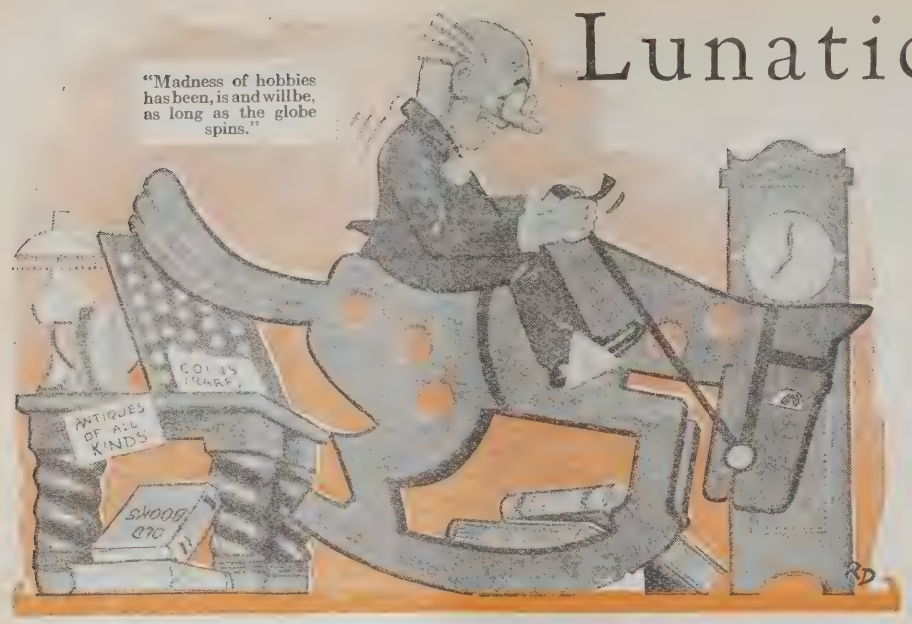
Thus we account for the fact that employment has become a competitor with private business for the favor of ambitious young men. Independence and opportunity are no longer to be found in only one of these lines, but are possible and plentiful in both, and mostly in employment.

Of course, no advice is offered here. The best procedure is to get the facts and make up one's own mind. Personal inclination has much to do in these matters. Being in business for oneself often makes a man a better employe. Being an employe of an up-to-date industrial concern, often makes a man a better manager of his own private business. Experience either way or both ways does not come amiss.

The principal interest of the pages which have been given to the discussion of this matter is that young men may see how wide the field is, how free their decision may be, and how utterly false it is that they have no choice in these matters. Moreover, it is good to know that of the two possible paths, both hold out the same promise of a good success.

There is no room for any plaint that life is narrowing. Opportunity in every direction, except wrong directions, is increasing.

EMPLOYMENT has become a competitor with private business as a career, because it offers creative opportunity and more places of usefulness, influence and reward. In private business the atmosphere is largely petty competition; in large employment it is broad coöperation. The fact that, with the avenues into private business wide open and inviting, so many ambitious and well-prepared young men seek their career in employment, is evidence of the certainty and satisfactory character of such career to men who could just as well have chosen the other course.



Lunatics, by One of Them

Showing How Collectors May Have Much Method Beneath Their Madness

By WILLIAM C. RICHARDS

LUNACY is striding down the highways—has been, is and will be striding as long as the globe spins. It is the madness of hobbies.

But—

Was Arthur Hind, of Utica, New York, addle-brained a few years ago when he bought for 5,000 English pounds (about $25,000 in American money) a twopenny stamp issued in British Guiana in 1850?

Was J. Pierpont Morgan giddy to keep his rare old liquors in two cellars, one for the reds and another for the whites, and issue a catalog distinguishing the various opulent vintages?

Why did the same Morgan, surfeited with thrills, thrill afresh one day when he found on the back of a picture of a woman and a baby for which he had paid a paltry sum, a memorandum in the handwriting of Napoleon III, saying that the picture was one of his mother and him, taken when the emperor was but an infant?

Why did James F. Ballard, of St. Louis, donor of $500,000 in oriental rugs to the Metropolitan Museum in New York, dare the perils of the war-ridden East, rioting at the Bosphorus and imprisonment in Thrace, just for a rug of Smyrna, but a rug woven as man has no time to weave in this day's hurly-burly and patterned in the glory of rainbows?

On Henry Ford's estate is the strangest of stables where are represented the varied vehicles which have carried man about in his work and pleasure and his courting in times long buried.

Is David R. Clark, nationally known psychiatrist, "queer" because he collects street-car transfers?

Some editor, stranger to the comforting horizons which spread out before the hobby-riders, might cynically head this article, "Lunatics—By One of Them," but he would need be a man who had never looked upon the lush panorama of some enriching fanaticism. He could not be a brother of the doubting editor to whom I was speaking of Ballard, oracle of rugs—the Ballard to whose eyes the weavings that came up from west of Suez are captivating archives of symbolism, tradition, folklore, religion and fray.

"What is golf?" I argued with this editor. "Nothing but a hobby, no matter how you dress it. Analyzed, it consists of walking tiresome miles after a small ball around a bunkered lot. If some people didn't have the film bias, do you think any newspaper under the sun would print the wanton, interminable gush which they do about the personal lives and preferences and eccentricities of actresses, some of whom are nothing but lucky vulgarians who don't know the meaning of the words their able publicity men put upon their tongues."

"Never had a hobby, not even when a boy," said the editor. He prided himself, we sensed, on what he considered this white mark in his character.

"What do you think is the most fattening food in the world?" we shot at him.

He was so literal. "Proteids—"

"A dye manufacturer in New York weighed 146 pounds ten years ago," we interrupted. "Today he weighs 210 pounds. Ten years ago a nerve specialist told him to play golf if he didn't want his heart to stop beating."

"You don't catch me chasing a ball around aristocratic meadows. I'm too busy," his patient said.

"Beetles, then," suggested the doctor.

"Don't be silly!"

"How about postage stamps?" the doctor persisted.

"You're crazy," said the dye manufacturer, "and if I collected stamps my friends would think I was.

"You don't think Colonel Green i crazy, do you?" asked the specialis naming the son of Hetty Green. "H saves postage stamps."

"I don't believe you."

"All right," said the doctor, "yo see him."

The sick man found Green fingerin some stamps on his desk in the Ne York financial district.

"It's true, then," exclaimed th neurotic caller, "you DO colle stamps!"

"Certainly I do, and I would hav lost my reason from worry some tim ago if I hadn't. These are from London dealer. He wants 80 pound for the lot, but I regard the price a too stiff."

The dye man walked into a stam dealer's office a half-hour later an asked for $200 worth of stamps. H didn't care what they were. The deale laughed and shook his head.

"I'll give you $10 worth, som stickers and a book to paste them i They'll keep you sufficiently busy," h compromised.

The manufacturer took home thes concomitants of philately and slun into his library. While he was shame facedly pasting stamps into the albun his wife came in.

"Alfred," she fluttered, "what AR you doing? DON'T let these worrie unsettle you. Now, you come on ou and we'll play a few hands of cards."

Alfred did no such thing. He kep pasting his stamps in that book- moistening the stickers, pasting; mois ening the stickers, pasting. Two hou later he couldn't keep his eyes ope Without bothering to undress, h threw himself on a lounge and wen to sleep. He didn't wake until 7 a. m when his wife, thoroughly alarme shook him into consciousness. H hadn't slept like that in months. started this collector on a world-wid quest that has made his name familia in every continental bourse whe stamps are auctioned.

Recently in Victoria, British Colun bia, a remarkable find in stamps wa made. It was a fine unused pair of th 12-pence black stamp of Canada issue in 1851. Some 51,000 copies of th stamp were printed but only 1,51 were delivered and sold by postmaster

The remainder was destroyed. Only one unused pair had hitherto been found. This was in the collection of Count de la Renotiere Ferrari. Ferrari left his collection to the Berlin museum in his will, but he happened to die in Paris during the war and his collection was seized by the French Government as enemy property and is now being dispersed. So far, it has netted 19,000,000 francs. The dye manufacturer, I am reliably informed, paid $4,000 for the pair of 12-pence Canadians found in Victoria.

"Very interesting," yawned my friend, the editor.

"The King of England obtained one of his greatest rarities when an old collector found a beautiful copy of the twopenny post paid Mauritius of 1847 in his forgotten stamp collection of his boyhood. King George bought it for $7,250. King Ahmed Faud, of Egypt, specializes in issues of the Confederate States, and Prince Hohenlohe, of Austria, has one of the finest collections of Chilean postage in the world.

"In Demerara, British Guiana, a woman several years ago found a pair of the rare British Guiana two-cent stamps. She gave them to her vicar to sell for the benefit of his church. They passed through several hands and were finally bought by Arthur Hind for $15,000."

Several rooms filled with letters and records not touched in years were cleaned out in 1901 from the Girard National Bank in Philadelphia. This bank is the successor of the first bank of the United States and still occupies the same premises and building where it has stood since 1793. The contents of the rooms were sold to a junk dealer.

Joseph Wayne, Jr., a stamp collector, is president of the institution, but at that time he had been with the bank only two years. He happened to pick up several envelopes that had been dropped when the junk dealer was carrying them downstairs to his wagon. They were sold to a New York dealer for $500 and consisted of New York 5's and the 5-cent and 10-cent United States stamps of 1847, now the most eagerly sought stamps in this country.

Wayne hurried to the junk dealer, but the entire remainder had been ground to pulp. He never has ceased to mourn the possibilities in postage and autographs which were thus destroyed, for in the archives were communications from all the presidents, from George Washington on through the Civil War, as well as from Benjamin Franklin, Robert Morris, and other Revolutionary characters interested in the nation's finances. If the lot were sold today, it very probably would pay for the whole bank, including the ground on which it stands.

Magnificent unused copies of the one-penny and two-pence "post office" Mauritius stamps acquired by Henry Duveen. In 1921, a superb Mauritius realized the choice price of £1,500.

"One more stamp story and I'll let you off," I pleaded with the editor.

Blocks of four of the 24-cent United States stamps of the issue of 1869 are virtually unobtainable in unused condition. A Detroit man has been friendly with many postmasters-general. Several years ago he went to Washington and visited the post office department. He was warmly greeted and was asked what could be done to entertain him.

"I'd like to see the private archives," he said.

An attendant acted as guide with instructions to show the Detroiter anything he cared to see.

In their travels they came to a drawer marked "Twenty-four Cent—1869—Nine Copies." In the drawer was a block of four and five single copies of the stamp, all unused.

"Did you see anything down there you liked?" asked the cabinet official when his guest returned to the office.

"Nothing but a block of four of the 24-cent '69's for which I'd about give my life."

The postmaster laughed and shook his head.

"Sorry, my friend, but it's government property, you know, and—"

"Say," wheedled the visitor, "on that box it reads nine copies. It says nothing about a block of four. If I got you four perfect single copies with gum intact, wouldn't it be ethical for you to give me the block of four in exchange for them?"

The postmaster-general considered the idea and said he guessed there would be no objection to that. My friend began a hunt that spanned the Atlantic. It was only after a six months' search that he gathered in the four copies. One came from Paris, another from London, a New York dealer contributed a third, and the collector himself had a single copy in his own collection. Now he owns the coveted block of four and he has a standing offer of $1,200 for it from an English dealer."

The editor interrupted me to ask:

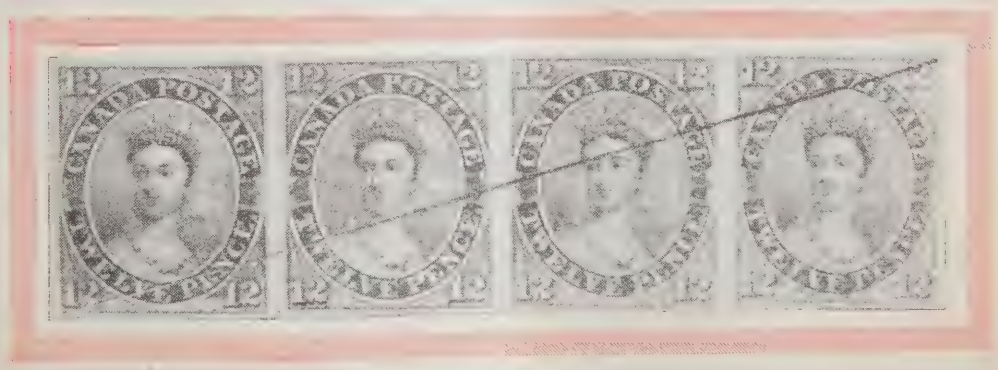
"But why do men collect things? Why this mouth-watering, this torment of Tantalus; this nut stuff, if you'll forgive me—or if you won't forgive me?"

When he said "nut stuff" the blow landed upon the heads of king and beggar alike, for hypnotism dwelt in the rich velvety background of the mezzotint for the last emperor of the Russians. Each day the rare copies in the collection of Nicholas of the Romanoffs were aired by a custodian and replaced, like tender babes, in their preserving and protecting tissues. Despite the fact that there are no especial rareties among the issues, what men of meager means have collected postal cards since that day in 1865 when Heinrich von Stephen proposed to the postal union this particular service?

Is the collector of armor a shallow-minded fellow or is he a meek visionary, seeing himself bold with shining cuirass and lance faring forth to tilt in the mail that is about him?

The blow fell upon the pates of the connoisseurs of old vineyards, those who know that no magnum of claret ever equaled that of 1875 and no port compares with the bottling of '34. Chests from Syria, enamels of Thibet, a letter of Bonaparte's, snuffboxes and ceramics and amber—why argue with a man cold to the magic of such names, one who at the mention of Nazareth, perhaps, sees not the obscure carpenter shop but only the stained-glass window presented to the church in memory of the rich manufacturer of hides.

Values meant nothing. I told him of Narcissus Luttrell, collector and bibliophile, who lived in a little English town. He died in 1732 but he had a habit of marking in each book he purchased the price paid for it. For George Chapman's "Shadows of Night," for instance, he paid threepence; February 6, of this year, it went in London for 270 pounds. He bought Gale's "Pyramus and Thisbe" for twopence. It sold recently for 617 pounds. Sir John Day, another Briton, had a leaning for the paintings of the Barbizon school, the works of Diaz and Mauve and Maria, and his family at Sir John's death reaped a tidy harvest by their sale.



12-pence Canadians, strip of four.

The Christian Sunday—Is It Passing?

First Day of Week a Day of Rest in Some Countries, of Unrest in Others

By WAYNE WOMER

MANY ancient nations observed a seven-day period of time. This was true of Egypt, Babylon, Assyria, the natives of ancient Peru, the Hawaiian Islands, and the Island of Borneo. Greece adopted a seven-day calendar shortly before the Christian Era, and at a much later period the Mohammedans introduced it.

It remained, however, for the nation of Israel to have a Sabbath, that is, a day in seven set apart for rest and worship, which day followed six days of labor, and closed the week.

If the Sabbath did not originate with Israel, it did, with them, acquire distinguishing features of a very distinct kind that marked it for adoption by the more intelligent nations of the world.

The old Sabbath of Israel was very different from the Rabbinical Sabbath. Jesus kept the former and condemned the latter, and by so doing came into conflict with the religionists of his day. The original Sabbath was a day of freedom; the Rabbinical Sabbath became a day of restraint. Jesus reëstablished the early principle in His saying—"The Sabbath was made for man, and not man for the Sabbath."

The early Christians observed the first day of the week as the Lord's Day, commonly called Sunday, in commemoration of His resurrection. As Christianity spread, the first day supplanted the seventh day in general observance. The Lord's resurrection was the event that it commemorated. This weekly celebration would have been impossible among any other people that did not already keep sacred the weekly division of time.

At first the Christian Jew kept both the Sunday and the Sabbath. The apostle Paul, at the beginning of Gentile Christianity, very distinctly laid down that the Jewish Sabbath law was not binding upon Christians. The Apostles' writings have made it clear that the Christian Sunday should be observed as a memorial feast of the creation as well as the resurrection of Jesus

Constantine Encourages Agriculture

Sunday, as a day of rest, was not generally possible until Christianity received civil recognition. This recognition was given on March 7, A. D. 321, by Constantine, the Roman Emperor: "Let all judges, inhabitants of the cities, and artificers, rest on the venerable day of the Sun, but husbandmen may freely and at their pleasure apply to the business of agriculture, since it often happens that the sowing of grain and planting of vines cannot be so advantageously performed upon any other day, lest by neglecting the opportunity they should lose the benefits which the Divine bounty bestows upon us."

The charge is often made that Constantine established by edict the first day of the week as the Christian Sunday. Constantine's edict simply sanctioned a custom that already existed and had been growing for more than three hundred years.

A few excerpts from the early church fathers who bridge the gap from the Apostolic Era until the date of Constantine's edict will prove this fact.

Ignatius, A. D. 101, an immediate friend of the Apostles, martyred at Rome about fifteen years after the death of John, said: "Those who were brought up in the ancient order of things have come to the possession of a new hope, no longer observing the Sabbath, but living in the observing of the Lord's Day, on which also our life has sprung by him and by his death."

The epistle of Barnabas about A. D. 115, says: "We keep the eighth day with joyfulness, the day on which Jesus rose from the dead."

Justin Martyr, A. D. 140, said: "And on the day called Sunday, all who live in the cities or country gather together in one place, etc."

The First Law Establishing the Sunday

Dionysius, Bishop of Corinth, A. D. 170, said: "We passed the holy Lord's Day."

Irenisus, A. D. 170, stated: "It is right with respect to the feast of the resurrection that we should celebrate it upon the first day of the week."

These, and numerous others, all witness that a general observation of the first day of the week as the Lord's Day, commonly called Sunday, was well-established when Constantine's edict was passed A. D. 321. This was the first law passed by any emperor, Congress, Convention, Parliament, or assembly, giving the Sunday civil protection. During succeeding centuries it has been written in the charter of kings, stamped with the royal seal of the world's greatest emperors, and drafted in the constitutions of the mightiest nations. And the laws which uphold Sunday have been upheld by the highest courts of all civilized lands.

Well may we ask regarding such an institution, so ancient and honorable, declared to be one of the Creator's greatest gift to man—What has entered the heart of the world that it should have grown weary of this sacred institution which liberates the toiling millions and sends them forth into God's great outdoors, to their families and loved ones, and gives them leisure for their higher concerns and to worship God according to the dictates of their conscience?

Europe and the Day of Unrest

For, certainly something very serious has occurred. The Bishops of a great church, who reside in the five continents and the islands of the sea, recently focused the eyes of the world upon the fact of Sunday desecration in these words: "But let us not forget that among those who are helping to undermine this Holy Day are members of the Christian Churches. . . . They have come to think of their careful observance of Sunday as antiquated and puritanical, and little by little their standards of reverence and consistency have been lowered. The patriot sees national waste and disintegration in the growth of Sunday desecration. The laboring man sees a threat to himself and family in the steady encroachment of Sunday work upon his day of leisure and rest. But no element has such actual reasons for alarm as the Christian Church. A blow at Sunday is a blow at the church, and a blow at the church is a blow at the Christian Civilization of which the Holy Day is the chief cornerstone."

In Continental Europe Sunday standards are much lower than those of America. The words "Continental Sunday" have long been a byword to express low Sunday ideals. Italy, Spain, France and Belgium try, in a measure, to regulate labor on Sunday. But in those and other Continental countries, the same content cannot be read into the word "Sunday," that we Americans put into it, because it means nothing more or less than a holiday.

It has been impossible to get definite information regarding the present status of Sunday in Russia, but it would be absurd to expect much Sunday observance in a land whose government has dealt with Christianity itself as an enemy and a crime.

Germany has lost much by the war and apparently her Sunday along with other things. Before the war she had many laws protecting Sunday. The late Dr. Wilbur F. Crafts reported in 1914 that 57 per cent of German factories *were operating seven days a week*, and 77 per cent of her commerce and transportation was carried on without regard for Sunday. Today Germany has no Sunday laws. Transportation is increased and while her factories are closed, her theaters, motion pictures, commercialized sports and

other amusements all flourish. Her churches are poorly attended.

Switzerland, Holland and Norway all have Sunday laws. Some are being revised, and some are only partially enforced. Manufacturing plants are generally closed. Holland has no Saturday half-holiday; 5:00 o'clock p. m. is closing time on Saturday in Switzerland. Government licenses call for fifty-two hours of work a week. The length of the laborer's hours are undetermined. Norway has a half-holiday on Saturday. In Holland and Switzerland the theaters and motion pictures are open. In Norway they are opened only after 5:00 p. m. Both Holland and Switzerland report decreased church attendance. The churches of Norway are well attended.

The other group of European countries to be considered is Ireland and Great Britain. Today there are two Irelands. The Free State has its Continental Sunday, but not so in the North of Ireland. Here, no intoxicating drink is permitted to be sold, manufacturing plants are closed, transportation is lessened; motion pictures are not shown, theaters and shows are all closed. Churches are well attended. North Ireland's Sunday is as well observed as that of any country in the world.

England and Wales both have Sunday laws on the statute books, but there is an ever-increasing tendency to lax enforcement. In Wales, the public houses are closed on Sunday; not so in England. Factories are closed, transportation is lessened in certain sections. Motion pictures are closed by law, but some municipalities have been granted licenses to open upon Sunday when part of the proceeds are given to charity. Churches are not so well attended as they were a few years ago. Sunday is less carefully observed than formerly. The economic, moral and religious life of the people is less satisfactory.

In Canada Sunday Is at Its Best

As to Scotland, Sir Harry Lauder's recent witticism is not applicable to Scotland insofar as it touches the individual Scotsman's attitude toward Sunday observance. When asked what a Scotsman was, Sir Harry replied: "A Scotsman is a man who keeps the Sabbath and everything else he can lay his hands on." We find Ramsay MacDonald, late premier of Great Britain, saying: "I would like to see a state of society where every man and every woman preferred the old Scottish Sabbath to the modern French one. In that state of society you would have a fine, solid, eternal foundation of character and self-command upon which to build up your churches and your state." Our survey in Scotland shows transportation rigidly limited; Sunday excursions greatly increased; manufacturing closed; theaters generally closed; motion pictures, when open, are under the auspices of some charity. The drink trade is closed; church attendance is decidedly less than twenty years ago. About 60 per cent of the children attend Sunday School. The weakening of Sunday observance has almost certainly helped to lower the general spiritual tone of the nation. Reports from all the countries, except one, definitely state that the effect of the World War upon Sunday observance was decidedly injurious.

Most people are familiar with the old saying that "Beauty is only skin deep," but comparatively few realize how true this statement is at the present day. "Beauty doctors," however, can give much enlightenment on this matter. A writer for THE DEARBORN INDEPENDENT has interviewed a number of these experts and gained much information as to their methods. The result will appear in an article next week.

There are three other parts of the world to be considered: Canada, where Sunday is at its best; South America, where Sunday is at its worst; and the Orient, where there is no Sunday.

South America Not a Good Example

Canada has splendid Sunday laws. The old English acts under Charles I and II are in force, and in addition the act of Canada in 1906, and the Upper Canada act that antedated Confederation. Some cities and towns have by-laws with reference to refreshment booths and stores other than restaurants. Canada's half-holiday on Saturday is general. This is a great aid to Sunday observance. All manufacturing plants are closed; public work, except in rare cases, is never done. The eight-hour day is dominion-wide. Transportation is lessened, local passenger and freight trains being discontinued; through freight trains may continue to destination, if en route when Sunday begins. No excursions, except in Manitoba and Quebec in a restricted way, are allowed; theaters, motion pictures, and shows are all closed except in Quebec. Baseball, automobile races, football, and commercialized sports are forbidden, except in Quebec and British Columbia. Fairs and carnivals are closed, also the stores. Church attendance is well sustained. There is, however, a deep undercurrent for a Continental Sunday (the desire to make it a holiday) rather than against industrial activity.

Most countries in South America have a nominal rest-day law, but not necessarily Sunday. Manufacturing plants are closed, only in compliance with this law, and the demand of the labor unions. Half-holidays on Saturday prevail only in the advanced republics, in the larger cities, and in some lines of business. There are thirty-five holidays in the year apart from Sundays. Transportation is greatly increased, especially excursions; all sports, shows, amusements, motion pictures, and so on, are wider open this day than any other. Regarding the church, the entire forenoon is given up to sleep, except by the few devout who attend church services. The afternoons and evenings are exceedingly lively and gay. There is a general indifference to religion. Protestants and Catholics alike treat Sunday as a holiday, which means a Continental Sunday in full swing, which has been the practice for over four hundred years. To the question "What has been the effect upon the moral and religious life of the people?" Bishop W. F. Oldham, of Buenos Aires, answers: "Little thoughtfulness, full chance to cultivate the world, the flesh and the devil."

Orient the Land of No Sunday

The Orient is the land of no Sunday, with the exception of Japan and China. When Japan took over our western civilization, she took over our Sunday as one of her holidays. It was after Commodore Perry made his memorable appearance that Japan sent an embassy to the Christian nations to find out wherein they had advanced farther than Japan.

The commission reported that they had found two things: a book called "The Book," or the Bible, and a day called Sunday. The Government decreed that all governmental offices be closed on Sunday, and that the Bible be admitted into the empire. It requires more than that to make a Christian Sunday, however. China followed, under her Queen Dowager. Government officials and workingmen, under the government, were to rest one day in seven. Stores where Americans trade are closed Sunday forenoons, but both in China and Japan working hours are long, and there is no other evidence of one day of rest in seven.

Buddhism in India observes the fifth or the eighth day, while the Mohammedans are supposed to keep Friday. Few respond to prayers; after the heated noon hours the stores are open. In the non-Christian world there are hundreds of millions of people who have no Sunday, nor any other day of rest. Every day dawns for them the same; the only people in the great Orient who have a Sunday are those who have been enlightened and emancipated by Christian teaching.

How appropriate are the words of James Russell Lowell:

"There is not a place on this planet ten miles square where a decent man can live in decency, comfort and security; not a place where age is reverenced, infancy respected, manhood respected, and womanhood honored, and human life held in high regard; there is not a place on the globe ten miles square of such description, except our religion has made it so!"

Romantic Rascals

Gonzales Gomez de Espinosa

(Eighth of the Series)

By CHARLES J. FINGER

WOOD BLOCKS CUT BY PAUL HONORÉ

(Copyright, 1925, by Charles J. Finger)

THE unidentified Alva, who kept a log of Magellan's cruise, mentions three islands in the Straits of Magellan near which the four ships found anchorage. They are certainly Isla Isabel, Isla Martha and Isla Magdalena, the largest being the first named, and when I traced Magellan's course I stayed there for awhile, trying to find things, an old helmet, or a sword, or something of the kind. One day a man came sailing there in a little boat, a wiry kind of man with the bloodshot eyes of a confirmed drinker, and, as human company was rare enough, he readily accepted my proposal to stay there for a day. So we fished and talked, and confidences gave way to confidences, and presently it came out that his name was Espinosa and that he had been interested in Magellan for years. Certainly he had many facts at his fingers' ends. But he did not become really affable until we caught a strange fish, a creature all head and teeth, a wicked snapping and ugly thing. Why that should have established a basis for confidences I do not know, but it was so. Then I found that he believed quite sincerely that he was a direct descendant of a certain Espinosa, alguacil, or constable, as we would say, on board Magellan's ship the *Victoria*. But the really extraordinary thing was the theory he advanced, which was that the constable was a rascal who plotted a tremendous adventure when he had once started, aimed indeed to be admiral and be the first circumnavigator, and only failed because he was an egotistical weakling when the real test came. And certainly, when things are pieced together in the light of the theory, what seemed to be parts of an inexplicable riddle, fall into place easily, and Espinosa of Seville stands forth as a most romantic rascal even if an exceptionally ignorant one.

* * *

The original Espinosa, my visitor's ancestor, Espinosa the alguacil, lived in the days of Charles the Fifth of Spain, and the turning point in his career came in the year 1519. He was a square-built, bull-necked fellow of occasional turbulent instincts, though generally he went about with a preoccupied air as one weighing heavy matters judicially. That attitude was partly due to his silly pride, for he was proud of his petty authority, proud of the badge and sword he wore, proud because in the market place he was the center of interest among the simple peasants, and especially proud because he was regarded with cringing fear by those with uneasy consciences.

Then one day all that pride vanished and left him flattened, wilted. For one morning he suffered the unbearable humiliation of being utterly disregarded. In the market place not a hand was lifted in recognition of his presence, not a word was spoken in greeting and even the rascally Carvalho, a sailor man under suspicion, a pirate kind of fellow who had sailed with Pinzon, rushed past him and pretended deafness and absent-mindedness. And all that neglect was because of a counter attraction, because of a crowd of laughing and blustering men passing down the street, cavaliers and sailors with guns and swords, in silks and velvets, and some in common clothes, on their way to the five ships that lay in the river.

So Espinosa took himself to the stone wall that overlooked the muddy Guadalquivir and sat there, reflecting dismally. When he was at the lowest point of despair and bitterest in rumination, something happened. His chief, the captain of the port, passe at the head of a body of alguacils, an after them went water-side loafers water carriers, beggars, cavaliers, swine herds and Negroes, hidalgos and th rag-tag and bobtail rubbing shoulders So Espinosa got on his feet and followed and in time came to where the fiv ships were, one of them on her sid for cleaning. But the trouble wa almost ended when he reached th place, yet it was evident that th careened ship, the *S. Antonio*, was th center of attraction, for men swarme back and forth from shore to ship an ship to shore. By putting this an that together, things heard and seen Espinosa understood that a ma named Magellan, admiral of the littl fleet, had failed to fly the flag of Castile whereupon a mob in a sudden frenzy of patriotic indignation had gathered and the captain of the port had tried t arrest the Portuguese. But Matienz the Canon had interfered to preven mischief, though the port captain wa still raving his way through transports of outraged patriotism.

Then the eye of the captain of th port fell on Espinosa, and authority spoke. The official indicated th constable by a slow and majestic wave of the hand, there was a word of command, a new center of attraction, and Espinosa found himself detailed fo river service. It was done in a moment Until the fleet sailed, Espinosa o Seville, guardian of law and order i the market place, would have to stay with the fleet.

It was an easy and pleasant task that he had, with nothing much to do and there was interest in it too, fo strange things went into the hold —colored cloths in bales, strings o hawk bells, bags of glass beads, fis hooks, little mirrors, red cloth caps and all kinds of odd things. Nor did the constable's slow mind grasp the meaning of it all until Carvalho, the man with piratic reputation who had shipped with the fleet, told him tales so strange that Espinosa's eyes opened wide and soon he was full of dreams of far-off islands, and flower-crowned natives who would give a calabash of gold for a glass bead, and fountains of eternal youth, and gold-covered temples, and other imaginings as fantastic as the dreams of Alnaschar. The end of it all was that Espinosa became the first policeman to sail around the world.

for when the fleet sailed, on Wednesday, August the tenth of the year fifteen hundred and nineteen, he was one of the adventurers.

Storms, hardships, short rations, all these Espinosa and his shipmates knew before they crossed the Atlantic, then one day there were constabulatory duties to perform. It was when the captains of the fleet had met on board the flagship to consider the case of a sailor who had refused duty. That rebellion had touched high places, and especially the captain of the *S. Antonio*, Espinosa did not guess until he heard voices in dispute in the admiral's cabin as he stood on guard outside the door. Suddenly his name was called and he rushed in with men-at-arms to see Magellan standing with fists clenched, erect and threatening. Like a tiger the admiral sprang at the aristocrat, clutching him by the throat and forcing him against the wall while the other captains sat undecided. Then Magellan's voice came with a roar like a bull, ordering Espinosa to put Cartagena in chains, and an hour later it was known all over the fleet that there had been a quarrel and the new commander of the *S. Antonio* was Antonio de Coca.

Then, as Espinosa's descendant held, the alguacil had visions of greatness, dreaming that if captain after captain passed from office, the time must eventually arrive when he would attain supreme command. And the next captain fell soon after, when the spirit of revolt broke out in San Julian Bay, where the fleet wintered. The rebel captains captured four of the five ships and to one of them Espinosa was sent with five men, carrying a message ordering Mendoza to attend the flagship. Mendoza fell into a paroxysm of rage when he read the order, and at the gesture there arose in Espinosa one of his torrential outbreaks, perhaps born of his ambition. Quick as a cat springs he leaped at the rebel captain and planted his dagger in the mutineer's throat and a sword cut from one of his men finished the business. It was a terrible piece of work and Espinosa overstepped the bounds, yet it saved the situation for Magellan, for the sailors had no mind for revolt and seeing their captain fall, surrendered, and soon after the other ships were overcome.

A third captain fell from grace in the Straits, which were discovered on the evening of October the twenty-first, 1520, for the *S. Antonio* deserted and returned to Spain, and the little ship the *Santiago* was wrecked and left her bones on the Patagonian shore. So only three vessels sailed into the Pacific.

For ninety-eight days the three ships sailed west over the unknown ocean; days when there was maddening idleness, when sails hung motionless, when gaunt and hollow-eyed men stared over an empty ocean or sat listless with closed eyes because they knew every furrow and seam in the faces of their fellows, and every knot and plank in the ships' decks. They ate by ounces, and as they drank water, held their noses because of the stench of it. Starvation sailed with them, and to such a pass they came that men ate the leather from the rigging, ate rats, anything to stay the hunger pangs. At last there was the music of breakers beating on reefs, the screaming of land birds, the scent of tree-clad islands and for the first time Europeans set foot on the Philippine Islands on the sixteenth day of March, in the year 1521.

Quick as a cat springs he leaped at the rebel captain.

Then came the realization of Espinosa's wild dream. For because of the tiger in man there were disasters, and in a miserable squabble with natives, Magellan was killed. Other able captains lost their lives in stupid fights with natives, and at last, the pirate Carvalho with the ignorant Espinosa ruled the destinies of the fleet. The expedition that had set out to aid the noble science of map-making had come very close to a mere buccaneering outfit. Indeed there were acts of piracy, the capturing of trading junks and the holding of men and women for hostages or worse. By order of Carvalho, one of the three remaining ships, the *Concepcion*, was burned.

Luckily, Sebastian del Cano succeeded in wresting the command from Carvalho before things had gone too far, but Espinosa remained in command of the *Trinidad*, and, strong in the belief that he had a particular organizing ability, eventually found enough men to support his plan which involved the establishment of a trading station in the Moluccas, and the sailing of the ship he commanded to Panama. So Del Cano sailed westward in the *Victoria* and reached Spain on the sixth day of September, 1522, while the *Trinidad* under its ignorant admiral bore a course eastward, with a crew of fifty-four men.

On board was a capable pilot, but ineptitude was in command, and a course was set that would have taken the ship to Alaska instead of Panama. Then the egotistical weakling fell to his doom. Halfway across the Pacific indecision beset them and they turned west again. When they reached the Moluccas, there were only nineteen left of the original fifty-four. It was a ship of despair. Espinosa, fronted with responsibility, was like water. He knew nothing of authority, nothing of discipline. Men had (Concluded on page 27)

"Ten Commandments" as a Healer

Doctors Are Prescribing the Mount Sinai Maxims as Mental Tonics

By WILLIAM A. M'GARRY

A STRIKING refutation of the widely circulated idea that science has abandoned religion and religious principles has come to light in Philadelphia, where Dr. Charles W. Burr, professor of psychiatry in the University of Pennsylvania, has publicly expressed the opinion that the best program for mental hygiene is included, for all practical purposes, in the Ten Commandments.

In amplification of this opinion Dr. Burr and one of his most brilliant associates have revealed that the great Philadelphia school of specialists in mental disorders descended from the late S. Weir Mitchell is and has been prescribing the Ten Commandments for the prevention of mental distortions. And according to the tested judgment of both experts, the Decalogue really works as a scientific instrument.

Before going into the details of how this significant fact came to public attention, it may be well to give an outline of the scientific status of the two men responsible for it. The colleague who corroborates Dr. Burr is a considerably younger man, but he has been much more in the public eye. He is Dr. D. J. McCarthy, now professor of Medical Jurisprudence at the University of Pennsylvania. During the World War he organized and directed the corps of mental experts summoned by the United States Government to provide treatment for shell shock and other nervous cases.

The mere fact that he was called to direct this work was in itself a signal recognition of Dr. McCarthy's scientific reputation, since the choice was made by professional men. His record fully justified the confidence placed in him. The war produced an entirely new field of mental disorders, calling for pioneer work in diagnosis and treatment. Dr. McCarthy is credited with blazing the trail for the greater part of this work. The story of his success has been told repeatedly. It was so marked that many of his methods were adopted by the British and French experts, although they were four years ahead of him in experience.

Perhaps the easiest way to introduce Dr. Burr to a lay audience is to say that Dr. McCarthy was his pupil, and the younger specialist has repeatedly given credit to Burr for much of his success. In addition, both men are members of the famous school of experts in mental disorders founded by Dr. S. Weir Mitchell, who was recognized even before his death as the man who made the treatment of nervous diseases a separate science. Among their associates are Dr. Francis X. Dercum, who was called in when the late Woodrow Wilson collapsed, and Dr. Charles K. Mills. Although these men and their colleagues have been called as consultants in cases where public men were in need of the best available treatment, it is significant that their school was not represented in the Loeb-Leopold trial.

Many good people have been wondering why there has been dancing in the church of St. Mark's-in-the-Bouwerie, New York, and not a few have been scandalized by the stories that have been circulated by the newspapers. A writer for THE DEARBORN INDEPENDENT, himself a clergyman, has investigated the matter at its source, and the result will appear in an article next week. It gives a very different picture to that conjured up by the daily press.

Dr. Burr has now authorized the statement that Mitchell used the Ten Commandments exactly as they are being used today in the treatment and prevention of nervous ailments, although he may not have described his methods in just those terms. The Burr statement was called forth partly by the discussion preliminary to the opening of a child guidance clinic in Philadelphia by the Commonwealth Fund, and partly by a desire to sweep from the public mind some of the foreign rubbish about mental hygiene based generally on the made-in-Germany Freudian theory. The explanation of how the Ten Commandments may be used as a program of mental hygiene, as furnished by Dr. McCarthy, has been specifically approved by Dr. Burr.

"The statement needs more than passing comment because it has in it a thoughtful consideration of a very different and pressing problem," Dr. McCarthy says. "It connotes a new definition of mental hygiene, to keep the mind clean and pure and free from dust and disease—dust in the human sense; to keep the mind and the body and its passions coördinately disciplined and under control; to have the growing child trained to respect his neighbor, his neighbor's property, his neighbor's wife and the community; to have all the qualifications for the making of a good constructive citizen.

"Dr. Burr puts into the Ten Commandments a scientific scalpel, looks at it through the enlarging end of a microscope, and treats it as a means to an end of a scientific problem. The newer psychology, the psychoanalytic movement, as practiced as a system of therapeutics by some psychoanalysts and as a system of philosophy by the layman, and the technique upon which much of the modern work in child guidance and education is based, stands in flat contradiction of this idea of Dr. Burr's.

"The inconsistency of the two ideas lies in the question of discipline and control. Burr's idea is based squarely upon the older idea of discipline internally and externally applied. Discipline of the mind, discipline of the body. A system of training begun in early childhood to do the right thing and to be punished for doing the wrong thing, in proportion to the wrong done. That every good action has its reward, that every evil action merits and deserves punishment.

"Thou shalt not steal, is a great modern Commandment and the child who transgresses here, more particularly in reference to money, must suffer a heavy punishment, if he or she is to be made a practical working member of the Community. Thou Shalt Not Steal! This entails the most severe penalty; the rest of the Commandments are taken lightly except by professed church members, and those who live within the church atmosphere.

"While it is quite possible, even probable, that kleptomania is at times an emotional equivalent in the relatively normal child, even at times in children relatively deficient, for the most part it is due to low standards, low morals, and low training in the environment of the child. When it first develops, it needs drastic action and the child must be made to appreciate, in a way that it will never in its lifetime forget, the penalty imposed by the parent, and the future penalty imposed by society. A psychological analysis may help to understand the situation, but it will not take the place of disciplinary measures.

"A psychologist recently has determined by psychological tests that a dog has the equivalent intelligence of a child of four years of age. If a dog can be trained by exemplary discipline not to kill a sheep, or a chicken, it would be folly to think that a woman with an age level of 7 or 8 or 10 years could not be trained with equal facility.

"It might be just as well to consider what is meant by discipline and disciplinary measures. This hearkens back to the fundamentals of life and the pleasure principle. We may assume that all children need discipline, the defective child in order to prevent crim-

al tendencies, the nervous child in rder also to prevent this, and to main- ain the nervous and emotional bal- nce; the normal child, in order to aintain a normal and logical attitude ward life and labor, and to make r efficiency and happiness.

"The very good child needs disci- line quite as much as the bad child, nd by discipline in the training of the ild we wish to impart into his mind at whatever his lot in life, whatever ccupation or profession he may select, ccess is dependent upon years of ard, unpleasant preparation. That the successful specialist in any field least 50 per cent of the work is a ard, grinding, gruelling, unpleasant sk, and this must be cheerfully and acefully done for the sake of the ten er cent or twenty per cent or thirty er cent of creative, productive, inter- ting work and results. This is the ndamental of success in science, or in siness, or in the professions.

"The other fundamental to be in- rted into the child's mind is that easure can be the reward of work nd effort only; that the idle, rich outh whose whole day is a search for easure, soon becomes bored into dis- pting in an expansive way most, if t all, of the Ten Commandments at e time; whereas, the man who works even months in the year to use what tle surplus is left over to go fishing, s more real pleasure out of the luxury work and the vacation, than all the illionaire idlers."

In actual treatment of nervous ses, including the vast number due shell shock during the war, mental perts are having more success with e simple methods of Mitchell based the Ten Commandments than with e modern theories criticized by cCarthy, according to Dr. Burr. hief among these methods is the old- shioned prescription of work, made, course, after a careful diagnosis. ere nature, guided by science, fur- shes its own cure by bringing about healthy physical fatigue before which llucinations become less frequent and nally terminate. The discipline at st is applied externally, by the spec- ilist. As the cure progresses the pa- nt disciplines himself, and the extent which he obeys the Ten Command- ents is an excellent measure of his covery.

"There are hospital social workers d field workers and psychopathic rkers, and settlement workers, and st social service workers, just as there e neurologists, psychiatrists, and sychopathologists and psychoana- sts, and just doctors," continues Dr. cCarthy. "The real social service rker and the real doctor are not tied an idea, or cult. The fault in both lds is the isms and the cults.

"I would prefer to say that the in- vidual who has drunk five or six arts of rum and who sees snakes and maniac is a case due to the effect of ohol, direct or indirect, on his brain function, rather than to explain it in a psychogenic way and interpret the snakes and monkeys. Our first duty would be to save his life, and that would mean that we would have to know his kidney function, his liver function, his intestinal function, his circulatory function; and, having saved his life, eventually to save his mind, we would need to have the background of his knowledge and character.

"Every community should have an expert machine for the diagnosis of, and the prevention of, poverty and crime and disease and insanity. This machine should be built along safe and approved lines, free from fads and theories, and permeated by a very high purpose to guide children along the right way, and to teach parents the dangers of a bad environment in the neighborhood and the home, the force of good example, of good physical health, and the necessity for proper discipline, and the sheer necessity in this regard for a right religious principle. Certainly, this is essential for that vast majority of us, who are not strong enough mentally, or in our moral fiber, to guide our lives by the golden rule alone.

"Undisciplined parents, a contentious atmosphere in the home, a disregard of law and morals is one of the great sources of faulty personalities in growing children. A sane atmosphere in the boarding schools and colleges is the only bulwark of the nation against this growing tendency. One cannot develop a healthy mental atmosphere in the children if the parents are leading a hypocritical life, disregarding morals and the law. The shock to the growing girl of delinquency on the part of the mother ofttimes alters the child's whole outlook on life. A well-disciplined home, with well-disciplined parents and children, will count for much to counteract the evil effect of heredity of nervousness and insanity. Good physical health and discipline, a well-ordered life, are the great checks in this regard.

"One thing we can do is to see that every child that is normally born, with the right given to it by nature to a fair chance of good physical and mental health, is protected in the period of growth from disease that cripples and alters the chemistry of the body; to see that the child has the right to a sane education, and that the duty of the citizen is to offer the child to the schools free from disease, of normal weight, and with pure red blood; to see that what is vicious in the environment of the child is removed, and when the home environment is bad, to have this corrected by the moral pressure of the community. This would mean control by the state of the health of the child; a most detailed medical and psychological study in the pre-school period, repeated at the adolescent or high school advancement. If all these were successfully accomplished, I feel quite certain that the State of Pennsylvania would not have 28,000 insane to care for, and 21,000 delinquent children to cope with in order to make the state a safe place in which to live."

Grand Teton Mountain and Jackson Lake

ONE of the gorgeous scenic wonderlands of the Far West, Grand Teton Mountain and Jackson Lake, lies south of Yellowstone National Park and may be reached by a side trip from Old Faithful Inn in the park proper. This particular region contains appalling heights and depths and colorful features of amazing beauty. A sunrise here is a thing to remember. Soft rose deepens to warm pink in the morning glow, and the shadows fall across it, a rich ultramarine. Then the serrated ridges, jagged spires ranged against a sky of incredible blue, become beautiful beyond expression. Mount Moran and Survey Peak to the north stand erect with their heads in the clouds, the sun shimmering on the perpetual glaciers which set like jewels in the wooded valleys.

The Grand Teton from Jackson Lake.

Forty Years' Study of Cost of Living

(*Concluded from page 4*)

well as they wished to be or as they could get along otherwise. Women, in going out to work more freely, have become more and more economically independent, and thus are more and more responsive to the economic factor.

"The basic affairs of family life, especially among wage-earning classes with which we deal, remain about the same. For instance, in 1918, we found that approximately 9 per cent of families had income from the earnings of wives. In 1901 we found that 8½ per cent of wives in the families canvassed did money-earning work outside the home.

"Here are figures showing how family expenditures were distributed—in terms of percentages—at three periods during the last twenty-five years."

The figures are as follows:

Year	Rent	Fuel and Light	Food	Clothing	Sundries
1901	18.12	5.69	43.13	12.95	20.11
1918	13.0	5.02	38.02	16.06	21.03
1924	20.0	6.3	30.01	13.4	30.2

"These figures show great improvement in the well-being of the average family. The food item is the important indicator as to that. The more cramped the family, the greater the proportion of all income that goes for food and the less that goes for those numerous items—health, diversion, house furnishings, luxuries—that are listed as sundries. Only twenty-three years ago the average working class family had to put almost one-half of all its funds into food. Now less than one-third goes for that item. And they get more and better food. The proportion that goes for housing has increased but not greatly, and, on the whole, they get less but in some respects better housing. The increase owes in most part to abnormal conditions.

"The distribution within the family remains about the same; that is, for example, about the same proportions of the average family's income go, respectively, for clothing for husband, wife and children. Husbands still get the largest individual share on that score, despite the common belief about women's extravagant clothing habits. Women wear much less now but the ratio of cost is about the same.

"Thirty-five years ago it took from 20 to 24 yards of cloth to make a woman's dress. She never wore less than from three to four petticoats and other ample undergarments. These were made of cotton cloth, muslins, usually of a fine texture. It did not take many women to keep a high-grade cotton mill or dress goods establishment going. Today with cotton mill equipment increased 300 to 400 per cent, a woman can make a dress out of three yards of cloth. As to the amount of cloth worn under the dress, let others speak.

"The change has had big bearing on an important item of national economy. It has had much to do with causing cotton manufactures to grow in the South, where heavy goods have been made, and to decline in New England, where the lighter goods have predominated. While women's dressing habits have tended to depress the cotton textile business in New England, better household habits have contributed to the growth of the industry in the South. The percentage of families which, 35 years ago, used two sheets on a bed, was rare, particularly among the working classes. Today, most of them sleep between two sheets and clean ones, too, which means more frequent changing and therefore more sheets than used to be customary.

"The silk underwear habit among women likewise has been a blow to the New England cotton mills but a big boon to the silk mills of New Jersey.

"In 1901 the average family's expenditures for clothing, as shown by detail for 2,567 families, were as follows: For the husband, $34.38;

The majority of divorces in the United States are procured by wives. The causes are usually economic.

for the wife, $26.37; for the children—averaging nearly three per family—, $54.15.

"In 1918, they were: Husband, $71.38; wife, $63.55; children, $102.67.

"In 1924 they were: Husband, $59.25; wife, $52.75; children, $85.22.

"This office has seen freedom from oppressive toil steadily granted to the children of the country. Even as late as 1901, nearly one-fourth of families investigated depended on children for an average of nearly 10 per cent of income. In 1918 only about one-sixth of the families derived any income from the work of children of all ages.

"The size of working class families has changed scarcely at all during the last quarter of a century, being both in 1901 and when the last study was made, composed of slightly less than an average of five persons.

"The average number of rooms making up their places of abode has declined somewhat; likewise, no doubt the average size of the rooms.

"The number of working class families which achieve savings has increased, hugely probably over the eighties. In 1901 only 50 per cent of families investigated reported a surplus of income over living costs. In 1918, 70 per cent showed surpluses. The average surplus in 1918 was $155.31 for the year, against $120.8 in 1901. I am quite sure it is larger now, though the proportion of families that come out ahead may not be so large.

"Curiously, a larger proportion of families ran behind in 1901 than in 1918, the ratio being one-sixth as against about one-fourth of all. This would indicate that the average family now either does better than live within its income or lives beyond it. Fewer evidently spend all and no more.

"We are better, though not so amply, housed; better clothed and much better fed nationally, than when the government began to keep a diary on those things for the working people of the whole.

"There, of course, still is room for much improvement. The worker is kicking harder than he did forty years ago, despite his incomparably better condition. He probably feels just as poor as he did then because the standards of those above him are just as far above him as before. He is kicking harder and more intelligently, because also, he has more leisure time in which to think of his troubles and plan his kick. He goes up and the world goes with him. Break his standards and you decrease consumption, and that would close the factories and thereby defeat the purpose of business and commerce and set back real civilization."

The Parliament Carpet

Even the strips of carpet which run along the floor of the Imperial House of Commons in England have a history and a reason. These strips are located near the front benches and were placed there originally to prevent the danger of members fighting with each other. The carpets were introduced in the days when members wore their swords, and a rule was made that no member was to stray beyond the edge of the carpet on his side of the House when speaking. The carpets were placed two sword lengths apart so that an excited speaker could not reach the members opposite if he flourished his sword. The carpets are still placed the old distance apart.

"It's a Long, Long Trail A-winding"

A Hike From Maine to Georgia Over the Appalachian Mountains

By S. R. WINTERS

HAROLD BELL WRIGHT, the novelist, in his book, "The Shepherd of the Hills," tells about an "old, old trail—that is nobody knows how old." Of a trail that is now being developed along the skyline of the Appalachian Mountains and the summits of the Great Smokies of the South, from Maine to Georgia, it may be said, it is a long, long trail—although it is computed to be approximately 2,000 miles in length—that is nobody knows how long! Suffice to say this footpath will be the longest continuous stretch of trail in the United States.

This project, known as the "Appalachian Trail," was conceived by Benton MacKaye, a former member of the Forest Service, and which branch of the United States Department of Agriculture is adjusting its trail-construction plans within the National Forest areas in furtherance of this super-footpath. In fact, the Forest Service is so imbued with the potential advantages of this pretentious undertaking that it anticipates "this trail system, with the supplemental system of recreation communities and facilities which will be developed along its course, will place within ready reach of half the population of the United States opportunities for recreation of body and spirit such as are seldom enjoyed by any people."

The Appalachian Trail, which the Forest Service says is a project whose keynote is the conservation of men and their love for freedom and fellowship, is not destined to die a-borning, if we are to attach due significance to the organizations fostering its development. Foremost among the group of supporters, probably, is the Appalachian Mountain Club, which was formed in 1876 and is the pioneer trail-making organization in this country. The permanent footpaths in the White Mountains and in other parts of New Hampshire and in adjoining Maine testify to the industry and accomplishments of this pioneer trail-blazing organization. Moreover, the Appalachian Trail was suggested by Benton MacKaye, for the committee on community planning of the American Institute of Architects, an organization of far-reaching import.

Above—Scene, Mount Pisgah, Pisgah National Forest, North Carolina, through which the 2,000-mile trail will course. Center—Hikers climbing out Linville gorge, Western North Carolina. This gorge will contain steps when Appalachian Trail is completed. Community camp established beside the Appalachian Trail.

Albeit, the Appalachian Trail is not a new pathway in the strictest sense of the term, it contemplates the unifying of the many independent trails and the bringing together of the several active trail-making agencies into a formidable unit for the building of a 2,000-mile pathway through a region of unsurpassed scenic beauty. Federal and state governments have already constructed great stretches of mountain trail and even more footpaths have been blazed by such private organizations as the Appalachian Mountain Club, a chapter of which has been organized recently at Asheville, North Carolina.

A score of recreational clubs have been active for a long period of time in the New England States. A little more than a dozen years ago the Green Mountain Club began an undertaking, the result of which is the famous Long Trail. The New England Trail Conference, Connecticut State Park Commission, and the Appalachian Mountain Club are organizations which have furthered trail systems—which Mr. MacKaye says is more than a pathway for hikers, "a new approach to the problem of living, a development of the outdoor community life, as an offset and relief from the various shackles of commercial civilization."

The example of New York State in unifying its scattering trails is emphasized as indicative of the even greater possibilities of providing an unbroken pathway from Maine to Georgia. Until five or six years ago pathways for hikers in New York were developed without any systematic effort, when the Conservation Commission introduced

a trail system in the Adirondack Mountains. A club taking the name of these peaks is continuing the work thus so auspiciously begun. About three years ago there was formed the Palisades Interstate Park Trail Conference, as a result of a meeting of delegates from the walking clubs of New York City, the New York sections of the Appalachian and Green Mountain clubs, the Fresh Air and Tramp and Trail clubs.

The impetus afforded by this meeting of scattering walking units prompted Major W. A. Welch to build a 25-mile trail from Tuxedo to Jones Point on the Hudson River. This same group of workers has extended this footpath northward along the west side of the Hudson River over Bear Mountain. The New Jersey State Forestry Department has constructed eight miles of trail in the Stokes Reservation on the summit of Kittatinny Mountain, northeast from Culver Gap. These two footpaths are the only ones of considerable length thus far systematically planned and constructed in the vicinity of New York City.

The forces active in the development of the Ramapo-Dunderberg Trail, as the Tuxedo-Hudson route, just described, is termed, included Meade C. Dobson, now of Rochester and an influential member of the Adirondack Mountain Club; and Professor Will S. Monroe, president of the New York section of the Green Mountain Club. He is an engineer and builder, primarily of the scenic Monroe Skyline Section of the Vermont Long Trail. Also, included in this group of trail-blazers is J. A. Allis, vice-president of the State Bank of New York, whose influence has been exerted in the behalf of several hiking clubs. These devotees of out-of-doors recreation indulged in dreams of an extension of the Ramapo-Dunderberg Trail north and south, connecting through the Berkshires with the Long trails and the Adirondack Mountain Club trails in New Hampshire.

The proposed Appalachian Trail, however, which has already assumed definite aspects, far and away surpasses the imagination of these promoters of a super-footpath. That a hiker can, ultimately, travel continuously along a trail for a distance of 2,000 miles—from Maine to Georgia, from Mount Katahdin and Mount Washington to the highest and southernmost of the Great Smokies—stimulates the fancy of mountain climbers to an extreme degree. Moreover, community camps are to be established at intervals beside this long, long trail and, likewise, there will be shelter camps, such as those maintained by the Appalachian and Green Mountain clubs. These camps, to quote a promoter of this project, "will tend to reverse the movement to the cities and induce people to settle in the country, to work in the open as well as play. The camping life will stimulate forestry as well as a better agriculture. Employment in both would tend to become enlarged."

The truth to tell, much of this long, long trail is to be built, but with Federal, state and private agencies coöperating the plans of constructing this pathway will be facilitated. Already the Forest Service of the United States Department of Agriculture has outlined the method of procedure. This involves, first, the making of location surveys, the purpose of these is to economize with respect to distance by making the trail by the shortest practical route; second, since this is to be a scenic footpath, it should proceed along a line where natural beauty of the mountainous region is obvious; and, third, the route surveyed should avoid excessive grades. Once the trail is surveyed and located the pathway is "swamped" or brushed out. A crew chops out the line, and following this crew are the force of workers engaged in grading and filling. These activities in trail-blazing apply to a trunk-line pathway.

The northern terminus of this 2,000-mile footpath is the Mount Washington locality in New Hampshire, this stretch having already been completed as far as Dartmouth College. The objective in the south is the Great Smoky range. The route in this region follows the Tennessee-North Carolina state line to the Watauga Valley. Thence, instead of following the Blue Ridge Mountains it diverts its course north so as to go through the White Top Forest Area and so as to make connection with the possible ultimate branch lines to Kentucky in one direction and to Western Pennsylvania in the other. Following the ridges, it crosses the New River near a place known as Goodwins Ferry. Thence, it jumps from one minor ridge to another until it hits the main Blue Ridge Mountains again near Roanoke, then follows the Blue Ridge through the Natural Bridge Forest Area and onward to Harper's Ferry.

"There will be a chance to catch a breath," to quote Mr. MacKaye, "to study the dynamic forces of nature and the possibilities of shifting to them the burdens now carried on the backs of men. The reposeful study of these forces should provide a broad-gauged enlightened approach to the problem of industry. Industry would come to be seen in its true perspective—as a means in life and not as an end in itself."

The Forest Service shares a similar view, although it is expressed differently in a statement furnished this writer: "Thousands of enthusiastic hikers already use the Appalachian Forest trails each summer. Two weeks in the open among the mountain tops, sends them back to the rush of everyday life refreshed for the struggle, with a new appreciation of Nature's wonders and of the possibilities for wisely using our natural resources in the solution of our national problems."

Relic of the Revolution

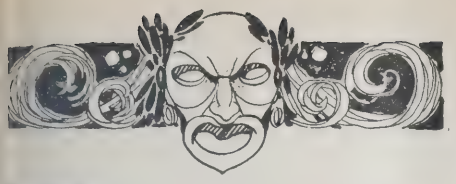
Birthplace of the Guns That Spoke for Freedom

ANCIENT deeds record that about 1750 Isaac Palmer built a sawmill on the spot now occupied by the ruins of the old Monmouth furnace. This was on the northern side of the headwaters of the Manasquan River near Allaire, New Jersey. The property passed into many hands and about 1814 the Manasquan, or, as it was afterward called, the Monmouth furnace, was erected, for a deed of 1817 records that "all the lands commonly called and known as the Monmouth furnace property" were reconveyed to William Griffith.

Old Monmouth smelting plant.

In Colonial days the surrounding country abounded in bog-ore, and the fame of this furnace was widespread. The iron was smelted from the ore by a rude process, the charcoal being burned on the ground. Here was made the cannon for Washington's armies during the War of the Revolution; here was made the air chamber for Fulton's history-making *Clermont*, and here too was later fashioned the engines for the *Savannah*, the first steamboat to cross the Atlantic. From 1834-1837 the largest concern in the world making marine engines was located here.

The site is now overgrown with brush and trees. The masonry is of the best or it would never have stood the ravages of time. Of late the property has fallen into hands that will no doubt preserve it as a memorial of pioneer days. Surely the birthplace of the guns used in the American Revolution should not be allowed to disintegrate



Footlight Flashes on Manhattan Stages

From the Zero to the Meridian of Merit

By PETER SCHUYLER

THE theatrical year which has just given up the ghost has been remarkable in four particulars. It marks the owest degree of degeneracy which the rientalized stage of Manhattan has far reached. It witnessed the astounding continued success of "Abie's Irish ose." It saw more legal accusations f plagiarism, a euphemism for theft rought against prominent authors, than ver before in the history of the Amerian drama. And it introduced the ultimate futility in the effort to deodorize the playhouse, the application of the play jury scheme.

Shows and Sales During the Season

Roughly speaking—in considering ne Manhattan show situation it is ltogether in the picture to speak roughly"—a theatrical season runs om the middle of August to the middle f the following May. That period kes no consideration of the so-called mmer season which is used for the roduction of hot weather musical ieces. "Hot weather" is the excuse for moving all appreciable covering from ne chorus, and reducing the salaries of ctors who are engaged in dramatic ccesses which the producer wants keep going during the off-season. trange as it may seem this economy not passed along to the ticket-buying ublic. Patrons are expected to pay the me prices for the show. The actors e permitted to carry on provided ey assist the management in its hilanthropic policy of entertaining the roletariat by accepting a cut in wages nning from twenty-five to a larger rcentage of their contracted stipend.

Approximately two hundred plays divers sorts were produced during 24-25. Of this number *one-fourth ere commercial successes*, which being terpreted means that the Great merican Sucker refused to be gaffed almost one hundred and fifty stances.

The season of 1923-24 saw about one ndred and seventy-five offerings nded to the customers. One hundred d fifteen times potential purchasers fused to buy. Artistically, dramatilly, and literarily the Manhattan eater in 1924-25 stood still. Conidered from the viewpoint of the most beral moralist the playhouse of "the rgest Jewish city in the world" opped another level toward the sewer.

On the evening of September 5, 24, the initial attack began with the esentation of "What Price Glory?" war drama which had to do with the nflict between two drunken officers of e U. S. Marine Corps over a French llage drab. The "war" was introduced give local color by permitting the audience to get a look at a front-line dugout under fire. The dialog was so profusely decorated with profanity of the bluest that even first-night spectators were astonished. But because Manhattan is nothing if not hypocritical, subsequent objection to the play was made not on the particular score of the vicious language but because the actions of the chief characters tended to bring the uniform of the army into disrepute. A great to-do followed with the subsequent elimination of the roughest of the lines and a jeer by the producer—in a program note—at those who were responsible for the wash-up.

Then followed in quick succession the Belasco offerings of "The Harem" and "Ladies of the Evening," the Eugene O'Neill effluvium, "Desire Under the Elms," a burlesque on the life of Benevenuto Cellini, "The Firebrand," and the Theater Guild's contribution, "They Knew What They Wanted." Some minority growls of disapproval began to be heard as the waves of stage indecency continued to roll higher.

When the Editor Grew Virtuous

Then the editor of an evening paper suffered an attack of virtue and burst out with a demand that the stage clean house. The fact that his paper was at the time carrying advertisements for the plays to which he objected did not lessen the warmth of his attack. Agitation for the establishment of a censorship over the drama began and those who were interested in keeping the theater unhampered by the laws of common decency got frightened. Anything was better than a censorship! A stuffed club was created with which to keep existing and potential offenders in their places. The stuffed club was the play jury system which may be described first, last, and all the time, as an attempt to prevent the stage from being really cleansed. Jurymen and jurywomen, from these self-appointed guardians of the community weal visited "The Firebrand," "Desire Under the Elms," and "They Knew What They Wanted." The first named has to do with the amatory adventures of Cellini and, from the incandescence of the situations and stage business, is well named; the second is concerned with a New England farm hand and his stepmother and the subsequent murder of an infant by the mother; the third concerns an I. W. W. California farm hand and the young wife of his old employer the night of the wedding. With a speed that is illuminating *the play jury found nothing wrong with any of the three* except one or two words of disapprobation for the Cellini play.

After these three exhausting labors the play jury called it a season and knocked off work. Mr. Belasco himself, in person, rewrote "The Harem" and "Ladies of the Evening" with small harm to the quality of these plays which were so bad originally that nothing could make them worse. Both have since succumbed to lack of patronage.

When Pulitzer Prize Was Awarded

But if persons of old-style ideals found fault with some of the entertainment thrown at them, the offending plays have not failed to win praise in higher and looser circles. Each year in Manhattan an award, the Pulitzer prize of $1,000, is made to the author of the play "best representing the educational value of the stage in raising the standards of good morals, good manners, and good taste." In 1921 the prize went to Eugene O'Neill for "Anna Christie" which was strong meat indeed. Last year it went to "Hell-Bent for Heaven" by Hatcher Hughes. That decision rent the deciding committee in twain with flying allusions to the double cross which had an acidity more than common in affairs wherein university professors of English are involved. This year the Pulitzer palm has been given to Sidney Howard who wrote "They Knew What They Wanted." Mr. Howard now is being sued by another gentleman of the inkpot who asserts that the prize winner was stolen from a play of his own manufacture. The courts will ultimately determine the ownership of "They Knew What They Wanted" but it needs no tribunal of the law to pass judgment on the mental acumen of judges who allotted Mr. Howard $1,000 for a drama in which the big and only moment is the seduction of the newly wedded wife by an itinerant I. W. W. If that sort of trash is to be judged the play "best representing the educational value of the stage in raising the standards of good morals, good taste and good manners" is it any wonder that the native theater descends steadily year after year into lower depths of degradation?

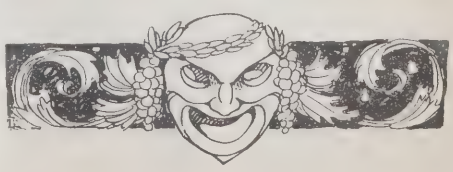


Mapping the Northwest Passage

How Hundreds of Brave Souls Succumbed to the Lure of Pathfinding

By LOUIS C. KARPINSKI

AFTER the discovery of America, Spain and Portugal arrogated to themselves the rights to the undiscovered territories of the world. Most naturally England and Holland did not view this partition complacently. Cape of Good Hope and Cape Horn being spoken for, the eyes of the English and Dutch were directed toward the northeast and toward the northwest as outlets for their exploratory ambitions.

For England the Cabots first braved the dangers of the Arctic but without sufficient success to warrant the continuation of the enterprises. But in 1549 the Company of Merchant Adventurers, known as the Muscovy Company, received a royal charter and four years later Willoughby and Chancellor established contact with Russia through Archangel which port was again most actively used in the World War. Speculation ran riot in 1550 and even a professor of mathematics, Robert Recorde, writer of famous textbooks, languished in the debtor's prison most probably because of too enthusiastic support. Recorde dedicates his "Whetstone of Witte," first English work on Algebra, to the Muscovy Company. The names of Willoughby and Chancellor and Burroughs are to be found today on the maps of the European Arctic, a testimony to English activity there in the sixteenth century. Similarly the Barents Sea perpetuates the achievements there of the Dutch from 1594 to 1599; it was in 1596 that Barents discovered Spitzbergen.

Renewed interest in the American Northwest was awakened by Sir Martin Frobisher. Here was a man of culture, able to interest in a venture Queen Elizabeth, the Earl of Warwick, the merchant prince Michael Lok and also the scholarly and versatile John Dee, astrologer and mathematician. Frobisher's patrons were due in part also to Sir Humphrey Gilbert who in 1574 showed on paper how easy was the Northwest Passage to India.

The account in Elizabethan English of Frobisher's first voyage begins:

"Our General, Captain Frobisher, being persuaded of a new and nearer passage to Cataya than by Capo de Buona Speranca, which the Portugals yearly use, began first with himself to devise, and then with his friends to confer, and laid a plain plot unto them that that voyage was not only possible by the northwest, but also he could prove easy to be performed. And further, he determined and resolved with himself to go make full proof thereof, and to accomplish or bring true certificate of the truth, or else never to return again, knowing this to be the only thing of the world that was left yet undone, whereby a notable mind might be made famous and fortunate . . . little and little, with no small expense and pain, brought his cause to some perfection . . .

"He prepared two small barks of twenty and five-and-twenty ton apiece wherein . . . he departed upon the said voyage from Blackwall, the 15 of June, anno Domini 1576 . . .

"And the 20 of July he had sight of a high land which he called Queen Elizabeth's Foreland, after her Majesty's name. And sailing more northerly alongst that coast, he descried another foreland with a great gut bay, or passage dividing as it were two main lands or continents asunder. There he met with store of exceeding great ice all this coast along, and coveting still to continue his course to the northwards, was always by contrary wind detained overthwart these straits . . . and passed above fifty leagues therein, as he reported, having upon either hand a great main or continent. And that land upon his right hand as he sailed westward he judged to be the continent of Asia and there to be divided from the

Map of the World, by Ortelius—1588

Blaev's conception of the Northwest—the most widely circulated map of this region from 1635 to about 1700.

irm of America, which lieth upon the eft hand over against the same.

"This place he named after his ıame, Frobisher's Straits, like as Magellanus at the southwest end of the world, having discovered the passage to he South Sea . . . and called the same straits, Magellan's Straits.

"After he had passed 60 leagues nto this foresaid strait, he went ashore, and found signs where fire had been nade . . .

"In this place he saw and perceived sundry tokens of the peoples resorting hither . . . coming nearer, he discovered them to be men in small boats nade of leather . . . five of our men going ashore were by them intercepted with their boat, and were never since heard of to this day again."

Frobisher captured one of the Esquimos with his kayak, but the poor fellow died in England "of cold which he had taken at sea."

Frobisher made a second voyage in 1577 but the most tangible result was a shipload of pyrites or fool's gold. However, Frobisher's exploits are duly recorded in the names of Cape Warwick, Lok's Island, and Frobisher's Bay and Strait found upon our map.

A more able pilot and navigator, John Davis, made three voyages between 1585 and 1588, finding beyond Davis Strait at 72° 12′ North Latitude "sea all open to the westward and northward."

Along the route of Davis, Baffin in 1616 reached a latitude of 77° 45′ North, in the vicinity of the true magnetic pole. Baffin's farthest north was not exceeded in the American Arctic for more than two centuries (1852).

Between the Northeast Passage around Norway and the possible Northwest Passage by the western coast of Greenland lies another possible route to the Arctic Seas, the route between Greenland and Spitzbergen. In 1607

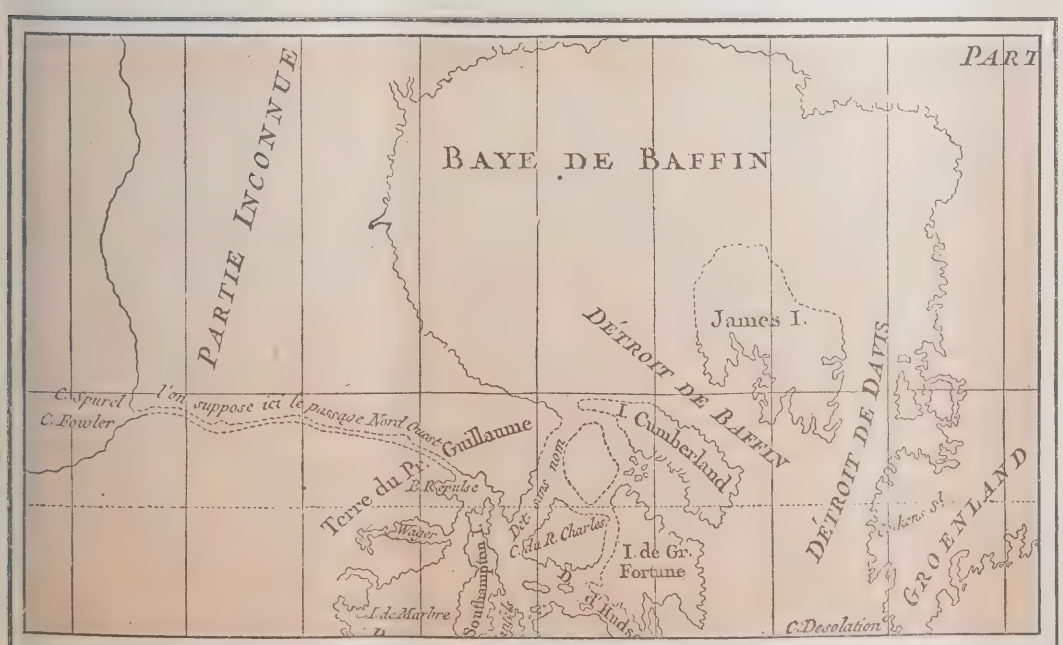
From Sanson's map of the North Polar Region of 1657. After Frobisher and Hudson.

Henry Hudson proved that this led only to a solid wall of ice, the barrier mentioned most recently by Amundsen. A further voyage by the Northeast Passage the following year gave Hudson further training in the Arctic and its ways. The famous voyage of the *Half Moon* began with a run to the northeast but the ice preventing Hudson turned to America and discovered in September of 1609 the beautiful river which bears his name.

In 1610 Hudson, with his lieutenant Juet, sailed away in the *Discoverer* under the English flag, "to try if, through any of those inlets which Davis saw but durst not enter, any passage might be found to the other ocean called the South Sea." Entering the strait which bears his name on June 24, 1610, Hudson passed by the Cape "Hold with Hope" and the "Island of God's Mercy," by Digges Island into "the bay of God's great Mercies," as Hudson termed the bay which became his last resting place and his lasting monument. James Bay was reached but exploration engaged their attention too closely so that the ice compelled them to winter in the bay. Adequate provision for this had not been made; mutiny broke out and Hudson with a few faithful followers was set adrift in a small boat and never heard from more.

With Hudson and with Baffin terminated the attempt to reach India by way of Davis Strait. However, the idea of a passage was not abandoned for even James Cook in 1778 and Vancouver in 1792 sought the great reward of £20,000 offered by England for a passage for the Pacific into Hudson's Bay.

During a period of two hundred years after Hudson only whalers pushed into the Arctic regions. At this time even Baffin's voyage was considered doubtful, so long had the Northwest been deserted. In 1818 and 1819 the British (*Concluded on page 29*)



French map of about 1775 based on an English map of 1769. Note that the Northwest Passage finally made by Amundsen was indicated in approximately the position found by him one hundred thirty years later.

A Chat With a Famous British Painter

(*Concluded from page 2*)

armchair upon the models' dais; a turmoil of pictures, finished and unfinished, landscapes, portraits, figure subjects; all the paraphernalia of a painter's workshop. In the center, upon a big easel, his well-known picture "A Reverie,"—a middle-aged man seated near the piano at which his young wife is singing; over all mingled firelight and lamplight; in a dusk corner the shadowy, the ethereal figure of a woman, looking wistfully at the man who sees her in his mind's eye—"the dear dead of other days."

"Is that a replica?" I asked.

"No, no, that's the original, back from the Walker Art Gallery," the famous municipal gallery at Liverpool. "You see, here and there the paint has cracked and I am putting it right. I preferred to do it myself. On the whole, in spite of somewhat injudicious treatment, it's kept wonderfully fresh . . . It stirs memories in me! A painter's work differs, changes as time goes by; this was painted in 1895. It's like turning over the pages of an old diary, which one hasn't looked at for a long time; finding a record of little and big things which one has almost forgotten; and the handwriting changed."

Then a comfortable armchair for each of us, and I with a cigaret in preference to the proffered cigar.

"I'm going to make a shocking nuisance of myself," said I. "You know how interested our American friends are in all our old institutions and how much they like to get a peep inside; to go behind the scenes, so to speak. Do tell me something about the Royal Academy?"

He laughed, hesitatingly, before he replied:

"What shall I tell you?"

"You're one of the elder brethren?"

"Yes; not the oldest in years, but, I think with two exceptions, I am the senior member."

"It's not a sinecure, being president, I imagine?"

"No, it's not. There's plenty to do, a lot that you must do and a lot more that you ought to do; more than I realized until—I had to do it! I have to take the chair at all meetings of the council; to preside at the elections of academicians and associates; to preside at the banquet and, which bothers me most, but I daresay I shall not mind it so much when I have got used to doing it, I have to make all the speeches on behalf of the academy at the banquet, six of them. So it is rather a trying function for me. Of course, some of the speeches are quite brief; such as the toast of the King. By the way, when I escorted the Queen round the exhibition I was greatly struck by her interest in and her knowledge and understanding of art. I had my work cut out to answer some of her questions."

"Who was the most interesting president you have known?"

"Leighton, without a doubt. Probably the finest of all our presidents, excepting perhaps Reynolds. Not only a great painter, and with the makings of an even greater sculptor, but a fine courtier and an admirable speaker."

"Some people say he was a better man-of-the-world than painter."

"Some people talk nonsense. He was a *great* painter; every picture of his has splendid decorative qualities. As all pictures should have."

"Presidents now retire at a certain age, don't they?"

"Yes, at seventy-five; so I have four more years to run. This new rule saves a man from having to acknowledge that he has had his day; from putting himself on the shelf, so to say. Never a pleasant thing to have to do?"

"Other work—?"

"The president has to keep an eye on the work of the academy school; to present the prizes each year, and every alternate year, when the gold medal is awarded, to deliver a formal address. Then I have to take the chair at every meeting, six or so, of the selection committee, to judge the pictures sent in for the exhibition; very tiring work; must keep fully alert all the time. Every picture must be given fair attention; you have constantly to readjust, to refocus, your point of view, your attitude of mind; there are violent changes of style and so on from one picture to the next. And we old'uns realize that we must not be as dogmatic as most young people are! Dogmatism leads to narrowness. In the academy we do our best to be just to all schools, even to those, perhaps especially to those, which may be violently opposed to our personal views and beliefs. Of course, we maintain that there are certain standards and traditions which we must uphold; at the same time we keep close watch on any new departure. We should see to it that in every picture we admit there is sincere work and of sufficient technical achievement. Without those there is no justification for any departure from tradition. We have a duty to the public; to guide its taste and increase its knowledge; and to the artists—we must see that there is fair play for everyone. The academy does influence public opinion and taste, and so has a great responsibility. If we admitted mere 'Bolshevist' stuff people would say, 'Then there must be something in it.' On the other hand we do our best to avoid sheer formalism, unthinking following of conventions and traditions."

"What about our budding artists?"

"I don't think the younger students work as hard as we used to do. They've got an almost comic war cry, that they must not sink their personality. As if any real artist could kill his personality! If a man does his work sincerely his character, his personality must appear in his work. A man's work cannot lie about himself. A student in our school had painted a model—shall we say—pea green. The visitor, as we call him, who is always a member of the academy ventured to say: 'But the model is not pea green!' The reply was: 'Well, that's as I see it. I cannot sink my personality!' It's a student's duty to paint or to draw, exactly what is set before him, or her, and to study from the old masters, who did after all know a thing or two! To be as Stevenson said he was, 'a sedulous ape.' If there is a personality worth anything in the end it must force its way through, its way out; the artist will be able to express himself all the better, all the more fully, if he has learned discipline and how to use his tools. I think the war is accountable for a great deal of the unrest, of the desire to rebel for the sake of rebelling, of the curious mentality that so many young artists show today. We know that there was something very similar after the Napoleonic Wars; even an outburst of extravagant dancing, as there is today! There seems to me to be a curious cult of ugliness now rampant, deliberate avoidance of beauty. I believe it is only a passing phase.

I came away refreshed, though not in accord with all that had been said by my host; feeling that I had been in touch with a man who belonged to the past and to the present.

The courtyard of Burlington House.

"I Read *in the* Papers—"

I read in the papers that a governmental department in the Irish Free State recently had occasion to write a letter to a German manufacturing firm. Patriotic insofar as its knowledge extended, the department began the letter: "A chara"—the Gaelic form of address—and wrote the remainder of the communication in English. In replying, the German firm went the patriots several better: its letter began: "Dear Sirs," and continued in *Gaelic* even to the end.

The Irish department was compelled to send the letter to Trinity College, Dublin, for translation.

(The following paragraph was in type three weeks before Mr. Bryan's death. We let it stand as the record of an interesting project.)

I read in the papers that William Jennings Bryan is to conduct an ocean Chautauqua to the Holy Land. A shipload of people will accompany him—maybe two shiploads. Mr. Bryan will speak where Paul spoke on Mars Hill; he will speak on Oratory where Demosthenes gave his great oration, "On the Crown." In Egypt he will speak on Joseph's dreams and Moses' Law. Indeed, at every notable spot, Mr. Bryan will be ready with an appropriate lecture. During the Easter Season he will give five addresses. On Good Friday he will lecture in the Garden of Gethsemane. Next day he will deliver at Bethlehem his famous lecture on "The Prince of Peace." At dawn of Easter Sunday Mr. Bryan will lead the party outside the city walls and discourse of the Resurrection. In the afternoon he will preach on The Mount of Olives, with a later address at the Tomb of David. Damascus will be marked by an address on St. Paul's Conversion, and the Sea of Galilee will echo Mr. Bryan's voice as he speaks of The Sermon on the Mount. It is a most interesting schedule.

I read in the papers that there is a plan to refurnish certain rooms in the White House in the style of our own Colonial Period. That is good news. If anywhere the distinctive American touch ought to exist, it is in the interior of the residence of our Chief Magistrate. True, the House itself is copied after that of an Irish nobleman and much of the scheme of interior decoration is in the French style; and there should, as the American Institute of Architects insists, be no change thus far. From British stock this nation descended, with French aid and friendship at the start. Fittingly are these facts acknowledged in the material fabric of the White House. But it seems that the Green and Red Rooms in the Mansion are somewhat nondescript, whence arises the suggestion that they be made American Colonial. It is an excellent idea. The choicest specimens of Colonial furniture, when honest work was expended on honest material through the medium of true artistic design, should find their final repository in the White House. Yea, even unto ye spinning wheel and ye pothook.

I read in the papers the record of public hysteria regarding many criminal cases. I wonder how much of it there would be without the papers. Recently a number of club women collected money which seems to have been effective in securing a reprieve for a convicted murderer, but it's dollars to doughnuts that those same women who believe that Scott is innocent also believed that Shephard was guilty. The Shephard case appears to have been a newspaper stunt, and the newspaper principally interested, affected the mind of this nation to such an extent that many newspaper readers had Shephard guilty, tried, convicted and hanged before he was even arrested. Twelve men, hearing the case, pronounced him not guilty. In the Scott case, twelve men, hearing the evidence, pronounce him guilty, but some women and a newspaper say he is innocent. It is a question whether it is our sense of justice or our emotions that are engaged at such times.

I read in the papers that "sacramental liquor," as the irreverent call it, is again in the front pages. The Jewish loophole in the prohibition law, though left with the good intention of allowing orthodox Jews to observe their religious practices, has degenerated into a dangerous leak. Most Christian churches have abandoned wines for grapejuice. The Jewish official organizations have protested against the misuse of the "sacramental" clause. But to no purpose. The traffic goes on. It requires only ten Jews to form a "congregation" and their "rabbi" can draw liquor on his title. The predominant Jewish element in the whole bootlegging business explains much. It explains the Philadelphia situation, as well as the nation-wide mail-order distribution of liquor just exposed. It appears from the papers, however, that law-enforcement is becoming so hot that "rabbis" are being made out of Gentiles. This is quite in keeping with the way it usually worked out.

Romantic Rascals

(*Concluded from page 17*)

him nor had he confidence in himself. Soon they fell into the hands of the Portuguese and what courage was left in Espinosa was suddenly extinguished. There were long months then of miserable slavery.

At last, when the wonder of the first world voyage had lost its sharpness, four men whose very existence was hardly suspected, haggard men and worn, found their way into Spain. They were Espinosa and three sailors, all that were left of the original crew that had sailed from the Moluccas. Fifty out of fifty-four had died from starvation, disease, drowning or suffering.

But Espinosa's cup was not yet full. Presenting himself before the proper officials and asking for his pay, he was told that he had been cut off from the pay roll from the time of his capture by the Portuguese, on the ground that he was no longer in the service of Spain. For the rest, beyond the mention that the former constable instituted a suit to recover his docked wages, history is scornfully silent.

Willows of St. Helena

Mementos of Napoleon's bitter end on the bleak and desolate island of St. Helena stand lamenting, with drooping branches, even in the remote parts of the world.

In 1799, an English settler on the island, J. Tarbut, who owned much land there, planted five weeping willows, which he had brought from England, alongside the tomb of Napoleon. Three of these died within thirty-five years of planting. By reason of the care and attention given to them by Tarbut, the other two lived several years longer.

Before the latter two died, however, slips of them were planted on the other side of the tomb. Owing to the unchanging solicitude for their welfare of the soldier-caretaker whom the British Government maintained on the island, who daily watered them, they thrived in a wonderful way.

Cuttings from these offspring of the original trees have been taken to all parts of the world by visitors to St. Helena. For the most part, they have become sturdy descendants of that day, reminders of the rueful ending of a notable life.

Even in far-away Port Arthur, in Tasmania, an island south of Victoria, Australia, stands one of these weeping willows near an old worn-out fountain in front of the ruins of the old Government House. It is known as "Napoleon's Willow," and is granted to have been a cutting brought from the grave at St. Helena.

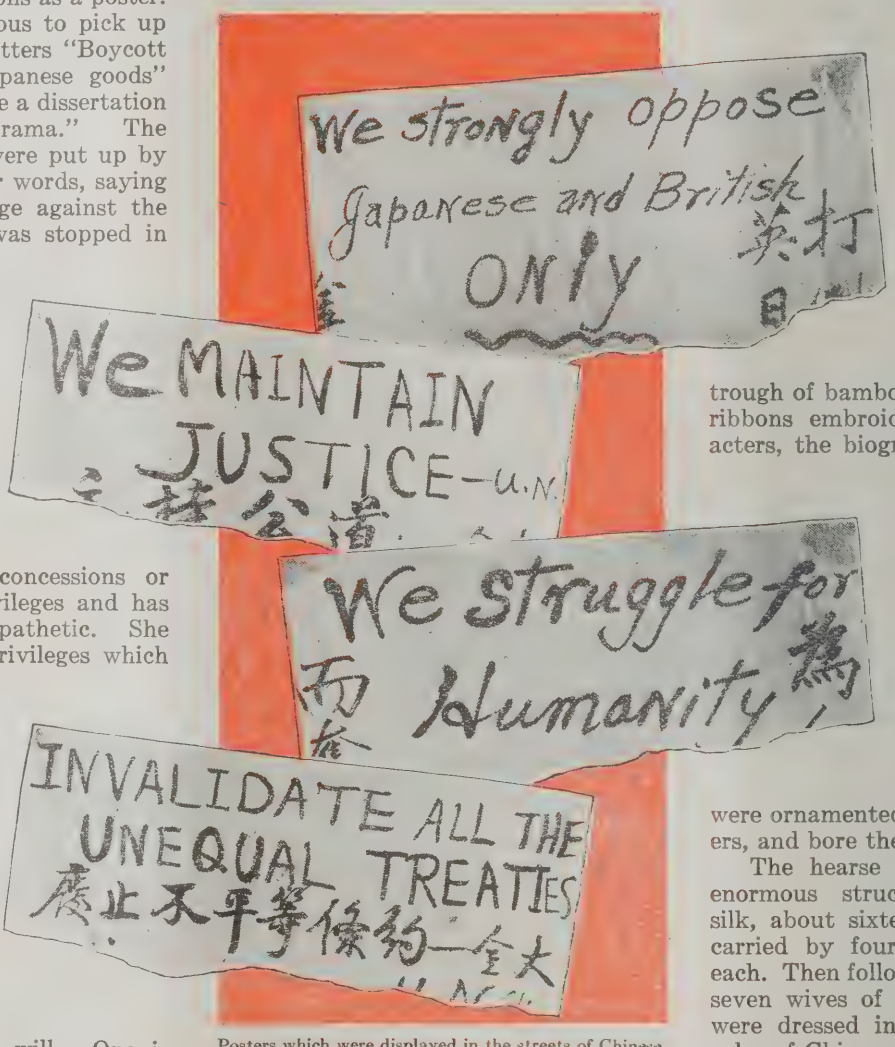
China Protests Greed

(*Concluded from page 5*)

other large places. Women who were accustomed to servants have had to go into the kitchen and prepare their own meals; banks and shops have had to close their doors; British ships of the Yangtze and coast trade are tied up idle because the crew refuse to work; all foreign factories are closed; a rigid boycott of all Japanese and British goods is going on in all the cities. Every available piece of paper has been turned into a poster. In some schools when all the available paper was used up, the students used the backs of their compositions as a poster. It seemed rather ludicrous to pick up a poster with the big letters "Boycott all the British and Japanese goods" and then turn over to see a dissertation upon the "English Drama." The accompanying posters were put up by the thousands. In other words, saying that they had no grudge against the Americans. A friend was stopped in her rickshaw this week and asked her nationality. When she replied "American" she was given a whole-hearted salute and motioned to pass on. Rickshaws are placarded "Not to carry British or Japanese."

America has asked of China no foreign concessions or railways or mining privileges and has been friendly and sympathetic. She is now being allowed privileges which may prove of more value than a bit of land or a railway. While in some instances the Chinese do not distinguish between Westerners, when they denounce their overbearing aggressiveness and wrongs to China, yet everywhere the word "America" seems to carry with it a feeling of friendship and good will. One is appalled at the possible future outcome when millions of people are harboring in their hearts deeper and deeper resentment and hatred against the Westerner within its borders. At the same time they are developing a national spirit that is so intense that as yet it is not altogether rational. Some claim that Bolshevism is back of the movement in its beginnings, although students disclaim this. America returned the Boxer Indemnity money to China for the advancement of higher education. Now it is generally understood that the Russian Boxer funds are being used to send Chinese students to Russia for "short courses" and funds supplied on their return for propaganda purposes.

The students claim that this is a wholly patriotic affair and advocate non-violence to foreigners and property. Although the situation is terribly tense, the students have kept their word. The few places where violence has occurred has been when the rabble, incited by the passionate, patriotic harangue of the students, has got beyond control. Every day the situation changes, and every day it is likely to continue to change until a thorough investigation of the Shanghai tragedy is completed.



Posters which were displayed in the streets of Chinese cities by students.

The shooting affair in Shanghai is only the immediate cause which brought out the aggrieved feelings that have been smoldering in the Chinese hearts. Where the flames may spread and what the destruction may be, we cannot say now; but we do know that business has been shot to pieces; millions of dollars' worth of business is at a standstill; hundreds of thousands of strikers are idle; schools are all closed and the students are draining themselves and the merchants to feed the strikers. International relationships are tense. A fair and just settlement will make four hundred million people our friends rather than our enemies.

The Rich Man of Hongkong

By W. E. BARTON

WE DO not go far in any land without meeting funerals. I chanced to see a funeral procession of a rich man in Hongkong. He was a Chinaman, but died in the English hospital. I should think his funeral procession was a mile in length. There were no horses or automobiles, though these are not unknown in Chinese funerals now. The basis of each unit was a sedan chair, or some such structure, borne by two or more men. At the head of the procession was a giant image of a Chinese god, made of paper. Its height was given me by an educated Chinaman as sixteen feet. Next was a table with four images, perhaps ancestors of the family. Then followed a long sort of trough of bamboo poles, with satin red ribbons embroidered with gold characters, the biography of the deceased, whose name, I am told, was Chan Hin Sam. Then followed four boys in scarlet coats, beating drums or gongs.

Then came two boys bearing enormous paper lanterns, perhaps four feet in diameter. These were ornamented with kingfisher feathers, and bore the name of the deceased.

The hearse followed. It was an enormous structure of embroidered silk, about sixteen feet high. It was carried by four relays of eight men each. Then followed two daughters and seven wives of the dead man. They were dressed in white, the mourning color of China, and each wore over her head a yard or so of sackcloth. I stood near, and could hear them wailing.

Then came perhaps a hundred men marching on foot, friends of the deceased. Then came 48 sedans with relatives, all I think women. The foremost wore sackcloth. The later ones wore European clothing, with evidently rolled stockings, and showed no sign of grief. The boys who carried these forty-eight relatives were dressed alike in blue trousers and blue conical hats and the sedans had green sides and white bodies.

This was the end of the procession which had often to halt as it made its tortuous way through the streets, and was long in passing.

Mapping the Northwest Passage

From the popular American Atlas by Arrowsmith and Lewis, Philadelphia, 1804. Note that even Baffin's Bay was considered "doubtful."

(*Concluded from page 25*)

Government began again the attack upon the Arctic, with expeditions by land and by sea. Captain John Ross and Lieutenant W. E. Parry penetrated by sea into Lancaster Sound in 1818, and the next year Parry in command of a new expedition entered Barrow Strait and Melville Sound and Banks Strait. Parry received a reward of £5,000 for reaching the longitude 113° 48′.

In 1819 John Franklin, thirty-three years old, with twenty years of honorable and distinguished service at sea to his credit, commanded an overland expedition which rediscovered the Coppermine River and placed it in its correct position upon the map, having been located by Hearne in 1771 some 5° too far north. Franklin returned again in 1825, leaving at her entreaty the bedside of his dying wife, and embarking, as planned, with Dr. Richardson and Lieutenants Back and Hepburn to complete in large measure the tracing of the northern coast of North America. A supporting expedition by Bering Strait under Captain Beechey sent a boat around the icy Cape of Cook as far as Point Barrow. This place was approached from the east by Simpson in 1838.

The most northerly point of the American continent is in Boothia Felix, reached by Captain John Ross in 1829. An equally noteworthy discovery of this expedition was the discovery of the magnetic pole at 70° 5′ North, 96° 46′ West. Five years, with only one fatality due to Arctic conditions, were passed there by Ross who was the first to bring a steamship into this service.

In 1845 Sir John Franklin again yielded to the fascination of the North. On May 19 the *Erebus* and *Terror*, with one hundred twenty-nine officers and men, sailed from England reaching Lancaster Sound in late July and *were never seen again save possibly by Esquimos.*

Space does not suffice for the story of Franklin and the numerous relief expeditions sent out in a search extending over fifteen years. In a cairn at Point Victory was finally found, after fourteen years of search, the brief and tragic record of the discovery of the Northwest Passage.

"28th of May, 1847.

"H. M. Ships *Erebus* and *Terror* wintered in the ice, in latitude 70° 05′ N., longitude 98° 23′ W.

"Having wintered . . . at Beechey Island in latitude 74° 43′ 28″ N., longitude 91° 39′ 15″ W., after having ascended Wellington Channel to latitude 77°, and returned by the West side of Cornwallis Island . . ." G. Gore, Lieut."

On June 11, 1847, Franklin died on board the *Erebus*. In Westminster Abbey the memorial tablet reads:

"Not here: the white North has thy bones;
And thou Heroic Sailor-soul,
Art passing on thy happier voyage now
Toward no earthly pole."

Gore's record was supplemented by Captain Crozier on April 25, 1848, by the account of the death of Franklin and the abandonment of the ships. This the last written record was signed by Captain Crozier and Captain James Fitzjames of the *Erebus*, with the laconic close: "And start on tomorrow, 26th, for Back's Fish River." One hundred five men started on the journey and on the dreadful trail from Point Victory to Todd Island graves and skeletons testify to their heroic but futile efforts. "They fell down and died as they walked," so said an Eskimo woman, forging "the last link of the Northwest Passage with their lives." Franklin discovered the Northwest Passage which became his tomb.

The successful passage northward from ocean to ocean was first made by the northeast by the scholarly Nordenskiöld, a famous collector of early maps, who sailed from Gothenburg on July 4, 1878, and before being frozen in arrived within two days' journey of Bering Strait, emerging at the strait on July 18, 1879.

The Northwest Passage by sea was accomplished in a voyage of three years, from 1903 to 1906, in the little steamship *Vega* by Captain Roald Amundsen. Life gave to him that passage from the Atlantic to the Pacific whose lure had brought destruction to hundreds of brave souls, intent upon adding to the store of human knowledge. To him also is due the almost equally great discovery of the South Pole. One man may well be content with these.

The Northwest Passage in 1850 after the voyages of Franklin, Ross and other Englishmen.

Footlight Flashes on Manhattan Stages

(*Concluded from page 23*)

Meanwhile the ideal creation for the amusement of super-morons, "Abie's Irish Rose" continued to smash all records for endurance runs in the history of the American show world. On the twenty-third day of May, in the year 1922, this indescribable hodge-podge of drivel made its bow to Manhattan the Wise. It has been roaring like a prairie fire ever since. Its author, Anne Nichols, was a playwright of sorts who had made some success in turning out pieces for a professionally Irish actor who tours the country year after year to delight the lonely souls of maid-servants, chambermaids, and others who long for a breath of Erin even when it emanates from an American playwright. Her experience as a fashioner of these comedy dramas evidently gave Miss Nichols a shrewd insight into what the public will tolerate. When she turned her talents to "Abie's Irish Rose" she capitalized that knowledge. She took the worst absurdities of the kitchen servant comedies and grafted her Irish rose on to a Jewish plant. Throwing in a little war stuff, a rabbi and a priest, a belligerent Irish father, an equally belligerent Jewish father, and a baby, she concocted a stage entertainment which is the most amazing spectacle the American theater has ever seen. It reeks with pro-Jewish propaganda. There have been as many as six companies assaulting the intelligence of the nation in different parts of the country at the same time. "Abie's Irish Rose" has played cities, towns, and hamlets the geographers never knew were on the map and it has made money by the barrel. One organization ran for fifty-seven weeks in Chicago, another for twenty-nine weeks in Pittsburgh, another for twenty-eight weeks in Cleveland, another for fifteen weeks in Washington, and still another for seventeen weeks in Toronto. Cities which have always been listed as one-night stands entertained Miss Nichols' play for three and four weeks at a time and it is still running in Manhattan. Figured out mathematically the combined number of performances already given by "Abie's Irish Rose" if made by one company in one theater would last for fifteen years. It has made millions for the author and the producer and is a perpetual sore spot in the heart of at least five experienced managers who turned up their noses at it when Miss Nichols asked them to do it. She was the only one who realized its value and she staked everything she had previously made in the chambermaid-drama line to get it on the stage. The opposition logrollers on the Manhattan newspapers and in the Manhattan magazines may war to the death because the Pulitzer prize committee passed up "What Price Glory?" in favor of "They Knew What They Wanted." Miss Anne Nichols should worry about thousand-dollar premiums. Her receipts for ten minutes of one night performance amount to more.

A Play Which Has Run Fifteen Years

Despite the fact that it may be the intelligence-annoying thing it is, "Abie's Irish Rose" is a better example of what the stage can do in the line of raising the standard of good manners, good morals and good taste of the theatergoing public than the other two plays combined.

"Abie's Irish Rose" appeals to the Jewish inferiority complex. Intellectual Jews, of course, despise it as do intelligent Irishmen.

Miss Nichols has achieved money and prominence by her work. She has done it with clean hands. That more than anything else is a record.

No comment on the theatrical season just passed would be complete without some notice being paid to the worst monstrosity of the year's crop, "A Good Bad Woman" recently "revived" at William A. Brady's theater, "The Playhouse." The manager confessed that the play was pretty bad but that he had put it before the people only with the idea of calling attention to the depth of degradation to which the Manhattan theater had fallen and not as a money maker. He wanted to stage something so bad the public reaction would be so fierce that the guardians of the community's morals would be forced to clean out the dramatic stables! They were so forced and Mr. Brady's theatrical stable got the first sweep of the broom. Whereat much acrimonious comment was heard issuing from the Brady offices but the harm was done and "A Good Bad Woman" passed into unfortunate temporary oblivion—unfortunate because it was only temporary.

What Happened to a "Good Bad Woman"

Mr. Brady's angry breast continued to heave tempestuously during the season as he sat and observed plays which he considered far worse than his very bad one, not only permitted to run but even to receive a pat on the back from the play jury squad. Naturally he felt he had been given a raw deal by the fates operating through the district attorney's office. So when the season was ending he decided to sing its swan song himself and let "A Good Bad Woman" play the accompaniment. So he "revived" the play "for two weeks only."

But in fairness to Mr. Brady it must be said that his offense is no worse than his brother producers. It doesn't make any difference in the Manhattan theater what you do—it's how you do it. Mr. Brady committed the unpardonable sin of making a bad woman in a play much worse than a bad woman could possibly be.

Treating My Plumber Diplomatically

(*Concluded from page 8*)

me when I say that in these matters w suffer together, as we should pu together.

"But I feel confident that in you heart you will remember our commo sufferings and believe in treating th problem neither as an exclusivel financial nor commercial problem, bu as a moral problem.

"Even from a commercial an practical viewpoint it must be appare to you that terrible difficulties would b involved in my making full restitutio to you. What you did for me did no increase my earning power in an way. It is true that when the wat started leaking, I needed you rath badly. Moreover, after I had car lessly turned cold water into a hot an dry boiler I was in acute distress, f the *Morning Profound* had predicte a cold wave. You saved us from floo and from perishing from cold; but become poorer every day just th same.

"I hope you will show as much goo will in helping me solve my problen as I have shown in this letter in helpi you solve yours. I have always bee loyal to our village and shall be loy to all of us at all times.

Fraternally yours,
Me."

And you know, I think that is th way to handle them—firmly, an definitely and clearly. I am so gla that I have been making a study international affairs. It is so helpful.

The River of Song

"WAY Down Upon the Suwane River"—Do you remember the ol song, one of the most popular Stephe Foster composed? The beautiful o Suwanee River heads in the souther part of Georgia and runs southwe through Northern Florida into the Gu of Mexico. To those who have visite this section the very name brings t mind peaceful bayous, sand, and su shine. And the cypress swamps, di mal but picturesque, with silver fe toons of Spanish moss hanging fro living cypresses leaning far out ov the stream. A jungle of young pine palmettoes, and scrubby live oaks inte laced with wiry vines and creeper Overhead a feathery canopy of pa sage-green leaves. On rugged ol trunks air plants find ample roothol Rare orchids hold out great cataract of bloom. Vivid amaryllis flowers gro out of the trunks of the cypress, wit delicate ferns to keep them company The smooth, unbroken water of th deep lagoons reflects the blue sky of th winter days. It is a paradise of th Southland.

On the road to Jerusalem, from the railway station.

Jew and Gentile in Jerusalem

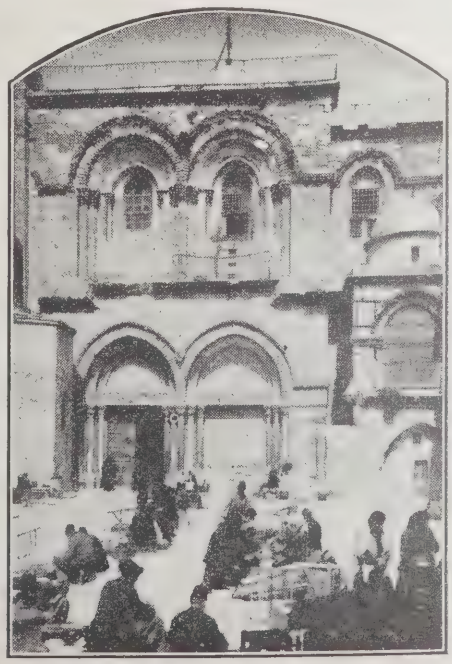
By HAL WALKER

NO ONE can approach the Holy City, I think, be he religious or skeptic, without a feeling of veneration for the ancient ity which has been the center of the hristian world for two thousand ears. He may have very indefinite eas as to what he will find at the oly Sepulcher on the Mount of lives, at Bethlehem or what the pool Bethesda will look like, but the sight those towering walls which he knows ve stormed by the Crusaders to de- er the Holy City from the "infidel," d which have seen many a conflict, bound to stir him deeply.

As we were whirled along the glaring ight road from the station, dipping wn into a little valley and then mbing again the hill on which Jeru- lem rests with her famous gates, I mit I was filled with a curiosity which other city in the world has aroused, t even Damascus with her age-old ditions and stories. We passed grims plodding along on foot and ders plodding only a little faster on e backs of tiny asses, and then, all at ce, we were through the gates, climb- g another steep hill and drawn up in nt of the hospice of Notre Dame de ance which was to be our home for e days we remained in Jerusalem.

Notre Dame de France is run by the suits for pilgrims of all races and, was told later, is by far the most mfortable hostelry in the city. It is huge stone building, severely plain e a monastery. There are no carpets other luxuries on the stone stairways d floors, but the rooms, mere cubicles, e extremely neat and the beds com- table. There is no running water, e old-fashioned pitcher and wash bowl taking the place of the later conveniences to which we of the West are more accustomed, but which are hard to find anywhere in the Near East. The table is excellent with good French cooking and wine with meals and the pension rate is only forty francs a day. This is considerably higher than such accommodations would cost in France but much of the food has to be imported, one of the Fathers telling me that they could get potatoes only by bringing them from Marseilles.

I was extremely fortunate in Jerusalem to be with this party of distinguished Frenchmen, for the Franciscans acted as our guides and any one of these priests knows more about the city and its interesting spots than all the professional guides put together. Under this guidance we not only saw all the places to which the ordinary tourist is admitted but we had entrance to others which are not open to the general public. Further, a few of us were invited, through the courtesy of the French consul, to dinner at Government House as the guest of Sir Herbert Samuel at which time we were able to learn much of the British idea of a national home for the Jews as carried out by Sir Herbert on behalf of the British Government.



Facade, Church of the Holy Sepulcher.

Naturally, our first pilgrimage was to the Church of the Holy Sepulcher, under the guidance of a white-robed and bearded Franciscan. Winding down innumerable steps and through many crooked streets we came to this Holy of Holies of the Christian world, the sepulcher from which the stone was rolled away and around which the church is built. Outside the church are scores of Jews selling views, picture post cards, rosaries and just plain souvenirs of every description, while inside the edifice are evidences of the warring sects (Christian) which are in practically open conflict over the use of the church for their various services. There are Protestants, Catholics, Jews, Armenians and Greeks, all of whom profess to believe they have the sole right to the church, hence the hours of services have to be arranged by general agreement so there is no conflict. In addition to this general grouping, there are various Protestant sects, Catholic and Greek orders, so that the problem becomes more complicated. It is said that on more than one occasion the

warring Christians have come to blows over the occupancy of the church, but for this I shall not vouch.

After visiting the Holy Sepulcher, itself carved out of the solid rock, the surface of whose entrance has been worn smooth by the millions of hands that have passed over it in the centuries gone, we went through other parts of the church and into underground passages in one of which we were shown three crosses which were purported to be those on which Christ and the robbers were crucified. There were tinsel, candles and decorations of cheap cloth in nearly every section of the church, and then we came out, through the beggars and peddlers massed at the doorways, into the bright sunlight and took our way to another part of the city to the Mosque of Omar, richest in all the world outside of Mecca itself.

Jew, Gentile and Mussulman, all claim Jerusalem for their own, but I was struck especially with the peace, quiet and dignity of the Mosque of Omar in comparison with the garish display at the Church of the Holy Sepulcher. Set, squatting really, in the midst of a wide open space, the Mosque is far more quiet than the church. There are no beggars and peddlers near the doors, half-naked Arab boys who tie the sandals on one's feet and then hold out their hands with the universal demand of "baksheesh" really going with the picture rather than spoiling it.

The Mosque of Omar is built on the site of Solomon's Temple and around the Rock of Abraham. Its interior is decorated with more gold than any other building in either the Christian or Mohammedan world and its floors covered with the most costly of rugs. It is much more impressive, to my mind, than the Church of the Holy Sepulcher. There are only a few attendants and the faithful at their prayers in this remarkable building, while a few hundred yards away a crowd all day draws water from a well by means of empty coal oil cans and then fill goatskins with it to be carried to distant homes just as has been done for hundreds of years. It is the sight of skins used as water holders that makes one realize the antiquity of the setting.

To the "wailing wall of the Jews" we next went through narrow passages where the sun beat down unmercifully and where we had to pick our way over and around scores of beggars. These beggars were in all sorts of stages of disease and imbecility, and one woman I shall never forget as she sat with her back against a wall of the passage, hand outstretched and mouth open while scores of flies crawled over her face and into her open mouth without disturbing her in the least. The noise of the lamentations from the crowd leaning against the wall can be heard for some distance—Friday is the day when the place is crowded, but at all times there are a score or more present who make up in noise what they lack in numbers.

That afternoon, late, a few of us walked out to the Mount of Olives and saw the sun set over Jerusalem with the Dead Sea at our backs in the distance, and then in the dusk walked back and through the Damascus Gate into the city again. In the morning along the Via Dolorosa, to other churches and to the Pool of Bethseda which is not a pool any longer but which is visited by tens of thousands yearly. The story of Christ's healing one who could not reach the pool, as related in St. John, is told in eighty-four different languages and dialects in frames around the entrance to the garden in which the pool is located and where a visitors' book contains names from every country in the world and from all races. The afternoon was finished by a walk to Bethlehem, past British military barracks, on the way, to the spot where the Three Wise Men were drawn by the beckoning star.

That evening I, with a few others in the party, had the good fortune to meet Sir Herbert Samuel and his official family at Government House the residence of the High Commissioner, which was built just prior to the war by the Germans as an embassy. On opposite walls of the great courtyard in niches high above the ground are two carved figures, one of the Kaiser and the other of the late Kaiserin, dressed as Crusaders.

Whether the scheme of turning Palestine over to the Jews and making them the overlords of this country is going to work out is not for me to say. Even with British help it would appear to the casual observer that 70,000 Jews have little chance of dominating the 700,000 Arabs in the country, unless with British or other outside aid. I found much resentment among British officers at headquarters over France receiving the mandate for Syria and Lebanon, these officers maintaining that as it was the British and dominion troops which cleared the Turks out of the country, the British should have had the mandate and not the French.

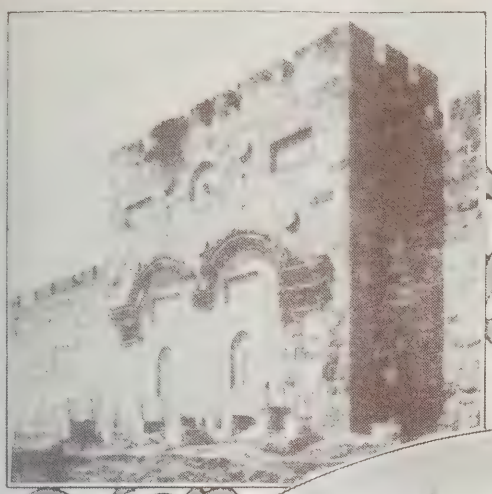
One officer with whom I talked whose name naturally cannot be mentioned, asked if I had gone to Palmyra and when I said we could not make the trip, because of the raiding Bedouins he smiled. He declared he had served there with the British expedition and they never, even in small detachments had had trouble with the desert tribes and that he had been to Palmyra with one or two companions on several occasions. "Why, the Bedouins of the desert there used to bring us goats' milk nearly every day," he concluded.

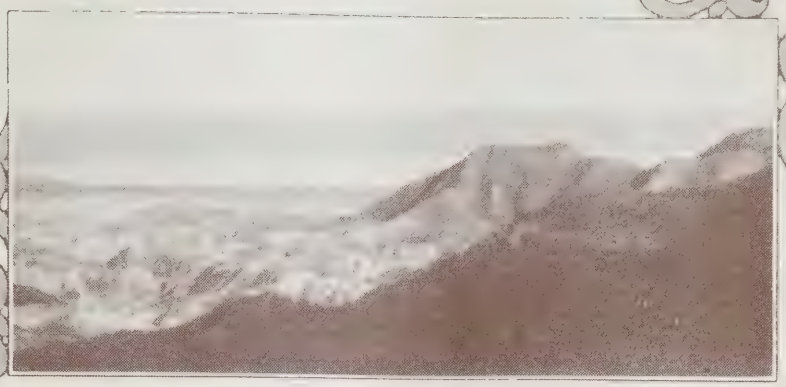
Another day and we started homeward, leaving the Holy City in the morning, back to Ludd where we changed to the Cairo Express, and then along through rocky and then desert country to the canal at El Kantara.

Two days in Port Said and five days later Notre Dame de la Garde on the heights of Marseilles welcomed us, a French statue at either end of the Mediterranean voyage.

The famous Mosque of Omar, Jerusalem, and (below) the rock inside the Mosque.

Jewish women on Friday at the wailing place.





The "Beautiful Gate" in the Jerusalem wall (upper left) was closed about A.D. 500. Part of the Dead Sea appears in the view above. At the left is shown the Mount of Olives.

HE who is for forcibly stopping the mouth of his opponent, or for burning any man at the stake, ... or impairing his means of procuring an honest livelihood, or treating him scornfully on account of his peculiar view of any subject, is under the domination of a spirit of ruffianism or cowardice . . . . . On the other hand, he who forms his opinions from the dictates of enlightened reason and sincerely desires to be led into all truth, dreads nothing so much as the suppression of free inquiry, calmly listens to the objections of others, feels nothing of anger or alarm lest his foundations be swept away by the waves of opposition . . . . . In proportion as we perceive and embrace the truth do we become just, heroic, magnanimous, divine.—*William Lloyd Garrison* (1805-1879).

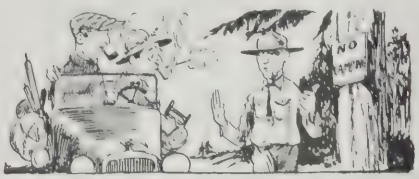
CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

U. S. Department of Agriculture explorers have brought from the Andes Mountains some rare varieties of potatoes that are said to have flesh as yellow as butter and a rich, nutty flavor.



As a result of disastrous forest fires in California last year, 10,000 acres of public land and forest have been closed to the public and camping and smoking restrictions have been placed on another several million acres of forest land.

The Royal Veterinary College in London cares for domestic animals in all their injuries and ailments and is the largest institution of its kind in the world.

Japan has decided to admit women to the bar.

In old King Tut's time, three barleycorns made an inch, and the length of an inch varied with the excellence of the barley crop.

A bronze tablet in honor of Edison, set in a huge boulder with a base of concrete containing bricks from the foundation of the first Edison home, was recently unveiled by Mrs. Edison at Menlo Park, New Jersey, near the spot where Edison made his first invention.

John Muir, naturalist and poet, and largely responsible for the setting aside of the Yosemite Valley as a national park, called sheep "hoofed locusts," because of their ruthless raids upon forest vegetation.

In May, 1926, investigators in several countries will make daily ascents to study the upper air.

The freighter *Saugus*, from Spain to New York, slid onto the submerged ledge of an iceberg. S O S.'s were answered but the vessel was finally released by a movement of the ice mass and proceeded on her way to port.

Glen Frank, newly appointed president of the University of Wisconsin, is said to be the youngest university president in the United States.

When Segundo Tellechea, a butcher of Campo Florida, Cuba, won the $20,000 government lottery prize, he reduced meat prices far below any other butcher in Cuba.

In 1681, though there were thousands of books in the library of the Royal Society, only 35 of them were on Agriculture, of which only a few were in English.

A flier was fined $25 for flying under the 2,000-foot altitude when he flew in his airplane over the stands on Yale Field, New Haven, Connecticut.

A Supreme Court Justice in Brooklyn refused to approve a certificate of incorporation for the first Hwerchnedneprowsker Progressive Society on the ground that the name was un-American.

An ordinance passed April 19, 1800, by the city of Schenectady, New York, fixed a limit of six hours as the time during which a carriage of any kind might stand on any street or alley "after sunset or in the daytime." Delinquents paid 50 cents for each offense against this law.

Rare coins are filtering through to Paris and America in numbers so large that they suggest that a valuable find has been made. It is believed to be in Persia.

From a total of 40,000 children and young men who have been before Judge Ben B. Lindsey in the past twenty-five years, only one case has graduated to the capital criminal class.

Of the more than 200 government farm films in circulation, at least 95 per cent of the rôles were portrayed by real farmers, because gestures or mannerisms savoring of artificiality would be unerringly detected by the audience.

On summer Sunday mornings in Berlin, so many thousands of people crowd the trains, so they can get out in the country to take a walk, that it is almost impossible to get on them.

Monkeys of Pattani, a southern province of Siam, are trained to pick cocoanuts and edible seed pods for their trainers.

"Rodeo" is the Mexican word for "roundup." It is pronounced "Roday'-o."

Federal administration of the Territory of Alaska cost the government a total of $10,467,064 during 1924, the money going for the support of 125 different government activities in Alaska, under the direction of 25 different bureaus.

In the Philippines there are fish that climb trees, fish that squirt poison through syringes, fish so small that 10,000 of them, matured, make a light breakfast for a native, and fish that live on dry land and drown when placed in the water.

When an insect plague swept over the region near Essen, Germany, defoliating all the trees, the estate of Hans von Berlepsch, which has over a thousand birds nesting on twelve acres of land, remained green, standing out like an oasis in a desert.

No trees grow in Iceland, except a species of low willow.

Small grain, stacked immediately after cutting, without the labor of shocking, and cured by electricity, was successfully tried at Ripon, Wisconsin, last year.

Potash, in great quantities, has been discovered in Texas.

A new trail has been made down the face of Grand Canyon. It is 18 per cent as compared with 36 per cent on the Bright Angel Trail. It is possible to go over this new trail from rim to rim of the canyon in one day.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue:

Mr. Ford's Page this week discusses the one door o entrance to practical life. (p. 11)

Of deep interest at this time is "My Last Interview Vth William Jennings Bryan" by James Schermerhorn. Tis article throws some light on the Commoner's last dys and the conditions under which he waged his last fht. (p. 8)

So many diseases are the result of food deficiency tht we feel it our duty to disseminate as much reliable ntormation as we can regarding causes and cures. Giter is now known to be due to the deficiency of food ad water in a certain element which is plentiful in sne parts of the country but not in others, which is psent in some foods and not in others. What this ement is and how it may be supplied is told in "Goiter Fadication and Diet, by J. W. Turrentine." (p. 3)

Half a billion dollars a yr spent on tricks to incase facial beauty! Some of tls interest in beauty doctors isridiculous, some of it dangrous. And it isn't only the laies who are deceived by ptenders in this field, men a sometimes victims, too. (j 6)

An earthquake is the affair oa moment, but the recovery islong lasting—and it is this en of it that people know lest about. In his journey toJapan, Dr. Barton studied th extent of that country's recovery from the destruction oSeptember, 1923, and found mch desolation still remainin, against which he contsts the splendid courage of th Japanese. This is one of tse travel articles that tell wat we want to know. (p. 12)

Who is it that keeps attaking the "hundred per cent Aerican"? Repetition of the prase may be tiresome, but antagonism to the quality it represents is often veiled beneath it. (p. 14)

You have read in all the newspapers about St. Mark's-on-the-Bouwerie. And you have wondered what kind of high jinks is that to cut up in church. What could the rector be thinking of? The papers gave no idea whatever as to what lay behind the innovation. So THE DEARBORN INDEPENDENT asked a clergyman to go down and dig out of Dr. Guthrie's mind the real reasons for the altar dances. It makes a different story. And it is beautifully illustrated. (p. 16)

Rugs as a man's hobby—but such rugs, and such romance in the hunting of them! Another story illustrating the passion of the collector. (p. 18)

"Smashing Sunday" represents what is occurring in this country. Sunday is the workingman's day. More people lose it than ever before, because it is commercialized. No one wants a Blue Law Sunday—"The Sabbath was made for man, not man for the Sabbath," said Christ—but we cannot have a humanized Sunday and allow commercialism to smash it. (p. 22)

Mr. Finger again discusses the abnormal elements appearing in fiction and misrepresenting itself as "modern literature." The decadents are never modern. (p. 4)

We dislike the thought of leprosy, we think of it as existing far, far away. This article is likely to disabuse us of both the horror and the mistake of thinking it absent from this country. (p. 29)

"The Chinese Student" (p. 15); the story of mapping Alaska (p. 20); Herodotus on the building of the Pyramid (p. 32); Editorials, Briefly Tolds and I Read in the Papers fill out the list.

Should We Upset Things Industrial and Domestic

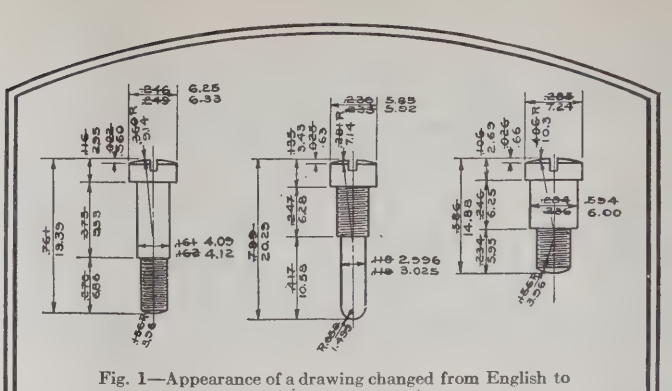

Fig. 1—Appearance of a drawing changed from English to metric measurements.

Metric System Means Muddle

by Substituti Alien Metho for Americar

IN PUBLISHING several articles on the propaganda which would change our system of weights and measures, this paper believes it is discussing a matter in which the plain people are vitally interested, though they may not know it. That they may not know it is due to the movement having been conducted among professional people.

A previous article (see issue of July 25) gave a general view of the matter. This present article presents a view of the changes in domestic and industrial life which would be caused by the introduction of the metric system, to which is added something of the tremendous cost that would be involved.

These are matters for the people themselves to consider, not for specialists alone, since the popular effects would be most far-reaching. The proposal to substitute the metric system for our present weights and measures is not merely a change of names, confusing as that would be, and impossible of accomplishment by compulsion in this country. The difference goes deeper and involves a change of quantities. It must be admitted that the quantities and sizes in which we buy things have a relation to our use of them. A bar of soap is a certain size for a certain reason. A bushel is a convenient measure, based on other convenient measures. Why the bushel should give way to the hectoliter, equaling 2.8 bushels, which is not a convenient or useful measure, or why the size of soap should be changed, is hard to understand by those who put practical matters before theory.

It might be argued, for example, that no great difference would occur if all the *names* of all the streets and all the *numbers* of all the houses were suddenly changed. It might be argued that the streets and the houses would be exactly the same in spite of the change of names and numbers. There would be a difference, however. The loss due to delay and confusion would be incalculable, so much indeed as to make such a supposed wholesale change impossible. But the metric advocates propose to go beyond all that: they suggest not only a change in the *names* and *numbers* but in the very *things* themselves. It might be possible to change the *name* of a *bushel* to a *quart*, and in the course of generations people might be trained to call a bushel a quart; *but when you change the bushel itself*, making it nearly three times as big as it is, that is quite another thing. A bushel has a right of existence quite aside from its place in a system of measures; it fits the handling and the uses and the convenience of men, such as a hectoliter, of two and eight-tenths bushels, never could.

If the new metric system were adopted, household affairs would immediately feel it. Grocers scales would require new weights. The present notched balance beams would have to be scrapped and new sliding weights provided. Quart, peck and bushel measures would have to be discarded. Cooking receipts would have to be rewritten in terms of kilograms and liters. Kitchen measuring utensils and the old quantity rules for combining ingredients would be hopelessly confused. Milk bottles would have to be larger than the present ones, because the *liter*, which would then be the new quart, would be 567/10,000 larger than our common quart. Tape measures, yardsticks and foot rules would be of no use because there would be no *yards* and no *feet*. Housewives could check up on the honesty of salesmen only by installing an entirely new set of measuring instruments at home and learning the new scheme of weights and measures. Dry goods now folded in yard widths would be folded in meter widths. An 8 by 10 plate of glass would become a 203 by 254 millimeters plate of glass. The housewife who has found certain quantities of food, such as butter and various perishable commodities, to be most convenient and economical to purchase, will find herself confronted with the necessity of buying either a larger or smaller quantity. It will not be buying a *pound* of butter and calling it a kilogram, because the kilogram weighs more than *two pounds*. The nearest the housewife could come to the convenient pound weight would be o order five decoliters wh would weigh 1.63 of an ou more than a pound, or 17.7 ounces.

Would the housewife this? No. But between sharp dealer and the unw buyer there would be a p fectly appalling opportun for fraudulent dealing. A as for enforcing such a l the sheer impossibility it is apparent without cussion.

This, however, is but and the least costly side the picture, although it wo doubtless affect the lar number of people. The c to the manufacturing and dustrial world would be so stupend that simply to consider its dimensi is sufficient to relegate the entire p metric propaganda to the realm of a and academic dreams.

Take the cost of changing and numbering 100,000 mileposts on r roads, the cost of repainting "mi to" and "miles from" on depot sig the cost of changes in time-ta mileages; the cost of rewriting railw tariff schedules and books of rul the cost of changing speed recorde dimensions of wheels and axles a capacities of freight cars into met symbols; and add this to the cost a confusion of travelers and shipp who have all their lives bought tick based on *cents* per *mile* and shipp goods at rates based on *cents* per 1 and some glimmer of the cost in c field will be seen. With the changes packages and shipments to met sizes and metric weights the wh practical system of transportation incidentally the best in the world would be woefully upset.

As to the American machine shop the cost of establishing the met system there is beyond computatio We are on the inch basis, have won t manufacturing supremacy of the wo on the inch basis, and yet we have be actually endangered by the met proposal which arose out of acade politics and has had no part in t manufacturing growth of America that other chief group of manufact ing countries, Great Britain.

"Just the single item of chang the figures on drawings to give t metric equivalents," says Luther Burlingame, "would be an immen task involving the probability of ma serious errors. Even after the drawin are changed, the expense has just b gun. Fig. 1 shows how just one porti of a drawing typical of ordinary co ditions would be (Continued on page

Fighting Goiter With Sea Food

Deficiency in Iodine Is Found to Be a Main Cause of the Malady

By J. W. TURRENTINE, Ph. D.

GOITER being a deficiency disease, the result of a deficiency of iodine in the diet, the question naturally arises—What diet should be adopted to provide an adequate supply of that essential element? To answer this question many analyses of potable waters and articles of diet have been made by chemists interested in the goiter problem. An examination of the results impresses one with the unreliability of our natural supplies of iodine and with the haphazard manner in which that essential finds its way into our diet.

We are indebted to Professor J. F. McClendon, of the University of Minnesota, for our most comprehensive survey of the drinking waters of the American populace.

Water Which Is Deficient in Iodine

His investigations have embraced samples collected from the various parts of the United States which he has subjected to analysis by most delicate methods to determine their iodine content. He finds a striking parallelism between the occurrence of iodine in the drinking water of various localities and of goiter among the inhabitants drinking it, incidence of goiter increasing as the iodine content of the drinking water decreases. Dividing the country into four zones on the basis of iodine content of drinking water, the first zone (the northern and northwestern states) in the water of which there is only from 0.01 to 0.1 part of iodine per billion parts of water is found to be the zone of the greatest occurrence of goiter; and the fourth zone (the southeastern states), in the water of which there is found from 1.4 to 10 parts of iodine per billion parts of water, is the zone in which the occurrence of goiter is least marked.

But the entire northern half of the United States constitutes a zone in which the drinking water is so low in iodine content as to be a distinct menace to the health of the people using it. This is the great goiter belt. It is here that goiter surveys among the school children show almost 50 per cent of them to be victims of that scourge. Because of the insidiousness of the disease, a full appreciation of the seriousness of the situation which these facts represent has yet to be realized.

McClendon says: "It is not intended to intimate that there is enough iodine in drinking water to prevent goiter."

It is maintained by certain of the Swiss goiter specialists that a child should have a regular daily supply of about one-tenth of a milligram of iodine if it is to be adequately safeguarded against goiter. When it is recalled that on this basis one pound of iodine is enough to supply four and one-half million children, or one child for four and one-half million days, some idea is obtained of the minuteness of this requirement. Yet the drinking water of even the southern states where the iodine content is at the maximum of ten parts per billion is not able to supply even this small quantity, for the child living there would have to drink about ten quarts per day to secure its quota. And any child living in the region where the drinking water contains the minimum amount of only 0.01 part of iodine per billion parts of water, would have to drink ten thousand quarts per day to get its full quota! Drinking one quart per day it would be 27 years old before it had acquired its first day's supply.

The thyroid gland of the adult of 27 years requires for its normal operations a permanent *store* of 20 milligrams of iodine in addition to a daily supply. McClendon has shown that if one relied, for example, on Lake Superior water for drinking purposes, it would require 2,000 years to acquire this 20 milligrams!

> *But since not more than 50 per cent of the people drinking such water suffer from goiter, it follows that they must obtain their iodine from their food or from artificial sources.*

What are the chances of obtaining necessary supplies of iodine from the average diet? Since articles of a vegetable origin make up the bulk of our food, let us examine them as carriers of iodine.

Unfortunately, vegetables while growing must use drinking water of the same general nature as do the people that use them for food, unless they are grown in one region and transported into another.

Plants are able to develop a small store of iodine within their tissues since the water that enters them through their roots carries with it its natural content of iodine which is left behind within the plant as the water evaporates through the leaves. There should accordingly be found a parallel occurrence of iodine in the plants and the waters of a given region. And results to date do show a certain correlation between the occurrence of iodine in plants and of goiter in a given region. If everybody ate the same diet, such a relation could be more clearly shown.

Effects of Certain Plants and Grains

Small amounts of iodine are found in many of the common fruits, vegetables and grains of the goitrous regions, but in amounts so small that they are comparable to that occurrence in the potable waters of the non-goitrous districts.

Thus in wheat (as shown by McClendon) there is to be found 1 milligram per ton; dried apples, 2 milligrams per ton; oats, including husks, 10 milligrams per ton; spinach, dried, 18 milligrams; and string beans, dehydrated, 29 milligrams per ton. The child in search of its requirements of 0.1 milligram of iodine would have a better chance here, but it would still be in difficulties with a diet made up exclusively of these articles, as it would have to eat 200 pounds of wheat per day, or 100 pounds dried apples, or 20 pounds of oats and husks, or 11 pounds of dry spinach or 7 pounds of dehydrated string beans to obtain the required amount of iodine. However, if the wheat and oats were grown in non-goitrous regions, such as Maine, it would have to eat only 65 pounds of the wheat, or 1.3 pounds of the oats *and* husks, since a ton of the former contains 2 milligrams of iodine and the latter 150 milligrams.

Sea Food Is a Preventive

A diet of milk, eggs and meat would be of some assistance. While milk from a goitrous region contains only 5 parts per billion, this is very much better than the water; and the butter contains 10.6 parts of iodine. Here the child that drinks twenty quarts of milk or eats two pounds of butter per day would be adequately provided with iodine. But it would require 42 eggs or 44 pounds of beef or 11 pounds of veal to satisfy its craving for iodine.

If we turn to fish as a steady article of diet for the child, provided we eschew fresh-water fish in favor of those from salt water, our problem is somewhat simplified. For while 22 pounds per day of lake trout from Lake Erie or 7 pounds of whitefish, or 4 pounds of black bass from the Potomac, or 10 pounds of yellow perch; or 22 pounds of black bass from the Mississippi or of black bullhead would suffice, if we provided a diet of one-fifth of a pound of hard clams or of oysters or of lobsters or one pound of bluefish or cod or haddock, or two pounds of pompano or 10 pounds of spotted squeteague, the child's needs would be satisfied.

But marine vegetables are lacking from this menu—a tragic circumstance, for here is the only natural growth that contains assimilable iodine in really liberal amounts. In some varieties of marine vegetables (Concluded on page 27)

Moderns and Ultra-Moderns

Should We Call Them "Intelligentsia" or Merely Faddists and Ultra-Faddists?

By CHARLES J. FINGER

A MOMENT ago I put aside a magazine after trying, but in vain, to read what purported to be a story written by Gertrude Stein. Its title ran "If You Had Three Husbands," but what it was all about I do not know. It was jumpy and disconnected, like a nightmare conversation, or a madman's talk. Here is a sample, taken from the chapter called "Length of Time":

"Pleasant days.
So to speak.
Sand to day.
Sunday.
Sight in there.
Saturday.
Pray.
What forsooth.
Do be quiet.
Laugh.
I know it.
Shall we.
One must be willing.

If one loves one another by that means they shall not perish. They frequent the same day and nearly it was six months apart."

But, mark you, I have not chosen the passage for its special and distinct mysteriousness. The entire installment was quite as wild and whirling and incomprehensible. Reading it, I was reminded of a tremendously long paragraph, thousands and tens of thousands of words long, at the latter part of "Ulysses," by James Joyce, the day dreamings of a woman. The passage twisted and turned, shot off at tangents, looped here and there, raveled and twined in a way beyond belief. Well, Gertrude Stein's story is like that. After a page you are obfuscated by the literary debauch. You haven't a leg left to stand on. Nor are you helped when Mr. Jean Epstein tells you that that kind of thing shows that "close relations link the kinesthesia of an individual to his subconsciousness," and find that you have been sampling the work of an ultra-modern.

To come down to bed rock, Gertrude Stein's work is interesting because it is representative of the eccentricities growing out of a modern movement. Sherwood Anderson's work derives from the same movement. So does the work of Waldo Frank, of D. H. Lawrence, of Ben Hecht and many others, and the movement, or fad, or theory, or whatever you choose to call it, is psychoanalysis, and Freud is its chief exponent.

Catering to the Appetite for Mystery

Psychoanalysis largely concerns itself with dreams and the dreams, life, as we shall see presently. What is most important, just now, is to note the effect it has had on literature, especially fictional literature. For effect it has had, and will have for some time to come, just as other movements and discoveries and theories have changed literary tone; the French revolutionary movement, for instance. Better still, call to mind the reading of a few generations ago which grew out of a fad for the mysterious. Then came a marked literary tone, when men and women delighted in flesh-creeping horrors and nerve-thrillin tales. Hardly a novel but had i action growing out of the fulfillment some dark prophecy; hardly a romanc but had its pungent horrors; awfu eyed astrologers; skull-faced specter phantom-like forms; skeletons an corpses; hidden manuscripts with terri ble secrets; lurking shadows that con cealed untold horrors; dead-cold hand that reached through unsuspecte panels and all that kind of thing. Th history of forgotten literature is crowde with the names of those who catere to the appetite for mystery—Mr Radcliffe, Walpole, Maturin, Beck ford, Mary Shelley, Charles Brockde Brown. And all that, as I have said grew out of a fad for the occult, whe any fellow of craft and intrigue coul manage to get himself taken seriously when any vulgar charlatan could se up shop as Diviner, Chartomanticis Onchymanticist, Geomancer. It woul be easy to fill a column with the quee names the pseudoscientists gave them selves.

Of course, the good folk of that da never for a moment suspected thei own deplorable case. The essentia tendency of an age is never manifest t the age that harbors it. If the reade who fed on horrors thought abou tendencies at all, they thought of, an wondered at, the tendencies of th sixteenth century when there was a the excessive discursiveness of th pastoral school, with an idyllic worl of flower-spangled valleys inhabited b youths and maidens who played a sheep-herding and who conversed i rhymed iambics. *Satisfied with the*

Satisfied with their literary diet of horrors, they bestowed swift, contemptuous judgment upon the former age, no more seeing their own follies than we of today see our

erary diet of horrors, they bestowed ift contemptuous judgment upon the rmer age, no more seeing their own llies than we of today see ours.

And we certainly are not conscious our own strange reverence for the ysterious. If you doubt that, tell the st ten men that you meet that our esent-day literature shows a queer ndency because of our superstition, d nine out of the ten men will stand hast. Not only that, but there will energetic protest, especially—and re is the strange thing—especially your men are those proud of their lightenment, if they are those given talk in resonant phrases of the cessity for freeing the masses from eir chains and opening their eyes to 'unk,' if they are of the sort to talk ge about the dull complacency of the ctorians, unsuspecting the fierceness Carlyle and Ruskin and Morris and ngsley and Mill. But suppose you go with your experiment, regardless of e baleful eye bent upon you, and int out the popularity of the mascot th ball teams. You will be met th the true statement that there is thing but a light joke adding to the iety of nations.

When Preposterous Notions Are Swallowed

But you counter to that, as it were mentioning the Zetetic society established to prove te flatness of the earth; or the Koreshites Florida and their belief that the rld is a concave sphere on the inle of which we live; of the spiritualists d their active propaganda. Those amples will probably be pooh-poohed d thrown out of court as evidences mental ailments peculiar to a weak k, or dismissed as something disputable to human intelligence. But ention some such thing as the Abrams siness where there seems to be delite machinery involved, or talk out the possibility of sending radio ssages to the inhabitants of Mars, or fer to Professor R. H. Goddard who nts to shoot a rocket to the moon, bring in Dr. Steinach with his uvenation scheme, or Dr. Charles oss and his invention, the motion of hich is to be controlled by the human e, and then your men will register spect. So also will they believe in the rrespondence schools and their ability instruct anyone in the proper thing do when a spoon falls to the floor, how to manage a railroad. And tere is abundant reason to believe at a good many of your ten hypotetical men will stand firm in their lief in the virtue of rattlesnake oil a cure for chronic deafness, or in the icacy of pads to cure indigestion, or a patent nostrum to destroy catarrh rms, or in an easy way to cure epiptic fits—if your men did not believe such advertised stuffs, it is difficult see why manufacturers should buy ace in a weekly of wide circulation e purpose of which is to destroy 'unk.' But of all things mysterious and wonderful, the Freudian theory of psychoanalysis would be held in deepest reverence. Of all clever talkers, those who have for their subjects complexes, the controlling force of the Censor, the sublimation process, the subliminal and the supra-colliminal—these would be most listened to because of their weird terminology and the mysterious non-understandable for which Tom, Dick and Harry have such deep respect.

I say the mysterious non-understandable because the psychoanalysts, like the old-time phrenologists, profess to read the inner man like an open book writ large. To them nothing is hidden, and the hypernormal and the subnormal functions of the mind are clear as crystal. Moreover, their names have a strange ring, and to the swallower of new things they seem to be the cream of the cream of foreign in-

After a page you are obfuscated by the literary debauch.

telligence. Just like the old-time dealers in the occult, their discoveries seem to open up a new field of romance, and should the men agog for a new thing venture far enough into the *arcana*, there is the ever-fascinating will-o'-the-wisp of mysticism. So, because of some or of all of these things the most incredible inanities, the most preposterous notions are being swallowed. Fads are elaborated into theories, the new thing presently finds its way into literature, under the wave of popularity good things are temporarily submerged, and the rising generation must pay the piper.

But the popularity of psychoanalysis is by no means entirely due to the love of sensation and the hunger for the mysterious. There is something besides the froth to account for its popularity. There is a residue when you get down to the bottom, and that residue is sex-interest. It is not the erotic, *per se;* that has been handled time and time again, often with delicacy and tact. It is something else, and the product ranges all the way from the stupidly vulgar to something very like the offering up of abominations in the name of art. To cite an example—Ben Hecht's fantasy, which brought burdens to author and publisher. Indeed it cannot be gainsaid that those with taste for things pornographic find much in psychoanalysis, very much, for in the movement are writers whose work when considered as literature is beneath contempt, yet handle filth with the same ease and unconcern with which the stable cleaner handles the ordure and shearn to which he has become accustomed by usage. And of course there are publishers who will handle almost anything likely to enjoy a skyrocket career.

Strangely enough, the literary exponents of the new fad pretend to interpret Nietzsche, wrenching that saying of his which he placed into the mouth of his Zarathustra into queer shapes: "Since humanity came into being, man has enjoyed himself too little." I say, wrenched the saying into strange shape, because there are novelists who have taken enjoyment to mean something very much like abandonment to crude desire. The plots of their books are almost entirely concerned with the gratification of sex. Consider Floyd Dell and his novel which was recently withdrawn from circulation, by way of instance. And there are W. L. George, Evelyn Scott, Joyce, Norris, Frank Harris, Sherwood Anderson.

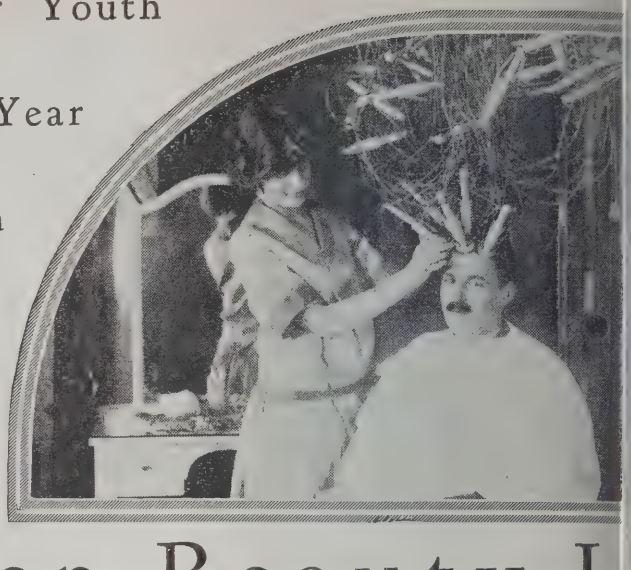
It Is Laughable to Think of Nietzsche

For Nietzsche, be it said, imposed a severe discipline upon men and aimed at the mental, moral and bodily development of the individual to the end that a race might be evolved as superior to ours as ours is superior to the Jagons of Tierra del Fuego. Certainly the fictional characters portrayed by the psychoanalytic novelists are far removed from any sort of discipline. Indeed, it is laughable to think of Nietzsche the self-asserting aristocrat so scornful of the lower types, so impatient of the weak and the sick in mind and body, interesting himself in the neuroses of diseased individuals and seeking opportunities "which should be given to the accentuated traits of our nature," to quote Tridon. And in Tridon's words much is hidden that does not at first meet the eye.

For if it means anything, it means that society should adopt a new ethics by which a use shall be found for everything. It sets aside the sound and proved belief that the destruction of tainted stock will leave a race the better for its removal. It means, in effect, the reign of that sloppy sentimentality by which a foolish parent would refuse to chastise a self-willed child.

Carrying the idea to its logical conclusion, society would seek out for a kind of public petting, each and every morbid deviation from the true type. That certainly is not Nietzscheanism, or I have badly misread that self-assertive philosopher.

Seekers After Youth Spend Each Year Half a Billion



The boys get their hair waved permanently, as well as the ladies, and no hair is too short for the waver to pick up and work on.

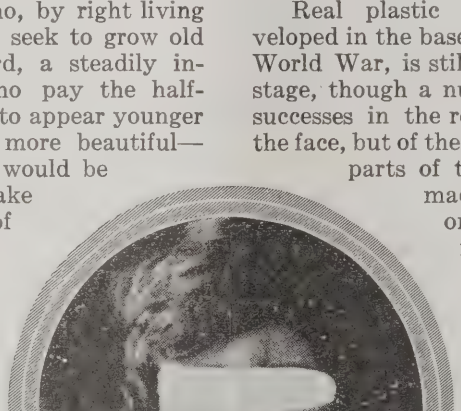
When Beauty I

By JOH

IT IS not only the artist who seeks beauty. It is not only the worker in marble or on canvas who is ever searching for the elusive perfect line, or the exact tint of the sunset. At least half of the women of these United States, and a constantly increasing percentage of the men, each year permit—and pay with the permission—beauty doctors, face-molders, so-called "plastic surgeons," and "flesh-builders," to play with scalpels and tweezers, acids and horse-hair, upon their faces, just as the artist plays with his chisel upon the marble, or with his brush on the canvas.

It is estimated that every woman in the United States spends at least $10 a year with her beauty doctor and her hairdresser. This does not mean literally that every woman in this country does this, but that enough women do do it to raise the average to this amount. The total spent in this annual chase after Beauty approximates $500,000,000 a year—half a billion dollars every twelve months—to have wrinkles removed, hair "restored," noses reshaped, ears set back, mouths made larger or smaller, necks made smooth and round, until an imitation youth replaces the natural appearance of oncoming age.

In this respect, there are three classes of women in America: First, and greatest in numbers, those who have not the knowledge of "facial surgery," or the time, or the money, to have it done; second, and in the great minority, those who accept age as inevitable and who, by right living and correct thinking, seek to grow old gracefully; and, third, a steadily increasing number who pay the half-billion dollars yearly to appear younger—though often not more beautiful—than they otherwise would be were Nature left to take her course. Most of this third class, once they have submitted themselves to the beauty doctor, find they have entered upon an endless pursuit, with annual operations necessary to preserve that which they so fatuously consider Beauty.



This women had a nationally known beauty doctor cut and tighten the skin, and fill the so-called "low spots" with paraffin.

Women are less vain than men, in that men, once they reach the fortieth milestone, usually are contented with their own appearance, or with what assistance the barber, the masseur and the manicurist can give them. Yet the number of men who seek to retain the above-the-collar similitude to youth also is increasing, particularly among those who depend upon public appearance, and the impression they make upon the public, for a livelihood. Among women, there is little distinction of class as to which most patronizes the "face-builder"; among men, actors are his best patrons, closely followed, oddly enough, by city politicians, ward bosses, and professional public speakers. One actor, whose name had been a household word for two decades, and whose face was as familiar as the faces of two celebrated brothers who manufacture cough drops, had his face rebuilt two years ago. He is now in permanent retirement, none of a dozen skilled surgeons having been able to remove the paraffin which was pumped into his sagging jowl muscles.

Real plastic surgery, which developed in the base hospitals during the World War, is still in the experimental stage, though a number of remarkable successes in the rebuilding not only of the face, but of the hands, feet and other parts of the body, have been made. To learn of these, one has to read the medical journals study reports of the great hospitals, or talk with the men who have been benefited. The results achieved are not being published in the newspapers, plastered on the billboards, or advertised in the fashion journals. Step by step, these surgeons, some of them the greatest in the world, are applying what the wounds of the World War taught them to the rescue of men and women marred by fire, explosions, and other accidents of peace times. But they do not stoop to skinning an old woman's face merely because she has the money to pay for it.

Out of this very real and very worthy, though comparatively new, science of plastic surgery has grown, however, the "beauty doctor," the "face-builder," the "youth-restorer," and the self-advertised "plastic surgeon." In the majority of instances these operators are licensed physicians who have walked that shadowland of medicine which lies between legitimate practice and quackery. They find their new field much safer than the old, because they obtain from their patients signed statements absolving them from all responsibility as to results; and because their financial returns are many times as great as are those of the doubtful or the incompetent medical or surgical practitioner in other lines. The writer knows one such whose income as a physician was about $5,000 a year three to four years ago. Today, his income is between $7,000 and $8,000 a month, or something like seventeen times the amount it was before he "discovered" the art of rebuilding faces.

It may be taken as a fact that the last result of these anti-age treatments is far worse than the first result was beneficial. The same is true, though possibly to a lesser extent, of hair-dyeing, permanent waving, and similar operations on the scalp and its growth.

In the early days of the beauty doctor, during and following the World War, injections of paraffin were widely used and advertised for the "lifting up" of flabby cheeks, the "sustaining" of sagging muscles, and the giving to the face of the solidity of youth. In fact, the only feature overlooked in this method of battling the years was the raising of falling arches. But what happened was that when the natural warmth of the body reached the wax injected by these paraffin pumpers, the material seeped down into the chin, and along the chops, where it was never intended to go. Then, very rapidly, the patient took on the appearance of an aged cow afflicted with the widely known "lumpy jaw." Yet no veterinarian, not even the best of surgeons, could remedy the condition

Vacuum and light treatment for the scalp, with an instrument also used for facial treatment. As used by capable physicians, these do no harm

Do Results Justify Such an Outlay of Good Money?

Skinned Deep

SLOAN immediately because the tissues grew into and through and around the paraffin, which could be neither melted out nor removed with the knife. Hundreds of women, and many men, are staying closely at home these days, while reputable surgeons remove, little by little, and very slowly, the mass of paraffin from their faces.

The mother of a well-known actor, once a leader in society in one of our larger cities, has undergone fifty-six operations on her face, and still retains some of the paraffin injected more than five years ago. A man, whom the writer knows well, has had surgeons working on his face for seven years, and yet has lumps as large as small marbles in several places on his jaws and throat.

These results, in spite of the fact that the paraffin pumpers were protected by the agreements signed by their patients, worked so heavily against these "beauty doctors" that very few still have the temerity to inject this material into the face. Copying to some extent the work of the legitimate plastic surgeons, they have turned to tightening of the skin to remove wrinkles and to lift up the sagging facial muscles. This is accomplished by making incisions back of the ears and in front of them, as well as within the hair line on the forehead, clipping out a section of skin, and then sewing up the wounds with horsehair, thus pulling the skin tight. The ultimate result of this is little better than that of the paraffin treatment, because wrinkles and sagging muscles come from the inside, and not from the outside. The face, beneath the skin, is a complicated, curved sheet of muscles, which age withers, so that, as the years pass, they grow thinner and the skin above them limp and flabby.

Quite naturally, some of these muscles become thin before the others, pulling the face out of its original symmetrical shape, and permitting the skin to wrinkle in some places while still holding it smooth in others.

Rarely do wrinkles of the same size and depth appear all over the face at the same time, or at the time when women—and men—first think of having their faces rebuilt. The result is that, with this network of facial muscles pulling in their various directions, with a skin covering them which may or may not stretch evenly and smoothly, a few months after the operation sees the patient with a lopsided face, smooth in spots and wrinkled in others, far worse in appearance than when she, or he, first appeared before the so-called "plastic surgeon."

Another method of removing wrinkles is to "iron out" the face, with a specially constructed instrument, and cut off evenly the loose skin which forms the wrinkle. The edges of the cut so made are brought together and sewed up, again with the ubiquitous horsehair. This is a painful process, as many as five hundred cuts having to be made in the faces of some patients, and few will endure the pain, even with the improved instruments which inject a mild local anesthetic as each cut is made. It is also expensive, for few of the beauty doctors will undertake it for less than five dollars a wrinkle, while most of them charge ten. When carefully and skillfully done by a competent surgeon, this operation leaves the face free of wrinkles for about two years, when the muscles again become thin, the skin sags over them, and the wrinkles return; only to be cut off again, if the patient wishes to retain that "skin you love to touch."

What happened to a man at the hands of paraffin pumpers. Foreign matter introduced into his cheeks cannot be removed.

By still another operation, the outer skin is peeled completely from the face and a new skin grown on it. This is done by first applying a local anesthetic, and then a caustic preparation, after which the entire face, including the closed eyes, is bandaged, leaving openings for the nostrils and mouth.

The patient remains in this "pack" from 24 to 72 hours, when the bandages are removed, bringing with them the skin. Not only is this the most painful process of "restoring youth" yet known, but it is one of the most dangerous, because the menace of infection and the chances of septic poisoning are very great. Unless the operation is extended by sections to include the neck, the line of demarcation between the new skin which grows over the denuded spots, and the original skin on the neck is so apparent as to nullify the effect of the renewed face. About two weeks of seclusion are required for the new skin to grow. Thereafter, it is likely to remain fresh and smooth for not more than two years, when the thinning muscles again cause the wrinkles to appear, and beauty must be peeled again to prove that it is only skin deep.

The rebuilding of noses, considered necessary by the legitimate surgeon only when the nostrils fail to perform their natural function of carrying fresh air into the throat and lungs, is now done commonly by many beauty doctors, and is the least difficult, as well as the most successful of their operations. Most artists and physicians hold that the average face is symmetrical—not necessarily beautiful, handsome or even pleasing to look at, but symmetrical with regard to the comparative position and size of its features. By some of the methods of the beauty doctors, this symmetry is destroyed, and if the face is once drawn out of shape, no surgeon has been able to return to it its original lines or form.

A large number of women patronize these face-builders to have alterations made in the sizes and shapes of their mouths. Increasing of the much-sought "Cupid's bow" on the lip is another demand, while the manufacture of dimples where none dimpled before is a regular practice with many beauty doctors. The permanent result of many of the operations on the mouth is that a perpetual smile is left on the lady's face, no matter how serious she may wish her expression to be. Fortunately, however, the mouth made too large can be sewed up, the one too (Concluded on page 27)

Bryan Gives His Last Interview

The "Happy Warrior" Chats With a Friend of Fights Past and Prospective

By JAMES SCHERMERHORN

Sharon Lodge,
Clifton Forge, Virginia, July 27—

"And having on the helmet of Salvation."

THE figure of the panoplied battler for righteousness came to my mind when the helmeted and coatless Commoner—it was too hot in Dayton to put on the rest of the uniform of the Christian warrior—called for me at the drug store where the Scopes defiance of the Tennessee statute was first revealed. But he looked the uncapitulating Crusader.

It was the Friday afternoon following the rejection of the testimony of the great cloud of scientists who flocked to Dayton to confound the prosecution.

This reduced the issue to the matter of the young teacher's culpability before the law and forecast the defeat of the evolutionists. Court had adjourned till Monday.

I had dropped off the New Orleans-Cincinnati limited on the Southern to see about joining the Bryan party on its pilgrimage to the Holy Land next February.

The most eloquent voice in America on Mar's Hill, over the Manger in Bethlehem and beside the Garden Tomb at Eastertide, formed a beguiling outlook for one who had been under the Bryan spell in convention hall and on the hustings.

Always Fighting Under Torrid Conditions

I did not know till I detrained at the tiny station that it was to be a congratulatory call. But the calm in the somnolent streets indicated that it was all over but the pronouncing of sentence.

As I waited at the drug store, whose proprietor had turned over his home to Mr. Bryan, for the Commoner to come in his car and get me, I mused on how every foe he ever fought was in a confederacy with hot weather. That was a torrid summer he went through after "the crown of thorns, the cross of gold" climax. It was hot when I found him at the telephone at Fairview Farm in 1908, directing the proceedings in the auditorium at Denver. There was perspiration a-plenty in the anathematizing of Murphy and Ryan at Baltimore in 1912. It was nothing less than an inferno on the second floor of the Waldorf-Astoria one year ago, when the resolutions committee of the Democratic National Convention wrestled for 48 hours over the Ku Klux and League of Nations planks, and called upon Mr. Bryan to lead in prayer at the dawn of the third day.

And here he was again in a mid-summer Armageddon battling for the Lord. Long ago he learned how to get out of a dripping shirt into a dry one between stops of his special car; this last challenging of the unbelievers on Mount Carmel had necessitated the fashioning of a shirt without collar or full-length sleeves.

And in this undress uniform he had won the outstanding victory of forty years of crusading.

Friends and Foes of the "Happy Warrior"

But he had paid the penalty of declaring the faith that was in him. As we motored out to the quietude of his mountain-side stopping-place, he said nothing in all of his political experiences had approached the venom and malignity of insults and maledictions heaped upon him for bringing his fundamentalism to the Scopes trial. Taunts, detractions, threats in newspapers and letters were flooding his headquarters in the field.

Much of this the Happy Warrior expected. He had faced opposition too often to be perturbed by reckless assailment. But the Commoner did confess surprise that several supporters in past adventures, to whom he had appealed for expressions of approval in this effort to uphold revealed religion, had not only backed away from the cause, but had taken offensive methods of making their break with the battling believer known of all men and a tribute to their own intellectual courage.

These calumnies ranged all the way from the bartering of the Bryan birthright for the gold of Florida realtors to the use of the monkey's tin cup to collect first-page publicity from the Dayton trial. He was wearing the livery of Heaven to serve the devil of sordid self-seeking.

Mrs. Bryan, who was awaiting us on the front porch—chair-ridden, but sweetly self-possessed and mentally alert—shared her husband's glow over the collapse of the liberal's case; but she also was shocked by the personal rancor displayed by the opposition. The papers that morning had carried an interview with Mrs. Darrow in which she had expressed surprise that an individual of Mr. Bryan's tip-seeking proclivities was tolerated at all.

But Mrs. Bryan was no more dumbfounded than Mr. Bryan was at the Darrow sally delivered to a group of boys at the courthouse door: "You'll have a better time going to hell with me than to heaven with Bryan."

She was reminded of the old saw: "The clubs are found under the best tree in the orchard." I was glad to bring the report that in the several states I had traversed there were audible evidences on every hand that Mr. Bryan's whole-hearted upholding of the Divine origin of man and his immortal hope had quickened the faith of his fellow men and brought to their lips avowals of renewed fealty to their Lord and Master.

Similar testimony was in Mr. Bryan's hands that moment, expressions of gratitude from near and far for his uncompromising affirmations of faith in old-fashioned religion. Among the fervent greetings was a cablegram from the Bible Society of London, England, extending congratulations and prayers. Delegation after delegation motored up to the house, bringing greetings and good will; mountaineers and neighbors ventured in with the choicest things from their gardens, rapturously happy to show in this way their thanks to a leader for "standing by the kind of a Bible they couldn't keep house without."

It was plain there was more of the sweet than the bitter to Mr. Bryan in that afternoon of foreshadowed victory. Very earnestly he confided in me that he sensed the coming of the glory of the highest consecration to which he had been called—the ceaseless advocacy of the Old, Old Story against the slurs of agnostics, the indifference of the worldly and the assaults of the scientists.

Sundry Slanders Which Were Refuted

"I have noticed the reflections on my good faith," said Mr. Bryan, "to the extent of giving out the statement that I have never made an address on Sunday for material reward, and time and labor given to causes without compensation far outweigh the services for which it has been entirely legitimate for me to expect compensation. But my enemies always sniff at this, and because of their slanders the world receives what I have to say on the subject with incredulity."

I reminded Mr. Bryan of a convention of the high school boys of the Michigan Y. M. C. A., at Ann Arbor, where I had the privilege of introducing him. It was held in the Hill Auditorium on a Sunday night. Next day it was current that the Secretary of State had charged $500 for his services, at this religious service, a feature of which was Mr. Bryan's success in getting 15,000 Michigan boys to sign the pledge.

It happened that it fell to me to settle with Mr. Bryan for the committee. As he refused to accept a penny for his services or for his trip from Washington, the (Concluded on page 25)

These Reckless Drivers Are Never Arrested

A HIGHWAY engineer was talking. He pointed to a map showing an acute curve in a roadway which dived blindly through a cut through a railway embankment.

"We rebuilt that road in such a manner that the thousands of cars which travel it on a big football day could be moved around what had been known as 'Dead Man's Curve' at thirty miles an hour."

He thought in terms of getting traffic moved. To him thirty miles an hour on that curve was safe when he had rebuilt it so that it was "blind" at no point.

This is a lesson worthy of study. Town and county fathers have come to have a great faith in regulation, signal systems and heavy policing expenditures.

In many instances one good whack at a horse and buggy curve still doing duty in a motor age would add years to the expectation of life of members of the community. But sizzling motorcycle policemen, whose mere appearance on a road will slow motorists from a legal thirty to a twenty-mile gait that is no more legal and no safer, are considered to be infinitely more important.

No sane person holds a brief for reckless speeding; but the most experienced drivers will tell you that fast driving is not the only menace on the highway today. There is the very "safe" driver who turns suddenly without signaling to the car behind. Then there is the meandering individual who signals a turn to the left, swings the car to the left, then turns to the right. Also the timid soul who has never yet driven faster than twenty miles an hour and who eases around curves at fifteen—on the wrong side of the road. If these could be taught that the road is there to move traffic and that nowadays the driver need think like a railroader!

A Billion Friendly Dollars

THE Oriental seeks today's petty gain today, perhaps at the cost of tomorrow; but we are learning to look ahead.

In the fiscal year now closed we sold the world a billion dollars' worth of goods in excess of what we bought.

We sent business missionaries traveling over the world, telling our neighbors how they may come to reap the advantages of a mechanical civilization such as we now enjoy.

We have loaned, in various parts of the world, huge sums to help peoples prosper that they may become paying customers

We are learning to look for the long advantage. And it is time, for soon we shall be importing food.

In preparation for that day we are learning how to sell the world a different line of goods. Instead of foodstuffs and raw materials, increasing shipments of machinery, engines, motors, labor-saving devices, finished products. Sound, hard-working things, these; makers of friends and creators of new wealth in the land of their destination.

That thing which the statistician calls a trade balance is a billion friendly dollars.

Golf and Other Things

"IS GOLF good or harmful?" is the caption which hits one in the eye in one of the Scottish newspapers. Fancy a Scottish newspaper asking such a question. But the editor does so, we have no doubt, with his mind on the breezy links; he thinks the question so ridiculous and unnecessary that it ought to be shown up.

The Earl of Balfour and Mr. Leo Maxse, the editor of the *National Review*, are also stirred and have had a mighty debate on this subject before a full house at the London School of Economics; and to outsiders the matter might seem to have been left up in the air; but golfers know better.

Mr. Maxse, in that penetrating and acidulous way of his, declared that golf, and nothing but golf, was the cause of the Arab hostility to Earl Balfour when he visited the Holy Land. This primitive and pristine people, said Mr. Maxse, fearing that under cover of an oration Balfour was proposing to introduce golf into Palestine and turn the Holy Land into a gigantic golf course, made the protest they did. They *stymied* the Zionist movement because they did not fancy their land being turned into a permanent home of *putting*.

But Mr. Maxse did not stop here. He proceeded to rub salt, as it were, into the wounds he fancied he had inflicted on his opponent. He alleged that "kolf," as he called it, was dumped into Holland at a very remote period, and afterward went to Scotland where it came to be part of the national life, just like porridge and haggis.

Quite undaunted by such "arraignment foul," the Earl told the editor a few things about the royal and ancient game. He informed

him that anyone with a little knowledge of golf would not find Palestine a cheerful place for a golf links. He did not give reasons for this assertion, but we assume that one of them is that there is so much sand in the place that it is one continuous *bunker*, and another, that there is grave danger of the golf balls being waylaid on their journey to Jericho or some other region not clearly defined.

Further, Earl Balfour said that golf was brought to England by the Scotsmen who accompanied James I, and that the English imbibed it just as eagerly as Scotsmen imbibed their porridge.

There was another thing that King James did, he got out the authorized version of the Bible. The Bible and golf, golf and the Bible. Who dare ask whether they are good or harmful? This country has profited by both. Food for the mind and recreation for the body. Safe things to hang on to.

The Commoner

MR. BRYAN'S death removes one of the strong figures of America, the last, or one of the last kings of forensic eloquence. He had the gift of statement in an extraordinary degree. His function was that of a Voice. To the experience and knowledge of a politician he added a high morality of intention and the zeal of a crusader. And for one who was so constantly before the public, dealing with a multitude of themes, he bore a reputation for accuracy of statement that is little short of amazing. His conclusions were often rejected, but his facts were seldom questioned.

Mr. Bryan's influence on the country has been much greater than most commentators will freely acknowledge. He has been master of his party for almost a quarter of a century, unacknowledged, but still master. He has made and unmade candidates and Presidents. Thirty treaties between the United States and other nations attest his efforts to prevent war. Much of the railroad legislation of the country must be traced to him, as must also the popular election of United States Senators. Publicity of campaign contributions was one of his issues and so was prohibition. Years before any other public man was even whispering the word, Bryan was thundering it. He fought corruption and the influence of wealth in his party, and, though every strong group opposed him, he remained the central and dominant figure. There are Democrats who go so far as to say that Bryan saved his party from moral disintegration and so saved it from political destruction.

And yet Mr. Bryan was not a profound thinker. He did not create the movements he espoused. He once described himself as a man who, when he saw a balloon going up, clung to it and went up with it. He advised young men to look for the coming movements and ride into success upon them. He had convictions and an unrivaled power of appeal, but his thoughts did not often go beyond those that could be turned to effective use on the popular rostrum. This, perhaps, throws into greater relief the moral purpose which inspired his life and enabled him to steer so straight a course amid the temptations of politics and fame. But it probably limited the extent of his political influence on his times. When he began public life, William Jennings Bryan had a vision of the Money System, as now established, which indicated his determination to get to the bottom causes of certain reprehensible conditions in this country. His appearance on the horizon, heralding the most unpromising of all political questions, namely, the Money Question, served to reveal how deep a popular interest lay behind all the political superficiality of the people. But Bryan dropped that issue—the most fundamental of all the fundamentalist political issues he ever espoused, and never returned to it, never, indeed, gave further indication that the money question occupied his thoughts.

His last campaign was for the moralities which are reinforced by religion, and for religion which rests on Biblical authority. It comes as a shock to learn that in this campaign he met with a degree of bitter attack that, so his friends say, exceeded anything throughout his career. There was little attempt on the part of the public prints to explain to the people the position of Bryan and the real intention of the people of Tennessee. The character of the general comment may be guessed from the hurried destruction of many thousands of copies of publications ready for mailing when the news of Bryan's sudden death arrived, and there were hasty revisions of much written material not then in type. Bryan stood forth to save a precious element in American life, but so concerted was the misrepresentation that multitudes were unable to gain the slightest idea of what it was. His death somewhat sobered the whole business. But it is no misreading of the signs to say that Bryan opened up a question which will not rest, but, having opened it, there was doubtless a better way to carry it through than he had planned, and hence his work was done. His death was in peaceful contrast to the turbulence among which he lived. His name will become a legacy to the nation and his career will long exemplify the opportunity which our civilization offers to men of able convictions.

MR. FORD'S PAGE

WHETHER a man chooses employment as a career, or business for himself, he will find but one door of entrance, and over that the inscription "Labor and Knowledge."

The business of every contributor to the world's welfare is to work and to know. To "know how" is the key to mastery. No man is a full-fledged employe, no man is a full-fledged manager of business unless he "knows how."

And one learns "how" by doing. That is the gate of initiation. Master or man, financier or apprentice, there is no other. If a young man thinks of entering business for himself, if to be master of his own establishment is his ambition, he is all the more obligated to begin as a learner, because the attainment of his ambition will require him to be teacher and director of others.

One of the greatest misfortunes that can befall any business is to be directed by a man who does not know it. To this can be traced most of the difficulty the industrial world has seen. Most of the so-called "economic" problems would be completely solved if industries were managed by men who know industry. The experts, research men and easy-chair philosophers are making "economic" mysteries out of nothing. There is no economic mystery about the ditch-digger trying to direct a surgical operation, there is only nonsense. The same kind of nonsense exists when mere money-brokers endeavor to manage productive business.

The majority of our so-called "labor troubles" are caused by managers who have no first-hand knowledge or experience of labor. They are "boss troubles," usually, and can be permanently settled by a new kind of manager—one who knows the job so well that no walking delegate, or anyone else, can tell him how it should be done. A man who must be told his own business by someone outside of it will be ahead of the game by getting himself outside of it as soon as possible.

Not only labor troubles, but the difficulty of industry in keeping pace with possible improvements and increase of service, come from this cause. Industry exists to make things that people use. That is its only reason for existence when it is managed by men who know the job. But when managed by men who know nothing of the factory, whose interest is confined to the balance sheet, its principal product becomes dividends, and that spells sure destruction to any business. It leads to those "economic" situations about which whole libraries of books are written. It is not economic at all. It is merely the folly of having those who know ruled by those who don't know.

Any young man who thinks that by going into business he will only need to wear a white collar, keep books and count the money, while other men supply the knowledge and practical experience, has a sad awakening ahead of him. The fate of the person who lets other people run his business is fully illustrated by the long, sad roll of failures. There is nothing in *business* itself that necessitates failure; but men who enter business unprepared by apprentice training in its special points bring their failure with them. Business never fails; only men do that.

Thus the way into business is by the door of work, employment. The business man who has never worked at the basic operations involved in his business is at a disadvantage. He simply does not know; he has no standard by which to judge the conflicting reports and counsels that come to him. He is not in business in any proper sense; he is a hanger-on, a parasite.

The young man who thus serves his apprenticeship *to* business for the sake of going *in* business will not fall into the error of believing that everything he sees therein is the perfect model for him to follow. He will keep his eyes open and his mind alert, with the good result that his learning *what not to do* will be equally valuable with the rest.

There is no accounting for the good change that has come over the spirit of American industry other than by the fact that so many of today's managers were yesterday's workmen. From the mistakes of *their* employers, they learned what not to do; the men they direct today are the beneficiaries of their ability to observe and discern.

So, whether the young man be ambitious for an independent business of his own, or the beckoning rewards of employment, here he is at the best door of entrance—the door of work. Far better the difficulties and stress of the factory floor than the protected atmosphere of some office. The Shop speaks with a voice of authority that quite drowns out the voice of office authority if it does not know. And the Shop is now the greatly preferred path to the office.

With a few suggestions on how to choose a boss, we may leave this phase of the matter for a time.

WHETHER a man chooses employment or a business of his own for his career, his first step is the same: he must go to work and learn his job. If a man is a misfit in industry, if he does not know his work, how much greater the misfit of him who presumes to direct others in what he himself knows not. Many so-called "economic" problems are only the ignorance of the directors of business. Business itself does not fail; but the man who is "boss" of a business that he does not know to its last operative detail is certain of failure before he begins. Whatever your goal in life, the beginning is knowledge and experience—or, briefly, work.

Japan Since the Earthquake

Country Shows Strength in Quick Recovery and Energy in Rebuilding

I HAD heard so much about the efficiency of the Japanese and the promptness of their work of reconstruction, I was not prepared for the desolation which greeted me at Yokohama. Then I looked again, and felt that, meager as is the actual work of rebuilding up to date, the accomplishment had been noteworthy. Still, Yokohama is a place whose glory has departed, and the restoration of the waste places is yet a thing for prophecy. Some of the business men who accompanied me said, "Yokohama will doubtless be a city again; it will be a port for Tokyo, and something besides. Indeed, after a sort it is a city now; but it will never be the city it was before the earthquake." Others said, "Yokohama will be rebuilt on a scale even greater than before, and that within ten years."

The earthquake which obliterated Yokohama occurred at two minutes before noon on September 1, 1923. The steamship *Empress of Austria* was just about to leave the harbor when the quake occurred, and some of the passengers are now back in Japan and are able to tell the story as they saw it from the deck of that vessel. Theirs is the most nearly connected narrative, for those witnesses who were on shore could see but little, and many of them were bewildered. As it appeared from the ship, the nearest objects on land, the pier and the warehouses adjacent, began to heave and shrivel and go down, and behind them, the walls of the buildings swayed and cracked and tumbled in shapeless ruin. The ship itself seemed to be struck on the bottom by the upheaval of the bottom of the harbor, but it was not seriously damaged. It floated and

By WILLIAM E. BARTON

became a haven of refuge from a land that offered no security, and that was fraught with every peril.

Japanese houses are said to be heated by the hibachi, or fire-bowl. This is a mistake. They are not heated. The fire-bowl serves to warm the hands of the little company that huddles around it, but if the hands get warm nothing else does. A good many thousands of hibaches were overturned when the earthquake struck Yokohama. Innumerable fires broke out simultaneously. The fire department was helpless. What the earthquake did not do, the fires did.

Yokohama is a town of canals and streams crossed by bridges, some of them of iron. Thousands of people packed these bridges, and were cut off from shore by fires at both ends. The streams below were almost solid with native wooden boats, many of which took fire. If the bridges did not ignite, the steel girders got hot and gave way. Thousands of people flung themselves into the water.

Figures mean little in aiding the imagination. Two hundred thousand lives were lost in Japan. Eight billion yen, or four billion dollars, was the property loss. Yokohama was obliterated. Half of Tokyo was destroyed. Walls were leveled. Mountains suffered vast slides. Hillside and seaside resorts were wiped off the map. Everywhere for miles around was desolation.

Relief flowed in immediately from near and far, but for some days it was impossible to reach all the places and people that needed it. There were islands of refugees marooned in little unburnt or burnt-over spaces, who could not be found until intermediate fires had cooled or ferries improvised across intervening streams. There was enough inefficiency, in all conscience. The Japanese navy did not at first cover itself with glory, and the Japanese Government held up cables and did other annoying and perhaps useless things. There was loot and murder and everything that ought not to have been.

And yet, on the whole, it would appear that the situation was as well handled as under all the circumstances could have been expected. The Japanese Government was new. Premier Takahashi had been occupying a most difficult position as the head of a party torn by dissensions, and his cabinet had fallen a very few days before the earthquake. Viscount Yamamoto had been selected to form a new cabinet, and he took office a few days after the disaster. He gathered about him a fairly strong group of men. The ruling spirit of the new cabinet was Viscount Goto, former mayor of Tokyo, who laid the plans for Tokyo's rebuilding on an elaborate scale, with wide streets and open spaces which, it is hoped, can never again be wholly flame-swept.

The matter of insurance was of large importance. All policies granting insurance against fire, issued in Japan, contain a clause exempting fires caused by earthquakes. The insurance companies could not have paid the losses in any event, and while they have paid something it is a pitiful sum toward the rebuilding of Tokyo and especially of Yokohama. Tokyo is building up. The last of the barracks in which the refugees are huddled are being rapidly vacated.

But when shall Yokohama be rebuilt? The Standard Oil Company is doing business in a sheet-iron structure. The Canadian Pacific, said to be the only organization on earth that can sell a ticket on its own lines around the world from Montreal to Montreal or anywhere else on its own route, has a temporary building. The Yokohama Specie Bank is building a large new structure, but it has few comrades. The Grand Hotel, where so many were killed, lies desolate.

Kamjura, fourteen miles away, was once a populous city, but

Shopping in Tokyo prior to the great earthquake of 1923.

e earthquake and
dal wave in 1369
most wiped it out,
d another, two
ars after Columbus
scovered America,
l rled down the tem-
p that covered the
clossal Buddha,
Jibutsu, and left
vat is now a shabby
vlage where once
l'd been the seat of
e.pire with a popu-
l ion of a million. Is
tis fate in store for
Yokohama? Some
Americans who see it
sy so. They say,
'ee these vast enter-
prises controlled by
American and Cana-
dian and European
capital, hesitating
about investment
here. To be sure, there is lumber
i plenty, coming over from the
United States and Canada, but
vhere are the steel girders for the
hy buildings? If this town is re-
built, it must be foreign capital
that does it."

But others say, "already the
city is rebuilt in a way. There
were 430,000 people here before the
earthquake; there are 400,000 here
now. Even with living conditions as
nearly impossible as they are, Yoko-
hama is even now a great city. It will
be far greater than it was. This port
is too valuable to the empire and the
world to be forsaken. It will not simply
be a port city, with docks and ware-
houses; it will be a great commercial
center, one of the notable places of
business in the empire and the world."

My own opinion is, from such
evidence as I could gather, that unless
there shall occur another earthquake
within a few months, there will be a
building movement of note in Yoko-
hama and that the new city will be
larger than the old.

This brings us to the interesting
fact that one earthquake appears to
be no guaranty that another will not
occur. On January 15, 1924, at 5:55
a m., occurred another quake which
those who experienced it tell me was
as severe as that of September 1 pre-
ceding. One American, who was thrown
out of bed, and received a severe cut
on his forehead, said to me that of the
two, this was more severe, but that it
did less damage than that of September
1 1923, because everything was al-
ready down and burned.

I asked an American engineer, who
was engaged in building bridges before
the earthquake, and is still at it with
work ahead for a good while, whether
anything had been learned by en-
gineers about erecting earthquake-
proof structures.

He said that it had been found that
piers of steel or masonry erected under
water were sheared off on a plane about

Upper—The great outbreak of flames which followed the shock at Marunouchi in Tokyo.
Circle—Refugees using the city's water main as a shelter from fire and smoke.

two-thirds of the distance from their base to the top of the water, thus confirming the theoretical formula of strain, that the maximum point is one-third the way from the top.

This engineer told me also about the effect of water on an earthquake-shaken area. He said:

"If you and I shake hands, and you are reluctant or indifferent, and I am persistent, I must shake several times to get our two hands to moving together. Water is the reluctant participant. If the shake were to continue, and with constant rhythm, the water would soon be moving in the same vibration with the land. But by the time the water gets to moving, the earth is either still, or is moving in a different rhythm. Hence, the tidal wave."

Much of the life of Japan since September 1, 1923, has been abnormal. And it could be wished that it had wholly regained its normality. There was urgent protest against rebuilding the Yoshiwara, the licensed vice quarters of Tokyo, but that has been one of the first sections to be rebuilt. There is, however, an increasing protest against it.

In the matter of public morals, it will be interesting to record that in the last days of February, 1925, a bill was introduced into the Japanese Diet to abolish licensed vice. The bill was rejected in Committee, but led to a debate on the floor. One member, Mr. Kira Motoo, in speaking in favor of Japan's licensed system, spoke words of scathing criticism of morals in Christian countries, declaring that chastity was absolutely non-existent in them, and the President of the Diet reproved him and compelled him publicly to apologize. But another member was not reproved for saying that Japan's system was far less indecent than the custom that prevails in other places.

Of two matters I must make mention as I close. One is the fact that Japan has been far worse hurt by the earthquake than she admits or the world realizes. And she has no assurance that other disasters are not in store for her. Her islands are the tops of oceanic mountains, of volcanic origin. Earthquakes created them, and earthquakes which have given them life and death for millennia are still to come. Japan has on an average of four earthquakes a day—most of them imperceptible except to sensitive instruments. I believe there were 136 recorded quakes in December, 1924. During the days I was in Japan, I felt only one, at Nikko, at 6:10 a. m., on February 27. But about that time the United States was having one of wider area. The mere tourist is glad to record an earthquake, but old inhabitants do not joke about them.

The other fact is the courage of the people. They surely are good sports. They are all at work, men and women. I saw no idleness, though I heard of unemployment in certain industries in Osaka and Tokyo. The Japanese people are hard at work. They work industriously and cheerfully. It gladdens one's heart to be in a Japanese hotel and see two or three maids actually running to answer a bell.

In all the eight or nine cities which I saw, very rapidly, of course, I encountered only two beggars, both in Yokohama, both women with babies on their backs, both professing to be widows. The contrast was immediate on entering China. Beggars there are everywhere, repulsive and persistent.

In considering the assets which the nation brings to its herculean task of rebuilding, one must not overlook the energy, the courage, the cheerfulness and the pride of the people.

Who Knocks the 100 Per Center

The Four Quarters From Which the Anti-American Wind Blows

I RISE to inquire, Gentle Reader, Why this outburst against One Hundred Per Cent Americanism?

I myself don't like the term. I don't like the use that is sometimes made of it. Like any other easy slogan, or strikingly apt verbal symbol, it is apt to be overdone and become wearisome.

But the reality it designates is so clearly identified that I cannot regard the opposition as being directed exclusively against the term, but also against One Hundred Per Cent Americanism itself.

From what quarters does the attack come? It is a question to which I happen to be able to make accurate answer because I have noted its appearance whenever I came across it in my reading.

The attack, including sneers, ridicule, denunciation and threats, have been found by me in four kinds of publications: Jewish, alien, Communist and Negro papers. Not all the Negro papers, I must say, but only in the more virulent of them, for there are Negro leaders who know that America represents the hope and not the frustration of their race.

The Attack on the Nordic

But Jewish papers, almost without exception, attack the slogan and those who are designated by it. It is a constant, calculated and somewhat concentrated campaign. It goes along with the program of belittling and besmirching everything "Nordic." Indeed, the pet bogies of the Jewish Press in this country are the "Nordic" and the "One Hundred Per Cent American"—that is, the white man and the loyal United Stateser.

The Jewish Press will not deny this: the available evidence is too overwhelming. An entire issue of this magazine—yes, a month's issues—could be filled with excerpts in proof.

This attitude can spring from nothing but a sense of alienation from the American and Nordic ideals. With all his cleverness the Jew apparently does not see that his claim to being one with us is shattered immediately it is defined what we are. He then begins to ridicule what we are. It proves his difference. Probably he thanks God that he *is* different, but that should not prevent him from admitting to us that he so considers himself. I understand that Jewish scientists in France are endeavoring to establish Jewish identity with us by showing that nose measurements do not differentiate us. But what if blood chemistry should show us to be two distinct races?

Even if we are two distinct races, what prevents us agreeing on Americanism as Americans exemplify it? Who else is there to say what Americanism is, if not the Americans?

Who Shall Define Americanism, if Not Americans?

But statement, not argument, is the purpose of this brief paper. And my first statement is that one of the biggest opponents of "One Hundred Per Cent American" is the Jewish Press in the United States. I couple with that statement the fact that the Jewish Press in every other country is more loyal-spoken toward the dominant population and the Government, than is the Jewish Press of the United States.

Then there is the Foreign Language Press. Exceptions exist, to be sure. We must steer clear of the mistaken notion that difference in language and difference in nationality constitute difference in race. One disadvantage of nationality is that it can be used to make people of kindred race think that they are different and therefore natural enemies. The only possibility of internationalism exists, not in the destruction of nations and nationalities, but in their recognition of their racial ties. The Anglo-Saxon race has its political existence under many national names, but it is rapidly arriving at an appreciation of its racial unity; and this will bring peace not only to itself, but enforce peace on the world. The only League of Nations that wise men can see is the League of the Anglo-Saxon. It is fear of this League which lies behind much of the derision poured out on the "Nordic" and the "One Hundred Per Cent American."

Language May Divide, But Life Unites

That section of the Foreign Language Press which represents types of mind which make fit soil for the ideas of religious liberty and political freedom is not resentful of Americanism but rather proud of it. And that section of the same Press which represents a type of mind that cannot reach up to the heights of religious liberty and political freedom, but must always be under the kind of authority which limits both, is one with the Jewish Press in its denunciation of "the 100 per centers."

The Negro papers have been referred to. There is a widespread and well-planned anti-American propaganda among the Negroes and it links in with Jewish influence at many points. This is a fact well known to investigators. As not one in a million white persons read the Negro Press, this fact remains unnoticed—and perhaps it is much better so. Persons who cannot chart the wide curves which certa movements take should not risk u setting their minds by inexpert e amination of temporary phases. T Negro is being taught to look upon t white man as his enemy, when a view of racial history should teach hi to look upon the white man as h friend. It is not by accident, it is n devoid of the elements of destiny, th Anglo-Saxon and Negro have been closely thrown together. They a not one race by any means, but th have more of the elements of frien liness toward each other than ma races have. Even in Slavery days th was known. So that I am not di turbed by the "Nordic" and "100 p cent" sneers that are found in the Neg Press. They are not of Negro origi The Negro will not be permanent misled by them. I note their Press he merely because it falls in the list my reading.

What Are the Communists Saying?

The Commun Press of eve shade detests ever thing American the Flag, the Constitution, the E ecutive, but, above all, I think, t intelligently patriotic American ci zen. To it, he is the prize boo Among certain sections of workin men this Press has done harm, not the Nation, but to the men. They a deprived of the knowledge and co fidence they ought to enjoy throu appreciation of what we have he how it came here, and what forc object to its being here. I distinguish, course, between the professional Co munist who is paid to spread h fallacy, and the poor dupe of h specious statements. But I believe Free Speech, and I vote to give ev the professional Communist his sa His talk usually destroys his influenc But I think it is up to intelligent ci zens to know *what he is saying.* Th is why I read his Press. The profession Communist is often a Jew, and near always an alien, so that in himself ties up at least three of the sourc whence come the attack on "O Hundred Per Cent Americanism."

The mistake all of these enemies Americanism make, of course, is believing that *America is nothing yet, a formless mass to be shaped by a hand that can grasp and mold it.* Th is the fundamental fallacy. Aliens wh have never been able to build a civ ization in the lands where they orig nated, claim the right to tear down t civilization which Christian morali is building here. It is on that rock th will crash, unless they heed a time warning. The character and tendenci of America are very definitely fixe It was because they (Concluded on page

China's New Force—the Student

"New Lamps for Old" Has Become a Settled Policy Among the People

By F. OTTE

CONDITIONS in the Shanghai mills have attracted considerable attention during the last few years and have been described as atrocious by both Americans and English. There can therefore be no question as to the real cause of the strike. It was directed chiefly against the Japanese mill owners. Bolshevik agitators are at work, but while they profited by they did not create the conditions for the strikes. Chinese students took up the cause of the workingmen and paraded the streets. This led to a clash between the police force of the International Settlement and the students, and a number of the latter were killed. No doubt, the police acted hastily. The result was an outcry which probably came without premeditation, and an agitation the end of which cannot be foreseen.

Since 1901, when I arrived in China, I have not witnessed an exhibition of public feeling of such tremendous intensity as the present outbreak. Students, workingmen, professors, bankers, merchant guilds, officials, suddenly appear to be united and they make it plain that the death of these students is looked upon as a wanton act and as a national insult. And first among them appears the Chinese student.

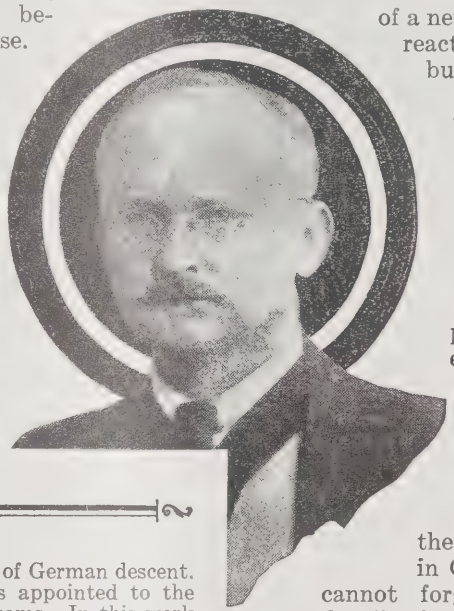
Practically all schools have joined in the present agitation, not only the National University but also the American mission schools and even the Customs College at Peking, where the young Chinese are being trained for the Customs service which is under the direction of Sir Francis Aglen. And such is the case in all China. This shows up a peculiar quality of the Chinese, that of holding closely together, especially when the masses instinctively feel that they have to defend themselves. Perhaps nowhere in the whole world is there a single people, which has developed this psychical quality to such an extent. The Chinese always had it, but it showed itself more among farmers, traders, artisans and clans. There does not appear ever to have existed in Chinese history any extra-administrative organization of this nature in the educational field. Only when the modern system of teaching began, this old Chinese ability suddenly grew up in a new form among the young people. The reasons, besides the ones stated above, were partly of a mechanical nature, that is, the students met in masses in high schools and universities, and having come into touch with each other, they organized themselves, because they were Chinese. The new form of individualism taught in the schools—at first in mission schools—simply acted as an incentive upon this force, ever inherent in the Chinese.

We are therefore face to face with a force which is not likely to disappear again, unless China's school system is abolished. And this is not likely, for the organization into schools of the masses of China is gaining force from year to year. The progress between 1900 and 1925 is tremendous and the Chinese student of today is a type of youth which China has not known before.

What we are witnessing today is the disappearance of the colonial age of China, and the arrival of a self-confident, physically trained generation of China.

Not only has the old, scholastic form of learning been cast aside, but the old code of morality, wherewith the Chinese used to measure out their deeds and the deeds of others.

These old codes of the mind have been destroyed in China as a result of the contact with the West, but the Chinese did not become Westerners thereby; their impulses remain Chinese. From a Chinese point of view, the action of Western ideas has been destructive, for it destroyed old China. It could not be constructive because no organism can possibly adopt the environment fit for other organisms without destroying itself. As it never wishes to destroy itself, it will react, but as the new influences and new dangers are of a new type, it will at first react in the customary, but false way.



Anyhow, it is futile to try to combat this gigantic process of transformation with the phraseology of the colonial age of a hundred years ago. Numerous articles prove this almost every day and the one thing the Chinese are objecting to most strongly is the supercilious attitude of a part of the foreign population in China who evidently cannot forget the "good old days" of the royal merchant, when the Chinese were docile servants. Those days are gone.

Unfortunately for the young Chinese student, he grew up quicker than did the teaching staff. The training of valuable and useful teachers is a matter of generations. As it is, there is a tremendous lack of good teachers, or even of average teachers, everywhere in China, but more especially are the middle schools and high schools in need of a well-trained teaching force.

My own observation at this university has been that the freshmen are hardest to deal with. They on various occasions try to teach me. It is the same story every year, but after four months I have them in hand. I had gained their confidence and they fully trusted that I should lead them the right way into the mysteries of accounting, auditing, factory organization, statistics, et cetera. But why the youngest should be the most distrustful, always puzzles me; it probably indicates that there is something lacking in the preparatory courses.

As time goes on, a better teaching staff will probably exercise a better influence, but student organizations as such are not likely ever to disappear, because they are the outcome not of an accident, but of native instinct.

The policy of "New Lamps for Old," which brought disaster to that mythical hero Aladdin, has now become the policy of the Chinese people.

Dr. F. Otte, the author of this article, is of German descent. He went to China in 1901, when he was appointed to the Indoor Staff of the Chinese Maritime Customs. In this work he was frequently transferred from province to province, thus affording him an excellent opportunity to observe and study the residents of the various sections.

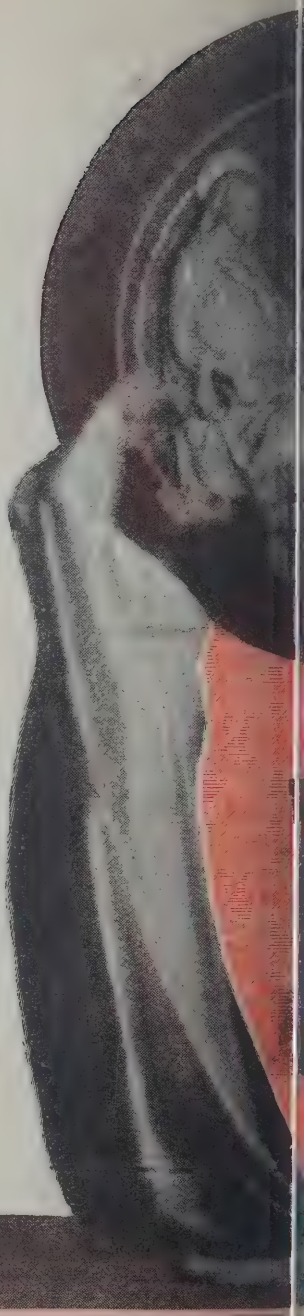
From 1912 to 1916 he became Assistant Chinese Secretary at the Inspectorate General of Customs and at the same time *ex officio* superintendent of studies of the younger assistants, mostly English and American. Dr. Otte further taught statistics at the Customs College. During the latter part of the World War he was deported because of his nationality, but returned three years later, after acquiring a degree, to instruct in business economics at the National University. He lectures in Chinese and English.

A number of books by him have been published by the Commercial Press of Shanghai.

Why They Danced at St. Mark's

This Story Digs Out the Facts About a New Form of Dancing in a Bowery Church, and Gives the Real Reasons for It

By WILLIAM L. STIDGER



FOUR names of Protestant Episcopal preachers have been blazoned across the headlines during the last year, Percy Stickney Grant, Bishop Manning, Bishop William Montgomery Brown, and Dr. William Norman Guthrie.

Each has made his own particular contribution to publicity.

Bishop Manning has made his contribution by trying to keep all three of the rest of the quartet in harmony. Bishop Brown has made his by bringing upon himself a trial for heresy (whatever that is); Percy Stickney Grant got his over the matter of theology and his announced intention to marry the lady of his choice against Bishop Manning's decree; and Brother Guthrie got his publicity by having girls dancing in his services.

Ordinarily the Baptists or the Methodists are in the headlines, but this has been distinctly an Episcopalian year.

I was curious to know this man Guthrie. The old saying has it, that where there is so much smoke there must be fire. This figure of speech would suit Dr. Guthrie well, for he uses the symbols of fire, smoke, earth, water, and sky to teach spiritual truths.

Therefore I went to a good Methodist preacher, Dr. Millard Robinson, who has been in New York most of his life, and asked him about Dr. Guthrie. I knew that they had been neighbor preachers years ago.

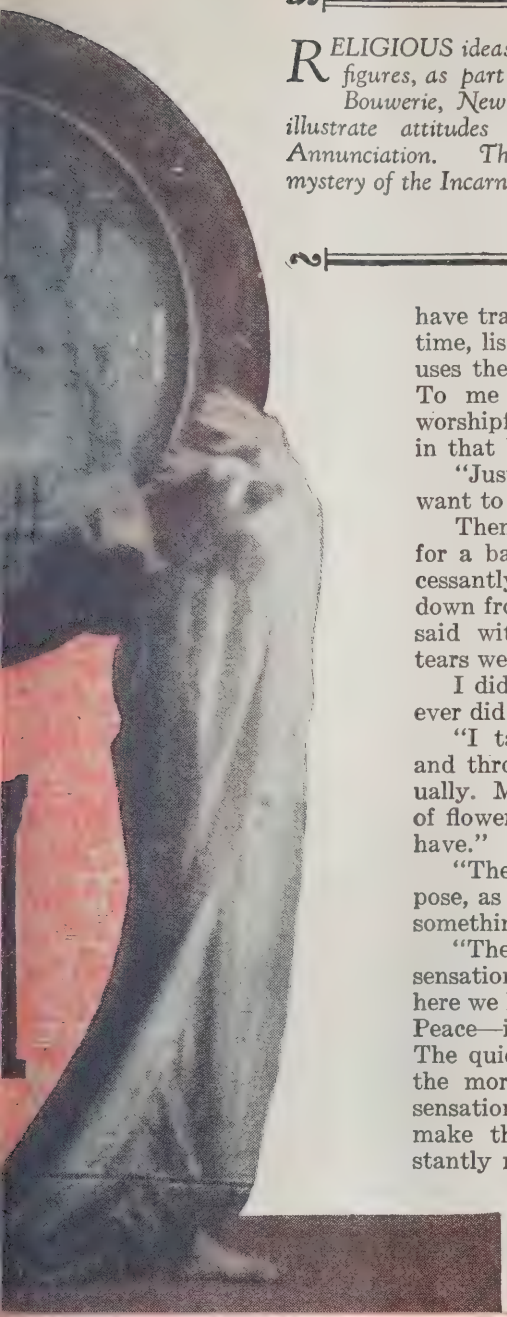
Said Dr. Robinson: "Dr. Guthrie came to St. Mark's when it was down and out. I saw him one day, shortly after he accepted this call and he asked me how many people I had in my congregation. I told him that I had several hundred, but that I considered that a slim audience. He turned around and said to me, 'Believe me, Robinson, if I had twenty-five I would consider it a mob in St. Mark's. But if the Lord spares me a few years there'll be no empty seats in St. Mark's. There must be a way to present religion so that the people will come to hear it and to have a part in its benefits and its inspiration. I'm going to find that way.'"

That was twelve years ago. Now he has his church crowded every service. I attended two services myself at a time of the year when one would not naturally expect crowds in any church.

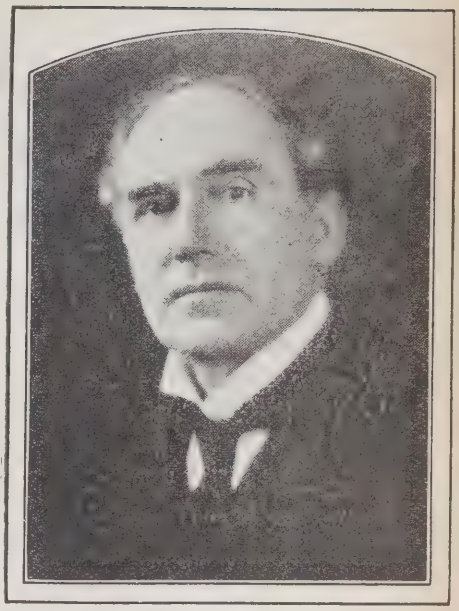
I found Dr. Guthrie at eight o'clock one bright May morning. His office force was already hard at work, with typewriters rattling, and an air of activity everywhere. The office is old and shabby, but work has been done there and a lot of it. The whole church, instead of having the atmosphere of incense about it, was saturated from top to bottom with the wholesome smell of a wood-fire smoke. A great open fire blazes always in his social hall which adjoins the office and the church auditorium. Thousands of young New Yorkers of every walk of life have danced and laughed and played and dreamed about that open fireplace before the burning logs. There was a homelike touch about the whole church.

The beautiful churchyard is inclosed. The famous marble statue of Piccirilli, called "The Outcast," is placed in this churchyard. The last time I saw it was at the San Francisco Pan-American International Exposition. There is also a statue called "The Little Lady of the Dew," done by Solon Borglum, brother of Gutzon Borglum.

He has a quartet of the most beautifully toned Chinese bells I have ever heard and I



RELIGIOUS ideas are interpreted by the posture of human figures, as part of the services at St. Mark's-in-the-Bouwerie, New York City. The pictures on this page illustrate attitudes and emotions arising out of The Annunciation. The ninefold candlestick symbolizes the mystery of the Incarnation. At the right is Dr. William Norman Guthrie.



have traveled through China for a year at a time, listening to temple bells. Dr. Guthrie uses these bells in his ritualistic symbolism. To me they seemed to produce a most worshipful atmosphere when he rang them in that beautiful Gothic interior.

"Just what are you getting at? We all want to know, Dr. Guthrie?"

Then he started. It was like the signal for a barrage. His flow of words came incessantly for two hours. He was up and down from his chair. He illustrated what he said with gestures, smiles, tears; and the tears were just as real as the smiles.

I did more listening that morning than I ever did in all my life before.

"I take what people are interested in, and through that, try to reach them spiritually. My services might be called a nosegay of flowers. I try to ditch every prejudice I have."

"The reporters misinterpret you I suppose, as they usually do those who are doing something unusual?"

"The newspapers never do get the real sensational story. Every Sunday afternoon here we have a sensational meeting. Peace—Peace—is really a sensation—in New York! The quieter our Sunday afternoon meetings the more dangerous they are. The more sensational it is going to be the quieter I make the advance publicity. I am constantly misrepresented by the press, not by the reporters but by the city editors. A boy wrote me a note, after a particularly obnoxious interpretation of our Religious Dancing had been made, and said, 'Dear Dr. Guthrie: Don't think that I'm such a Jackass as to write this story, a clipping of which I inclose. My City Editor did it. I'm ashamed of it.' "

"As I understand it you have three types of meetings here each Sunday? May I ask you about each of them?—I want to know. People all over this country want to know."

"Yes. In our afternoon service, we attempt to reach out into the community and touch as many diverse interests of as many groups as we can. I call it a symposium rather than a forum, for a forum suggests debate and a symposium suggests a quiet talk. I try to get experts in their particular line. I say to people whom I invite to speak, 'Present the thing that you are crazy about! What are you after?' I ask them."

"And that is just what I want to ask you, Dr. Guthrie. What are YOU after?"

"I am after getting men interested in religion, through their other interests. Men are never bores who are talking about something they really care about. I seldom pay men to talk here. I don't want them on a professional basis. They 'Witness' here."

"I follow the Church Year as a basis and then add Political days. I ignore such special Sundays as Mother's Day and Street Cleaning Day because I do not want to celebrate artificial days. I have a Burns' Day Sabbath. I do this because Burns is one of the saints of the Scotch people."

Dr. Guthrie makes out a full year of special days. He uses the birthday of famous men in every walk of life. I noticed in his 1924 calendar such names as John Wesley, Matthew Arnold, Gladstone, Louis Pasteur, Beethoven, Phillips Brooks, Robert Browning, Mark Twain, Rossetti, (*Continued on page 28*)

Hobbies—This Time It Is Rugs

Showing How Ballard, of St. Louis, Found the Famous "Bird" Specimen

By WILLIAM C. RICHARDS

EVER heard of Ballard of St. Louis, famed for his rugs?" I asked the editor. "He came into a newspaper office recently and the first thing he said was that he wanted to talk to some one who had a hobby. They sent him to me."

"I collect stamps of Holland. I collect them because I see in them the changing dynasties; I see the windmills stirring, the dikes, the passing of William of Orange, the young queen growing out of her childhood and becoming a beloved matron; I see Holland celebrating the various anniversaries of her regency with special jubilee issues; I see the die makers of Haarlem and Utrecht at work, and as I look at my old covers I wonder what the stout, young Dutchman, now gone or very gray, wrote to some maid of Amsterdam, perhaps, in the envelope I now treasure."

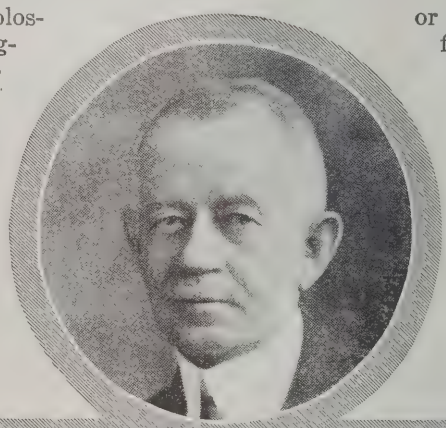
Ballard made his money manufacturing rugs. It is not a barren field for sentimentalists, but it has not the fertility of the ground where Ballard turned for his carpets. He passed a shop in New York one day and an auction was going on. He went in. He bought several rugs. The germ went to work.

Let your mind go back three years. Picture the harbor of Constantinople, following the Smyrna conflagration. On the blue waters is the first ship to bear away refugees. Among the refugees an American—a slight man over sixty. Hugged to his heart, a note of persistent and lovely vitality in the midst of desolation, this American, Ballard, holding something for which he had searched years, something he many times despaired of ever finding. The something was the famous Bird Rug, now hanging in the Metropolitan Museum.

Marts of Asia and Europe were sterile. Ballard almost had given up hope of ever finding a bird rug. They had gone the way of the lost, apparently. Ballard kept on—down into a Thrace none too cordial then to the casual visitor. A select coterie of soldiers dragged him from his train at 1 o'clock one morning and made him a prisoner of war. An army officer fell in love with the collector's mission, however, and became his strongest ally. He accompanied Ballard to Adrianople three days later and led him to a dingy shop. The first rug produced—a thing of ivories, tans and gold birds that dipped their beaks in myriads of colored blossoms—was the long-sought bird rug. Ballard went on to Constantinople, and the very first night his hotel was mobbed by Turks celebrating the capture of Smyrna. Four men were killed in the melée which raged in the corridors all night. There is the famous rug once owned by General Forsythe, an aloof beauty which looked on unmoved while wars raged and Arab tribes cut each other up. The rug was hacked in several places and buried deep in the earth until more leisurely and peaceful times permitted exhumation and rejoining.

Or perhaps you would like best the one woven in the reign of Shah Abbas, when arts flourished in Persia and developed as they had not since the third century when Alexander conquered the country; or the Persian garden rug, second best known in the world, which was once placed in the throne room of the King of Sweden every winter to remind him of the mellowness of summer.

"I read 1,300 pages of the history of Turkestan once," Ballard told me, "to get two lines of rug information. Of course, every hut and tent and palace in the Orient has been scoured for finer examples, but a fine rug isn't to be found in desert or hut. Just like the fine things in the United States today, the fine things of ancient days were the possessions of the nobles and they are obtainable now only through natural Oriental sources or as they come out of the estates of antiquaries.



Circle—James F. Ballard. View of Mr. Ballard's Art Room, St. Louis, Missouri, built for displaying Oriental rugs and carpets.

It is impossible to duplicate them in this mechanical age. In old days a ruler could command a master weaver's services. Time was nothing. I have a little Indian rug as a sample. It has 980 knots to the square inch, all hand tied, and it is only one-sixteenth of an inch thick. The making must have taken 20 years. Rugs today are things to walk on and not to talk about."

The editor and I talked of shoes and ships and sealing-wax after that until I got up to go. He called me back from the door.

"Say, I've something here I want to show you," he said, fishing in the top drawer of his desk and bringing out a folded sheet of writing paper. "Want to hear it?" he asked.

It was dated 1876 and the years had stained it saffron. It was from one minister to another and it discussed the impending birth of a child in the family of one of them.

"How much did you give for it?" I asked, when he had finished the reading.

He had paid $4.50. I feigned a jeer.

"For an old personal letter exchanged by two unknown clergymen who have been dead many years?"

"But don't you see it gives a bit of an insight into the thought of the day. It's history. Look (he showed a blue cancellation on the reverse side of the sheet), they didn't have any stamps then. Letters were carried by coach. The sender paid the fee and letters were stamped with the amount of that fee. See, this one says 'Paid-10?'"

I laughed in the editor's face.

"The seed of a hobby," I accused him. "You could have bought volumes which would tell you authentically the religious thought of that day, yet you buy this little old letter exchanged by two obscure clerics and you titillate over it. You'll pick up more letters, and you won't be able to give yourself a convincing reason for it, but there you'll have a hobby?"

It nettled him. The inexplicable does.

"I don't believe you," he said, "but the idea interests me. What do psychologists say about it?"

Here are some things psychologists said:

Dr. David R. Clark is nationally known. Florid, gray, blunt, a psychiatrical war horse who speaks the intertwined argots of the intelligentsia and the corner policeman, a skeptic who scoffs sacrilegiously at Freud—there you have an image of Clark as he sat across the table from me in a hospital consulting room.

"Hobbies," he said, "are simply vacations from duties. Some people might think it righteous if man thought only of the development of conscience and the performance of what we have come to call the individual's duty to the race. But steel, if sufficiently vibrated, crystallizes and breaks. If a human being is sufficiently vibrated by a duty that is effort and never turns from the duties of life to rejoice in the rest periods of life, he crystallizes and breaks. Some men are lucky to have productive hobbies. Some make a

Early sixteenth-century Ispahan carpet, once cut up and buried.

hobby of work, but that is no credit to them. That may be the finger of God writing on those men, that's all.

"Nothing I do is harder for me than the work at my office. Nothing is more pleasure to me than the study of human nature. That interests me. The thing you're interested in is easy and the thing that's easy is rest. If every one had plenty of money we'd have more people pursuing hobbies. Did you ever know how much information you can gather from a street car conductor? Let me talk with the policeman and in five minutes I'll know what church he goes to, how many children he has, and who's getting the graft in the city hall."

"Why," I asked, "did Ballard ask to see a collector when he entered the newspaper office with his story of his rugs?"

"Heat and light have vibrations," said Clark. "A living cell has a million jumping atoms, and each cell has a million chemical processes. They don't remain local. They shoot out impluses, and these impulses travel from cell to cell, creating a current of energy. From these currents extend waves like the Herzian waves of wireless. That's why you can sense the presence of another person in a dark room without seeing him. If the aura of the other man on the railroad platform at Ypsilanti fits in with yours, you tune in with him. You rather like him. Dislike is the result of conflicting vibrations.

"My collection of transfers? I suppose it's the things they suggest to me. I have one from Venezuela and it always reminds me of a bottle of gin I got in Caracas for 84 cents, although I didn't know a word of the language.

"The late John Dodge, of Dodge Brothers' Motor Car Company, had his millions of dollars but he always wanted to be sheriff. One time he was appointed a deputy by a sheriff who knew of his desire, and John, all plastered with guns and badges and other formal gewgaws, sat in the jail a whole week enjoying the thrill his millions never gave him.

"You find the collecting instinct in some birds, crows, for instance, and certain mice in Mexico known as trade mice. They steal but always put something in the place of what they take. A group of engineers working across the border had some wadding on a shelf in their cabin. These trade mice took the wadding, and one day when the engineers looked at the shelf they found that while the wadding was gone, the mice had left acorns and pieces of mud in exchange."

Dr. Henry A. Reye, a Viennese psychologist who was in charge of psychopathic work at Plattsburg during the war—he is a graduate of the University of Michigan—puts hobbies down as simply the outward expression of deep underlying needs and cravings, an outlet for longings.

"A man," he put it, "may have been compelled in youth to enter a commercial field and still may have had latent musical yearnings, a slant for art which he couldn't cater to because he had no money. Those yearnings often lie buried and undiscovered for years.

Dr. Arnold L. Jacoby, head of the psychopathic clinic of Recorders' Court in Detroit, says:

"The thing collected is a symbol of something which the patient wants but which he can't get in the ordinary course of events. It isn't a mental disease. It's a mental process, and it has the greatest therapeutic value. A hobby turned inwardly frequently becomes chronic invalidism. The constant sickness of some people is sham. It is simply a hobby with them."

Joining Asia to America on a map of 1570 in Turin.

Mapping Alaska Took Centuries

But It Led to the Discovery of Sauerkraut by Captain Cook

By LOUIS C. KARPINSKI

THE fabled riches of the Orient, gold and silk and jewels, played a great part in the early explorations of the New World. Two full centuries and a half elapsed after Columbus before Asia and America were by exploration definitely and finally separated upon the map. During three full centuries explorers hopefully sought a water passage from the Atlantic to the Pacific. The navigable route free from Arctic ice was not to be found but riches beyond that of the Orient were found in the land which was first conceived only as a gateway to treasures beyond.

In the year 1562 Gastaldi, an Italian geographer, wrote a supposedly learned treatise on a strait between America and Asia, the Straits of Anian. Gastaldi had never seen the strait nor had any European been in this region. The strait found favor, however, in the eyes of many cartographers as general geographical considerations were in favor of the separation of Asia from America. The first map with the strait was made in 1566 by an Italian, Zaltieri. The placing of the strait caused some difficulty, leading to very different conceptions on the maps for two centuries after 1566.

Some cartographers preferred to join Asia to America and several interesting maps were made with a broad and easy connection between the two continents, fine if true.

Early in the sixteenth century Portuguese missionaries and traders reached China and Japan, and exploring expeditions in the Pacific were fairly numerous. Systematic exploration of the region north of Japan was due first to the energetic Dutch and secondly to the Russians and the English in the eighteenth century.

The island of Jedzo, now Yezo, just north of Japan, was noted in 1620. A Dutch expedition under DeVries in 1643 further explored the region. But entirely erroneous notions of Jedzo and a Compagnies Island became current. Upon many Dutch maps of the seventeenth century a tremendous "Land of Jedzo" appears northwest of Japan between Asia and America. Wiser geographers left a great blank in this region, indicating the real state of knowledge about the Northwest.

During this period the Russians were gradually making progress into Siberia, eastward and northward. Finally, in 1697, a Russian with the most appropriate name of Atlassof reached the Kamchatka Peninsula. Shortly thereafter Russian expeditions reached the Kuriles Islands from the Asiatic side.

The energetic Peter the Great, master seaman, appears upon the scene with a scholarly interest in Siberia and the land to the northeast. Shortly before his death an expedition under the leadership of the Dane, Vitus Bering, was arranged. This enterprise was launched in 1725. Peter's instructions were to build "one or two boats with decks . . . at Kamchatka, or any other convenient place, with which inquiry should be made in relation to the northerly coasts, to see whether they were not contiguous with America, since their end was not known."

Three years of toil and cold and starvation brought these heroes to the waters of the Pacific. Amazing efforts culminated in a ship, the *Gabriel*, with which Bering in 1728 reached North Latitude 67° 18′ and the strait which bears his name. The Arctic fog prevented him from discovering the American shore. By observations based on eclipses of the moon in 1728 and 1729 Bering determined the longitude of Kamchatka correctly to within a fraction of a degree, a most remarkable tribute to his ability as a scientist.

The first map with the Straits of Anian

Bering's fine map of his discoveries was published in Russia in 1731 and became the basis of the map of Northeastern Asia by D'Anville in 1737.

Bering's second expedition included some six hundred men and a series of attacks upon the Arctic by the northern rivers of Siberia. Bering himself and Captain Chirikof set sail in the *Peter* and the *Paul*, respectively, both of which reached the American mainland, giving Russia indisputable claims to Alaska.

Chirikof sighted land on July 15, 1741, in Latitude 55° 21′, landing in a small boat being made on one of the islands near Prince of Wales Island. Farther north, near the present Sitka, a boat with eleven men was sent ashore and after a searching party of four men; none of them were ever heard from again. Bering in the *St. Peter* discovered Mount St. Elias on July 16 and landing was made in this vicinity.

But the life of the Arctic, the scurvy and the hardships of such voyages, were not meant for a man of 61. Bering died and his grave is found upon the island that bears his name. America owes to his heroism and capable leadership great possession and some day an American tribute should grace his tomb.

Upon this expedition the sea otter, the foxes, and other fur-bearing animals were discovered, so tame that hundreds were killed with clubs. These animals contributed to the further exploration and exploitation of the region from that day to this. Fur and fish, the beaver and the seal and codfish, were long the prime motives for activities in America north of the forty-ninth parallel.

The Siberian frozen north was penetrated by the parties which accompanied Bering and although the separation of Asia from America was not definitely established yet Bering's first map indicates a clear conception of the separation. It was Bering's plan to have one group of men pass from the Arctic around into the Pacific.

The Russians continued actively their fur activities in the Alaska region from the time of Bering's first voyage down to modern times. Undoubtedly some fortunate readers have been wearing winter furs, or possibly are wearing summer furs, whose history connects directly with the commercial activities of the Russians in Alaska.

The English enter upon the scene of Alaskan activities with Captain James Cook, scientist and navigator. So far as the correct delineation of the Alaskan coast is concerned that is due to Cook and his successor, Vancouver.

The greatest discovery which Cook made was *sauerkraut!* Before this harbinger of vitamines became a part of the regular mess on shipboard every extended voyage was certain to have its toll of death due to scurvy. Cook made long and serious scientific study of the problem. Dry clothes, plenty of water, light, and cleanliness were insisted upon by him. But in addition Cook paid particular attention to the diet. Fresh vegetables were obtained "at all times when they could possibly be got," orange and lemon juice, malt, wild celery, raisins and sauerkraut became regular portions of the diet of the sailors. By Cook's discoveries the most potent foe of the Arctic explorers was banished. Now we know that Cook discovered the carriers of essential vitamines; Cook knew that his men did not have scurvy.

The sailors objected to the sauerkraut but Cook made it for a time a regular part of the officers' mess, upon which the able seamen discovered that it really was a fine and succulent food.

The English acquired through Cook in 1778, through Vancouver in 1792, and Mackenzie overland in 1793, and other English expeditions, a certain claim to the Western Coast. By the overland expeditions to the Arctic of Samuel Hearne in 1771 and Mackenzie in 1789, the English claims to the region of Northern Canada were incontestably established. Hearne's voyage was disputed until later Arctic explorers found near the Coppermine River the skulls and other evidences of the Eskimos massacred by the Athabascan Indians who accompanied Hearne.

About 1790 by a show of force England compelled Spain to abandon her somewhat exaggerated notions of proprietorship of the Western Coast.

Spain claimed for a time rights by discovery to a strait across the whole continent of North America. This was the fine invention of one Lorenzo Ferren Maldonado, the voyage being supposed to have been made in 1588, but first published in 1788. On another such mythical journey across from the Pacific to the Atlantic one Admiral de Fonte encountered a ship from New England but no New Englander ever claimed the honor. This story was published in 1708 in the "Memoirs for the Curious." Maldonado's or De Fonte's passage across the continent was duly recorded on French maps at about the time of the American Revolution. Vancouver's voyage of 1792 definitely and finally set at rest the notion of some passage across America, below Bering Strait; his voyage was made to search for such a passage.

In 1825 England conceded to Russia the strip along the (Concluded on page 24)

Map of 1752 with fake route across America of Admiral de Fonte. Strange shape of Alaska.

Smashing Sunday in the States

Shall the Humanized or the Commercialized Sunday Prevail?

By WAYNE WOMER

THE different nationalities and religious groups that led in the colonization of America had everything to do with the kind of a Sunday the New World should have. The majority of the early settlers were English or of English descent, with the Dutch, Scotch-Irish and Germans. The religious groups were the Pilgrims, Quakers, Huguenots, and the Moravians with a small percentage of Catholics.

It was only natural that these settlers in the New World should seek to protect their Sunday rights, both for themselves and their posterity. The first Sunday law of the Western Hemisphere was passed by the Virginia Colony in 1617. This law made church attendance compulsory by imposing a fine of two pounds of tobacco for one absence and twenty pounds sterling for a month's absence as provided by the law of Queen Elizabeth. In Massachusetts no man could vote unless he was a member of the church.

Penalties for Profaning the Sabbath

When the Pilgrims laid the foundation of their colony the things that stood out prominently were the open Bible, free school, free press, ballot box, and Sabbath observance. In 1643 the New Haven Colony passed a law which provided that the profaner of the Lord's Day should be punished by a fine, imprisonment or corporal punishment; and even, if he profaned proudly and with a high hand against the authority of God, with death; it was quite the customary type of law of that period. At that time there were two hundred twenty-three laws of England which required punishment by death.

In the first draft of the laws of the Massachusetts Bay Colony in 1648, the death penalty was provided for profaning of the Lord's Day. Winthrop erased it.

The so-called Blue Laws of the New Haven Colony were never enacted. They were an invention by one Rev. Samuel Peters, an exiled traitor to the American cause during the Revolution. John Fiske, the eminent American historian, compares him to Baron Munchausen. In his "History of Connecticut," which Mr. Peters published, known as Peter's "Lying History of Connecticut," he refers to these so-called forty-five Blue Laws, which he admits were never suffered to be printed.

In 1695 the General Assembly of New York passed an act against the profaning of the Lord's Day, commonly called Sunday. All the colonies had laws protecting the Christian Sunday; and for them it was a day of rest and worship. Famous in this connection is Washington's army order of 1776: "That the troops may have an opportunity to attend public worship, as well as to take some rest after the great fatigue they have gone through, the General excuses them in the future from fatigue duty on Sunday, except at the shipyards or special occasions under further orders. We can have little hope of the blessing of Heaven in our arms, if we insult it by our impiety and folly."

When the Constitution of the United States was written, the President's Sunday was safeguarded: For every bill the President shall have ten days for its consideration, *Sunday excepted.*

The words "Sunday excepted" have been written into more than two-thirds of our state constitutions.

Forty-four states in the Union have laws upon their books safeguarding the Christian Sunday.

The states having no laws are California, Montana, Arizona and Oregon. The District of Columbia is also included in this group.

Arizona, Montana and Oregon have laws prohibiting barbering on Sunday. Montana's law prohibits horse-racing and playing pool, but they cannot be termed in any real sense as Sunday laws.

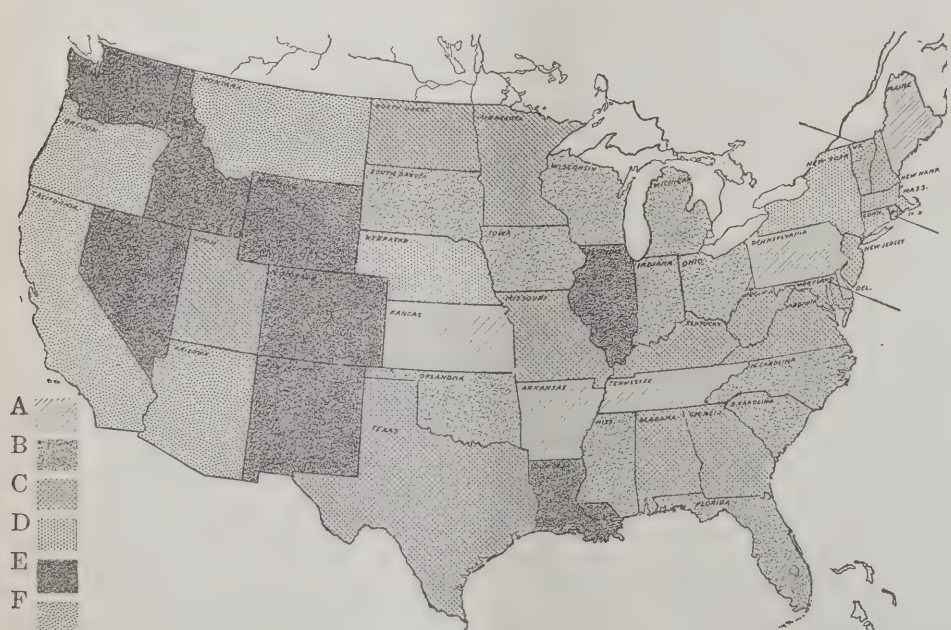
The United States may be divided into three groups regarding its Sunday laws, and for this survey I am indebted to Dr. R. H. Martin, of Pittsburgh:

A Survey of the Sunday Laws

"A. In eighteen states of the United States which have good Sabbath laws with comprehensive prohibitions of secular employments and amusements to which there are either no exceptions or few exceptions, the Sabbath school enrollment is 20.8% of the population of these states (Chart I. A.), and the average attendance 12.1% of the population (Chart II. A.). These states are as follows:—Arkansas, Delaware, Kansas, Maine, Pennsylvania, Tennessee, Florida, Indiana, Iowa, Michigan, Mississippi, North Carolina, Oklahoma, Ohio, South Carolina, South Dakota, Vermont, and Wisconsin.

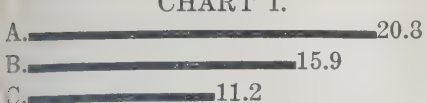
"B. In eighteen states of the United States which have comparatively weak Sabbath laws with many exceptions to the general prohibition of secular employments or amusements, the Sabbath school enrollment is 15.9% of the population of these states (Chart I. B.) and the average attendance 9.8% of the population (Chart II. B.). These states are as follows:—Alabama, Georgia, Kentucky, Maryland, Minnesota, Missouri, New Hampshire, New Jersey, North Dakota, Rhode Island, Texas, Utah, Virginia, West Virginia, Connecticut, Massachusetts, New York and Nebraska.

"C. In twelve states of the United States which have very weak Sabbath laws or no Sabbath laws, the Sabbath school enrollment is 11.2% of the population of these states (Chart I. C.) and the average attendance of 7.1% of the population (Chart II. C.). These states are as follows:—Colorado, Illinois, Idaho, Louisiana, Nevada, New Mexico, Washington, Wyoming, Arizona, California, Montana and Oregon."

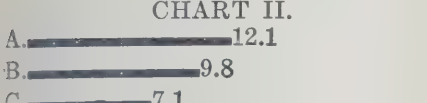


The states are divided into four classes in respect to their Sabbath laws: I. States with very good Sabbath laws (A) and states with good Sabbath laws (B). II. States with medium Sabbath laws (C) and states with laws slightly below medium (D). III. States with very weak Sabbath laws (E). IV. States and District of Columbia without Sabbath laws (F).

Sabbath Laws and Sabbath School Enrollment.
According to percentage of population.
CHART I.



Sabbath Laws and Sabbath School Average Attendance.
CHART II.



Analysis of these laws shows that in twenty-five years twenty-nine states made no change in their Sunday laws; sixteen states weakened their laws; while three strengthened them.

The 18 states having the best Sunday laws have 8% foreign-born population.

The 18 states having next best Sunday laws have 14% foreign-born population.

The 8 states having the weakest Sunday laws have 14% foreign-born population.

The 4 states having no Sunday laws have 23½% foreign-born population.

We may well ask: "Of what value have these laws been to the nation?" They protect millions of laborers who would otherwise be condemned to the slavery of seven days of unremitting toil. As it is, more than four million men now labor on Sunday, and more than half of this labor is unnecessary. Millions of homes are blessed because this is the only day possible for the family to meet with all its members present. Thus, the home ties are strengthened. Sunday laws minister to business prosperity by keeping the day free for instruction in those moral principles that underlie all successful business. They are of inestimable value to the Republic. On this day the seed of righteousness is implanted, without which Democracy cannot live. For where there is no Sunday, there is is no worship; where there is no worship, there is no religion; and where there is no religion there is no liberty.

Protecting the Health of the Nation

Again, Sunday laws protect the health of the nation. Scientists have claimed that this additional rest on Sunday is needed to eliminate waste and rebuild worn tissues. Professor Hagler, of Switzerland, said that fifty years of Sunday-keeping would add seven years to a man's life for each fifty years that he lived. Professor Martin, formerly of Harvard Medical College, demonstrated by electrical instruments that the Sunday observer reached his highest point of physical fitness sometime during Monday; the man who rested on another day than Sunday did not reach his highest point until sometime Wednesday, while the seven-day laborer did not reach his highest point of fitness until sometime on Thursday, all of which is in harmony with the decision of the Supreme Court of the United States, and handed down March, 1885:

"Laws setting aside Sunday . . . have always been deemed beneficial especially to the poor and dependent, to the laborers in our factories, and workshops, and in the heated rooms of our cities; and their validity has been sustained by the highest courts of the states."

Upon the face of it one would believe that all the people of the country would rise and commend such beneficial and helpful laws. BUT that is far from the fact.

During the recent legislative session of 1925 there were twenty-six anti-Sunday bills pending before the legislatures of sixteen states at one time.

In setting forth the history of Sunday legislation in America from 1617 our object has been to show that Sunday legislation began when the country began; that it was not restricted to any one colony, that it was written into the laws of all the colonies; that Washington's army order was in accordance with the laws, spirit and practice of the times; it was written into the Constitution of the United States, and into the constitutions of the states, and handed down in Supreme Court decisions by both the Federal and State Courts.

Amusements and Sports on Sundays

How is the Christian Sunday observed throughout the United States? The survey here given was made upon the following basis: Sunday movies, Sunday baseball and commercialized sports, Sunday State Fair, Sunday theater, vaudeville and dancing; Sunday excursions, open stores, attendance at church and Sunday schools, and how people generally observe their Sundays.

The information was received from motion-picture associations, Sunday organizations, clergymen, bureaus and church boards, sporting sheets of the press, mayors of cities, and by personal observation.

Beginning with the New England States, Sunday motion-pictures operate in Connecticut and Massachusetts; commercialized baseball and sports in Connecticut and Rhode Island; fairs are partly open in Massachusetts, Rhode Island and Connecticut, but the legitimate theater is closed. Connecticut, which recently legalized Sunday commercialized baseball and football, began its open trend some years ago when its first act was to legalize Sunday amateur sports and Sunday movies *without pay;* Sunday concerts for pay, movies for pay; Sunday practice by the militia, Sunday trains, unrestricted Sunday excursion trains, Sunday professional commercialized baseball and football.

In the Middle Atlantic States the report is:

New York: Possibly 55% of the cities and towns have voted to open their motion-pictures on Sunday. *The legitimate theater is closed by action of the Actors' Equity Association.* Vaudeville, music halls, dance halls, carnivals, all flourish. *Eighteen anti-Sunday laws were passed in fourteen years.*

Pennsylvania: The Pennsylvania Synod of the Presbyterian church says that it is the only great state in the Union which retains even the semblance of Sabbath observance. This is evidenced by the fact that practically one person in every four of her population attends Sunday school. There is no commercialized baseball or sports, and motion-pictures do not open on Sunday. Actors and actresses sigh upon leaving Pittsburgh for the West, because it means Sunday work. *In the last twenty-seven years Pennsylvania has defeated upward of one hundred anti-Sunday bills—four in 1925.* It is said that Pennsylvania contributes more money for benevolence, charity, education and philanthropy than any other state in the Union, in proportion to her wealth and population.

New Jersey: Motion-pictures are closed except in several centers which are still under litigation. *In eleven years more than forty anti-Sunday bills have been defeated in the legislature.* State and county fairs are not open. Commercialized sports are partly permitted under the Act of 1920.

Virginia, West Virginia, Delaware, and Maryland: These states are closed to commercialized sports and amusements; motion-pictures, shows, baseball, races, state fairs are all closed. Sunday is generally observed.

In the Southern States the record runs thus: Sunday is well observed in the South. In North Carolina, South Carolina, Georgia, Alabama, Tennessee, Mississippi and Arkansas commercialized antagonism to Sunday has not been able to make much headway. In only a few places are motion-pictures open on Sunday. In Arkansas Sunday baseball was recently vetoed by the governor. Florida has Sunday movies and commercialized baseball, but in general a better Sunday than ten years ago.

In Some Cities the Law Is Defied

The Central Western States come next in the survey:

Ohio: Under the police power, the state allows the cities to regulate all amusements. Of the eighty-eight counties, thirty-eight have motion-pictures, notwithstanding the decision handed down by the Supreme Court that motion pictures on Sunday are theatrical performances and are contrary to the state laws. This applies also to vaudeville, which in the larger cities is carried on in defiance of the law. Baseball is legal on Sunday afternoon. Auto races, football, pool playing, are illegal but are conducted upon Sunday. Highway contractors work on Sunday when they can. A few of the factories endeavor to run seven days a week. (*Concluded on page 27*)

Mapping Alaska Took Centuries

(*Concluded from page 21*)

Atlantic Coast from the "fifty-four forty" line. This had already been accepted by Russia in 1824 as the southern limit of Russian activities in America, in a convention between Russia and America. At this time the declaration of the Monroe Doctrine was first made and that with particular reference to Russia.

During the two centuries of Russian occupation of Alaska the colonization, by exiles and criminals, was attempted there as in Siberia. No good could come from such a source and official Russia found Alaska to be a white elephant upon her hands. The difficulties of governing at such a distance and the friendly feeling of Russia toward America explains why William H. Seward in 1867 was able to effect the purchase of Alaska from Russia for seven million two hundred thousand dollars. For many years this was viewed as a doubtful acquisition but today the United States views with great satisfaction this acquisition, not only from the financial standpoint but equally as strategically and sentimentally highly desirable for the United States.

The Russian activities over more than a century are clearly indicated in and around Alaska by the names of Bering, Chirikof, and C. Chaplin (a cape). Numerous other and worse names whose Russian origin is immediately evident are to be found on any maps of the region. Cook and Vancouver named many farther points, while a few honest American names appear to testify to the activities of the sailors and explorers from the United States.

New Zealand's Skyscraper

ON Main street, in Wellington, capital of New Zealand, there stands a new "skyscraper" of beautiful New Zealand granite, the finest and most modern structure in the Dominion. It is the home office of the State Fire Insurance department and so, of course, is a fireproof structure. The general government offices, a few blocks away, are housed in a great, lengthy frame building, said to be the largest frame office building in the Southern Hemisphere, and perhaps in the whole world. The State Life Insurance department is in an old brick building.

The new granite Fire Insurance building is a monument to the fact that New Zealand, land of government ownership, has found fire insurance its best paying venture. In the brief span of fifteen years the government fire insurance department, starting with no capital, has made enough money to erect this pretentious home and still have sufficient cash assets left so that it does not need to worry about its ability to pay fire losses that may occur.

"I Read *in* the Papers"

I read in the papers, this time *The Catholic World,* that the great pilgrimages to Rome this Holy Year have as their principal purpose prayers for the Pope's intentions. These intentions are two, the peace of the world and the unity of Christendom, the second being logically first in the Pope's view, since a united Christendom he feels would be a guaranty of world peace. The unity of Christendom, of course, means the inclusion of all under Catholic rule.

I read in the papers much about Bryan, but little of his tremendous capacity for work. He was no shirker. He never turned down an invitation. I have seen him deliver his set speech and then be dragged off to speak to two or three little Sunday schools. He did not seem to feel free in his mind to refuse to talk to children. Less than a year ago, he arrived in my city at 7 a. m., of a Sunday, drove forty miles to address 2,000 persons in the morning; took a hasty lunch, drove back forty miles to address 15,000 persons in a vast coliseum, where he spoke for two and a half hours (I thought all his positions right, and all of his reasons wrong); then to a Christian Endeavor meeting, or something of the sort—about 50 youngsters present—but he warmed up to them and kept on for forty-five minutes. On his way to his evening meeting he was dragged into another young people's assembly somewhere down the street, and then whirled off to his last date for the day. He staggered a little from weariness before his speech, but no sooner was he before his audience than he kindled and became fresh again and made a most impressive address. At midnight he took the train. And he received no payment for that day's work. It was understood that he never took pay for Sunday speaking.

I read in the papers that during the first quarter of 1925 the ports of Texas exported cargoes of more value than the once imperial port of New York. The traditional movement of exports and imports of the nation through the North Atlantic ports have come to be somewhat reversed during recent years and now the movement is more from north to south and vice versa. Formerly it was not believed that a north and south railroad could prosper. Today the Illinois Central, the principal vertical carrier, is one of the richest railroads in the country and other north and south roads are likewise benefiting from a more logical arrangement of commercial routes. The South is a treasure house of national resources.

Bryan Gives His Last Interview

(*Concluded from page 8*)

injustice of the report of his thriftiness was evident.

Upon another occasion when the Detroit *Times*, of which I was publisher, carried in full Mr. Bryan's speech against the theory of evolution at the University of Michigan, I know that he paid out of his own pocket for a thousand copies of the paper and had them mailed to members of the student body. Yet the charge has persisted that he found the upholding of fundamentalism alluringly remunerative.

Then this spiritually minded man of the world, this moral leader who has kept himself unspotted from the world, said something upon which he placed the seal of confidence until death had laid upon him the silence of mortality. How little he dreamed it would be released so soon!

It answers the question of many of the Commoner's close friends—"Why does he take up the cudgels in such a dubious cause?"

It provides a different solution of his prominence at Dayton than the sordid one the abusers of Bryan hurled at him in dispatches to the eastern press.

When Mr. Bryan Got Ready for Action

"When I found that I possessed powers of appeal, that enabled me to influence men's thoughts and actions, I went into my closet and in prayer to my Maker sought the way in which I should make use of that gift. And then I followed the guidance that came to me. The first speech I made in Congress which attracted national attention was a matter of communion with God.

"Ever since, at the threshold of important decisions and undertakings, I have followed this practice. It has controlled me in coming to Dayton."

A great life hid with God in prayer! The calm that encircled him in the midst of contentions and calumnies came from the Beatitudes which reads: "Blessed are you when men shall revile you and persecute you and shall say all manner of evil against you falsely, for my sake."

From that Dayton porch to pulselessness in the Sunday siesta only confirmed the forebodings of Mrs. Bryan while we had our afternoon together ten days ago. Faithful fellow-farer through all the tempestuous years of the Commoner's life, I noted the concern with which she followed from her invalid chair the approach of delegations that came to schedule her husband for "just one short speech." There was a procession of them.

"Pray speak a little louder, gentlemen," Mrs. Bryan would urge mischievously as the party moved from porch to gate. "I want to hear if you are giving Mr. Bryan any more work to do after he is through here. He must rest, gentlemen. I am a warning to him and to you. He has already drawn too heavily upon his nervous energy. Positively not another speech."

Yet the Commoner, seemingly in fit condition, felt he must keep going in a cause that had come to possess his whole being as the crowning crusade of his toilful forty years. Writing or speaking almost every hour since the verdict was pronounced in the Scopes case, he foreshadowed what he was prepared to suffer, if need be, namely, martyrdom—ready to spend and be spent in the same vicarious spirit that impelled exposure to Darrow's vitriolic shafts as he sat on the witness stand.

Father and Son Work on the Same Case

But with all of its tensity and interruptions there was much homely charm and satisfaction in that family foregathering. It was a joy to the parents to have William Jennings Bryan, Jr., the Los Angeles attorney, there as an associate with his father in the prosecution. "It is the first time Mother ever saw her husband and son in action together at the bar!" the senior Bryan announced.

Then there was evident pride in recapitulating the grand total of descendants—twelve grandchildren and one great-grandchild. Yes, indeed, a great-grandchild!

And there followed inevitably the fond recital of the third generation's sayings, especially that of the lawyer's little one in Los Angeles, who said when her father declined to tell her a second time what she must do to be restored to parental favor: "But, daddy, isn't it your business to give advice?"

Having traveled and campaigned with the Commoner much through 30 years, it was settled that I was to be enrolled with the sponsors of the pilgrimage to the Holy Land and to accompany the party. As we let our thoughts travel back over the track of three decades, there stood out two days that had to do with what was the most poignant disappointment of his official life.

The Pen Which Signed a Peace Pact

One was when I went over from Baltimore in the spring of 1913 to urge him to come to the convention of the Associated Advertising Clubs of the World, and he showed me the pen with which he had just signed the thirtieth international pact in the fulfillment of his long-cherished plan to maintain world peace by postponement.

We met a year later at a dinner given by Dean Williams of the School of Journalism at the University of Missouri, when Mr. Bryan had laid down the portfolio of state largely because the treaties he had negotiated by dint of long and earnest endeavor were put aside by the Administration as inapplicable to the European conflagration. The ex-secretary sealed his lips, insofar as the public was concerned, but I recall distinctly that his estimate of the President for whom he had saved the day at Baltimore was that he was the most self-centered man in all the world.

When I told Mr. Bryan I was leaving for a stay of a fortnight with Mr. and Mrs. J. H. Callahan at their lodge in the thermal region of the Alleghanies in Virginia, he asked to be remembered to them. He was their guest many years ago, and one of the things that fixed the event in his mind was that the Callahans were the only people he had met in his travels that could share with him the recollection of the wonders of the then inaccessible Shoshone Falls in Idaho. The incident illustrates the far reach of the Bryan journeyings.

Mrs. Bryan was arranging, when we parted, a collection of the old hymns, some favorite selection to be used every morning of the Holy Land pilgrimage in greeting the dawn of a new day amid sacred scenes.

The defender of the faith has gone on beyond Bethlehem, Gethsemane, Calvary and the Open Tomb in his itinerary of triumph.

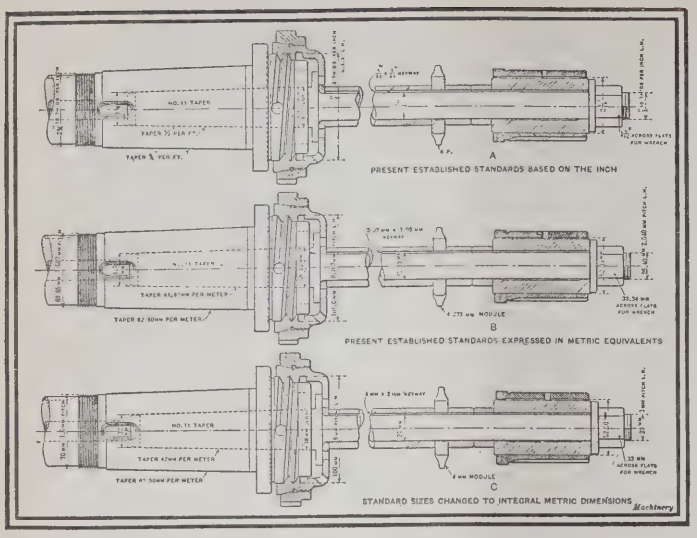
Who Knocks the 100 Per Center?

(*Concluded from page 14*)

were thus fixed that they formed a sufficient attraction to draw tens of millions of immigrants hither. They came to the America that was, not to a new thing they hoped to make of America. That is a later idea, spawned by the destructive elements of the world which are jealous of a power based on morality.

The Jews shall not be able to Judaize America, the aliens cannot paganize it, nor can the Communists bolshevize it—because it is America, founded on a racial stock that has never been enslaved, on principles that convey light wherever they go, on morality that is self-protective against the Devices of Darkness as they are being practiced against us. America has room and welcome to all who are kin to her spirit, but she has strength to resist the invasion of a spirit eternally dissimilar to hers. She has shown that.

It is the duty of some of us, at least, to talk across language, national and racial lines and make this clear, that there may be a line-up of those who are for us. And one sign of kinship will be to drop the sneer against "One Hundred Per Cent Americanism."



PRESENT ESTABLISHED STANDARDS BASED ON THE INCH
PRESENT ESTABLISHED STANDARDS EXPRESSED IN METRIC EQUIVALENTS
STANDARD SIZES CHANGED TO INTEGRAL METRIC DIMENSIONS
Machinery

Fig. 2—Showing how the very size is changed when metric measurements are used.

Metric System Means Muddle

(*Continued from page 2*)

changed if the metric equivalents were used.

It is not, however, merely the change in drawings that becomes necessary under the metric system, but the *change in actual sizes.* This is illustrated in Fig. 2 which shows a milling machine spindle for cutting gears. In the upper view (A) the part is shown measured by our present standard. Note the simple figures of the taper, ½ inch per foot, ¾ inch per foot, and the keyway of 5/32 by 5/64 inches. In the next view (B) the same part is shown, exactly the same size, with the measurements *converted* from inches into millimeters. Note the taper figures become 41.67 millimeters per meter and 62.50 millimeters per meter, while the keyway becomes 3.97 by 1.98 millimeters. Well, what occurs? Certainly, the measurements will not be permitted to stand at such odd figures. No. The 41.67 millimeters of the taper will be increased to 42 millimeters. The 3.97 by 1.98 keyway will be increased to 4 by 2 millimeters, as shown in the third view (C). With what result? *The part becomes larger. More metal is used.* The whole scheme of designing of which this instrument is a part would have to be changed over to correspond, and there would be no gain of convenience, lower cost or increased efficiency. Instead of figures fitting commodities, commodities will be changed to fit figures. "Butchered to make a metric holiday" is the phrase that comes to mind when contemplating what such a change would require in the modern machine shop. The United States system of gear cutting is almost universally used and "there is not a single pitch in the metric system that will fit the United States system," says Mr. Burlingame.

This point is made in a report by a committee of the Cleveland Chamber of Commerce, which says, "A common automobile cylinder dimension is that of the 3¾ inch bore. It is a standard size and is turned out by one concern alone in quantities of 12,000 per day. This standard is so well established that pistons and rings can be secured to fit it in every city of the United States. The metric translation of this size is 95.25 millimeters. Would our manufacturers be willing to adopt, or would other countries be willing to adopt, this size of 95.25 millimeters, or would it be found necessary to adopt a 95 millimeter bore? If 95 millimeters should become the standard, it is not difficult to estimate the effect on the manufacturer who would be forced to scrap his tools, fixtures, jigs, et cetera."

And that this change of size would occur, and not rest merely at a mere translation of figures, is a justifiable argument since one of the most frequent arguments of the metric advocates is that the system makes for "simplicity." There is no simplicity about most of the metric translations of inch measurements.

The enormous extent of such a change cannot be realized fully even by those familiar with industrial methods. But by glancing at Fig. 3 the layman may get a dim idea of what it would involve. Here are shown the tools and gauges used in the manufacture of just one small part of a sewing machine—the needle-bar clamp guide. This small part is shown, marked "A," in the photograph. To make this small part, more than seventy other parts are needed. What would it mean, either to restamp these tools with metric symbols, or to change them altogether to bring a convenient correspondence between metric and inch measurements? *Who would pay for it? And what would be the gain?*

The immediate effect of the compulsory imposition of the metric system on industry would be a destructive confusion which would unsettle trade and commerce and leave the country more helpless than under a foreign military invasion. The United States, in mechanical confusion, would be a pitiable spectacle and an invitation to wholesale violation of world peace. The long lasting effect would be a permanent increase in cost, first the incalculably great investment required for the initial change, and then the probably larger quantities of material made necessary by the adjustment of our present sizes to fit the metric symbols. An ounce of material on every unit in these days of vast production constitutes an enormous tax on the public.

Who would pay? Mechanics would pay. Workingmen in this country, from the mason and carpenter to the highly skilled mechanics or toolmakers whose tool chests contain a large assortment of measuring devices, *which they have to buy for themselves,* would find it necessary to spend from 50 cents to $150 to replace inch tools with metric tools. Engineers who have carefully gone over the field make that estimate. But the money cost is not all. The artisan's natural difficulty in pro-

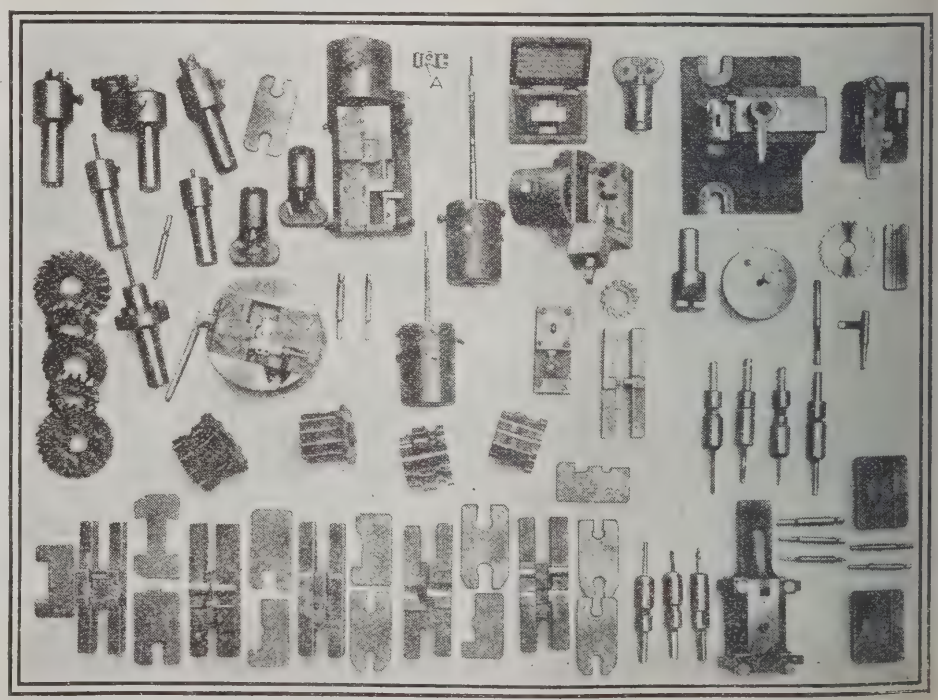


Fig. 3—Number of parts used in producing small part "A" for sewing machines. (From *Machinery.*)

ducing work under an unfamiliar system will result in wage losses impossible to estimate.

Employers would pay. There are actual figures existing on this point. Thirty-one representative firms were canvassed by the American Institute of Weights and Measures for figures showing what costs they would incur by changing over to the metric system. The results stood as follows:

Aggregate cost to 31 concerns	$21,464,688.00
Average cost per concern	715,489.60
Workers employed by concerns	94,392
Average cost per worker	227.40

The merchant will pay. The cost of replacing scales and measures (dry and liquid) by the 1,250,000 wholesale and retail dealers of the United States, would of itself constitute a heavy drain on capital and a waste of huge quantities of perfectly satisfactory material.

As a matter of fact, no one can hope to make a complete estimate of what the cost would be, so enormous is it. One metric advocate has estimated the cost of weighing devices alone at $10,000,000 and the total cost in all fields at $60,000,000. These figures are, however, too low. If the metric advocates estimate, as they do, that *the loss incurred by teaching our children in school the system of pints, pounds and inches* amounts to $250,000,000 a year, (an apparently ridiculous calculation), the cost of upsetting our present system would certainly be more than that.

One American industrialist estimates that the cost of changing to the metric system in his plant would be 20 per cent of the plant valuation. If this represents the general cost, it would be confiscatory. The United Engineering and Foundry Company stated that the cost to it alone would be $1,000,000. Several concerns stated that the cost of such a compulsory change as certain bills in Congress have contemplated would be "ruinous." They would have to quit business. Henry R. Towne, author of "Our Present Weights and Measures and the Metric System," testified before a Congressional Committee:

> "One thousand millions of dollars would not cover the ultimate cost to the manufacturers of the United States of the compulsory adoption in the resulting changes in their equipment, tools and gauges. The cost, it has been estimated, would be from $50 to $200 per employe. If the number of employes in the metal working and allied trades be assumed to be only 5,000,000, and the cost per employe only $100, the aggregate would be $500,000,000."

In any case, the metric proposal is by no means a simple one. Such a drastic change should have some overwhelming compensatory advantage to offer, which this has not.

Goiter Eradication by Way of Diet

(*Concluded from page 3*)

there are 3,000,000 parts per billion as contrasted with the 3 parts per billion in wheat, 6 parts in lettuce, 5 parts in milk and beef, 1,000 parts in cod and 6,000 parts in oysters. Thus the merest pinch of desiccated and pulverized sea algae of the right sort contains more iodine of the right sort than all the rest of the dinner and pantry supplies combined and where employed represents the complete solution of the iodine problem.

Marine vegetables as they come from the ocean bottom are not appetizing articles of diet. They have an odor and taste which do not appeal to the palate. They readily spoil, fermenting and turning sour. When dried without the loss of their valuable mineral elements they are too salty to make them agreeable except as a salt substitute. If bleached to remove their salts, they lose much of their dietary value, as is also the case when they are processed to destroy or mask their natural flavor.

Solution Is Found in Dieting

To meet these objections the carefully desiccated algae are now pulverized and the resulting powder is intermixed with ordinary articles of diet. But to save the time of the wide-awake individual who would take steps to provide his dietary with adequate quantities of assimilable iodine and would take shortcuts to accomplish that end, this powder is compressed into tablets, so that the day's supply of iodine can be taken in one swallow.

And the iodine-rich extracts of these algae, also in tablet form, are now employed by physicians with great success in the treatment of goiter, even in advanced forms. Since the adoption of this diet amendment cures well-established cases of goiter it follows that its use will serve as an effective preventive.

Here is a simple solution of our problem. To provide the requisite iodine for the child, or for the adult, one compressed tablet per day, containing five grains of properly prepared algae or extract, chocolate coated, if you please, would supply ten times the necessary one-tenth of a milligram of iodine together with many other desirable ingredients.

One 5-grain compressed tablet of marine algae (each containing 1 milligram of iodine and 1,400 being required to make 1 pound) is equivalent to:

	Pounds
Clams	2
Oysters	2
Lobster	2
Shrimp	4
Sea Fish	
Bluefish	10
Cod	10
Halibut	10
Mackerel	15
Spotted squeteague	110
Smelt	220
Fresh-Water Fish	
Lake Trout	220
Bass	220
Perch	110
Black bullhead	220
Carp	220
Lettuce	374
Oranges	136
Eggs	183
Cheese	57
Milk	440
Beef	440
Oats (and husks)	200
Wheat	2000

It is obvious from the foregoing that the goiter problem is largely one of diet. It means that those who, living in goitrous regions, are able to obtain an imported diet and one diversified with fresh vegetables, fruit, milk and sea fish may escape the scourge.

It has been stated by the eminent authority, McCarrison, that "There are few human beings living under modern conditions of life in whom the (thyroid) gland is wholly normal." A statement which is astounding in its broad significance but which is readily understandable when the absence of iodine from the average diet is exposed.

Beauty Skinned Deep

(*Concluded from page 7*)

small may be enlarged, the Cupid's bow straightened, and the permanent dimple removed, all by a skilled surgeon, and in the face of the best efforts of the beauty doctor.

The human hair is not unlike a tulip, a hyacinth, a gladiolus, or any other bulbous plant. It springs from a little bulb seated in the skin. When that bulb is dead, when the hair disappears, it is of just as much effect to douse the scalp with lotions and expect the hair to grow as it is to irrigate a field and expect unplanted onions to burst forth from the soil.

It is a conservative statement, which virtually any reputable surgeon will support, that facial surgery, as practiced by the beauty doctor, and by the "face-builder," has converted more young women into old women, and more old women into older women, than it has old women into even fairly young-appearing women. Yet the get-rich-quick self-styled "plastic surgeons" go right on getting richer, whether it be at $10 a wrinkle, or $500 for a new nose, or $5,000 for a peeled face. If the women of this country would learn that the only way to be certain of what can be done to one's face is to consult one's own physician or surgeon, and then follow his advice, these face-fixers would be forced out of business overnight.

Why They Danced at St. Mark's

(*Continued from page 17*)
and an average of fifteen birthdays a month noted. This gives him an opportunity in these Sunday afternoon symposiums to have something especially attractive and timely and through the discussion to link the thoughts of the groups that attend with the church and with religious ideals. I attended the afternoon symposium on eugenics, and, if a preacher's testimony is worth anything, Dr. Guthrie most certainly linked that discussion up with Divine truth.

"Every symposium must show that the body of the thing is religious," said Dr. Guthrie, with the snap of a deep conviction.

"The morning service is a steady apologetic, an effort to show that the religion of Christ is capable of becoming a world-religion. If you want a phrase that will symbolize me myself it is this: I'm a Bridge Builder. I am building a bridge between the practical and the spiritual.

"The evening service is where we have had the dancing that attracted so much public attention. This is an attempt to appeal to the imagination. I drop the appeal to the intellect. The dance makes the greatest psychological appeal in religion. All who come here in the evening and see our dancing are gripped. Our first symbolical dancing was done in celebration of the Virgin Mary. We have never done anything more seriously, more sincerely or more sacredly. We trained a group of dancers, one of whom was my own daughter, for seven years before attempting this service. I did not dare attempt this tribute to the Virgin Mother, the Ideal of Womanhood, until we had trained for that long period, with deep devotion and reverence.

"Our second Dancing Service was called 'The Evolution and Progress of the Race.' We simply showed this progress through rhythmic motions. Our third Dancing Service was entitled 'After the War—What?' It was really a Pacifist Oratorio. It was the poetry, and dance and music of Peace, and it gave us an opportunity for spiritual creation. Our fourth Dancing Service was what I called the 'Spring and Corn Dance.' It was an attempt to teach the holiness of food.

"No human being who ever saw these dances but was subdued to reverence," said Dr. Guthrie quietly.

"I have developed my own dances and dancers just like a church choir. I use green and blue lights and that gives the girls who take part a dim, far-off, idealistic appearance. They become entirely impersonal. I would hardly allow my own daughter to be one of the dancers if this were not true."

"The public has a different idea of your dancing," I suggested.

"The public's idea of the dance is that it is a display of a person. The real meaning of the dance is that it is the language of the spirit. In the dance the human body is used as a symbolical and contagious vehicle of ideas, the same as a minister's gestures in preaching. Any religious function is a survival of the dance."

"Give me some idea of just how you interpret thought in a religious dance," I requested.

"All right. This is it: Say we want to tell the audience that violence will not promote the interests of the human race. The girls in the dance move from left to right, giving the gestures of pushing, and lifting, and hauling, and fighting, and when they reach the extreme right stage (*Concluded on page 31*)

Extreme top—"The Della Robbia," St. Mark's Hall. Immediately below—The portico. Oval—"The Friendless Immigrant," by Piccirilli. Above—"The Little Lady of the Dew," by Borglum.

Leprosy Under the Stars and Stripes

Fighting the "Three Dreadful D's" in America's Island Possessions

By W. M. DANNER
General Secretary, the American Mission to Lepers, Inc.

IN THE last quarter of a century the United States has learned that there is far more truth than poetry in the song of "The White Man's Burden," and it is a truth that is far more expressive than even the best poetry, written by the most popular and the highest priced of all the poets. Once taken up the burden cannot be easily laid down nor its responsibilities shifted or shirked without drawing an interest that compounds itself with alarming frequency. Dirt, Disease and Death are the dreadful D's that we have acquired with our Oriental and island possessions. Having acquired them we are now busily applying antidotes; doctors, diagnoses and disinfectants will win in the long run, but at times it looks as if the run would be very long indeed.

When we annexed Hawaii we took over a good many hundred lepers—there are some 600 there now, segregated on the Island of Molokai. There are nearly a hundred in the Canal Zone and a well-conducted colony in Porto Rico. In the Philippines when Spain gave over her claims to Uncle Sam we found at least 10,000 lepers there, scattered throughout the islands, living for the most part without any sanitary care and spreading infection broadcast. We had some cases too in the United States, but nobody knows how many. They were not registered in many cases because no law required it. The disease was so rare that the average physician would not be likely to recognize it in its earlier stages, if at all.

MAP OF THE WORLD
SHOWING
DISTRIBUTION OF LEPROSY
THE MISSION TO LEPERS
OFFICES

NEW YORK, TORONTO, MELBOURNE
EXPLANATION:
COUNTRIES WHERE DISEASE IS SEVERE ARE SHOWN THUS
COUNTRIES WHERE DISEASE EXISTS IN MILD FORM,
IN SOME ONLY A FEW CASES, ARE SHOWN THUS
TWO MILLION LEPERS IN THE WORLD
(ESTIMATE OF DR VICTOR G HEISER)

We think of it, primarily, as a hideous and loathsome disease, but dreadful as it is in its advanced stages, more than anything else it is a disease of mystery. Where does it come from? Probably the Orient. Nobody knows certainly. How is it spread? Probably in one of three ways: it may be transmitted by means of food cooked or handled by a leper; it may be breathed in through inflamed nostrils. Possibly a blood-sucking insect may be the carrier of infection. The one thing that is sure is that the infection spreads wherever lepers are found. It is not hereditary. Parents, both of whom are tainted, may nevertheless have children who are free from it and fully 90% of these children do not develop the disease if separated from their parents while very young. The germ, which was definitely determined in 1874 by Hansen, the Norwegian, cannot exist apart from the human body for more than a few moments.

But for this it would be far more deadly than it is, and because of this it is possible for nurses and physicians to care for lepers without taking the disease themselves. On the other hand, the germ once taken into the system may remain there, dormant, year after year, without developing any known symptoms at all. Physicians and scientists who have made a special study of this malady believe that they have found cases where the bacillus has developed after thirty years have elapsed. What stirs the malignant organism to life and starts it on its course of devastation? Nobody knows. This is one of Death's mystery stories that has so far defied solution.

It is at once interesting and curious, as if indeed coming events cast their long, dark shadows before them, that in 1897, one year before the Spanish American War, the United States held its first conference on leprosy. A year later it had somewhere between nine and twelve thousand lepers of its own, with no very well organized plan for their care.

One thing alone was thoroughly established, even then, and had been for long centuries running back into prehistoric times, and that was the fact that the leper must be segregated, and the United States Government set about doing this in the Philippine Islands with more dispatch and humanity than is usually to be found in the easy-going affairs of government.

An island was found and set apart; this was easy where there were a thousand islands to choose from, but there was a city to be built also, a city in the Occidental meaning of the term, with modern plumbing and lighting and a sewerage system and paved streets and administration buildings and sanitary cement lodgings for the accommodation of the patients. Supplies had to be brought a long way and did not always arrive intact, and workmen were not willing to go to the island—why, a shipload of lepers might arrive at any time. They had their troubles. Three hundred laborers ran away at one time, took ship and refused to be coaxed back.

In the meantime, the Governor-General, through Dr. Victor G. Heiser, Director of Health, had had started a campaign to induce persons infected to accept the opportunity of going to this island, where there was a hope that their sufferings might be alleviated—at that time, no one spoke of "cures"—and in any case they would be assured of food and shelter and safety. Parenthetically, it should be said here that one of the great benefits accruing to the Filipinos was that a number of patients who were believed to be suffering with leprosy were found to have other diseases, which were speedily cured and they were restored to their families, "made whole."

In speaking of this vast transfer of more than eight thousand men and women, Dr. Heiser said:

"When it is remembered that this frequently involved separating husband from wife, mother from child, brother from sister, friend from friend, and furthermore that family ties among Filipinos are very strong, it will be appreciated what great forbearance the Filipino public showed in not opposing this public health measure and what it meant when they helped to carry it into effect."

Practically the entire leper population went to Culion freely and of its own accord, not without tears and heartbreaks, but with resignation and sometimes with hope, a hope that was

now and then fulfilled, and the leper paroled and allowed to go home, reporting every six months, or immediately upon the return of any unfavorable symptom, and there seems to have been entire willingness to do so, for no one dreads leprosy more than he who has had it.

The result of this system has reduced the number of known lepers to less than six thousand. In matters of this kind there are no such things as stable statistics. One of the singular phenomena of this scourge is that it seems to increase suddenly, now and then, without any particular reason that is apparent even to the scientific observer. It may be a matter of diet, or some condition that means a lowered physical resistance, and the dormant bacilli wake to horrible and devastating activity. One can only deal in approximate figures from time to time claiming only that they are relatively correct.

During the last few years the Filipinos have urged smaller colonies on the islands where the families of the patients might contribute to their support and comfort, and one such leper settlement has been established.

Modern Science Searches for a Remedy

The consensus of opinion seems to be that this would be "a deathblow to segregation," and segregation is the one thing that has reduced the number of lepers wherever it has been tried. After the Crusades there was so much leprosy found throughout Western Europe that more than 20,000 leprosaria were established and maintained until the disease was practically eradicated. Iceland has a small colony and there are still a few cases in Norway. In fact, there is reason to believe that the population of Norway has contributed a number of cases to the list to be found in this country.

Of course, the government is not content with "segregation" and amelioration. Those are long words, but what the government wants is a small, one-syllable word, and so in Culion and in the hospital at Carville, Louisiana, it has laboratories where men are giving their lives in searching out a cure. We used to recite,

"For every evil under the sun
There is a remedy or there is none."

Modern science moves to amend by striking out the last four words and putting the period after "remedy." There is a remedy, and if it has not been found, it will be found. For long centuries the oil of the Chaulmoogra fruit has been employed with beneficial results in Oriental countries, but it is only recently that its curative properties have been reduced to such a form that it can be used hypodermically. The oil itself is absolutely rejected by the average stomach. That the Chaulmoogra oil is a foe to the leper germ has been demonstrated amply, but now, through the derivatives of the oil—called Ethyl Esters—many patients have lost all traces of the disease. Four thousand cases in Culion are under treatment and in all parts of the world smaller numbers are receiving treatment under favorable conditions and with excellent report of apparent cures. When we consider that for thousands of years this disease has been considered incurable, save by miraculous intervention, the reports that show men and women "paroled," who appear to be actually cured, and whose semiannual reports show them still free from the plague are enough to give a reasonable hope that this is a new age of miracles that may be worked on a larger scale than those of the past. "Greater works than these shall ye do."

It is true that they would like to be near their own people, and they get homesick, and Culion is "200 miles from anywhere," and families cannot afford to go. It is hard, but it is not so hard as conditions outside very often are, and for many sufferers it opens a door of hope that does not exist for those who are receiving no treatments for their malady. Moreover, it is the only way to safeguard the rest of the community. The fact that year after year about a thousand new cases are sent to Culion is proof positive that new cases are constantly developing, and that other cases that have been in hiding have been found. It may become necessary to fit up another island, but there is no suggestion that there will ever be any modification of the ideal of complete isolation until the sufferer is cured or released by the pitiful angel of the last long sleep.

Some of the critics who have written most harshly may not be aware that this great undertaking is wholly financed by the Filipino government. Whatever is done they pay for; whatever is left undone is because the local authorities have not fully grasped all the possibilities that this great leper colony, and it is the greatest in the world, offers in the way of alleviation and remedial assistance. In spite of the universal epitaph of the fool who "tries to hustle the East," Culion Colony does prove that even the East sometimes hastens its pace.

Finding Homes for the Children

There is a very pleasant story told of Dr. Heiser, who gathered up some twenty children, who were untainted and took them to Manila, having announced that he would have a number of children for adoption on his return. Incidentally, and this was tragic enough while it was happening, a typhoon struck the ship, and the nurses he had taken along to look after the children were so seasick that the good doctor himself had to be doctor and nurse and caretaker for the entire shipload. When he arrived at Manila there were so many families wanting children that he disposed of all he had brought and, in addition, nearly closed out two orphanages.

In the Hawaiian Islands the lepers are treated with the utmost generosity. "Molokai" is a name that strikes terror, but the island itself is one of the loveliest spots on earth, and the Colony there has 5,000 acres on which almost anything can be grown. Lepers who have means live very well indeed. Much has been done to add to the comfort and pleasure of even the poorest, and nothing means more to them than their music. Anyone who has heard the native Hawaiians sing, or their bands, knows how liquid their language is, and what a natural gift they seem to have in this direction.

When the Secretary of The American Mission to Lepers went there to see the colony, the bands, of which there are two, took turns playing for him, and when he was asked to make a speech he said he would rather hear them sing. Evidently the request pleased them when translated, and they sang from memory, "Savior, Like a Shepherd Lead Us," with much feeling.

When the Leper Was Told to "Move On"

In the United States proper there have been sporadic cases for long years, but so few in proportion to the population of the nation and so widely separated that it is only recently that the government has undertaken to deal with this problem at all. In fact, the government almost never does attempt to take over work that is being well done by the states. In this case, the states failed and dodged and sidestepped. Like poor Tom, the leper was told to "move on," and wherever he went he was unwelcome.

One man, who was taken sick far from home, was ordered to go to the pesthouse, and when he insisted on going home, was told he might do so if he would buy a freight car, allow himself to be locked inside and guarantee to burn it up as soon as he reached his destination. He found it simpler to buy an auto. If anyone undertook to stop him, he had only to mention his malady to find a clear road before him, with all speed limits lifted. Not a few met with such brutal treatment that they died. In other cases, the families concealed them, regardless of the risks to themselves, and in a few localities doctors refused to pronounce a diagnosis of leprosy because there was no place in which such a patient could be cared for properly. Investigation carefully made disclosed the fact that one or more leper patients were to be found in 32 states. In some few states a considerable number, and only two states —Massachusetts and Louisiana—giving anything like needed care.

And so comes Hospital Sixty-six. When at last the government did move, it found great difficulty in getting a site for such a hospital. Just as the states had shunted these afflicted persons across their borders, state after state refused to admit them even under all the regulations which

were proposed for safeguarding any community. Finally, it was decided to solve the difficulty by taking over an existing institution, and the Louisiana Leper Settlement was selected because that state had had a more general involvement in this trouble than any other, more than half its parishes, or what would be called counties elsewhere, having had lepers at one time or another.

Even then it was felt that the community should be consulted. A representative meeting was held and the whole situation put before it, withholding none of the facts. Louisiana people voted approval and Hospital Sixty-six found a favorable neighborhood. The act for the establishment of the hospital was passed in 1917, and the Louisiana plant, with some buildings and some 400 acres, was acquired by the Federal Public Health Service in 1921.

Making It Easy and Bright for the Patients

Financially, Louisiana has already found the institution has brought them prosperity. More than a million dollars has been spent there, and there is a steadily growing market for various products. The cottages are the last word in sanitary perfection; they are neat, commodious, comfortable.

Each cottage has a porch of noble proportions, screened in, with easy chairs and hammocks, and here the patients spend much of their time. In the center of the hospital site there is a cafeteria dining hall for such patients as are able to wait upon themselves. An electrically heated lunch car distributes good things to eat to all the patients who are confined to their rooms.

Nothing is more necessary for any sick person than to keep the mind occupied and cheerful, so it has been the practice to hire such of the patients as are able to get about freely to act as orderlies and assistant nurses and in any capacity which they can fill. All of the food is prepared by persons who are perfectly well, and who do not come in contact with those who are sick. The laundry work for staff and patients is kept absolutely separate, as are the dishes. Everything that comes in contact with "the untouchables" is sterilized and every precaution is enforced vigorously. Just as an officer learns to keep an insane patient in front of him at all times, these nurses take the most rigorous pains never at any time to take any chance whatever.

It is the layman who dreads the disease yet grows careless as he becomes accustomed to its presence. Many of the patients are on the pay roll, earning small salaries, which help sometimes to support dependent relatives or to procure a few luxuries. Suitable occupation helps the patients to feel that though out of the world, they are still part of it.

Why They Danced at St. Mark's

(*Concluded from page 28*)

they are exhausted and fall. Then one of them, after a time, slowly rises to a sitting position, catches a vision, lifts her arms, awakes the others and gets them to rise and look up to where the vision shines. They catch the idea that the source of the vision is above. The audience also catches that idea.

"Then they all start from where they stand, moving to the left, moving back across the stage from right to left, pushing upward, lifting. Then they stand erect and straight, and strong, fresh with power. They have demonstrated in their bodily movements that they have got the coöperation of the Heavenly forces; and that violence does the human race harm and keeps it from growing upward, but that coöperation lifts the race toward God."

"Does your audience get the idea through the acting and dancing?"

"No; the idea has been discussed before the symbolic dance. It has been printed in pageant form in our bulletins, and folders. The whole thing is clear and the climax of that discussion is the dance."

"I call this the Art of Symbolism, Sights and Sounds. *We teach through Silence. It is a Quaker Meeting put into motion.* That is all. There is no preaching at all at this service."

"I understand that Bishop Manning requested you to stop these services. Do you intend to go on later?"

"We do. We shall interpret all of the sacramental symbols used in the church. The great elements on which we base our sacramental services have been lost to us. We Americans draw our water from a faucet and know nothing of the flowing spring. Baptism means nothing to the children of a modern American city. In these dances we try to make people understand the sacramental meaning of these elements; The Fire of the Holy Spirit, the Water of Baptism, the Earth from which our Daily Bread comes; the Air, which means the Spirit, the Oil which was used in annointing, and the Salt which is the symbol of hospitality. Milk was used in the early Eucharist. All of these sacramental symbols we try to make real and sacred again through our dances and our Silent Services. Few people in a modern city know anything about the sacred beauties of these elements. We have to visualize it all."

"It needed a man in the church with Scotch blood and Latin experience to bridge this gulf between the practical and the spiritual. I was a Scotch boy, born in Dundee, raised in Siena and Florence. I grew up all over Europe; went to college in Swanee, Tennessee, and have as deep a regard for the idealistic, the beautiful and the sacramental, as any clergyman in my church. But my practical Scotch nature causes me to know that the church is not reaching the people. I tried to find out why. I learned that the church had separated itself from human life. I have simply tried to bridge this separation. And my plan works."

This is the story of his work as the man himself told it to me, and it puts a rather different face on certain things, does it not?

Smashing Sunday in the States

(*Concluded from page 23*)

The Ohio State Fair opened its gates last year, and had a so-called religious service held on the grounds, as a smoke-screen. Sunday dances are prevalent in most parts of the state. The bill, recently introduced, to prohibit Sunday dancing in public places was killed. Many stores owned by aliens are open.

Wisconsin: About three-fourths of Wisconsin's Sunday laws have been written or rewritten during the past seven years. This indicates progress or at least a willingness to try to meet the situation. Work on highways and public work on Sunday is done in some localities. There is a compulsory eight-hour-day law, and half-holiday on Saturday, which is almost general throughout the state, both of which are helps to a better Sunday observance. The theaters, vaudeville and motion-picture houses are open in Milwaukee and in some of the other larger towns, but are closed elsewhere in the state. Baseball, auto races, horse races are in full swing in Milwaukee but closed elsewhere in the state. The amusement features of the State Fair have been leased to a corporation which operates them on Sunday, but the Fair proper is closed. Church attendance is decreased, except among the German, Dutch and Scandinavian churches.

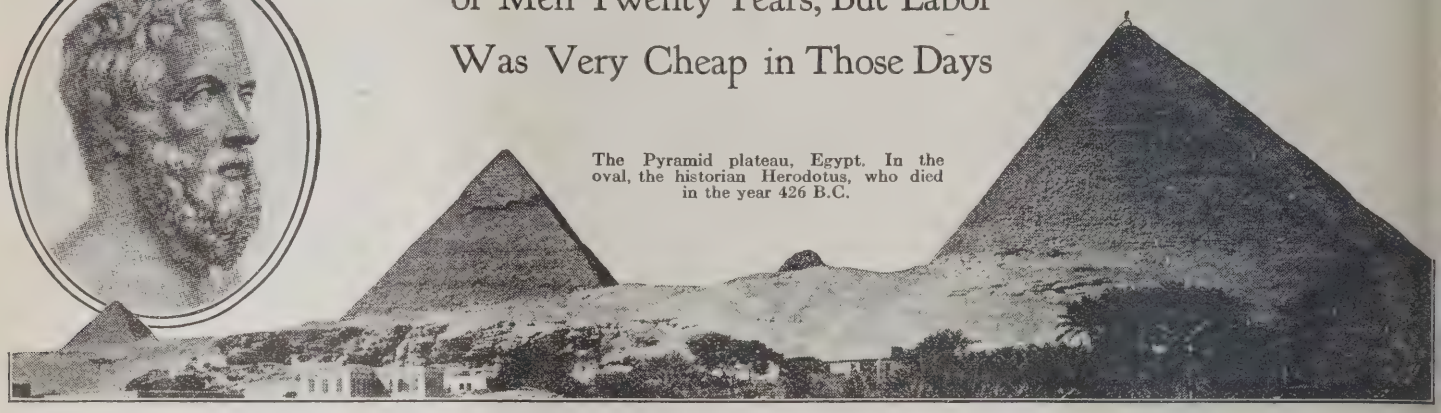
Minnesota, Michigan, Nebraska, Iowa, Indiana, Illinois, Missouri and Kentucky are practically open-Sunday states with limited districts in each state where Sunday is still observed.

The mountain and Pacific states, together with the Southwestern States, Arizona, New Mexico, Texas, Oklahoma and Louisiana, are also open-Sunday states, while North Dakota, South Dakota and Kansas have well-observed Sundays.

The summary of the survey shows that twenty-eight states in the Union, with a population of 64,450,371, are living in the environment of an open Sunday. The balance of the states, twenty in number, with a population of 41,258,394, have a comparatively well-observed Sunday.

Building the Great Pyramid

It Took Hundreds of Thousands of Men Twenty Years, But Labor Was Very Cheap in Those Days



The Pyramid plateau, Egypt. In the oval, the historian Herodotus, who died in the year 426 B.C.

THE Pyramid of Cheops, or the Great Pyramid, was at one time included among the seven wonders of the world and is still regarded as one of the greatest engineering feats ever performed by man. Owing to its exposure to the action of the elements for thousands of years, and the convenient quarry that its material provided for the nearby city of Cairo, its dimensions and sharpness of outline have deteriorated, but it still remains the most remarkable monument of antiquity, and attracts wondering pilgrims from every part of the globe.

The Great Sphinx, which stands not far off, would, if it were not for its inviolable silence, tell much of what the Pyramid of Cheops means, but in the absence of this the following account of the building of the pyramid will be found to give the main facts. It is in the words of Herodotus, the "Father of History," who lived in the fifth century before Christ:

Down to the time when Rhampsinites was king, they told me that there was in Egypt nothing but orderly rule, and Egypt prospered greatly; but after him Cheops became king over them and brought them to every kind of evil: for he shut up all the temples, and having first kept them from sacrifices there he bade all the Egyptians work for him. So some were appointed to draw stones from the stone quarries in the Arabian mountains to the Nile, and others he ordered to receive the stones after they had been carried over the river in boats, and to draw them to those which are called the Libyan Mountains; and they worked by a hundred thousand men at a time, for each three months continually.

How the Stones Were Brought From the Quarry

Of this oppression there passed ten years while the causeway was made by which they drew the stones, which causeway they built, and it is a work not much less, as it appears to me, than the pyramid; for the length of it is five furlongs and the breadth ten fathoms and the height, where it is the highest, eight fathoms, and it is made of stone smoothed and with figures carved upon it. For this they said, the ten years were spent, and for the underground chambers on the hill upon which the pyramids stand, which he caused to be made as sepulchral chambers for himself in an island, having conducted thither a channel from the Nile.

For the making of the pyramid itself there passed a period of twenty years; and the pyramid is square, each measuring eight hundred feet, and the height of it the same. It is built of stone smoothed and fitted together in the most perfect manner, not one of the stones being less than thirty feet in length. This pyramid was made after the manner of steps, which some called "rows" and others "bases"; and when they had first made it thus, they raised the remaining stones with machines made of short pieces of timber, raising them first from the ground to the first stage of the steps, and when the stone got up to this it was placed upon another machine standing on the first stage, and so from this it was drawn to the second upon another machine; for as many as were the courses of the steps, so many machines there were also, or perhaps they transferred one and the same machine, made so as to be easily carried, to each stage successively, that they might take up the stones; for let it be told in both ways, according as it is reported. However that may be, the highest parts of it were finished first, and afterward they proceeded to finish that which came next to them, and lastly they finished the parts of it near the ground and the lowest ranges.

On the pyramid it is declared in Egyptian writing how much was spent in radishes and onions and leeks for the workmen, and if I rightly remember that which the interpreter said in reading to me this inscription, a sum of one thousand six hundred talents of silver was spent; and if this is so, how much besides is likely to have been expended upon the iron with which they worked, and upon the bread and clothing of the workmen, seeing that they were building the works for the time which had been mentioned and were occupied for no small time besides, as I suppose, in the cutting and bringing of the stones and in working at the excavation under the ground?

This Cheops, the Egyptians said, reigned fifty years; and after he was dead his brother Chephren succeeded to the kingdom. This king followed the same manner of dealing as the other, both in all the rest and also in that he made a pyramid, not indeed attaining to the measurements of that which was built by the former (this I know, having myself also measured it), and moreover there are no underground chambers beneath nor does a channel come from the Nile flowing to this one as to the other, in which the water coming through a conduit built for it flows round an island within, where they say that Cheops himself is laid: but for a basement he built the first course of Ethiopian stone of divers colors; and this pyramid he made forty feet lower than the other as regards size, building it close to the Great Pyramid.

Others Who Built Pyramids as Monuments

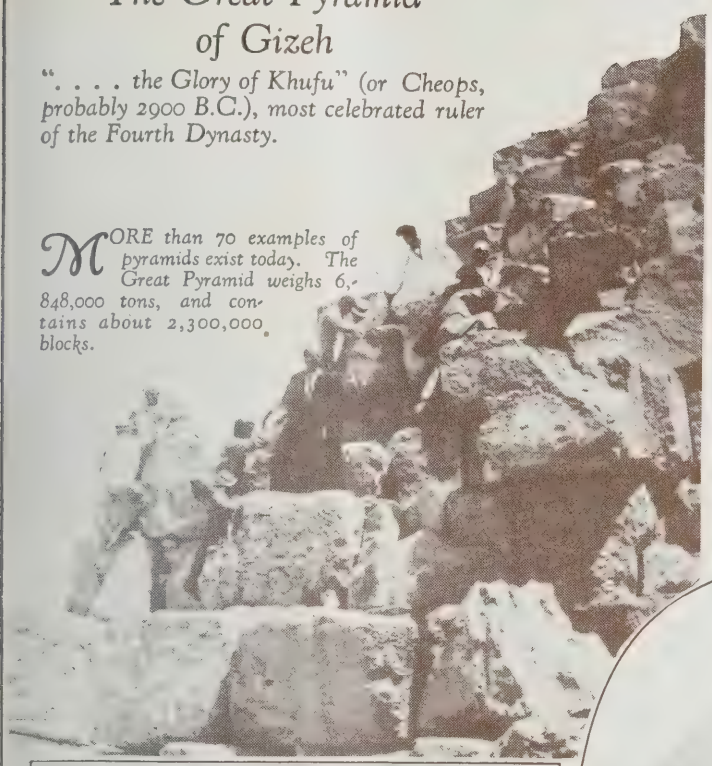
These stand both upon the same hill, which is about a hundred feet high. And Cephren, they said, reigned fifty and six years.

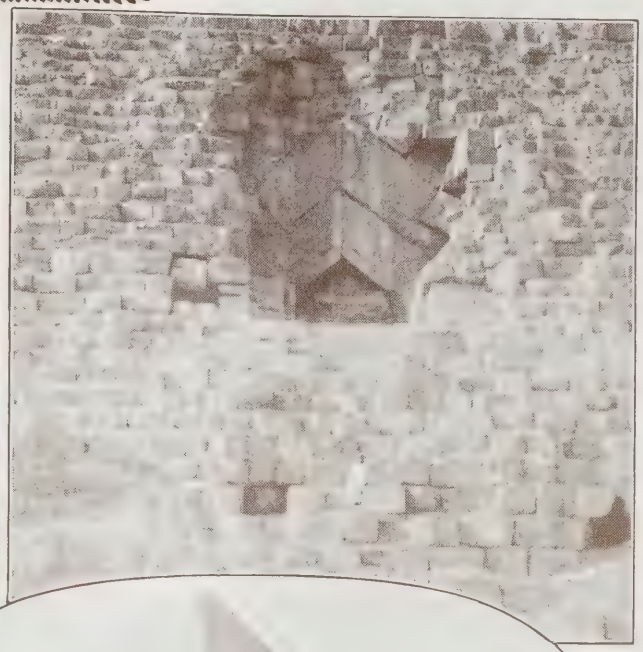
But Cephren was not a monarch of the caliber of Cheops. He acted very meanly with his daughter, causing her to earn money at the price of her degradation. But the girl took an exceedingly novel revenge. She secretly importuned her friends for money and materials to build a pyramid for herself. After her death this structure was duly erected, and although it is very much smaller than that of the great Cheops, or of her father, it remains a very tangible protest by a weak woman against the tyranny of man.

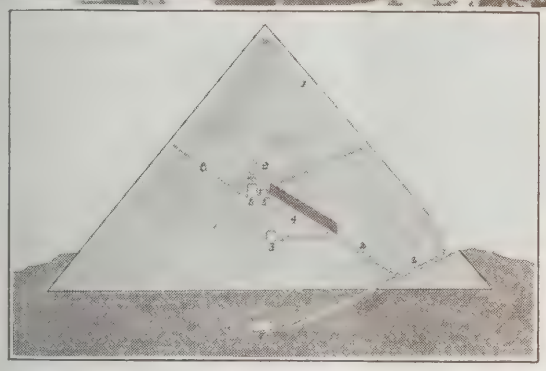
The Great Pyramid of Gizeh

". . . . the Glory of Khufu" (or Cheops, probably 2900 B.C.), most celebrated ruler of the Fourth Dynasty.

MORE than 70 examples of pyramids exist today. The Great Pyramid weighs 6,848,000 tons, and contains about 2,300,000 blocks.







THE entrance to the Great Pyramid is shown in the view in the upper right-hand corner.

The Sphinx and the Great Pyramid, a few hundred yards apart, appear in the picture to the right.

Below, aviators may be seen viewing the Great Pyramid quite differently from the way its builder gazed upon it. The present height of this pyramid is 451 feet. The sides at the base measure 750 feet long.

THE Great Pyramid is entered 48 feet from the ground, whence leads a descending passage 293 feet long. A second passage ascends to the Great Hall, which is 28 feet high and 155 feet long, but only 3 feet 4 inches wide. From here a corridor leads to the Queen's Chamber and another to the King's. Above the ceiling five chambers serve to reduce the superincumbent pressure.

THE Americans are the first people whom Heaven has favoured with an opportunity of deliberating upon, and choosing the forms of government under which they should live. All other constitutions have derived their existence from violence or accidental circumstances, and are therefore probably more distant from their perfection, which, though beyond our reach, may nevertheless be approached under the guidance of reason and experience . . . . . Every member of the State ought diligently to read and study the constitution of his country . . . . By knowing their rights, they will sooner perceive when they are violated, and be the better prepared to defend and assert them.

CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

The earliest weather forecasting service was established in France as a direct result of a destructive storm that raged over the Black Sea in 1854.

On the borders of Swansea Bay, Wales, in the heart of a great sand-hill, lies buried a city once known as Kenfig. Chronicles of Margam Abbey make it plain that the sand encroachments lasted for many years and the burial was a slow one.

About 900 Presbyterian churches refrained from joining the United Church of Canada.

Dr. Safford of the United States Department of Agriculture declares that bananas did not originate in America as is popularly supposed, but in the Malay Archipelago, they being brought to the West Indies in 1516 by Padre Tomas de Berlangas.

A death toll of 26,000, of whom 10,000 were children, resulted from traffic accidents last year.

It requires sixty men to carry the two-ton carpet covering the floor of the Waterloo Chamber of the King's Windsor Castle in England. It is 80 feet long and 40 feet wide and took seven years to weave.

Protection of California fruit orchards against frost has become almost an exact science because of the accurate temperature predictions by the weather bureau.

The *Arcturus* scientific expedition found two new volcanoes in active eruption in the Pacific. Attracted by the immense supply of food, whales and porpoises wallowed in the mass of foam caused by the violent collision of two great currents meeting in a tide race.

Lubricating oil made from crickets has been found suitable for aviation, since it does not congeal even at high altitudes.

A ship's tonnage has nothing to do with its weight. Originally it meant the capacity of a ship carrying huge barrels of wine, called tuns. Ever since then English ships have been measured by tunnage—or, as we now call it, "tonnage."

Bugs, worms, and fungi cost the farmers of seven counties in New York State $3,500,000 a year for apply spraying.

Beleaguered garrisons hereafter will be provided with provisions and ammunition from airplanes equipped with special canisters attached to parachutes. A metal dome or cap at one end absorbs the shock of landing.

In 1924 the Methodist Episcopal church paid in excess of $25,000,000 in ministerial salaries. At that, there were only 218 churches that paid $5,000 a year or over.

A clothes moth lays 150 eggs and her descendants are capable of destroying 100 pounds of wool in a year.

The early advertiser was humble and obsequious in attracting attention, he often wording his appeal by such expressions as, "solicits a call," "has the honor to announce," et cetera.

The last words of David Livingston heard by human ear were "alright, you can go now," spoken to an old and trusted servant shortly before his death.

In patterning the borders of bark cloth, Fiji women use a strip of banana leaf in which a pattern has been cut to make a stencil, this being an independent invention of the art of stencil.

Railroad coaches in Egypt have six wheels, two at each end and two under the center of the cars.

Japanese have inclosed nearly 7,000 square miles of Formosa with electrified barbed-wire entanglements to keep the "tamed" natives from the "untamed."

The Seine and the Thames have been linked by an experimental flight of a French plane from the heart of Paris to London. It is planned to eliminate the airdromes and save an hour's time and considerable expense by landing planes directly in the heart of the cities.

A telephone company on the Texas coast, during 24 hours after giving warning of an approaching hurricane, made more than 100,000 connections for weather information.

The old city of Athens is to be torn down and archeologists will excavate 25 feet beneath the surface in search of centuries of deposits. Forty American colleges plan to assist in the expectation that the work will yield more important disclosures concerning classical civilization, history and art than resulted from the excavations at Pompeii.

Michael Faraday discovered benzine in 1825, giving to the world the knowledge of that discovery on June 16 of that year, but it remained for others to show its value.

When five of his flock of thirty pure-bred Buff Orpington chickens died during a recent heat wave, a Milwaukee man attached an electric fan to the henhouse light socket and revived the other dying members of his flock.

"A British economist estimated the ratio between the productiveness of the worker in dry America and in beer-drinking Britain as that between $3,750 and $1,500. A writer in the *English Brewing Trade Review* asserts that seven American workers are equal to ten in England."—*Rep. John G. Cooper.*

Goats are sometimes driven over the plowed fields in the Nile Valley to help break the clods.

The Bermudas may be said to be a land of perpetual springtime, for their monthly temperatures average between 62° and 79° F.

Two thousand plains buffalo have been liberated by the Canadian Government in the Great Slave Lake country to roam at will.

French courts have ruled that editors are compelled to print at full length replies from those who have been attacked in the newspapers. The reply must be given the same position as the attack and may run to the same length.

Presented in This Issue:

Mr. Ford's Page this week discusses the art of choosing a boss.

The neglected truth is percolating through the public mind that our "scarcity of coal" arises from a surplus of coal. Strike rumors help to move the surplus. Therefore "strike" appears in the headlines. It has taken a long time, but gradually all the facts come out. (p. 7)

In Sunday school we were taught that the Jews are the Chosen People. Biblical authorities now say the Jews were never given that name, but that Israel was. Question: who is Israel? One article on this question was published May 23. Here is another. (p. 8)

People are beginning to wake up to the question of "psychopathic" government in public business. There is a strong suspicion that much of this so-called science is still theoretical and experimental—headed in the right direction, possibly, but too young to be intrusted with authority. Here is a practical outline of some of its workings. We think it is fair. (p. 12)

China is no longer in the headlines, but she lies heavily on the minds of the governments. Headlines are really poor indications of what is transpiring in this world. We are printing a few useful points by men who know China. (p. 15)

The attack on Sunday is organized. This article tells how the film industry gets church officials tangled up to connive at a commercialized Sunday. This series contains the most striking articles on Sunday ever published. (p. 18)

A Bit of Old Edinburgh carries the cover picture, which is made, by permission, from a Robert Hopkin painting. Hopkin was an artist whose fame went high after his death. (p. 31)

William E. Barton, the famous Lincoln research biographer, passed some time with the Japanese drama, of which he writes in his usual entertaining fashion. (p. 5)

Luring the festive lobster in Casco Bay makes a delightful seashore story which with its drawings quite conveys the atmosphere of the coast. (p. 2)

That there are 8,000 lepers under the flag of the United States is a fact to arrest interest. However, the newer knowledge of leprosy deprives it of much of its former horror. (p. 20)

Why should Liberty bonds, the securities of the United States, drop below par value in the market? Why should the means provided to prevent such an occurrence have failed? These questions have been soft-pedaled for a long time. But the facts are of such vital nature that they keep pressing for attention. (p. 3)

Romantic Rascals, men of energy and brains, both misdirected, are represented this week by Dr. Dover, whose impresario, Mr. Finger, is so skillful in this work. Mr. Finger, by the way, has received the Newberry Prize, for the best children's book of the year. (p. 16)

A hobby which consists in preserving by photography the disappearing handicrafts of America is ridden in Tennessee and the Carolinas by a man of whom Mr. Barnet writes this week. (p. 22)

There's an air about Providence (the city) that those who know it cannot forget. Its past is of the best, and some of the worst is to be found in its present. It has hosts of friends, and it is here written about in admiration. (p. 25)

Temples, towers and sacred shrines (p. 32); Editorials (pp. 9 and 10)

Lobstering in Casco Bay

How the Crustacean Is Lured From Its Ocean Lair

By ALICE YOUNG

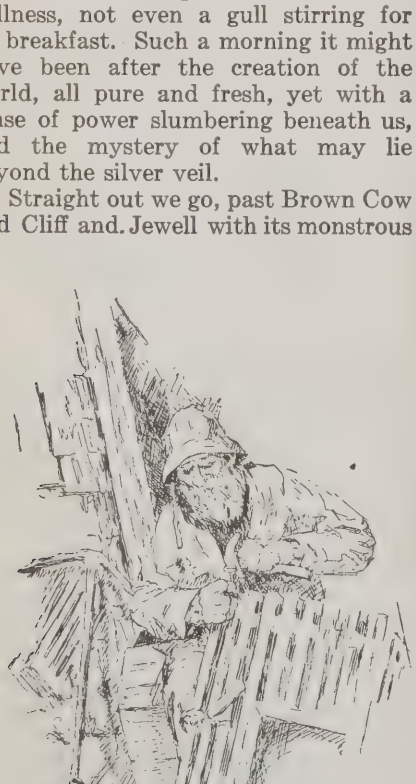
IF YOU wish to go lobstering down Casco Bay you must arise with the dawn. There is no time for breakfast, for slumberers must not be disturbed, so, with a snack of cracker and cheese in one hand and a warm coat in the other, you clamber down over the rocks in the misty light. Out in the cove the fisherman is loosing his boat from its mooring, and he heads it in toward the little promontory on which you are perched. It is a critical moment, the one in which you balance on one foot in the slippery seaweed and scramble over the side into the boat. But you tumble in somehow and the prow heads out between the islands.

In the stern, discreetly covered by a piece of sail cloth, is the bait barrel. You pass it at a respectful distance and climb over the pens into the prow, in the narrow V of which is a seat where you can best enjoy the "feel" of the boat as it gaily lifts its head to meet the dancing waves.

The morning clouds veil the horizon in pale lavender and pink, the light is a silvery gray, and all is silver gray upon the waters. There are no white-caps, but a long swell left from a bit of a "blow" of the night before. Except for the ripple against the prow and the beat of the engine, there is a wide stillness, not even a gull stirring for its breakfast. Such a morning it might have been after the creation of the world, all pure and fresh, yet with a sense of power slumbering beneath us, and the mystery of what may lie beyond the silver veil.

Straight out we go, past Brown Cow and Cliff and Jewell with its monstrous marking of Old Chase's nose at the end, past Hope and Long and the Stepping Stones toward Inner and Outer Green, the former with the wreck of a West Indies trader whitening on its shore. It is an hour's sail before we arrive at Junk o' Pork, a square block of rock rising abruptly from the water, the outpost of that desolate region where we must go a-lobstering.

The fish hou on the cove.



Repairing lobster traps.

The lavender and pink mists at the horizon have scattered, the silver light is tinged with azure, the gray of the water melts into a sparkling blue with emerald streaks. The morning breeze is stirring, and here and there a wave breaks into a rippling line of white. The boat turns in between the islands and the prospect of the wide, untroubled ocean changes. Here are ledges upon ledges, raising their dark ribs heavy with brown seaweed on which the waves break in tossing foam and then rush down in torrents. A ticklish place to navigate, and only a well-seasoned fisherman will attempt it. Yet spots like these are the favorite haunts of the lobster who finds his hiding places on the rocky bottom.

Beside the ledges are the dancing lobster bobs, marking where the traps are set. As we draw near to the first one, the fisherman stops his engine, leans over the edge of the boat, and with his gaff catches the line. Then he begins to haul in, the rope coiling at his feet, u you wond how abru must be t pitch of the ro and how stra the life in th dim regions great pressu At last the t comes to the s face, and fisherman ha it in the ste empty, exce for the ba washed chal white, a marauding crab which tossed back contemptuously into t ocean, and a sculpin with bony f and flaming eye, quite out of luck, he is destined to become bait.

The odors, like the unleashed d of war, rush out ferociously as the fish man turns back the sail cloth, tak the head of a codfish, some time funct, threads a baiting iron, a sort immense needle, through its e socket, and with a twist of the ro hangs it in a tempting position, th heaves the trap overboard. To t scavengers of the deep, the scent doubtless sweeter than the perfumes Araby.

The next haul is more lucky. The are two lobsters inside, sitting i passively beside the bait. The fish man takes his gauge and measures fr the eye socket to where the tail joins t body. One is a "counter," the other "snapper" or "short" and is toss back into his native element another chance at

Liberty Bonds From the Inside

How Far Did the War Finance Corporation Act as Purchasing Medium?

By PAUL PERRINGTON
ILLUSTRATED BY WILLIAM FREYSE

WHEN Eugene Meyer, Jr., became director of the War Finance Corporation in the spring of 1918, when it was ganized, he at once came into com- nd of Government funds amounting t between six hundred and seven ndred millions of dollars annually.

In two years the staggering amount \$1,894,000,000, aside from its her operations, was used by the War nance Corporation in the purchase Liberty loan bonds. Few persons ew that the War Finance Corpora- on had aught to do with the Liberty n bond transactions. Supposedly e bonds bought by the Government ere bought for retirement and sup- sedly the Treasury Department con- cted these operations. While the ports of the War Finance Corporation ve much to say on livestock, riculture, loans to railroads, and s on, little is said about the handling Liberty loan bonds although the nsactions in these securities were many times greater value than the her operations.

When the Special Committee of the st Congress made its report on the duplication, prep- aration and de- struction of Govern- ment bonds, it re- ported also, as it d been directed to do, on the pur- ase and sale of bonds—bought pre- mably for retirement purposes. Its port was a severe indictment of the easury Department. It reported in summary, among other things:

Citizens Discovered There Was a Gamble

"The Evidence Discloses:

* * * * * * *

"9. That the will of Congress has been overridden in the purchase and sale of millions of dollars' worth of bonds;

"10. That questionable methods were employed in handling these funds;

"11. That substantial, actual losses to the Government have resulted;

"12. That the extent of these losses has been rendered uncertain by failure of records to agree."

The Committee requested of Congress that its life, which was destined to d on March 4, 1925, be continued, t at its investigation be com- ted and that there be ascertained he amount of losses sustained by te Government," and "that necessary ps be taken to recover these losses d to prevent in future the abuses rein outlined." The Committee's olution asking for this extension nd its way into a convenient vest cket. The Committee died on the rth of March. Congress was thus kept uninformed. The Committee was refused the floor.

In its report the Committee stated: "In the repurchasing on the market for the bond purchase fund, the sinking fund, et cetera, *the Treasury employed the War Finance Corporation from May 20, 1918, to June 30, 1920, and part of 1922.*" The report then continues to show somewhat in detail how these matters were handled and how the use of funds was abused.

The joyous public which in 1917 had received the news that the much coveted Government bond, until then unknown to any except large investors, was to be made available to the small man who could safely invest his small savings in the bonds of his country, had its first jolt in 1920. The Liberty bond, the safest known investment, which also enabled the citizen to do a patriotic thing by helping to supply funds which the country then needed, was parted with by many.

Few citizens had any idea that there was a gamble in such an investment as a Liberty bond. Yet after two years —in the month of May, 1920, to be exact—American citizens saw *the bottom drop out of the Liberty bond market.* Nine of the various issues touched rock-bottom point, and sold for nearly 20% less than their face value. The small investor who had to sell his bonds at that time lost 20 cents on the dollar. The financial writers of various papers complained bitterly of the condition presented. The value of the various issues during May, 1920, reached the following low points in their history:

First 3½%'s - -	fell to 90.00
First 4%'s - - -	fell to 83.00
First 4¼%'s - -	fell to 84.00
Second 4%'s - -	fell to 81.70
Second 4¼%'s - -	fell to 82.00
Third 4¼%'s - -	fell to 86.30
Fourth 4¼%'s - -	fell to 82.64
Victory 4¾% notes	fell to 94.82
Victory 3¾% notes	fell to 94.72

A financial expert writing in the New York *World* referred to the drop in Liberty bonds as "a national scandal."

Congress Provides Means for Marketing

Such a situation, however, had been anticipated, and Congress had provided at the request of the Treasury Department a means of maintaining the market by enabling the Government to go into the market and buy up Liberty bonds where the small investors found it necessary to part with them. This, of course, *as designed,* would necessarily provide a help to the small investor and would automatically tend to give his bonds a greater value than they would otherwise have. That is, if the plan had been maintained *as designed.* We shall see what occurred.

At first the bonds were purchased under what was known as the "Bond Purchase Fund." The Sinking Fund and other funds were provided afterward. The language of the law was "*that the Secretary of the Treasury is authorized* from time to time until the expiration of one year after the termination of the war (the treaty of peace between the United States and Germany was ratified October 18, 1921) *to purchase bonds* issued under the authority of this act including bonds issued upon the conversion of bonds issued under this act or said act approved April, 1917, *at such crises and upon such terms and conditions as he may prescribe.*"

The above-quoted authority is given in Section 15 of what is known as the Second Liberty Loan Act. This Second Liberty Loan Act was approved September 24, 1917, and as originally enacted had no Section 15. Curiously, Section 15 was added six months later by what was known as the Third Liberty Loan Act, approved April 4, 1918.

When the Treasury made its request for legislation which would enable it to purchase bonds, the draft of the bill which it proposed had a provision which would have permitted it also to *sell* bonds. *The Ways and Means Committee struck out the provision and permitted the Treasury Department only to purchase bonds.* About the same time, however, that Congress passed this act, *the Treasury introduced and had passed legislation known as the "War Finance Act,"* and among the functions of this corporation, the language introduced permitted it to "*buy and sell bonds.*"

Utilizing the War Finance Corporation

This was immediately taken advantage of by the Treasury Department and the War Finance Corporation was used as a medium through which the purchases under the Bond Purchase Fund were made. As a matter of fact the bonds were purchased by the Federal Reserve Bank of New York—the immediate servant of the Treasury. But the War Finance Corporation was utilized as an intermediate step to issue orders to the Treasury's own servant. Thus the Treasury, says the report of the Congressional Committee, *did, indirectly, that which Congress had stated directly that it should not do.* The excuse given was that they could not afford to let the "market" know the Government was to buy bonds at a particular time. But that

the method was made to serve other purposes will be seen presently.

When the War Finance Corporation began to function, Eugene Meyer, Jr., had full charge of the bond operations. He was soon made its managing director. Mr. Meyer handled all of the bond purchase operations. He directed *what bonds* were to be bought and *from whom* and *when* to buy—likewise what, where and when to sell. Congress had provided for the purchase of these bonds with a twofold purpose in view. First, to relieve the small investor and help him to get a proper price for his bond when he sold it and, second, to retire the bond when purchased.

When Mr. Meyer, on October 25, 1924, appeared before the Committee of Congress which investigated the bond question, he was asked why bonds, which had been purchased for retirement purposes, should again be sold into the same market. His answer was that the purpose was to "stabilize the market." He was then asked how dumping bonds into a market could do anything else than tend to lower the price. He finally answered that some of the issues had been "over-bought" and when this was discovered that they had to be sold. After Mr. Meyer left the stand and other records were obtained from the Treasury and examined, it was found that the reason given by him could not have been the true reason because the Treasury records showed many instances where bonds had been sold on the market when there was ample credit for the purchase of the same issues as those sold. The refusal to extend the time of the Committee precluded further examination of Mr. Meyer as to this. Many other matters were left equally "up in the air."

In view of the issue raised by Mr. Meyer's answers, it is perhaps well to set forth some of the reasons given to Congress for the repurchasing of the bonds, in the hearings before the Ways and Means Committee, February 18 to February 22, 1918, which antedated the passage of the War Finance Corporation Act. Secretary McAdoo at that time stated: "I do not mean that the market should necessarily be supported up to par, but there should be some machinery provided to prevent the bonds from having an undue decline."

Paul Warburg, at the same hearings, stated: "The psychological effect I had in mind was this: That the people in general and the people who were not well inclined in particular would not have the certainty that here is a market which is absolutely unprotected and a market which is without any purchasing power, because when we have completed our Liberty

As a matter of fact the bonds were purchased by the Federal Reserve Bank of New York.

loan sales there is no more purchasing power because we have taken every cent that will come during the following two or three months, so everybody knows they can begin to sell these bonds short and find an entirely unprotected market. That is what I mean when I say there is a psychological effect. It is very important that there should be somebody to *protect the market.*"

Various financial writers complained bitterly of this condition. The *World* writer stated, "The little fellow was forced to sell his bond at a loss of from ten to eighteen per cent," and adding that *as long as the then present conditions prevailed* "these bonds will continue to sell at a level that is nothing short of a national scandal."

An examination of the reports of the Secretary of the Treasury showed the information that was furnished that official as to the bond situation. This information, furnished Congress, would make anyone wonder how the price of the Liberty bonds could continue to fall. These records, *as made*, showed that enormously heavy purchases were centered just around this period. *But all the dates of purchases given Congress were incorrect.* For example, the *records show* that during May, 1920, the Treasury Department purchased:

May 29,	Second 4¼%'s	$51,923,000
May 8,	Third 4¼%'s	19,900,000
May 29,	Third 4¼%'s	11,625,000
May 29,	Fourth 4¼%'s	99,682,000
May 14,	Victory 3¾%'s	32,000,000
May 19,	Victory 3¾%'s	71,219,000
May 19,	Victory 4¾%'s	22,781,000

Therefore on the face of the record would be concluded that the mark was enormously well supported. However, the financial papers showed such purchases and when the record of the Federal Reserve Bank at N York, through whom the purchases the market were made, and the record of the War Finance Corporation w examined, it was shown that the purchases were *merely transfers* fr the War Finance Corpor tion to the Treasury Depa ment and during the mon of May, 1920, that *the Gove ment sold into a falling mar as many if not more Libe bonds than it bought*—abo six million dollars' worth on This continued until the W Finance Corporation clos June 30, 1920.

The record shows that of these enormous amounts bonds had been in the proc of accumulation for mont ahead, some of them fr nine months to fifteen mont before they were transfer to the Treasury Departme These bonds had been h in the Federal Reserve Ba at New York in the name the War Finance Corporation and *the meantime the War Finance C poration clipped the coupons and Government paid the War Finance C poration the interest on the very bo which the people's money was used accumulate.*

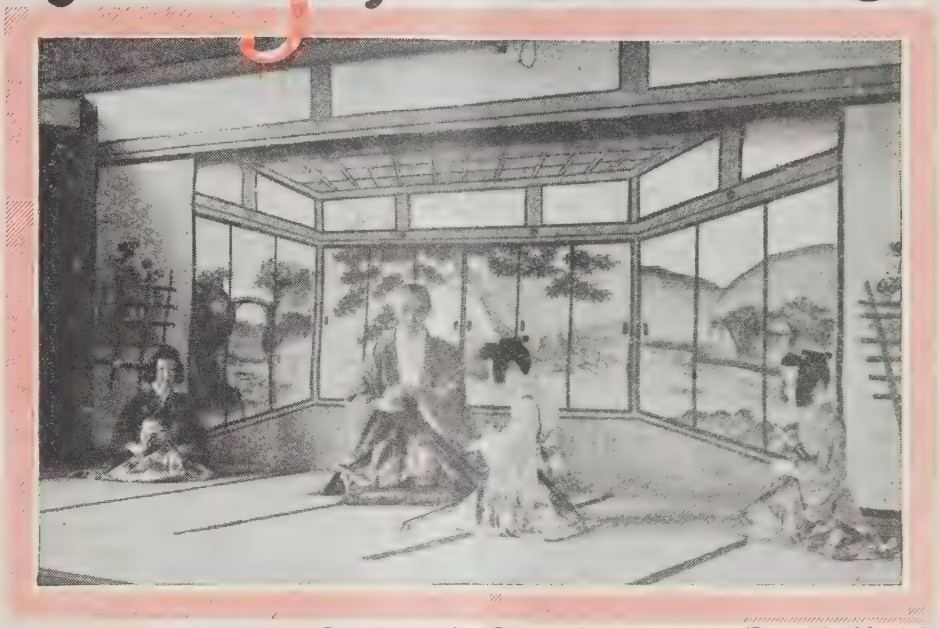
Altogether the War Finance C poration collected interest from t Treasury Department to the value more than twenty-seven millions of d lars, practically twenty-eight millio Congress had directed, *by law*, exac how this "Corporation" was to *get* a *expend* the money it handled. And was unaware of this extra $28,000,0 *What was done with it was anot question to which the Committee of C gress expected to have the answer when March 4 the "leaders" said "stop."*

The fact that the War Finan Corporation was not appreciably *buyi* on the market during the period wh the records would make it so appe does not mean that the War Finan Corporation was not *trading in bon* to the great advantage of *someboc* During this period and particular during the months of April, May a June, 1920, the War Finance Corpor tion was actively selling off bonds whi had been purchased for retireme purpose *directly back into the mark from which they had been purchase* the transaction being made throu various banks and stock brokera houses and the dealings having be made directly on the New York Sto Exchange.

The most surprising features these transactions are that the sa broker and same banking house wou *buy from* the Government and *sell* the Government, (Continued on page

The Drama of the Japanese Stage

By WILLIAM E. BARTON

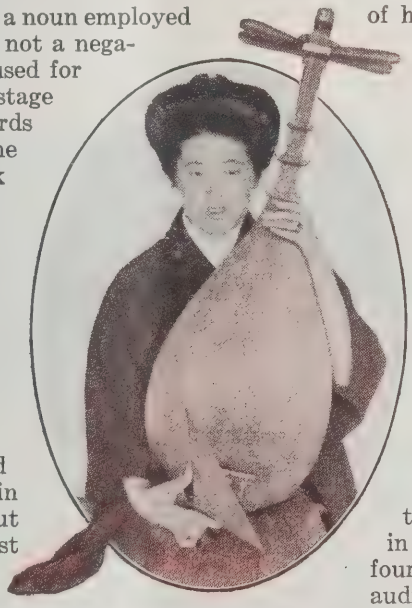


Scene from modern Japanese drama. (Courtesy Asia Magazine)

I DID not see much of it, and I did not understand much of what I saw. That is perhaps my best qualification for writ-g on the subject. How dull and upid are most of the learned treatises ritten by men who have spent years learning their subjects, and whose ident disqualification is the excess their knowledge. I am not the only an who has noted the fine ardor and ely imagination which Wordsworth anifested in his "Yarrow Unvisited," e commonplace nature of his "Yar-w Visited," and the insufferable illness of his "Yarrow Revisited." et me tell what I saw as I saw it, and t it be acknowledged as my first ualification that I do not know too uch about it.

My study of the Japanese drama as quite incidental. I had only a few ays in Japan and they were busy. ut as I passed places where Japanese ama might be seen, I saw what I uld conveniently observe, and most not all of it was the real thing. I hor those exhibitions that are staged r tourists and which have in them ly enough of the native element to rve as the basis of misrepresentation. s nearly as I am able to classify, I w about five kinds of Japanese ramatic art.

First I saw the Japanese tragedy, the No Dance." The word "No" as here sed is an adjective, or a noun employed s an adjective. It is not a nega-ve. It is the word used for e austere dance or stage hibition, in other words is the tragedy. The apanese do not mix omedy and tragedy s we do. They keep e two separate as he Greeks did. hakespeare livened p Hamlet with the rave-diggers' scene, nd an odd subject it as for comedy; he eldom trusted too ng to the sustained terest of his hearers in ure tragedy. He put argoyles on his most ignified Gothic. ut the Japanese eparates his omedy from his ragedy. His Aes-hylus and his Aristophanes have othing in common.



Biwa, used to accompany singing and recitation.

"Theater Street" seems to be a well-narked section in Japanese cities. Banners are draped from the tops of the two-story buildings, and they impart a festive air to the vicinage. Rickshas in some cities are not permitted to pass, but discharge their passengers who walk through and find their rickshas waiting for them at the other end of the street. Motion pictures appear to make up a large fraction of the business of the theaters. One may see Charlie Chaplin in his own plays, or in Japanese adaptations, as I am informed, and it was said to me that he is popular in both characters. That is, as I understand it, the Japanese have made impersonations of him and invented scenes in their own land with Japanese Charlies sitting down in whatever may be the equivalent of Japanese custard pies. I did not go to see him.

In Yokohama I found a theater with no advertisement in English, and with no attempt to secure foreign patronage, and I went there for a short afternoon. The building was large enough to seat, I should say, eight hundred persons, most of them on the floor, some in boxes elevated three or four feet on the sides. The audience was wholly Japanese. Japanese mothers were there with their babies on their backs, and whole families were present. I entered between two plays. I do not know how many were given, one after another, in an afternoon. This one had two acts. A Japanese who spoke a little English told me that I was about to witness a classic tragedy about 300 years old. I later described this play to Professor Lombard of the Doshisha, a very able interpreter of the Shakespearean drama to the Japanese, and making his quarter-century study of Japanese drama as an approach to his interpreting Shakespeare to Japanese students. He told me the name of the probable writer of this play, a contemporary of Shakespeare, who wrote a good many of the Japanese tragedies. The name was Chikamatsu, and I heard it spoken elsewhere as we speak of Shakespeare.

The people who occupied the "bald-headed row" were on their feet between the acts, lifting the curtain, and looking under to see the work of preparation. No attempt was made to stop them. There was much light hammering as the set was put up. Now and then a pair of castanets or some other instrument of percussion would sound, and less frequently there would be the tap of a gong. These sounds apparently had for their purpose the preparation of the mind of the audience for what was to come, as if to say, "Be getting ready; something great is coming." The clacks increased in frequency, and after a time the curtain was pulled aside.

The back-drop was a painted scene, the angle of a walled inclosure with fire from a house rising above the garden wall, all being done with the brush, and not very well done. In the middle of the stage, as if measured, was the hero, a shogun or emperor, mounted on a horse. The horse was made of two men, and had a movable head and a practicable tail. On the right stood, at regular intervals, four gentlemen or servants, attendant upon

Popular-priced theater in amusement district of Asakusa Park, Japan.

this dignitary, and on the other side three ladies of the court. The Japanese must have an unequal balance.

The emperor or shogun declaimed from the back of his horse about the fire and his losses. He had treasure that was about to be consumed in the flame. To go in and bring it out was probably beyond the power of man. But rich would be the reward of any one who would undertake it. The court ladies wept. The servants one by one said it could not be done. Then rushed in another servant or officer, and although the fire was getting hotter every minute, he took a long time to tell how brave he was and how ready to undertake anything for his lord the shogun. He laid down his sword, and bent his head till it almost touched the stage, and with many blessings from the high and mighty official he went into the burning structure to recover the treasure.

The next act, as I was informed, would show his success in the recovery of the treasure but, as I understood it, no reward was his save that of his heroic achievement, for he died in the attempt. I did not wait for this scene, as I had other matters to attend to, and I thought I had the idea of the play.

The acting was not all done upon the stage. The orchestra consisted of a player upon a long-necked mandolin of peculiar construction, and a reciter, who intoned much of the story. Partly the dialog was on the stage and partly in the recitation of the orchestra. And, whether on the stage or in the recital, every emotion, of sorrow or joy or love or hate, was accentuated by the musician who ejaculated "Ach!" by way of intensifying whatever the audience ought to feel. He struck his string with his bone player, or struck the leather head of his instrument, as he judged proper. The audience was intensely interested and followed each movement minutely and with apparent intelligence.

Telling of this adventure to my friends on the ship, I was importuned to go back that night to the same place and take a little group with me. I saw the latter part of one play, with magnificent background of gold leaf, in which the climax appeared to be a mother's disowning of her ungrateful daughter, and the whole of the next play, about an hour in length, which was, as I gathered, the Romeo and Juliet of this sort of drama. The hero, a youth with chalked face, and the heroine, a lady with gloriously built-up hair, were separated by the hostility of their respective families, and after a very well-acted drama, the father took his son away and the mother took her daughter back home, and they all lived unhappily ever after.

All the women's parts, however, were taken by men. There were no actresses in these plays of 300 or 400 years ago.

Now these plays, as I judge, are fairly representative of the tragic element in Japanese drama. These are of the "No Dance" type, and they are austere. No single suggestion of humor is in one of them. Juliet's nurse and Yorick's skull afford no merriment to serve as a contrast to the somber parts of the drama. When the Japanese want tragedy they take it straight. At least that was true of what I saw, and I was told that this was fairly typical.

At Nara I saw two little plays of the Kyogen or comedy sort. One hardly seemed a play at all. The title was "Fuku-no-Kami." In it two men accompanied by a mute, who, in ordinary Japanese clothing, squatted at the back and now and then moved the scenery as was required, conversed concerning the New Year approaching and wished for various kinds of good luck. The god of Good Luck, big and masked with a grin, entered and turning as on a swivel from one to the other gave them the promise of what they had been asking for, and evidently with humorous adaptations, the force of which I could not recognize.

The other play, however, was quite intelligible. It was entitled "Ninin-Daimyo." Two daimyos, gentlemen dressed in the preposterous style of four hundred years ago, wearing trousers with long trails, and pompous high hats, met on a public road on their way to the capital. Both wore their short swords, and one carried his long "tachi" which ought properly to have been borne for him by a servant, but he had found no servant available. They encountered a man going in their direction and asked him to accompany them. He protested that he did not belong in their class, but they bade him welcome. Then they began to demand that he carry their luggage, and especially the "tachi." He handled the long sword awkwardly, and they taught him the proper way. Also they taught him his proper name, which was "servant."

Watching for a favorable opportunity, he drew the sword and rushed at them, disarming them and compelling them to strip off their rich outer robes and do them up for him in bundles. Then he called them (Concluded on page 21)

"No Dance." (Courtesy *Asia* Magazine)

The Art of Skinning Coal Consumers

Mythical Strikes and Chimerical Shortages Lead to Substantial Surpluses

By WM. A. M'GARRY

IF UNSOLD anthracite should bring about a shutdown of the Pennsylvania hard coal mines this autumn the period of idleness will be referred to generally as a "strike." Operators and their newspaper friends will then do all in their power to encourage the use of that word, as in past years, because in the public mind it means a refusal to work and thus puts the burden of responsibility on the miners.

In the official statements issued by the men who earn their daily bread in the mines, however, it will be noted that such terms as "suspension" and "shutdown" will be used. And though the miners may stop short of a detailed explanation, for very definite reasons of policy, they will have the same purpose in their choice of terms—to put the burden on the operators.

On the surface this fencing with words may seem of no public importance, but the truth is that it conceals the real cause of all the recent suspensions in the hard coal mines. If it is a strike the miners are to blame for any public hardship that may result. But if there is no real danger of any shortage, and the suspension is only wanted by the operators to make the public think that such danger exists, then it is vitally important for the public to find out about it.

Publicity Program Which Makes Dividends

One way to find out is to study the history of previous periods of idleness in the mines. The program has never varied in certain fundamentals. There is no reason to believe it will change this time. Before and during a suspension the columns of newspapers are filled with an earnest ballyhoo about coal shortage. That has been gathering headway now for many weeks. Editorial demands are made for Federal and State intervention. That is now being done. In the past Governors have been bullied or cajoled into the appointment of coal administrators, and tons of propaganda have been put forth in the shape of vague plans of fuel rationing that never come to anything definite. If mine work stops on September 1, all of that will be done over again.

Everybody knows what happens after that sort of thing. It is what would happen in any other market if all the newspapers could be induced to print threats of shortage. It happened in the sugar market during the war. Consumers reluctantly begin to believe that it may be hard to get coal after all, and heed the advertised admonitions of dealers and chambers of commerce to "buy before it is too late." The demand becomes abnormal. Stocks in the yards are swept away, and the sight of empty pockets brings in more buyers. And then the price begins to inch up, and the newspapers print long explanations of the heroic efforts made by dealers and operators to parcel out the coal among the needy consumers.

The records of all previous suspensions show this—and one thing more. When all the surplus coal is exhausted, miners and operators get together, hold a three-hour session, and sign a compromise agreement—generally the identical agreement over which they had been "deadlocked" during the earlier stages of the negotiation. By that time the ready press agents of the operators and dealers have put out more propaganda showing the "losses" in keeping the mines free of water during the suspension, and giving other reasons why the new high prices must be maintained. And then everything goes on as before—a little more money from the consumer, another stock dividend for the operators.

If no other evidence were available than this brief historical outline it would be sufficient to arouse at least a strong suspicion that unsold anthracite has something to do with a suspension of work in the mines. In other years additional evidence has been hard to get, but this year certain developments enable the consumer to get more than a mere suspicion. The government is slowly showing signs of recognizing how the game is worked. The miners are becoming impatient and therefore more outspoken. And even the consumer is learning. He is not stampeding as easily as in former years.

When the mines closed in 1922 competent observers estimated the unsold hard coal above ground at *thirty million tons*, and most of that—nearly a half-year's normal supply—was moved in four months. It didn't move with nearly enough rapidity to suit the operators. In earlier suspensions the artificial demand had been even more rapid. This year the growth of suspicion is evidenced by the fact that even a concerted campaign of newspaper, street car, direct mail and billboard advertising, all making use of the strike threat, has failed so far to create a "panic market." The consumer is learning that the club held over his head is stuffed.

A Stuffed Club Held Over the Consumer

The miner has given even more definite evidence. Ordinarily, for obvious reasons, he keeps his mouth shut about the amount of coal in storage. The sale of that coal is just as important to him as it is to his boss, or nearly so. He knows that when it begins to move fast enough to put the price up a little, or to club the public into submission to present prices, he will get back to work. Hence it has been considered policy for him to keep quiet in public, no matter how acrimoniously his leaders might hurl the truth at the operators in the negotiations.

But in recent years it has been dawning on the miner that his only hope lay in alliance with the consumer. He has not yet gone the whole route, but now and then he does something to indicate that the idea is taking hold. For example, Andrew Mattey, one of the veteran union leaders, stood up in public a few weeks before the opening of the Atlantic City convention and told what would happen and why. A suspension would be forced, he asserted, so that operators could frighten the public into buying ahead of their actual needs ten million tons of hard coal held in storage at the mines. When this was submitted to Ellis Searles, editor of the *United Mine Workers' Journal* he gave it confirmation on all save one point. In Mr. Searles' opinion there is only five million tons in storage. But he added that at an advance of a dollar a ton this would be a neat little item for the operators.

Where Geological Survey Falls Down

What Mr. Searles did not add is that once the operators get an increase they never abandon it. If he had any definite reason for believing that one dollar a tax is the increase to be sought this year, he might have multiplied it by sixty-five million tons to show what the operators stand to get out of a suspension. But Mr. Searles is interested in helping the miners to hold what they have, and if possible to get more. He may be interested also in helping the public, but he cannot be expected to adopt a policy toward the operators that might hurt his own cause.

To the consumer it should be quite plain that the vital question is the amount of unsold coal now in storage at the mines and elsewhere. The natural place to turn for this figure is to the government. And it is when one turns to the Geological Survey that a curious thing comes to light about the anthracite industry. *This highly efficient branch of the government is found to be lacking the simple figures that mean so much, although it is able to furnish reams of intimate statistics about other industries.* It can

Lt. Col. W. G. MacKendrick, D.S.O., known as "The Roadbuilder," is a Canadian who has built roads in all parts of North America. In 1915 he left Canada for France as Captain at Canadian Corps Headquarters. In the autumn of 1916 he was promoted to Lieutenant Colonel and made Director of Roads for the British Fifth Army, remaining in that position until 1919. He was twice mentioned in dispatches, and received the Distinguished Service Order from the King, and the Legion de Honeur (officer class) from the French Government. Col. MacKendrick is the author of "The Destiny of the British Empire and the United States" (McClelland & Stewart, Toronto), which deals with the general subject discussed in this article. The book has attracted important attention in both the Empire and the Republic.

Lieutenant Colonel W. G. MacKendrick, D.S.O.

Is the U. S. "The Chosen People"?

John and Jonathan, the Number 13, and the Destiny of Israel

By Lieutenant Colonel W. G. MacKENDRICK, D.S.O.

IN A recent number of THE DEARBORN INDEPENDENT (May 23), a most interesting article appeared which dealt with a truth not generally known, namely, that the Anglo Saxon-Celtic peoples—the northern white strain, to describe it roughly—comprise the Covenant Nation and Company of Nations referred to about two thousand times in the Scriptures as Israel, Jehovah's Elect Nation, chosen for service to the nations of the world, forever.

What rather surprised me, however, was the meager mention made of the fact that the United States of America are as much a part of this Covenant people as is Brother John of the Isles and his other offspring in the Dominions afar.

Are the Jews Israel? Hardly, on any line of logic. The word "Israel" means "ruling with God" and during the 2,500 years the Jews have been claiming they were Israel few people have ever accused them of working very energetically along God's lines. Are the Bolshevik Jews of Russia ruling with God? They make the claim that they have killed God. If the Bible can be relied on as an historical authority, regarding the people with whom it peculiarly deals, the Israel nations were to be a blessing wherever they went down through the ages. Does the Jew fulfill that specification? Is he a blessing in your community? Jehovah is represented by the prophet as knowing that Israel would be ousted from Palestine, and ordained a place for His People Israel where He said *they would move no more* and where they would not be afflicted as heretofore. Does the Jew fill this specification since he was boosted out of Jerusalem? Has he ever nationally had a country of his own where he might not be afflicted as heretofore? The Jew cannot be Israel because he has never found the place from which he should not be moved, while it is a fact that the Anglo-Saxon peoples have found such a place. And these Anglo-Saxon peoples further fulfil the Israel specification in that they have been a blessing, an enlightenment and a benefit, to the nations.

It is further stated in the Bible that the descendants of David should be seated upon the throne of Israel from the time David the First was anointed King until the end of time. Have the Jews fulfilled this specification? Certainly not. They have been, from the fall of Jerusalem until now, without a country and without a king. Even Palestine is under the government of England, a Scottish soldier being appointed the new High Commissioner of Palestine. While on the other hand the present occupants of the British throne, and the Heir Apparent, are shown to be as directly descended from the House of David (not the House of Judah) as you are from your grandmother.

The Brand of Israel is on America! Take one fact out of hundreds that can be brought forth to prove this heading true. "Wherefore the Children of Israel shall keep my Sabbath throughout their generations for a perpetual Covenant. It is a sign between me (Jehovah) and the Children of Israel forever." Today is a part of the aforementioned "forever" and wherever today you see Nations observing the Sabbath by the law of their land it is a sign or brand that that nation is of Israel.

Your Puritan Forefathers left Britai seeking more liberty and they state in their letters that they were plantin the Israel vine in an unknown land fo the Glory of God. They observed th Sabbath and one of their earlies enactments was to set aside a day o Thanksgiving to God for the man evidences of his providential care o them in their severe struggles in thos early settlements. Both the Sabbat and Thanksgiving Day have been dul observed ever since in America. Th Anglo-Saxon nations of the world ar the only peoples who, by their laws o the land, observe the Sabbath.

Which Reminds Me! Americ nationally is descended from that earl food controller, Joseph. Joseph when i Egypt had two sons, Manasseh bor 1700 B. C. and Ephraim born 171 B. C. The younger son was given th headship of Israel by Jacob who fore told that he would grow into a natio and a company of nations. The far flung British (Brith-Ish, which is He brew "covenant man") Empire know as "Johnny Bull of the Isles" is a nation and a company of nations, th British commonwealth of Nations while the elder brother Manasseh, now known as Brother Jonathan, was t become a great *people*, a Republic And the offspring of these brothers were to be a blessing wherever they went These two sons of Joseph were giver by destiny the wealth of the sea an the wealth of the mines—coal, oil copper, nickel, silver, and gold. I fact, all the good things of this earth A captain of industry once said tha Providence had provided America such a wealth of mines, and so forth, that she would remain the manufacturer of th world for all time. EDITORIALS

England and Coal

ENGLAND appears to the world today as harder hit than at any time in the war. To the support of millions of her unemployed by taxation, she now adds the support of her employed coal miners by the same process. In a situation between miners and operators, neither of whom would concede an inch, it was the government that surrendered by offering to subsidize the mines. Thus the basic industry of Great Britain is to be supported by taxes, with the question of "Where are the taxes to come from?" daily more pressing. The remedy is of temporary nature at the best, but the condition of affairs which it reveals is of the most somber significance. At least, it so appears at this distance.

It is not a mere coal question at all. The larger matter is this: England is changing her base and does not know or will not acknowledge it. She is passing off the scene as a premier manufacturing country and coal supply of her section of the world. The English industrial population is on the verge of being forced out of the Isles into the ample spaces of the Empire. Ichabod is being written over all the old system of English industrialism because the industrial leaders have betrayed their trust; they have neither cared for their people voluntarily nor improved their industrial methods, with the result that their glory is departed, and an emergency like the present one finds them helpless. For dividends have ceased to be the main product of modern business. Both the English miner and the mine operator are victims of false ideas now being eradicated from the world. Both are wrong. And now in company with them their government is wrong. The end will doubtless be better than can now be foreseen, but it will not be due to labor leaders, capitalists or ministers of government that this is so. The fetish of the "gold standard" before which England has lately fallen down in a new adoration, under the guidance of that high priest of financial fallacies, Mr. Churchill, is already proving its powerlessness to help England and its bitter power to hurt.

Doubtless this compromise is a sad blow to the Baldwin government. It has shown itself as incompetent as the MacDonald government. With the wise men of all parties proving only their capacity for failure, Englishmen must be feeling a sense of loss which way to turn for help. When the mighty and the wise fail, what shall the feeble foolish do? All parties have had their fling now, but the disease eats remorselessly in. Something of England is dissolving, something of the old system is passing away. And what the new thing shall be that comes in its place does not appear. But this appears, the pathetic helplessness of the captains and the kings of the old system to guide the people in the matter of self-sustenance.

Swank

"MIDDLE class" or "lower middle class" families abroad cut down actual necessities that they may have a maid who puts on a white apron and answers the door knocker in the afternoon.

Two noted automobile men who attended the Chamber of Commerce convention in Belgium discovered that about the biggest reason why we do not sell more cars abroad is the reluctance of the European to buy a car until he can afford to swank about with a chauffeur.

We may like to brag, but about fifteen million of us are so "common" we like to step on the gas ourselves.

What Is Money?

THE Money Problem is not so complicated as certain persons would have the plain people believe.

Laying aside foreign exchange, which has nothing to do with domestic trade and barter, any acceptable medium of exchange will serve if decreed by Congress, which has sole power to create money having a debt-paying power.

Let us suppose there existed no legal restriction against the circulation of private bills of exchange. Then suppose that Standard Oil, in an emergency, issued a quantity of bills in denominations of one, two, five and ten dollars, to relieve a stringent situation, guaranteeing them and accepting them at every station for petroleum products. Is there a doubt that the people generally would accept and use such bills indefinitely? Of course not. Standard Oil today issues "money" in the form of books carrying coupons in terms of gallons of "gas" good in any part of the country.

When currency of all kinds was short in 1907 because bankers would not honor drafts, many clearing houses issued private currency, and violated a law in doing so, but there was no call for arrests and punishment. Common sense prevented that. There was need of a

substitute for the un-get-at-able funds we had loaned our bankers for safe-keeping, and which they had in turn sent to New York for speculative profit, and could not get it back! So industry and commerce invented a medium or method of exchange never authorized by Congress. The border states even used Canadian money, which in ordinary times is subject to a tax—called discount—by American bankers, who were then glad to secure the bills without paying a premium.

The Money Question is persistent, and wise financiers will put their knowledge and experience to work on a system that favors plain people and producers, and not merely the money brokers.

Ten Million Links

NEARLY ten million words a week now are knitting the two sides of the Atlantic together. That's the really significant story revealed by the recent opening of a new cable.

No doubt wars have been waged for trade; but commercial relations are much more likely to prevent wars. And the war fever cools when you know your man.

About four hundred million amiable words we have exchanged with Europe this last year—business, personal messages, news. The latest cable is of a new alloy and much faster than the old ones. Wireless is being tuned up to higher speeds. Shortly, experts say, long messages will be "photographed" across the ocean. Shot through the air as a halftone is now transmitted; and then static will be a dead obstacle.

All these things mean cheaper communication, an increase in our knowledge of each other and a consequent decrease in quarrelsomeness. The North doesn't quarrel with the South, or the East with the West so much any more, since the motor car has shuffled us up and made out the distances we learned in our geography classes to be gross exaggerations.

The exchange of ten million amiable words a week reduces the war risk

The Job of Not Growing Old

"THEY say I am too old to work."

These were the words of a man who told his story recently in a newspaper office. It was a story of slipping backward, through the years, until he became a messenger boy. And then, nothing. He wanted but seven dollars a week: he could live on that.

And this man was but fifty-seven.

In a hospital, about the same time, doctors and nurses gave a birthday party. There were flowers and books and fruit and candy; and a cake that was topped by twenty-five candles. Everybody at the party joked about that. It was all the candles the cake would hold.

The number was an odd circumstance, coupled with the case of the man mentioned above. When the birthday guest of honor was twenty-five the other man had not yet been born.

The smiling man on the cot was eighty-four. Weeks before he had arrived, alone, from his home, six hundred miles away. With an interval of rest he had had two operations, the second rather serious; and here he was, chipper and contented, reading novels voraciously and writing several letters a day to his wife, children or grandchildren.

After while he got up out of bed, jollied his nurses, and strolled off home.

And there you have one of the big jobs the human race has set itself.

It is the job of not growing old.

We have come a long way already, and not all our progress has been due merely to the cold science of diet, exercise, ventilation and sanitation.

In the two cases mentioned above the difference was very largely *a state of mind:* the faces of the two men show it, as well as their histories.

Certain Kinds of "Bond" Houses

THE species of "bond" houses that fatten on lending money at heavy discounts to builders of apartment, hotel and office building and then sell to the public bonds based upon the mortgages, is too resentful of reasonable criticism of their commerce. Those who oppose fair comment must be apprehensive about the possible disclosures. The appraisals of the properties upon which the money is loaned are very often in excess of real value. This feature of the appraisal business is simply disreputable and "bond" houses are responsible for the ensuing deception of security buyers who are thus given a false idea of the margin between the mortgage and the value of the property. Furthermore, the acute shortage of the above classes of buildings, that existed when the traffic in these bonds began several years ago, is being overcome. No property is worth more than it will earn, especially property that must pay a high toll to the money lenders. The profitable process of tenants bidding for accommodations is being reversed and now the tenant is being sought. Lessened earnings usually spell foreclosure and the wiping out of the equity of the borrower even though the bondholders may get their money. But there is no assurance that the bondholders in every instance will escape the results of usurious discounts and false appraisals.

MR. FORD'S PAGE

A YOUNG man starting out to learn the business to which he desires to devote his life, or to experiment among the various lines of business to find one that best fits his abilities, is wise to begin by choosing his boss.

It is worth while making an effort to exercise this choice, and possibly most young men of purpose do it unconsciously. Others may think only of the wage that is paid or the job that is available. A job which does no more than pay a wage, that does not become a doorway into a knowledge of method and practice in business, is sheer loss of time to a young man.

If men become—as the familiar charge has it—mere cogs in the wheel, it is because they *are* cogs, or wish to live the mentally inactive life. No man of alert mind can be *made* a cog; it is from men who refuse to be cogs, or from cogs that come alive, that industry grows. The life process in industry is not fitting men to jobs, but fitting jobs to men. A broadening man broadens an otherwise narrow job. Jobs shrink or expand to the size of the man. How can it be otherwise? When an insensate tree can burst the rock by the silent process of growth, what can life in a man not do?

Assuming purpose in a man, he will do with his work what he would do if he were a student of an art, he will choose the best teacher. Leaders of industry are ultimately teachers of the men who staff their institutions. Inevitably they are teachers, good or bad. Some teach very bad lessons. They teach that dividends come foremost if you wear a white collar, and wages foremost if you work in the shop, and the devil take service and the public. Absentee dividend-takers at one end, and irresponsible union demands at the other are results of wrong teaching in business.

Many bosses are unfit for their positions, and are presently moved out, because they do not see industry and its processes and results as part of the general life, but rather as a sort of private piracy. They regard the work of the workers and the money of the public as spoil to be extracted in the largest quantities with the least return.

Choose a boss who knows the shop. A man who knows the shop only from the office end is not nearly so beneficial to follow as a boss who knows the office from the shop end. The boss who knows the job from personal experience may be a little harder to work for, that is, it may be impossible to fool him, because he knows what good workmanship and sufficient production is, but he will impart to his men the feeling of doing man's work in an honest way and to a useful end.

But, in the physical sense, he will be easier to work for, because he will be constantly improving the way of doing things.

It matters not how large or small an establishment the boss may have, it is only necessary that it be growing. A business is becoming smaller or it is growing greater. It is never static. Size is not so important as direction. Some very big concerns are going back; some very small concerns are coming forward. Choose a boss who is a "comer," because growth is the seal placed on a certain important percentage of merit.

A boss who knows the principles of his business and has strength enough to enforce what he knows, and moral character enough to know that mechanics and manufacture are parts of conscience—such a man is worth any young fellow's apprenticeship, and for such a man he ought to seek.

This, of course, always assumes that the young man himself is awake to his future and the necessity for knowledge and experience. Hosts of young men hardly look farther than "getting a job." And the job is measured by its pay. Getting the job is necessary, and the right kind of boss will see that nothing is lacking in the pay, but if these constitute the sole elements of the matter there is certainly no future in the job nor in the individual. The right kind of boss will make young men aware that there are opportunities waiting, and thus making them aware will try to kindle in them a wholesome desire to move up and make room for others.

It is every man's duty to get ahead, to make room for those who follow him. When a man succeeds for himself, he makes way for dozens and hundreds and thousands farther down the line.

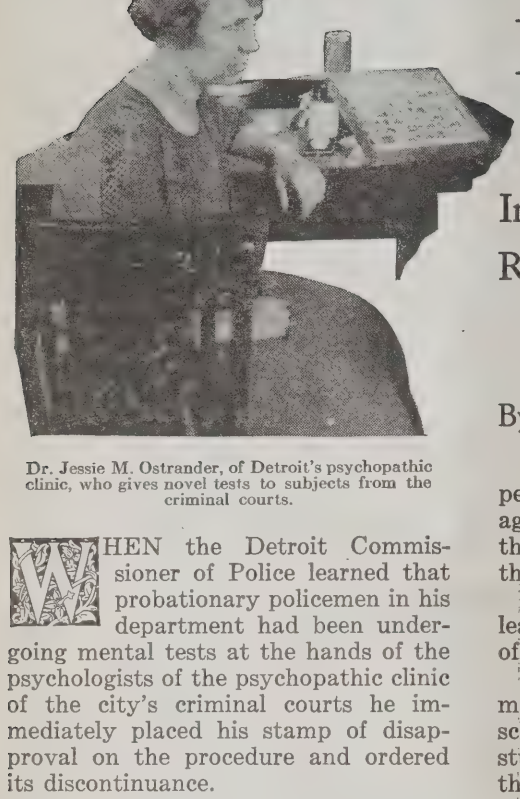
The enduring reward of industry, which nothing can take away, is what a man learns. That is *his*. He will have to spend his wages, he will have to expend his energy, but what he learns is his always. And he can learn only under men and methods that are dedicated to principle, that principle being the mingling of mind and matter for the honest uses of mankind.

CHOOSING a boss is important for young men, whether business or employment be chosen as a career. For the boss is inevitably a teacher. Sometimes bad lessons are taught with sefish results at both ends of the business. Young men should choose a boss who knows the job from the shop end, not from the office end; the boss of a business that is growing. Direction is more important than size. Growth shows merit, and merit argues conscience in mechanics and manufacture. Getting a job is easy. Getting permanent value out of a job means purpose and fitting means to ends.

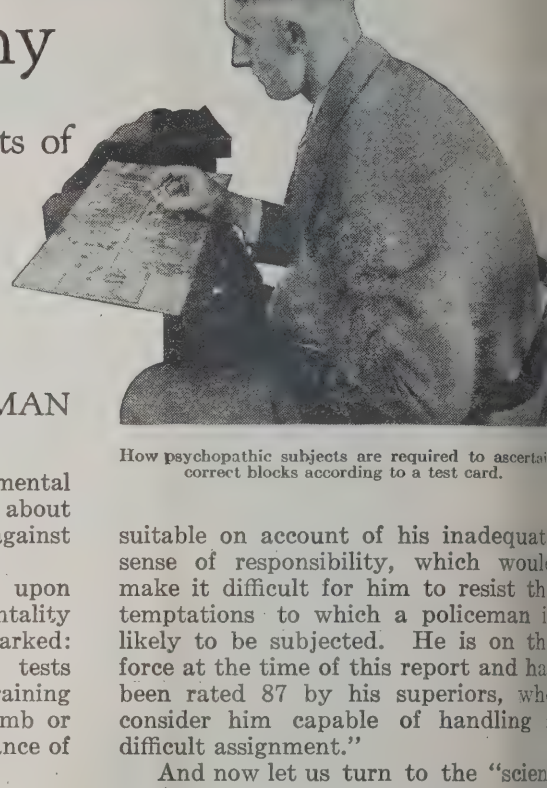
The Social Side of Psychopathy

Some Believe in Tests of Intelligence, But Others Regard Them as "Nut" Questions

By HOWARD W. BOWMAN



Dr. Jessie M. Ostrander, of Detroit's psychopathic clinic, who gives novel tests to subjects from the criminal courts.



How psychopathic subjects are required to ascerta correct blocks according to a test card.

WHEN the Detroit Commissioner of Police learned that probationary policemen in his department had been undergoing mental tests at the hands of the psychologists of the psychopathic clinic of the city's criminal courts he immediately placed his stamp of disapproval on the procedure and ordered its discontinuance.

The idea of having applicants to the force submit to "intelligence tests" had been originated by a predecessor, but the attention of the present commissioner was not called to this "advanced mode" of selecting guardians of the law until the lady assistant psychiatrist of the clinic issued a report on the observations.

The test was made of the last group of 150 applicants sent through the clinic, and in this report it was set forth that approximately 15 per cent were subnormal. The Stanford Revision of the Binet test was employed, one hundred and forty-three of the men passed through it, while seven were diagnosed from their past histories. Two were given other tests because there was a suspicion they had been "coached." And when the psychiatrist concluded she had before her the following table:

Chronological age	Total	*Mental age in years* 9	10	11	12	13	14	15	16	17	18
21 years	1	....	....	....	1	....	....	....	....	....	....
22 years	14	....	1	....	2	2	4	2	1	1	1
23 years	23	1	3	2	3	6	2	3	1	2	....
24 years	19	....	1	2	4	4	5	....	1	1	1

Total	143	8	10	12	26	31	24	16	6	6	4

To amplify the table, it was practically said (according to the Stanford Revision to be roughly explained farther on) that of the 143 examined 15 per cent had the mental ages of children of from 8 to 10 years, were "below par in their social and emotional reactions" and that the "middle 50 per cent of the group" had a mental age of from 11 to 13 years, or about that of the average offender against the law.

The Police Commissioner, upon learning of this analysis of the mentality of the prospective policemen, remarked:

"In some instances mental tests may be valuable. I think our training school officers can detect a dumb or stupid fellow without the assistance of the psychopathic clinic."

The psychiatrist in charge of the psychopathic clinic of Detroit's criminal courts, upon the Commissioner's mandate that the tests must be eliminated in his department, said:

"The Commissioner takes particular offense at our analysis of case No. 3475 and after one has read what our observations disclosed I am sure they will agree with us that this type of probationary patrolman is not of a kind the citizens would desire as a regular policeman."

Taken from the records of the psychopathic clinic, "Case No. 3475" reads as follows:

"This 26-year-old married man was descended from native born parents. No serious diseases were recorded in his family history.

"His schooling was somewhat irregular, owing to frequent changes of residence, and he finished the sixth grade at 16 years of age. He was employed at clerical work until he joined the army, where he was promoted to the rank of sergeant. Upon leaving the army, he was engaged in factory work for a few months before taking up the profession of boxing.

"He also acted as 'stake man' in gambling houses and took in the usual 'profits.' He continued these occupations for about three years until he applied for a position on the police force. He considered himself popular with other fellows and continued his interest in athletics, but said, at the time of his examination, that he was giving up his gambling habits. His mental age on the abbreviated Stanford scale was 14 years, 1 month; IQ (intelligence quotient) 80.

"The clinic considered him unsuitable on account of his inadequat sense of responsibility, which woul make it difficult for him to resist th temptations to which a policeman i likely to be subjected. He is on th force at the time of this report and ha been rated 87 by his superiors, wh consider him capable of handling difficult assignment."

And now let us turn to the "scien tific" side of the controversy for a pe rusal of the "tests" that, of necessity must be brief, for officially sanctione psychopathic analysis of human trait is comparatively new and first becam generally discussed in this country whe such an analysis was made of ou fighting forces in the World War.

To gain some idea of what is terme "the Stanford Revision of the Bine test" one goes back to Alfred Binet a notable French psychologist, wh was called upon by the authorities o his country to study the backwardnes of the children in the schools of Paris He accomplished his work in a de cided way, leaving school knowledg to one side and seeking out what in formation the child had gained fron his playmates and elders.

Binet worked out his intelligence test on a scale of mental age. He em ployed not one test but many, his point being to use many brief tests and per mit the child to demonstrate what he had learned and what he could do Professor Louis M. Terman, who published "The Measurement of In telligence" in 1916, explains the Stan ford Revised Test, in part, as follows

"From the tests for three-year olds: Name familiar objects—the child must name correctly at least three of the five common objects that are shown him.

"Six-year-old test: Finding omis sions in pictures of faces, from which the nose, or one eye, et cetera, is left out. Four such pictures are shown, and three correct responses are required to pass the test.

"Eight-year-old test: Tell how wood and coal are alike; and so with three other pairs of familiar things; two out

four correct responses are required t pass the test.

"Twelve-year test: Vocabulary test -rough definitions showing the child's derstanding of forty words out of a ndard list of one hundred."

These tests are primarily adapted t use for school children, yet the nford Revision is the most widely ed adaptation in America in testing te intelligence of adults and forms a ge part of the outline of work in troit's psychopathic clinic. It pro- les six tests for each year from three t ten, eight for twelve-year, six for rteen-year, six for adult, and six for perior adult intelligence.

When the psychiatrist has his sub- t before him starts his ob- vation with a en number of ts in mind, h test having allotted nu- ral in keeping h the gener- y accepted ory that to be rmally intelli- t the subject st register 100 p- cent.

The different ts are numer- s and not all chologists use same. There form boards, h missing spaces, and the sub- t of the test is called upon to fill se spaces with blocks that will exactly; there are dissected ture puzzles; there are the ables," the latter being little es for which the subject is ex- ted to supply a common-sense ral.

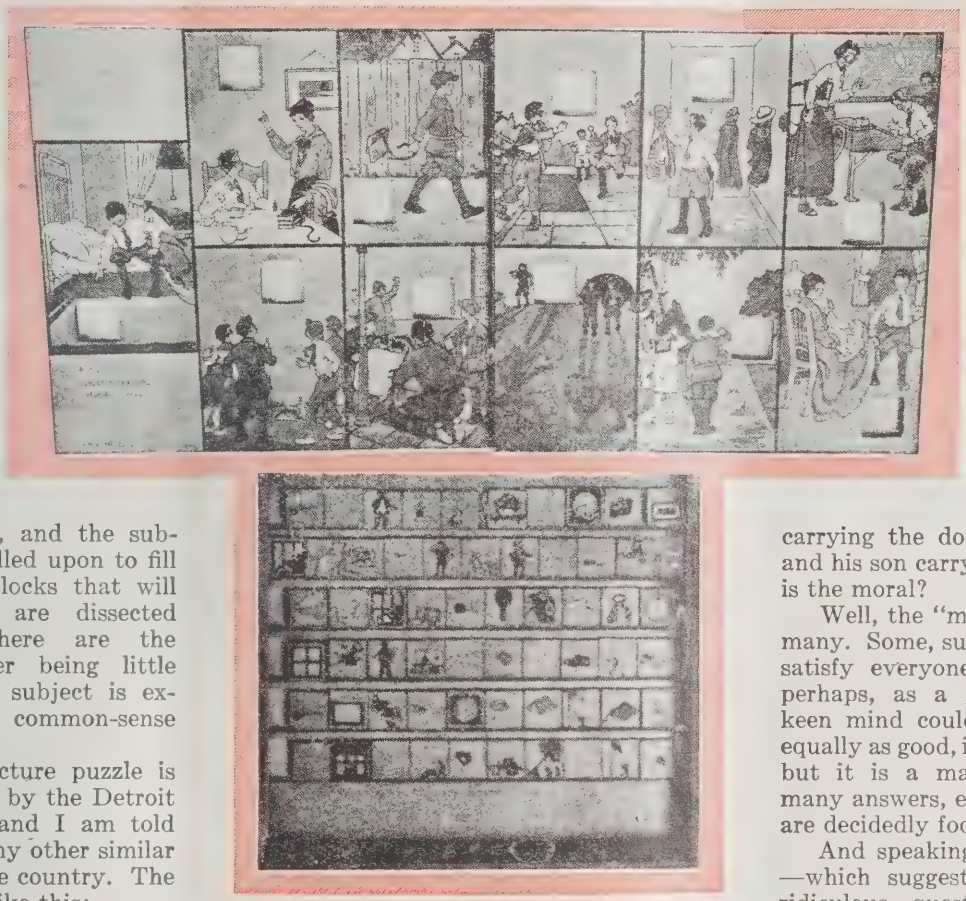
The dissected picture puzzle is e of the tests used by the Detroit chopathic clinic and I am told t it is used in many other similar ics throughout the country. The t goes something like this:

The psychiatrist lays before the ject a large cardboard done in ors depicting the adventures of a ng schoolboy from the time his ther unceremoniously calls in the rning until he is seated in the ssroom. It is blocked out in separate nes much after the fashion of tures in the comic section of the nday newspapers, although this at- pted illustration is meant in no y as a reflection upon the test.

In the first section of a continuity ten pictures the boy is seen with one e on and looking for the other. here the mislaid shoe is supposed to a space about one inch square is ssing. In a box nearby are a number squares, among them being six t carry pictures of shoes. The idea to pick the shoe which matches the e the boy has already on. It goes hout saying that an Oxford would not match a high laced shoe, such as must be the mate in this particular picture—and furthermore a close study shows the shoe must be one that is decidedly worn to match.

In the next scene the boy is shown at the breakfast table with his mother admonishing him to hurry and pointing toward the wall where there is another vacant space. In this space should go a clock. There are several pictures of clocks which will fit this space but again it is apparent and reasonable to suppose that one showing the hour as 10:30 a. m. and another 3:00 p. m. would not do. The one of 8:30 a. m. is correct.

And so it goes, with the boy losing



The Healy Pictorial Completion Test No. 2, used upon subjects coming before the criminal courts. It depicts a boy's experience from the time he arises in the morning until he arrives at school. The vacant spaces are to be filled in from the blocks contained in the case.

and chasing his cap—and it must be a blue cap for that is the color of the one he wore when he left home. The last shows the teacher beside her desk with skirts held slightly aloft, her features wearing a somewhat terrified expression, and looking down at a vacant space. I put a square with a picture of a mouse in the missing space—and ran my IQ down thereby. My examiner said what should have been there was a spilled inkwell. It seemed, however, to be expecting too much for her features to mirror such terror over a spilled inkwell—especially after the accident had occurred.

In reciting the incidents of the aforementioned test it must not be concluded that it is the primary one used in ascertaining one's mental age. There is no primary test, all go to make up the general observation. One is subservient to the other.

In going through Detroit's psychopathic clinic—and it is much the same in others, I am told—one runs across, in the records of cases, such expressions as "He responds to the Fable test" or "He does not respond to the Fable test." For example, here is one of the Fables used by some psychiatrists:

A man and his son are traveling a highway, leading a donkey. A passer-by says: "Why doesn't that cruel father put his boy on the donkey's back?" The father heeds the advice. Farther on a passer-by says: "Look at that boy riding and letting his father walk." The father changes places with the son. Again a passer-by says: "Why doesn't that inhuman father take his son up beside him?" This the father does. Again a passer-by says: "Just look. Two people on that donkey's back. They ought to be carrying the donkey." The father and his son carry the donkey. What is the moral?

Well, the "morals" advanced are many. Some, such as: "You cannot satisfy everyone" could be taken, perhaps, as a good response. A keen mind could undoubtedly give equally as good, if not better, answers but it is a matter of record that many answers, even to the layman, are decidedly foolish.

And speaking of foolish answers —which suggests to some equally ridiculous questions—there comes to mind a soldier in one of the Southern cantonments during the war. The army was in the midst of its psychopathic tests which were being made in an effort to place the soldier in the position to which he was best fitted—anyway that was the idea.

One of the "boys" bounded out of the mess hall, after having been given the test. On his face he wore a smile of none too mild derision.

"Say," he exploded, "what do you think? That guy in there giving them tests asked me, quick like: 'Is the moon made of green cheese?' "

"What did you tell him?" we asked anxiously, for we were yet to be examined.

" 'Tell him?' " he seemed as if he were going to burst—" 'Tell him?' Say, what can you tell a guy that asks a nut question like that? I told him nuthin'. "

I told the psychiatrist of the Detroit's psychopathic clinic of this incident. He only smiled blandly and said: "Not so bad. Just study the proposition and you will see its possible merit. The officer giving that test was watching most alertly for the reaction his question would produce in that soldier." Well, the reaction asserted itself.

Now, perhaps, enough has been said of the tests to give some inkling as to what they comprise. Volumes have been written on this science of testing mental intelligence as it has to do with courts, prisons and other social institutions of the country, and every up-to-date library has these books.

But what of the "IQ," the Intelligence Quotient, and how is it reached? Binet's scale set forth that if a child could pass the eight-year-old performance he had a mental age of eight. If the child were actually eight years old he had a normal intelligence and his "IQ" (you divide the mental age by the chronological age, the decimal point being omitted) is 100.

Furthermore, if the child is only six years old but has a mind of a child of eight, he is unusually bright and has an "IQ" of 133. If the child is ten years old and only has the mind of a child of eight, his "IQ" is 80. And here may be the proper place to answer the question: "How is the mental age of eight, or ten, or twelve, or whatever it may be, arrived at?" The answer, as given by the psychologists, is that actual trials made upon thousands of children have standardized the tests in such a manner that a child of a given age can barely pass the tests of that age.

Who standardized these tests? Binet started it in France, the Stanford Revision rather simplified it in this country. The expression "simplify," however, must not be taken to mean that it has become such a simple proposition that one not thoroughly trained in its use may employ it. The layman must admit, because of the ever-advancing strides psychopathic analysis of men's minds is making in connection with social institutions, that it is a science, no matter what effect it may have upon man's relationship with man in the future, and that persons trained and equipped for its application will alone be those into whose hands it may be trusted.

The denunciation by Detroit's Police Commissioner of mental tests for his officers brought Detroit's psychopathic clinic into more limelight than it has ever found before. Employing the "IQ" in connection with the chronological age of the policemen observed in the clinic it is found that thirty-one—the largest of any given number—have but the mental ages of thirteen years. Of this the psychiatrist says that citizens who trust in police protection should not become unduly alarmed, because, he adds: "The average mental age of the man on the streets is but 13 years."

When the tests were made the majority of the officers were in the police school. They ranged in years from 21 to 36. Sixty, or 40 per cent, were from 21 to 24 years of age; 56, or 37.3 per cent, from 25 to 29; 30, or 20 per cent, from 30 to 34; and 4, or 2.7 per cent, from 35 to 36. Seventy were single, seventy-three married and seven either separated, widowed or divorced.

Sixty-seven came from Michigan, an equal number from other states and sixteen from other countries. Six of the latter came from Great Britain. Eighty-four were of parents born in this country, 50 were born in the United States of foreign-born parents, the remaining 16 being born in foreign lands.

"Why do you want to join the police force?"—was the first question put to each and the answers were, in substance, usually the same. It was attractive because it was outside work, there was a lack of monotony, the chances of advancement were good—and the pension. At this point reference to the table setting forth the mental ages of the applicants by school grades they attained is of interest for it may give some idea of the worth of our school system.

"Playing with the blocks" in Detroit's psychopathic clinic. The examiner taps the blocks on the table in irregular order, and the subject is expected to follow in the same order. This is to determine mental observation.

		Mental age in years									
School grade	Total	9	10	11	12	13	14	15	16	17	18
Third	1	....	....	....	....	....	....	1	....	....	....
Fourth	1	....	....	....	....	....	1	....	....	....	....
Fifth	5	1	1	2	....	1	....	....	....	....	....
Sixth	15	5	1	....	4	3	2	....	....	....	....
Seventh	16	1	2	1	5	2	3	2	....	....	....
Eighth	57	....	4	6	11	17	9	6	1	2	1
Ninth	9	....	....	....	1	1	2	2	1	2	....
Tenth	14	....	....	....	1	5	1	2	3	....	2
Eleventh	3	....	....	....	1	....	1	....	....	....	1
Twelfth	6	....	....	....	1	....	3	1	....	1	....
Beyond the 12th	4	....	....	....	1	....	1	....	1	1	....
Other systems	12	1	2	3	1	2	1	2	....	....	....
Total	143	8	10	12	26	31	24	16	6	6	4

Sixty-one of the 150 applicants came from the farms. Most of them had come to the city and worked for a time in factories, as street-car conductors or motormen, firemen, milk wagon drivers, electricians or in clerical positions. Then followed an auto-repair man, a boarding-house operator, an expressman, a jitney driver, an oil station operator, a tailor, a pool room operator, and so on.

The probationary period for officers is usually six months, the first month consisting of a school period of eight hours a day. There is gymnasium work and classroom study in laws, ordinances, rules and regulations. The police department rating is as follows:

John Doe Patrolman Badge No.— Reserve Division

Name Rank Badge No. Kind of Duty Precinct

(Mark on scale of 10: excellent—10; good—8; fair, good—6; poor—4; very poor—2.)

I. Appearance:	1. Physical condition	(10)
	2. Neatness and bearing	(10)
II. Intelligence:	3. Intelligence	(10)
III. Discipline:	4. Discipline	(10)
	5. Attitude toward duty	(10)
IV. Efficiency:	6. General ability	(10)
	7. Exercise of authority	(10)
	8. Preservation of order	(10)
	9. Handling arrests	(10)
	10. Getting and presenting evidence in court	(10)
	(Maximum 100)	

Would you give this man an important independent assignment, where he would have to rely on his own judgment in unusual circumstances? (Answer "yes" or "no") *Yes*

Have you given him any such assignment? (Answer "yes" or "no." If "yes," explain on back) *No*

Has this man done any unusual work which you believe should be placed on his record, either good or bad? (Answer "yes" or "no." If "yes, bad" or "yes, good," explain on back) *No*

Signed by: Richard Roe
Rank: Lieut.

The assistant psychiatrist obtained the police department ratings of 108 applicants as made by the officers who prepared them. Compared with these ratings the Stanford mental test showed:

		Mental ages in years									
Officer's rating	Total	9	10	11	12	13	14	15	16	17	18
50–59	2	1	1	....	....	....	....	....	....	....	....
60–69	20	2	1	1	3	5	7	....	1	....	....
70–79	33	3	1	4	5	9	5	4	2	....	....
80–89	45	1	2	4	8	7	9	8	....	3	3
90–100	8	....	....	1	1	2	....	2	2	....	....
No report	35	1	5	2	9	8	3	2	1	3	1
Total	143	8	10	12	26	31	24	16	6	6	4

Considering the officers' recommendations as to the advisability of placing these men in positions where they would be called upon to handle important assignments, the assistant psychiatrist's following table sets forth:

Recommendation for important independent assignment		*Mental age in years*									
	Total	9	10	11	12	13	14	15	16	17	18
Yes	50	3	2	3	7	12	11	9	....	1	2
No	33	4	2	3	6	6	8	2	....	1	1
Not answered	60	1	6	6	13	13	5	5	6	4	1

At the time of the above table, twenty-four of these applicants were off the force. Four were dismissed for drunkenness, fighting with citizens or insubordination. Five resigned on advice of the department surgeon, one failed to report, four resigned with charges pending. The others resigned for different reasons.

In analyzing the results of the psychopathic test with the police department ratings, the psychiatrist was forced to admit there was little agreement between the two, but held that ten years hence a more reliable comparison might be made.

Who Started the Riots in China?

Was It the "Awakened Giant"?

By JAMES H. LEWIS

Natives jeering foreigners in the city of Shanghai.

THERE have been riots in Shanghai, Canton, Foochow, Kinkiang, Chungking, and probably in other cities.

Look at the map of China. Mark these places. They cover the north, the south, the east, the west and the central part of China. The present Chinese unrest is not just a little skin rash, to be cured by a little salve.

What are the facts about the Shanghai shooting? Let me state them rather abruptly:

There had been a strike for three or four weeks by the Chinese workmen against working conditions and wages in a Japanese cotton mill. About three hundred Chinese students marched down the main street of Shanghai in a demonstration in support of the strikers. They carried handbills which were directed chiefly against the Japanese. The students were ordered by the police to disperse. Refusing to do so sixty of them were arrested and taken to the police station. Some of these were held for trial but the rest released. They declared they would remain there. While the altercation was going on other students gathered in protest against the arrest and detention of such students as were held. Then it was that the police inspector ordered the shooting. Seven were killed, ten severely wounded and more arrests were made, including two girls.

The police who did the shooting were Sikhs from India, under the command of British Police officers. The students were unarmed. No Chinese is allowed to carry arms in the International Settlement of Shanghai. It is probably true that there were guns in the police station, but it is not likely true that these guns were sought by the students. If they had wanted guns they could have secured all they desired from Chinese sources, who supply contending armies near Shanghai, or from the Chinese arsenal a few miles away from Shanghai. The other demonstrations throughout China have been sequels to the one in Shanghai—meetings of protest, indignation meetings, et cetera.

Guards at the edge of the foreign settlement of Shanghai, in an effort to prevent further attacks on the British, Americans and others.

Whatever the subsequent details of all these demonstrations may reveal, two outstanding facts of real importance show themselves with extraordinary clarity. First, the fear, awe and prestige of the foreigner—because he is a foreigner—is past in China. Second, China's national consciousness is a new factor with which the world must reckon in the Far East.

China opened her first treaty ports with the signing of the Treaty of Nanking in 1842. This treaty closed the opium war, in which China was defeated and forced to accept importations of Indian opium. Both Lloyd George and Mr. Chamberlain have been greatly exercised lest the agitation in China become definitely anti-British instead of anti-foreign. Unfortunately for them, there is some basis for their fears. The Chinese have never liked the fact that the British had an alliance with Japan—China's closest rival—for a good many years.

Foreign prestige in China was founded upon the demonstrated superior knowledge of things which the foreigner possessed. The Chinese surmised that this knowledge extended to include superior knowledge of themselves. The Chinese had also built up a rather strong hope in the morality of the western nations, which was predicated very largely upon the fact that the United States returned to China for educational purposes, half of the indemnity exacted from the Boxer uprising.

The World War, however, and its aftermath in Versailles—and also in Washington—dissipated most of this prestige. More than a quarter of a million Chinese saw the "Christian nations" shooting each other in a war to end war, and at its close, a peace treaty likely to stimulate additional wars. The Chinese delegates to the Versailles Conference met for prayer every morning. *Many of the deliberations of that Conference did not indicate a similar attitude of reverence upon the part of the representatives of the nations which the Chinese had been taught were "Christian."*

The Washington Conference gave very little more hope to the Chinese, and the net result was one of disappointment in their treatment by the foreign powers. It seemed to the progressive Chinese that it would be necessary for them to work out their own salvation single-handed.

The Chinese situation has been very greatly complicated by a system of military governors—one for each province—a system which Yuan Shi Kai instituted when he was in control of the government, some ten years ago. He placed these military governors in command of each province to bind them to himself. When Yuan Shi Kai died, practically every one of the military governors felt that he was the proper person to take Yuan's place. The net result has been civil war and political chaos.

Again, factories have come into China during the last five or six years with extraordinary rapidity. Also thousands of Chinese students who studied in Japan, America and Europe have returned to China, determined to weld the nation together into a unit and to do away with illiteracy and to begin the construction of a really new nation.

With all these diverse elements at work inside the nation, it is no wonder there has been confusion outside of China about Chinese affairs. One must continually remember that China has a population equal in size to the combined populations of all North and South America and Western Europe. It is not surprising that such a mass of people moves slowly. It is also not surprising that when this mass does move, it is well-nigh irresistible. The currents flowing among the Chinese people during the past quarter of a century are just now beginning to show on the surface. A spirit of nationalism is really beginning to take hold on the imagination of her people.

(Continued on page 28)

Romantic Rascals

Doctor Thomas Dover 1660-1742

(Eighth of Series)

By CHARLES J. FINGER

WOOD BLOCKS CUT BY PAUL HONORE

(Copyright, 1925, by Charles J. Finger)

HARDLY a ship sailed out of Bristol without being watched by Doctor Thomas Dover. Transported, he would stand on a breezy hilltop, forgetting his strangely unadventurous life in following a white sail until it dropped below the horizon. Or, seeing an incoming craft, he would have eyes for nothing else until it dropped anchor, then he would be down at the White Hart Inn before the sailors were ashore, ready and eager to mingle with them, and drink with them, and listen to their stories. Nor was he a mere listener, for he, too, had tales to tell, tales read when he was a student at Caius College, Cambridge. Rich and wonderful tales they were and he told them with spirit and intelligence, tales of the doings of buccaneers and lusty knaves who sailed the seas to return with pockets stuffed with pieces of eight, of fellows who had captured heathen ships and ransacked and pillaged in the South Seas, who had taken towns with fireballs and the naked sword, who had put to rout Indian bravos and terrified covetous Spaniards, who knew rivers on the banks of which monstrous poisonous adders guarded gold dust.

One day, most strangely and unexpectedly, the Doctor was dragged from his orbit. It was a sailor, a very sick man at the King's Head, who influenced him. The poor fellow's leg had been amputated by some ship's cook at sea, with a knife and a common saw, and Doctor Dover found him talking like one demented, not of his wound or his sufferings, but about some voyage that he would miss. He seemed to be driven to the verge of his reason because of his disappointment, and things evidently centered about some island. At first the physician thought that he was talking in his madness, but soon abandoned that notion. The sick man was too quiet, too lucid, too concerned in holding himself well in hand.

"Goin' on four years he must ha' been there on that island," said the sailor. "We left him in 1704, I think it was, an' I gave my word I'd fetch him. Now there's this leg an' you don't know how hard it is lying in bed, for I'll never sail again." For awhile he stared up at the ceiling. When he spoke again it was all about his shipmates, and the listening physician had to piece things together. It seemed that a Captain Woodes Rogers would soon sail from Cork for the South Seas, and they would pass Juan Fernandez where the castaway was. Then there was much about a Captain Dampier, "as fine a captain as ever sailed a ship" who had pushed his ship, the *Roebuck*, into strange waters until she almost wore herself to pieces. Dampier, it seemed, knew the man on the island, whose name was Alexander Selkirk. The sick man flew off at a tangent then, with much about a Lionel Wafer, "a man of gallipots and medicines," who sailed as a buccaneer, and his tales grew more and more wearisome because of his drowsiness. But the physician sat listening, silent and motionless, while a strange resolve grew in him. It took shape presently. For forty-eight years he had followed the road set him by Fate and nothing but the seriousness of middle age faced him. If ever he was to see things, to sail the beating seas and gain experience, now was the time. And, if Fate was kind, he might find that lonely man on the far island. To do that seemed a splendid hope.

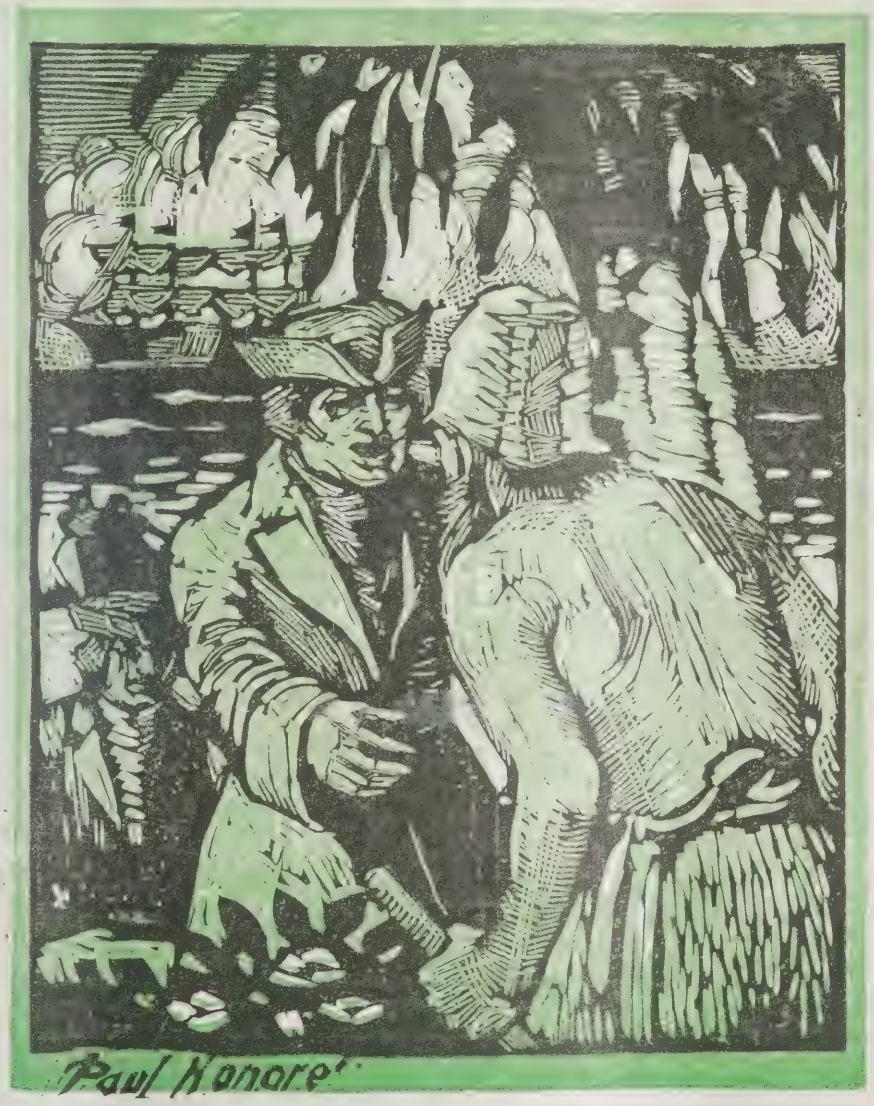
Fired with his new ambition, Doctor Thomas Dover underwent a transformation. New and wonderful things occupied him and for the following three weeks he was busy with Bristol merchants, an enthusiastic man persuading, promising, pleading. There was a kind of pathos in the physician's anxious perseverance. But he made great headway when he met one Edward Cooke, a ship's captain, and enlisted his services. Between them they painted vivid pictures of vast wealth to be had almost for the picking up in the South Seas, told of riches and things so magnificent, and spoke of the certainty with which investments would be returned twentyfold in such convincing a manner that the Bristol merchants found a ship which they called the *Duchess*, provisioned and manned it, and put Edward Cooke in command with Doctor Thomas Dover as his second, the physician having invested his all in the venture. So when Captain Woodes Rogers sailed at last out of Cork harbor, his ship being the *Duke*, the *Duchess* followed in its wake. As for the crews, there is matter for wonderment in the words of Captain Rogers as we find them in his book written long afterward, and called "A Cruising Voyage Round the World." He says: ". . . a third were foreigners, many were taylors, tinkers, peddlars, fiddlers and hay-makers, with ten boys and a negro." Much of that odd mixture was due to the activity of Doctor Dover who made up in enthusiasm what he lacked in sea-knowledge, and being determined to keep melancholy at arm's length and conceiving the whole adventure to be somewhat in the nature of a high-hearted game, had inclined himself toward interesting characters and those with musical tastes. Indeed, one of the men he had enlisted was a loafer about inns who played the hautboy, a trifling fellow who had never done a day's work in his life. However, drilling was part of Captain Rogers' life work, and what with sharp words, a hard fist, and the rope's end, much could be accomplished. So, by the time the ships touched Brazil, the tatterdemalion crews had been battered and bumped into a measure of discipline and seamanship.

The place they touched was Angra de Reyes, where, because of a recent unpleasant visit from French pirates, the Governor Raphael de Silva Lagos was blunt and fierce, emphasizing his

distaste for visitors by firing a gun at the *Duchess*. In spite of the hint, Doctor Dover, very determined to find points of contact, went ashore, took a light-hearted view of the discouraging greeting, and, in his halting Portuguese, made the Governor understand that he held piracy to be a very detestable business and persuaded him that their hopes and aims were higher than those of ordinary buccaneers. So the whole threatening affair turned into a time of untroubled happiness and presently the musicians came in handy. "We waited on the Governour," says Captain Rogers' record, "in a body, being ten of us with two trumpets and a hautboy, which he desir'd might play us to church, where our music did the office of an organ, but separate from the singing which was by the fathers very well perform'd. Our musick played 'Hey, boys, up go we!' and all manner of noisy paltry tunes. And after church service our musickers, who were by that time more than half drunk, march'd at the head of the company; next to them an old father and two fryars carrying lamps of incense, then an image dress'd with flowers and wax candles, then about forty priests, fryars, etc., followed by the Governour . . . with each of us a long wax candle. The ceremony lasted about two hours, after which we were splendidly entertained by the fathers of the Convent, and then by the Governour." On the day following, the ship's people entertained the landsmen with a Gargantuan feast, with everyone extremely polite and helpful, and at the end, the ships were well laden with "strange fruits and a new kind of fish, so that all were glad and grateful to be there."

Their rounding of Cape Horn was one of the experiences that stood out in Doctor Dover's recollection. There were days when the ship was a speck in a furious gray immensity, when there was black darkness at noon, and when pursuing watery green monsters, white-crested and hungry, swept men from the decks as if they had been wisps of straw.

Soon after came Juan Fernandez, to visit which the Doctor had to assert himself, for men and officers were all for sailing past the island, holding that the man must have died long since. But the persistent Master Dover prevailed. He was full of a suppressed excitement that increased as they neared the island. When the ships stood in toward it he was at the masthead, straining his eyes and ears, and before anchor was dropped he was in a skiff with four men and under way. While he fully expected to see some such sight as he saw, yet he was curiously affected when he stepped out of the boat to greet the man who had been on that lonely place all those years, a tanned and bearded figure he was, too full for words, too dazed to answer questions, and almost resentful in his manner toward those who wanted to be tender and sympathetic. And there was a strange flash of pride in Alexander Selkirk, the marooned man, when he led the sailors about his island showing them the things that he had done and made, his two houses, his growing things, his goats and his boat. Nor did he leave, when the ships sailed, without colliding emotions and a certain dissatisfaction. All that business of living at first hand, of winning wild Nature, of caring for the creatures he had tamed, all that direct contact with things meant far more to him than his new shipmates could understand. Even Selkirk himself did not thoroughly realize the wholesomeness of those five years until his island was in the wake of the ship.



He was curiously affected when he stepped out of the boat to greet the man who had been on that lonely place all those years.

North of Juan Fernandez the *Duchess* fell in with a Spanish ship. At the time Captain Cooke was in his cabin, too weak and sick to move, for the doctor had been bleeding him for his fever and the operation was no trivial one. A hundred ounces of blood was the physician's measure. But the captain's misfortune was the doctor's opportunity, and, when the prize was sighted, the Bristol man was like a tiger in his eagerness. He was capable, vigilant and daring as a commander should be. He clapped on all sail in chase, set the men to work clearing decks for action and getting up powder kegs and shot, cleaning and oiling guns, preparing for boarding and what not, while he himself was everywhere, an active figure in a bright blue coat and scarlet sash, his long black hair flying about his shoulders, a sword and pistol in his belt.

The *Duchess* easily overhauled the Spaniard, came so close that her decks crowded with men could be seen, and her name, *El Soltero*, read; then at the doctor's word a thundering volley was fired. One moment the Spaniard's mast leaned oddly as if in astonishment, slued a little to hang queerly poised, then went over the side in a tangle, and the ship broached to. *El Soltero* had no fight in her, and, as the doctor said, it was like a pugilist thrashing a child. Across the water came yells, and shouts, and oaths, then the flag fell without the firing of a gun. It was the supreme moment of the doctor's life when the *Duke* came up and the physician became captain of *El Soltero*, renamed the *Bachelor*.

With his first taste of victory, Captain Dover seemed to drink in ambition with the air he breathed. No hardened Barbary pirate was more filled with the lust of battle, and for a time he was devoted to destruction. Lightly armed (*Concluded on page 30*)

The Film Attack on Our Sunday

Church Officers Who Are Bought Off by Interest in Movie Stock

By WAYNE WOMER

FOR this concluding article we give a close-up of the Sunday situation in a single state, Michigan being chosen because it is the state at present most familiar to the writer.

Certain factors in the history of Michigan have largely determined the manner of its Sunday observance. First, the early settlement was primarily French, and the French viewpoint of Sabbath observance followed naturally.

Second, Michigan was the headquarters for many years of the Seventh Day Adventists, who observe Saturday as their Sabbath.

Third, Michigan's rapid rise as a manufacturing state has brought within her borders scores of thousands of aliens, speaking other tongues, and living by European standards of life.

Detroit is America's fourth largest city. If there is a more wide-open city on Sunday in America, we do not know of it. Sunday is its big day for commercialized baseball, especially in playing off tie *games that cannot be played on Sunday in Philadelphia and Boston.* It is practically the same with all other commercialized sports and amusements. There does not seem to be any stopping point.

In the legitimate theater, actors and actresses are forced by public demand to violate the rules of their association by showing in Detroit theaters on Sunday. The motion pictures have long since lost all sense of Sunday by openly taking advantage of the law. Three times as many persons attend the movies on Sunday as on any other day.

Upon the stage of the movies in Detroit there have stood men and women upon whose pictures the moral judgment of the American people had placed a ban. One theater interest exhibited prize-fight pictures both on Sunday and weekdays which were brought into the state in violation of the Federal Interstate Commerce Act. The man who brought the pictures into the state was only fined $500 in the Federal Court, a nominal sum. The pictures were then exhibited over the state. The fine could have been $1,000, a year's imprisonment at hard labor, or both.

Some Glimpses of Sunday in Detroit

Dance halls are run wide open and filled to suffocation. Sunday is a big day for the real estate man and all other kinds of salesmen. Hundreds of stores are open on Sunday, and some of the largest compel their employes, at certain seasons, to deliver on Sunday. Some factories continually ask their men to work on Sunday. The noise of the house-wrecker is heard in the land, while the black smoke from the funnel of the engine of the steam shovel darkens the sky. Road builders are busy upon the highways. Convicts have been compelled to work on Sunday and we have been informed that our Governor said that he considered it as necessary to build the highways of Michigan upon Sunday as to operate a hospital.

This is the Sunday in Detroit. What is done in Detroit is done on a smaller scale in a large part of the State of Michigan. The motion pictures are operated in almost all of the small towns of the state, although communities like Holland, Bad Axe, and Yale, with a few other places in the state, have not yielded.

Lure of Dancing and of Movie Shows

It is interesting to know how people view these things. In two municipalities, a vote was taken upon Sunday baseball and Sunday movies. One voted in favor of baseball and against the movies; the other voted in favor of the movies, and against baseball.

Michigan is well dotted with dancing resorts, along lakeshores, crossroads, and wooded resorts, where people congregate and dance all day Sunday and all Sunday night. In one of the pavilions about four hundred couples had gathered. The manager declared: "If I had a daughter she wouldn't be here." The reason was self-evident.

Sixteen of Michigan's sheriffs have placed a ban upon Sunday dancing. One of these sheriffs writes: "They are the worst thing we have to contend with, because every tough in the county goes." A conference was held with a group of young people of a small town, high school girls, and others of the high school age, who said that they frequently went to a certain city on Sunday afternoon and danced all afternoon and all night, returning home in time for school and business on Monday morning.

A survey was made in the vicinity of one of these resorts, and within a radius of fifteen miles the church had been denuded of its young people. The Amusement Association is busy planning other resorts throughout the state; one member said recently: "You people do not half appreciate the vacation value of your state, with its pretty inland lakes, and your great peninsula three-fourths surrounded by water—the greatest chain of fresh-water lakes in the world."

This leads us to ask the question, "Is the Christian Sunday being betrayed into the hands of its enemies at so much a share?"

In one Michigan town the commercialized group sold 48 per cent of its stock to the merchants. One by one the churches closed, until finally the three churches of the community had all closed their doors. Eventually the merchants got together and selected the best church and it was opened as a community church with the proviso that all services end at noon on Sunday. The pastor resigned, saying: "You openly espoused the open Sunday for the money that returns to you. I can see now why you called me to be your pastor, not because you wanted the gospel preached, nor your children taught the principles of Christianity, but because it would give your town an air of respectability if it had a church."

Another pastor was anxious to close the Sunday motion pictures, but it was found that the citizens and churchmen who paid his salary owned the motion picture stock.

In still another place the church was closed on Sunday night because officials of the church owned stock in the motion pictures of the town.

In another community the pastor said that 75 per cent of the young people had left the church since the motion pictures had opened on Sunday. At least six of the officials of this church were stock owners in the motion pictures.

But this is not limited to Michigan alone. Reports from other states show that similar methods are being used there. The Amusement Group and the Motion Picture Trust are attempting to do in America what the brewers of Great Britain did years ago, when they sold their brewery stock to the bishops and clergy of the established church, thus buying off church criticism of "the trade."

One Method of Muzzling the Church

The alien enemies of the Christian Sunday sell stock to churchmen and thus suppress any protests against the destruction of this social blessing.

There are several causes which stand out prominently and which with few exceptions are applicable to the world Sunday situation.

When the population of the world was rural, people lived in the open. Today, with a larger urban population, the desire to get out into the open, away from the congestion and noise of the city life, is strong. Sunday is a day free from labor for the vast majority. Therefore, it is used as a day to be spent in the open.

Modern transportation has aided man in his desire. Our fathers traveled very slowly, and their accessible world was small. As a lad I journeyed from my grandfather's to my home in two short runs by rail and the balance by stagecoach, which required from 8 o'clock in the morning till 9 o'clock at night. Last summer I made the same journey in two hours by auto. With 17,000,000 cars in the United States, people are free to go far and wide, while special sight-seeing busses are running in all parts of the civilized world. The radio and the silver screen, as well as good roads, have all contributed their proportion. And our moral and educational tasks have not kept pace with our inventive skill.

Outdoor sports and games are comparatively recent—baseball, football, tennis, and golf. To a man of fifty years of age these things were new or not known in his boyhood days, while today every village and town and city has its schedule, its program, its meets, its teams, its tennis and tournaments, many of which are held on Sunday. Church teams, clubs and organizations are taking part in these things, but that is about as far as the religious idea ever reaches some of the players. On one church team the star players did not know the name of the pastor of the church.

The character of modern preaching and religious teaching upon the subject of the Christian Sunday: This accounts for much of the loss of the religious content of the day. Someone said recently that our forefathers called it the *Holy Sabbath;* our fathers called it *Sunday;* we call it the *week-end.* Much of the teaching regarding the day gives one the feeling of having stayed too long at a pink tea. Among religious leaders and many pastors, the subject seems to be taboo, "soft-pedaled" is the word. Few, if any, sermons are preached upon the subject. If it is right for men to work seven days a week, if a commercialized Sunday is consistent with the principles of Christianity, very well; but if not, why the indifference?

In the United States there are approximately 46,000,000 aliens or children of foreign-born parentage. When the alien came to our shores, he brought his Old World ideals with him. We speak of the alien as one who is with us, but not of us; and one who seeks to get and not to give; as one who would pull down rather than build up; it is this class who, when laws were not convenient to keep, show little or no hesitancy in breaking them. And after they become more accustomed to conditions, they elect men into office who give them what they want; hence the wholesale attack to amend or repeal the Sunday laws of the country.

Sunday in the United States would not have fallen to its present low estate, had there not been for years a well-defined, highly financed, organized propaganda to amend or repeal all present Sunday laws so that certain commercialized interests could continue their traffic seven days a week.

The Sunday Closing Evil —And How To Combat It

Co-Operation with Schools And Churches a Solution

MANY exhibitors are being faced with the terrifying problem of closing their doors as tight as a drum on Sundays, simply because cer- organizations, whether they be civic, feel that entertainment ned on the Sabbath. Thus, always the wish of would like us day on which closed, ive

should embed him so deeply in the hearts of his townfolk that it should take tremendous effort on the part of Blue Law advocates to gain a feeble footing. Whatever the results in this experiment, it must be borne in mind that much can be gained and so little can be lost by such acts of consideration. The community, if it be one which is uncertain as to whether it wants its Sunday shows or not, can be

their Association if they have one, and suggest that they assist you in fighting this insidious influence. They can do so if they refrain from renting or loaning any films for Sunday use to anyone but exhibitors, unless it be an Open Town. If the town is one already closed the distributor can make this a point in case, and if the agitation is in progress he can help you use this as an argument in favor of Sunday Opening, stressing that if theatres cannot show films the Church is really disobeying its own laws and therefore should not. If one goes carefully into this tender subject it can be shown that ith the Church and Theatre can show id profit thereby—and thus edu- ertain the people and per- ior to carry on, unmo- work he is trying to The Church, with closing in the tary

Portion of a page from the *Exhibitors Trade Review* of January 3, 1925.

Chiefly among these are the motion picture interests, which have maintained lobbies in halls of legislation and corps of speakers who are sent from state to state during the legislative season. Motion picture interests boast that they are the third largest industry in the United States. They have led, as a rule, the fight against Sunday, and when they have not been able to procure legal sanction for their Sunday business, they have not hesitated to violate the Sunday law as in Michigan, Ohio, and other states of the Union. It has been found that similar methods that have been used in America to pry the Sunday lid off are being used in other countries today.

The international sporting clubs, which hold the monopoly on prize fights in seventeen of our states, have been active in breaking down Sunday laws; the Michigan Religious Liberty Association, officered by Seventh Day Adventists, and which I have publicly charged is financed largely by the Amusement Group, principally Jews; the Exhibitors' League, which opposes all political candidates who were not in favor of anti-Sunday laws; the Anti-Sunday League of California, which sent questionnaires to the candidates for President in the last presidential campaign—these are among the chief opponents of the American Sunday.

Here is an example of their activity. Recently an auditor in examining the books of a motion picture house came across an item of $500 as having been contributed to an anti-Sunday society.

A careful survey of the whole country shows that about sixty-five million of our population are living under the influence of an open Sunday in America today. In New York last year four motion picture shows had as many people present on Sunday as 573 Protestant churches of the six leading denominations had that day.

Some investigations were made in Michigan, which show that one denomination lost 9,878 Sunday school scholars in average attendance in 1923 and 1924. During the same period Ohio made no church gain, yet her population increased 3 per cent. In a Michigan town, the attendance at the motion picture and vaudeville houses was 2,250, while the total attendance at the Protestant churches amounted to 200.

Another community with 892 scholars enrolled in the public school had an average attendance at the two Sunday schools of only 78. The Indiana survey by a group of scientists showed that 62.2 per cent of the population were receiving no religious education, Catholic, Jewish, or Protestant.

Effects upon crime, especially juvenile crime: In *Columbia,* the official organ of the Knights of Columbus, under issue of January, 1925, Courtenay Savage, in an article, "Vice on a Rampage," says that a survey of the state institutions of the United States reveals the startling fact that the average age of the prisoners in state institutions is between nineteen and twenty years; and reminds us of the fact that no first offender is ever sent to a state institution, but always it is for a second or subsequent offense, which would lead us to believe that the beginning of crime for these prisoners must be between the ages of fifteen and seventeen.

Dr. Frank Moore, head of the Rahway Reformatory of New Jersey, recently talked to 417 boys of that institution, all criminals, and the amazing fact was disclosed that only four had ever been attendants at Sunday school.

Albert B. Hines asserts that 80 per cent of the crimes of the country are committed by men and boys who have had no religious training. Dr. William J. Cox, rector of St. Andrew's Protestant Episcopal Church, of Philadelphia, found that in Chicago in five years, up to 1915, out of 55,000 persons under the age of sixteen who had passed through the hands of the police, about 46,000 of them had never heard of the Ten Commandments. In an eastern high school with 2,000 pupils, a test was given and they were told to write what they knew about the Ten Command-

8,000 Lepers Under the Stars and Stripes

Panorama view of part of grounds of United States Marine Hospital Number Sixty-six, Carville, Louisiana, the only hospital for lepers in the United States.

New Methods and Fresh Discoveries Are Eradicating the World's Oldest Scourge

By W. M. DANNER

General Secretary, the American Mission to Lepers, Inc.

IT WILL surprise many people to know that there are at least eight thousand lepers under the Stars and Stripes. Probably not less than fifteen hundred of these are in the United States, but there are leper settlements in Panama and Porto Rico and Hawaii, and six thousand lepers in the Philippines. In addition to the 218 leper patients already residing in Hospital Sixty-six, the newly established leper colony at Carville, Louisiana, there are one hundred and fourteen known lepers in the United States (one or more in each of twenty-two states of the Union) waiting for transportation to this new haven for their care and treatment.

In numerous isolated cases, the leper people had been treated with inexcusable hysteria, with unsympathetic and even inhuman indifference to their needs. In only two states of the Union had there been anything like adequate provision made for the care of the lepers. These institutions, in Massachusetts and Louisiana, were constantly inadequate and insufficient. The maintenance of these places was conducted on a scale not at all liberal or commensurate with the needs of these sick people.

In the campaign led by the Mission to Lepers for Federal coöperation, many organizations—political, civic and religious—united, and the culmination was the bill introduced by by Senator Ransdell, of Louisiana, which led to an initial appropriation of $250,000 for the purchase of grounds and buildings.

Following this, a commission was appointed to find a location where the neighborhood would be friendly and sympathetic to the idea of locating the lepers as patients in the New Federal Hospital, bringing together people, suffering with leprosy, from thirty-two states where patients were known to reside.

The objections raised from many quarters when perfectly suitable sites were considered caused the commission great difficulty, and led to the final selection of the State Hospital for Lepers in Louisiana as the natural and logical headquarters for all the leper people in the United States—a well-located four-hundred acre tract of land with ample open space on three sides, on the east bank of the Mississippi River. One advantage of this site was the friendly attitude of the neighborhood. Here the State of Louisiana had maintained a leper colony as a state institution. The neighbors had grown accustomed to its presence and had voted sympathetic approval of the plan to assemble all the known lepers of the United States in their midst.

The new Community Church, recently dedicated at a cost of $51,800, is one of the most beautiful churches in North America. It comprises a commodious auditorium for the patients—a balcony for the staff and community rooms for small meetings.

Under the Stars and Stripes, this Federal Hospital Sixty-six is to be made an example that may and no doubt will be copied by many other nations.

Part of the new Tai-Kam Island leper colony.

The latest paroled patient at Hospital Sixty-six is a woman missionary, forty-three years of age. After giving eighteen years of her life to foreign mission service, in some unaccountable way she contracted leprosy. It was a sad message, given to her one day in New York, soon after coming home for her last furlough, when the doctor was compelled to diagnose her case as leprosy. When help of the American Mission to Lepers was enlisted, the only thing to advise was residence in Hospital Sixty-six. Her first question was not—"Will there be a private room, with bath, and ample servants to care for my needs?" but, without thinking of herself, she said at once, "Would I be able to be of any service to the other patients?" For two years she devoted herself to helping enrich and enliven the community life in this hospital. During this time she was careful to follow medical instructions—a good patient. She was recently released having lost all trace of leprosy.

Not only is sentiment growing in the United States toward favorable treatment of all leper people, but, in the territorial possessions, increasing interest is shown by local gifts and contributions of various sorts.

A remarkable demonstration in this line has been the response made to Governor Wood's request for gifts for the Philippine Leper settlement. Many tons of useful articles have been contributed in Manila and the effort to raise two hundred thousand pesos bids fair to succeed.

The Governor has also interested himself in finding a suitable quantity of the ethyl esters of Chaulmoogra oil as worked out in the Hawaii Leper Hospital. At one time he placed an order for three tons of the oil, and now four thousand patients are taking the treatment. Large numbers are making remarkable progress.

Not only is the Mission to Lepers interested in people in the United States afflicted with this malady, but its influences are at work all over the earth.

The Drama of the Japanese Stage

(*Concluded from page 6*)

cocks, and compelled them to fight each other for his entertainment. Then he called them dogs, and required them to bark. They performed these duties reluctantly and with adequate persuasion from the sword which he held over them. When they had done all this, they begged him to return their swords and robes, but he told them it would not be well to put them in position where they could abuse other men as they had abused him. His rage at their conduct and his mirth at their chagrin were contagious. Finally he set them down, each one with hands clasped under his knees, rocking back and forth like two crazy half-moons, and singing a song whose burden was:

"Gotting, gotting, ya, ya, ya!"

What it meant I do not know, but I hummed it in my ricksha, and the ricksha-men sang it. Evidently it was well known. While the two daimyos were busily singing this and rocking back and forth, the erstwhile "servant" gathered up the swords and robes and slipped out. When they dared look around, they were alone, and as nearly stripped as was proper for Japanese gentlemen on the stage to appear.

All these performances were called dances. They were not so from our classification. Play and dance would appear to be interchangeable terms among the Japanese.

At Nara also I saw the Kagura, or priestly dance of the Shinto sect. It was in the Wakamiya shrine, and the performers were the aged high priest and his wife and two daughters. More elaborate dances, that is, dances performed by more priestesses and more musicians, may be had by paying for them, but what I saw appeared to be typical. The aged woman played a stringed instrument and the priest intoned songs. The girls, their faces covered with thin silk masks pasted on, as I discovered by close inspection, and wearing the ancient court dress with divided skirts of red under thin kimonos, danced in slow, rhythmic movements, with moderate use of their fans and of little bells, five small sleigh-bells, or bells of some such character, on the end of a short stick. I was told by the guide that this performance was supposed to be pleasing to the Shinto god.

Of course, saw a geisha dance, and it was wholly proper, according to the most Puritanical standards. That was not the reason I selected that kind. I asked to see the kind that the people themselves enjoy, and this was the kind I saw. If it had been improper, according to my standard, I still would have seen it if it was true to the life of the Japanese people. But I do not go to see exhibitions just because they are improper, and I hate those that are made improper for the sake of showing tourists.

The geisha dance as I saw it was a series of performances, the whole occupying perhaps two hours, in which attractive and well-attired Japanese girls gave rhythmic movements with themes that were announced in English, descriptive of the Pine Tree, the Maple, the Harvest, and so on. There also was a burlesque Priests' dance, which showed no reverence for the Buddhist priests, a masked dance and others. I need not describe this at length, but it contained much of beauty and nothing objectionable. I presume there are different kinds of native dances given by the geisha girls, not all of this character. This happened to be the only one I saw.

Geisha girls of Japan in the "Pine Tree" dance.

The last dramatic exhibition I saw was in Osaka. I went to the marionette show in the Bunraku Theater, the very one in which, as I was informed, this kind of entertainment originated 800 years ago, and where it has been maintained ever since. Theodore Richards, of Honolulu, and I, accompanied by a Japanese minister and a Japanese editor, went in an automobile through unmentionable streets to a muddy passage four or five feet wide, and after many windings emerged into a flagged court, with homes and business houses opening from it in the center of the block. There was the main entrance to this ancient and highly reputed theater. It was no such plebeian place as I had attended in Yokohama. We had to put on slippers as if entering a temple. We had a box with plush furniture, and two fires were made for us four in the hibache bowls. We were served tea. No admission was collected as we entered, but after we were seated we were presented a bill for twelve yen, three yen each.

The orchestra consisted of the usual two performers, the player on the long-necked guitar, who uttered ejaculations as at Yokohama, and the reciter, or singer, who was a famous one, named Tosa Dayu. He put into his voice all possible expression from the tenderness of wooing to the inconsolable grief of unrequited love and the wrath that accompanies bloody battle. The play was the love affair of a man of high birth for a girl, beautiful and good, but of lower social rank, and it had a tragic ending which I did not remain to see.

The marionettes are about a yard high, and are manipulated in full sight of the audience. For the subordinate characters, one operator is enough for each doll, but the principal characters require three men to a doll, one to manipulate and support the body, and one for each side to operate hands and feet. All the operators are shrouded in black, and the art is in making the spectator forget these mechanicians and concentrate wholly on the dolls.

The entire Japanese drama, sacred as well as secular, I am told, has evolved from the marionette show, and there are performed the plays of Chikamatsu, greatest of Japanese dramatists. But I was told that here, as in Italy, the art of the marionette performer is giving way to the movie. There is a playhouse in Kyoto, presided over by Awaji Genoski, most famous of living manipulators of dolls, but I am told that it is not doing well, and my engagements in Kyoto did not permit me to see it. I am glad to have seen it where this form of art originated, and where it still is highly regarded.

May it be long before Doug Fairbanks and Charlie Chaplin displace Chikamatsu in the city where this art has so long endured.

The Art of Skinning Coal Consumers

(*Continued from page 7*)

tell about the coal in the ground, and it knows something about annual production, but it cannot get any nearer than four years back to the amount of coal in storage.

This lack of information is not due to negligence. The Geological Survey has been trying valiantly for some years to get the figures. But there is only one place to get them—from the operators. The operators are represented in publicity matters by the Anthracite Bureau of Information, which can furnish statistics showing the number of automobiles and radios bought by miners, and lots of other interesting things. But when the government, or a writer, asks the Anthracite Bureau of Information for the number of tons in storage he is told that "nobody knows." He is told that it would be a fearful job to canvass all the mines.

Canvassing the mines is a simple matter for the government, but getting the facts out of the operators is something else. Official government reports show that while operators can tell how much coal they had on hand four years ago, they will not tell the United States Government the size of the present stocks. For proof of this the reader is referred to the official bulletins of the Survey, and specifically to the following extract:

"Unlike bituminous, large quantities of anthracite are stored at the mines or at intermediate points en route to consuming centers. The supplies at such storage yards were exhausted by the urgent demand for anthracite that followed the strike of 1922. Unfortunately it has been impossible for the government to obtain complete information on this important subject, and accurate totals cannot be given. The data available indicate that, during 1923, no domestic sizes were stored and reserves of steam sizes did not reach pre-strike level.

Mining More Coal to Put in Storage

"Beginning early in 1924 the producers began to stock small quantities of domestic sizes and by the end of the year the quantity held in storage appears to have reached or passed the level of 1921. The latest complete information available is that for November 1, 1921, which showed a total in producers' storage piles of 4,488,000 gross tons, of which 1,768,000 tons were domestic sizes including pea and 2,720,000 tons were steam sizes. *Additions have been made to storage during 1925 and it seems evident that the tonnage on June 1 was somewhat in excess of that on November 1, 1921.*"

The striking fact here is that in the face of an admitted falling off in demand due to high prices and the invasion of substitutes, the anthracite operators have been paying miners to take coal out of the earth only to put it in storage. Reference to the figures of weekly production will show—as in previous "strike" years—that this process is now being carried on as briskly as ever. And therefore the natural question arises—why, if people are not buying anthracite in the summer months, do the operators pay for putting it in storage?

Mr. Mattey furnished the answer to that question when he asserted that "panic buying" means a higher price to the operators. Mr. Searles confirmed it when he pointed out that even if the surplus held by the operators is only five million tons, an advance of one dollar a ton would mean considerable money. The truth is that when the artificial demand is stimulated by the strike scare to the proper point, wholesale prices invariably are shoved up. And history shows that when once they are put up because of an "emergency" they are maintained thereafter as standard prices. This has been the historic process in the hard coal business.

How Increased Shipments Affect Supplies

It may be of interest, therefore, to examine a little more closely into such figures as are available of surplus coal. The report quoted above also contained the following item:

"The lake movement of anthracite this season was early and comparatively heavy. The movement off the docks has not kept pace with the receipts, and as a result *the upper lake docks held one million net tons on June 1. This was about double the stocks on March 1, 1924, and June 1, 1924.*" (The italics in both excerpts are ours.)

Two reasons may be assigned for this—the falling off in demand, and the increase in shipments. No one would contend that half the anthracite market in the lake regions has disappeared in one year. Therefore it is apparent that most of the increase in surplus coal is due to increased shipments. Anticipating a suspension, the operators have stored so much of it there. And when this known figure of one million net tons is added to the mine storage estimate of "somewhat in excess of 4,488,000 gross tons" it becomes evident that quite a lot of coal remains to be sold. A net ton is 2,000 pounds, and is the unit of measurement used nearly everywhere except for retail sale in Pennsylvania. The gross ton is 2,240 pounds. Without going into all the arithmetic it is evident that on the net basis the total stored coal at the mines and on the lake docks is close to seven million tons—remembering that the government places the mine figure in excess of 4,488,000 tons.

But that isn't all. Turning back to the same bulletin of the Geological Survey, the following additional item of information is found under the heading "retail dealers":

"It was not possible to obtain reports from all anthracite dealers, but reports from a group of 497 dealers who have reported regularly for the last six and a half years throw considerable light on the situation. On June 1, 1925, this group had on hand a total of 1,188,000 net tons of anthracite, against 1,060,387 tons on March 1, 1925, and 1,006,891 tons on June 1, 1924; 555,814 tons on June 1, 1923, and 488,268 tons on June 1, 1920."

The growth of stocks in a suspension year is only one of the significant points about these figures. First, it should be noted that here again the United States Government is denied essential information, being able to get reports only from 497 dealers. How low this number is in comparison to the total number of retailers in the country may be indicated by the statement that some years ago *Philadelphia alone had more than 300 retail coal dealers.*

The total number in the anthracite consuming sections of the country must run into the thousands. But for some reason these dealers are as reluctant to tell the government what stocks they have on hand as are the operators.

Government officials can and do get accurate statistics of the supplies of wool, steel, glass and a thousand and one raw materials and manufactured products. Most of the big industries themselves make public reports of these supplies. It is only in the coal industry—in the hard coal end of the industry—that these figures are unobtainable. Soft coal is always in excess of the demand. No opportunity exists to gouge the consumer by creating an artificial shortage, or a fear of shortage, and therefore nothing is to be gained by withholding the figures. The reason for the secrecy maintained by the anthracite operators therefore becomes quite plain.

The Hush! Hush! Policy of Operators

Back in 1922 the government estimated ten million tons to be in storage at the mines, and observers on the ground put it at thirty millions. When the stocks held by retailers are taken into consideration, and when the attitude of the operators is made plain, it becomes evident that all the estimates made this year are too low. In other words, operators, wholesalers and retailers are ready for another "killing" at the expense of the public. It is common knowledge, too, that control of all agencies of production and distribution is held by a small group of railroad mining companies, and it is unnecessary to go into details of

that particular end of the scandal.

Nevertheless many readers will be misled by the mass of propaganda. If suspension comes the miners will be blamed for the "strike," although the average wage of the men in the industry is only $1,600 a year—less than the earnings of motormen and conductors in Philadelphia, Detroit, Buffalo and Chicago. For this sum the 155,000 hard coal miners face the certainty of four to six hundred deaths a year in the mines, and 26,000 injuries. And even this average is reached only through higher earnings of some contract miners, the day rates for 105,000 men being far below that figure. Naturally the miners will not submit to a reduction, and naturally they demand more of the enormous profits taken by the operators.

These facts help to explain why miners do not regard their refusal to work at lower wages as a "strike" in the true sense of the word. None of the workers is fooled in the least by the magnanimous offer of the operators to keep on producing coal while terms are being arbitrated, because all of them know this offer is made only because it is unacceptable, and making the offer puts the operators in an advantageous position with the public and covers up the preliminary steps in a possible price boost. Likewise it should be borne in mind that even while the operators are admitting the price to be too high, they have shown no disposition to surrender any of their own extra profits, and have never overlooked an opportunity to put it higher. They will not overlook it this year if the public is stampeded into competitive buying.

Where Red Seals Originated

The red seal used upon all legal documents is a survival of the days when people were not blessed with the educational advantages of today. The majority of the people could neither read nor write. In those days the seal was used instead of a signature. It was a disaster if the seal were stolen, for the thief had in his possession a perfect instrument of forgery. The seals belonging to a corporation or a company are still used to authenticate important documents. In this respect the seal acts as a safeguard against forgery.

In the eye of the law a document issued by a company and merely sealed, not signed, would probably be accepted as authentic. The most important seal in England is, of course, the Great Seal. It is kept in a metal case, and the color of the wax used is yellow. At the death of the monarch the seal, after being "defaced," becomes the property of the Lord Chancellor. Only second in importance is the so-called Privy Seal. No document can be sealed with the Great Seal until it bears the authority of the Privy Seal.

"I Read *in* the Papers"—

I read in the papers still more harsh words about the traditional virtues of John Barleycorn. Dr. H. H. Rusby, dean of the Columbia College of Pharmacy, a qualified critic, emphasizes the fact that alcohol in any form is a narcotic, a depressant and never a stimulant. It seems to stimulate merely because it inhibits or deadens the later developed faculties or restraints of the mind, and permits the older and lower ones to have greater play. In other words the man in the drinker is inhibited and the brute released. Mental activity may seem to be increased for a while, but its quality deteriorates. There is no inspiration in the bottle. As for increasing physical strength during emergencies, swigs of liquor merely cause more motion, but the accomplishment does not increase. Liquor does not make cold men warm; on the contrary it increases the danger of freezing. Alcohol never cooled a person a single degree; the nerves that detect temperature changes are dulled, but the heat remains the same. For bootleg, multiply these factors enormously and the answer will be correct.

I read in the papers that a group of once cheap but now rich New York politicians whose profits from the bonding game have been exposed by the controller of the city have retained a well-known Jewish criminal lawyer to sue every newspaper in the metropolis for $750,000. The aggregate of all these so-called libel suits is $13,000,000. This is an old game, but it no longer achieves the object of frightening newspapers into silence. There may be ways of dealing with papers here and there, but stout resistance to libel suits invariably enables the newspapers to avoid trouble. Meanwhile, the New York newspapers will give redoubled attention to these worthies.

I read in the papers that a protest has been lodged with the Governor of Illinois against holding rodeos. It is alleged that rodeo involves "cruelty to animals of an outrageous and brutal sort." This matter of rodeo cruelty arose in London, England, some time ago when at the Wembly Exposition a steer had its leg broken. The Society for the Prevention of Cruelty to Animals brought the matter into court. The person was an American citizen. The laws of Illinois forbid cruelty to animals, but so do those of England. The difficulty seems to be the definition of cruelty. Broken limbs and sundry disfigurements occur at prize fights and football matches, but there is a difference in voluntarily suffering injuries for the sake of a game, and subjecting tame animals to maltreatment for the purpose of making them seem wild. There are some grounds for likening the rodeo to the bullfight. No entertainment involving the suffering of dumb animals is likely to make much headway with the American section of the American people.

I read in the papers that the Standard Oil Company is using "breather bags," a special type of balloon, 18,000 cubic feet capacity, to avoid a present loss of about three per cent through expansion in gasoline caused by the heat of the sun. The annual saving will be about fifty million gallons. The gasoline in the three-million gallon steel tanks upon the "tank farms" gives off saturated fumes under the sun's heat and ordinarily these fumes have to be valved off into the atmosphere to prevent rupture of the tanks. These fumes are now trapped in the "breather bags" and after sunset the cooling tanks draw the fumes back into the tanks again. It used to be said that the Chicago packers saved everything but the squeal; the Standard Oil people now seem to be saving what might be termed the squeal, under the sun's fiery rays, of the gasoline tanks.

I read in the papers that a man in New York advertised for public advice as to how to dispose of his millions. He must have been a man of very little experience else he would have known that the public loves nothing more dearly than to tell men who make money how to spend it. The act was almost though not quite so foolish as Mr. Bok's advertisement for peace plans. People who can't make a dollar think they know how to spend millions; and those who cannot regulate their own affairs teem with plans for the government of the world. Maybe it is a good sign, this interest in things beyond our scope and power, but certainly those who follow the advice of the public in anything are due for some serious lessons in the comparative value of advice.

I read in the papers that Michigan's secretary of state proposes that all automobile taxes be included in a 3-cent gasoline tax. It is a suggestion that smacks of common sense. One tax is always to be preferred to two or three, and a use tax is just. State protection of ownership by registration will be carried on as now, but the cost of license collection will be obviated.

Lobstering in Casco Bay

(Concluded from page 2)

life. The "counter" is placed on the floor of the boat where he scuttles into a hiding place behind a coil of rope.

So the morning wears on. Sixty traps are pulled, but the toll of counters is less than a dozen, although there are crabs galore, sea spiders, and now and then a greedy cod swimming disconsolately from wall to wall. By the time the sun is halfway up the last trap is hauled. As the fisherman turns the boat homeward he whittles plugs about two inches long, puts one into the joint of the crusher claw of each lobster and throws it into a barrel, covering all with a handful of dripping kelp.

Nature has given lobsters claws of a different character, one long and slender for seizing prey, the other heavy to break it up. In danger the lobster will amputate one or the other and at once start to grow a new one. There are few large lobsters caught which do not show this process of renewal.

Aside from his attraction on the dining table, the lobster is a very interesting creature. On his slender legs, strong enough to support his weight under water, he scuttles along the ocean floor waving his feelers in front of him to find his prey. If very hungry, he will burrow in the sand like a pig, or, if food is plentiful, he will drag it to a secluded spot, dig a hole and bury it, mounting guard over his store. He is a fierce fighter and often eats his own kind, and, were it not for the solitary mode of life, the species would exterminate itself.

Besides man, who is his most persistent enemy, the lobster has a host of others. The female lobster, when "in berry," carries about 12,000 eggs glued fast to her abdomen. After hatching, the young float about for a month or so, a prey to every creature that strains the surface of the water for its food. Then, after several moltings, they seek the bottom of the ocean and find shelter along the rocks and ledges. Yet even here the most relentless of their foes, the codfish, pursues them, and a lobster must be almost old enough to be a "counter" before it is safe from their attacks.

The molting time of the adult lobster is a critical period. The "shedder" crawls beneath a rock, bends into a V and a break occurs where the tail joins the body. Slowly the body is liberated, the great claws being dragged through an aperture one-fourth their own dimensions. Then the lobster casts out the lining of his stomach and intestines and starts forth to face the world feeling like a new man. It takes about ten months for his new shell to harden.

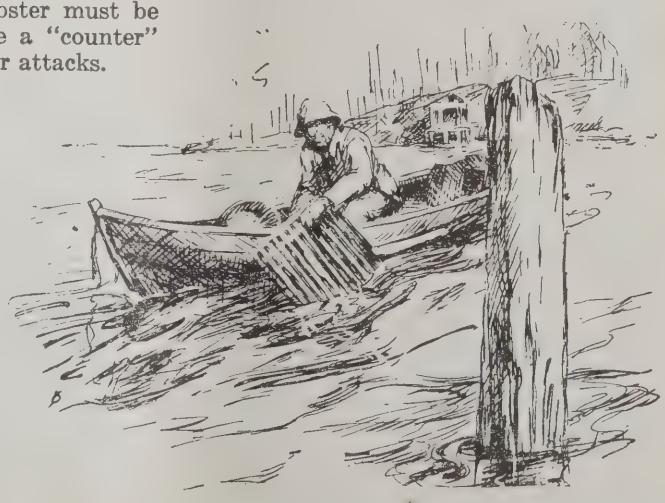
All the processes of a lobster's life are slow, and, if good fortune smiled upon him, he would enjoy a span of life not so much shorter than man's.

In the window of a restaurant in Portland is a giant lobster caught in Casco Bay only six years ago, weighing, when alive, twenty-one and a half pounds, and whose estimated age was nearly seventy. The largest specimen on record, now in the Smithsonian Institution, weighed thirty-four pounds.

But there are none even remotely resembling these favored sons in our barrel. The catch will not warrant a run to Portland, so the fisherman returns to his cove where this "cage" is moored. This is a box about seven feet long and four wide, made of slats and floating just at the surface of the bay. The water circulating through will keep the lobsters alive for days.

Hauling of the traps, arduous as it is, is not all there is to lobstering. Every year the "bobs" must be fresh painted, each fisherman having his own particular markings. The traps themselves must be kept in repair, and, since the storms are constantly chafing them away, new ones must be built. They are not unlike a giant rat trap of the old-fashioned variety that caught its victim alive. They are semi-cylindrical in shape, made of hardwood laths, the bottom double with a flat stone held between the rows. On one side is a funnel-shaped "head," knit by some old lady, of hard twine, and smeared with kerosene and copper paint, with metal entrance ring. There are two buoys, one to mark the position of the trap and one to hold the rope from the bottom with a "warp" or rope of twenty-five fathom (150 feet). The traps are set empty overnight in the cove before they are taken to the ledges for at first they will not "fish" with the bubbles rising from the dry wood.

Once a week or so the lobster smacks come around to all the coves among the islands and take the catch to Portland. These boats have usually one mast with an auxiliary engine, although there are a few two-masters carrying about 15,000 pounds. There is an air-tight compartment at each end and in the center a "well" in which the lobsters are kept. The floor of the well is pierced thick with holes and the circulation of the water keeps the lobsters in good condition. Each dealer has his own cold storage, similar to the cage of the fisherman, only many times magnified, and here the lobsters are kept until shipped to market, perhaps halfway across the continent.



Hauling his traps.

Fishing has undergone fewer changes than any other industry. Lobstermen have been setting the same type trap for years although the heavy dory of a few decades ago is now supplanted by a motor boat, perhaps with an engine that will do the work of hauling. The smack, too, is being slowly replaced by a new type power boat. The government has made considerable effort to keep up the supply by artificial hatching and by trying to introduce the lobster into other waters than the narrow strip from Canada to Delaware which is its habitat. But every year the catch is smaller and more effective means must be found if lobster fishing is to continue a staple industry along the coast of Maine.

Film Attack on Our Sunday

(Concluded from page 19)

ments; only 439 were able to write anything. In New York City at the present time, only 400,000 out of the 1,200,000 public school children are receiving any religious education.

The estimated thefts for 1925 made by William B. Joyce, chairman of the National Security Company of New York, are:

Stock frauds	1,000,000,000
Credit frauds	400,000,000
Burglary, larceny, petty thefts	250,000,000
Forgery	100,000,000
Embezzlements	100,000,000
Seaport piracy and custom frauds	100,000,000
Railroad freight robberies	25,000,000
Home-building frauds	25,000,000
Miscellaneous	1,000,000,000
Total	3,000,000,000

Sunday has been the day that the children and youth of America received religious instruction. Today when millions are receiving no religious education, as surveys show, and when those who do are having their religious training neutralized by a commercialized Sunday, the movies, the theater, the dance, and all other forms of Sunday desecrations, what may we not expect?

In the "City of Pleasant Greetings"

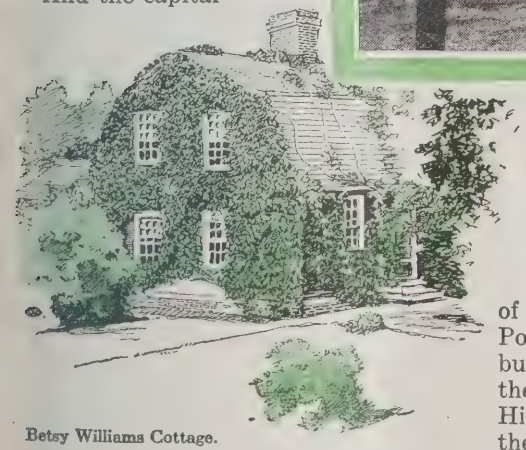
Providence, a Place With a History, Which Does Not Discard the Past Until Assured That the Present Has Something Still Better to Offer

By MAY B. WHITING

PROVIDENCE might well be called the "City of Pleasant Greetings." When Roger Williams, banished from Massachusetts, floated down the Seekonk River in his canoe, a group of Indians assembled on a slate rock called out to him, "What cheer, Netop (friend)?" It must have been a welcome message to the exile, and he straightway swung in to shore, and gave to the landing place its name "in grateful remembrance of God's merciful Providence to me in my distress."

Today the city greets the traveler in a manner no less gracious. As he leaves the unusually efficient railroad station he finds himself in an entrance plaza as fine as any in the country with a wide mall leading into a square adorned with statues and a fountain and surrounded by handsome public buildings. Just beyond, crowning a hill, rises the capitol, a Renaissance structure of Georgia marble surmounted by one of the few marble domes in the world. Over its southern portico is engraved the purpose for which the colony was founded, "to set forth a lively experiment that a most flourishing civil state may stand and best be maintained with full liberty in religious concernments."

And the capital



Betsy Williams Cottage.

city is surely flourishing. It leads in the manufacture of silverware and jewelry; it is the headquarters of the file industry of the country, and has the largest machine shop in the world. It ranks high in the textile industry, while its harbor is nearer the east coast of South America than any Atlantic seaport except Key West. Big business, while it raises immense factories close about the civic center, seems to preserve here the decencies that it sometimes forgets, and the city boasts that it is without slums.

Providence is unique in the number of memorials of the past which play an important part in the life of the present. It seems to be a motto of the city not to discard the old until there is some assurance that the present has something better to offer.

Just a few minutes' walk from the center, or Exchange Place, is the First Baptist Church, the oldest structure of that denomination in the country. Roger Williams organized the society in 1636 and the present edifice was built in 1775 from plans drawn for Saint Martins-in-the-Fields in London. The mechanics of Boston, thrown out of work by the Port Bill, were invited to aid in its building, and in May, halfway between the battles of Lexington and Bunker Hill, the church was dedicated "for the worship of Almighty God and to hold commencements in." Every June the graduates of Brown University march down College Hill and receive their diplomas from its pulpit.

Old State House.

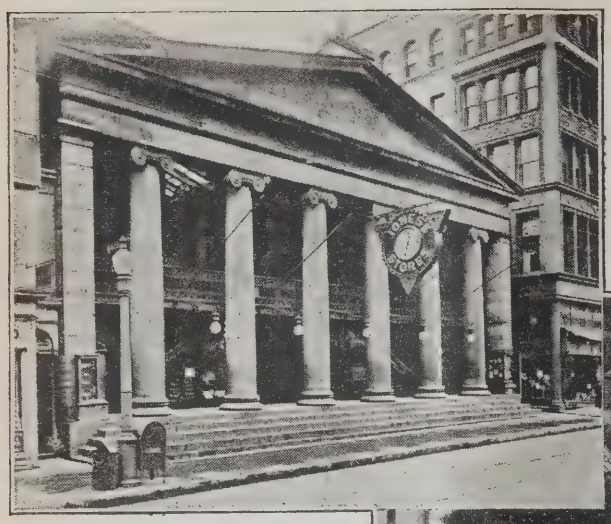
One of the most interesting relics in the church is a handsome crystal chandelier brought from England in 1792 and first lighted for the wedding of Hope Brown, daughter of the benefactor of the university which bears his name. The bell, which was made in London and which still rings at sunrise, noon, and nine o'clock, bore, until recasting was necessary, this quaint inscription·

John Brown House.

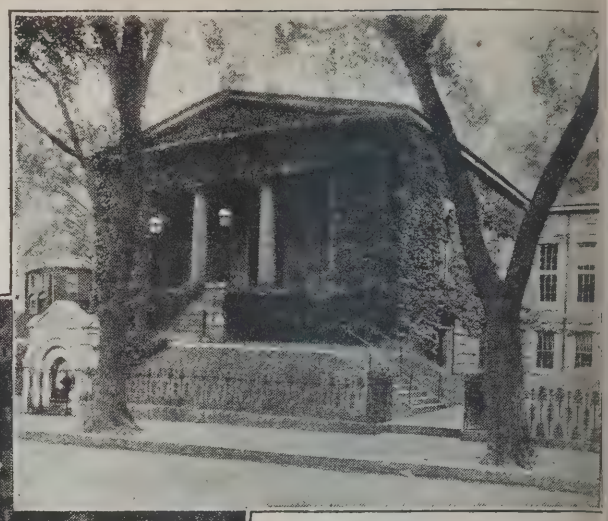
"For freedom of conscience the town was first planted.
Persuasion, not force, was used by the people:
This Church is the eldest and has not recanted
Enjoying and granting bell, temple, and steeple."

In the vestibule is a slab of the "Slate Rock" on which Roger Williams landed. That whole area is now filled in and the bulk of the stone is buried beneath the soil of Roger Williams Square. A few steps beyond the church, past Friends' Meeting House, is the site of Williams' dwelling, and, in the basement of a house across the way, his "spring of clear water" still flows.

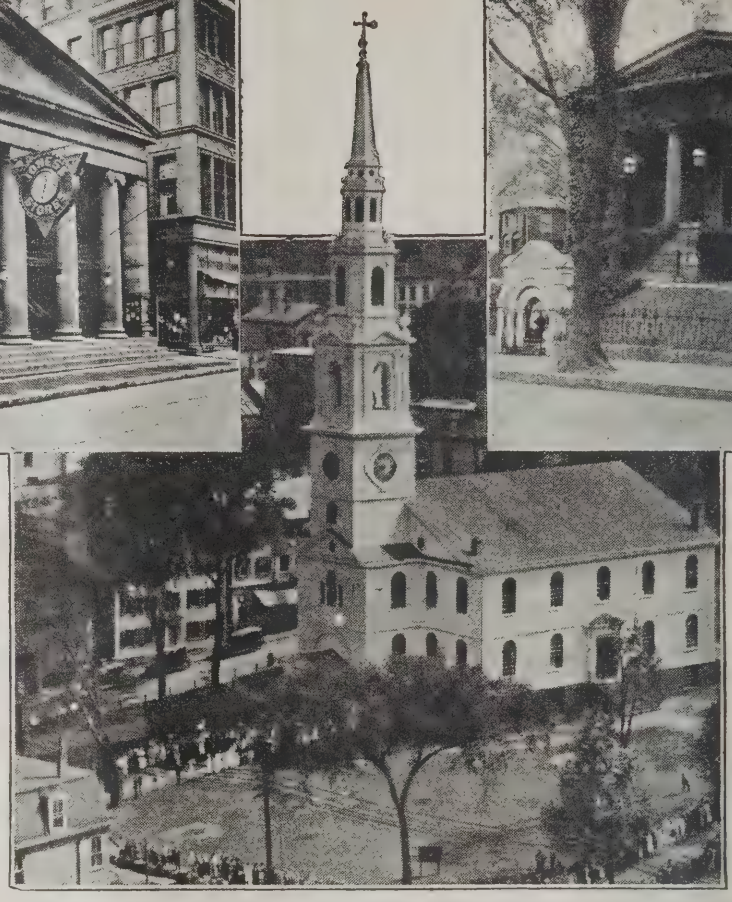
The Quaker spirit which found a refuge in Providence from the persecution of the sister colonies is reflected in the names of the streets. We find Benefit, Hope, Friendship, Peace, and Plenty. Such names as Dollar, Pound, Sovereign, Shilling, recall the fact, too, that the worthy settlers were not behindhand in securing a share of this world's baubles. The Brown family alone had a fleet of almost a hundred vessels and practically controlled the trade in spermaceti in the days when candles were the only means of lighting. And Moses Brown, about 1780,



The Arcade.



The Athenaeum.



First Baptist Meeting House.

employed Samuel Slater to set up from memory a replica of the new spinning machinery of Arkwright, thus laying the foundation of America's textile industry.

The first bank in New England, the Providence National, was founded here in 1791, and in its existence of a century and a half, each president has been a member of that same illustrious family. For more than a hundred years the bank has been housed in one of the beautiful colonial mansions of the city. Once, when the French soldiers were quartered there, a chevalier rode his horse up the flight of stone steps that lead to its entrance, through the wide hall and out into the courtyard at the back to the pear tree where Washington had recently sat and regaled himself with the fruit.

The Arcade, built about a hundred years ago, is a most delightful business block, somewhat suggestive of the "Rows" of Chester, England. It is a huge, granite portico, supported by Ionic columns with galleries of shops in three tiers, extending between the two principal thoroughfares. The Old Market House, with its arched windows which were once stalls, is now the home of the Chamber of Commerce. Here, in March, 1775, the inhabitants burned the British tea.

For Providence, with all her peaceable foundation, nourished a spirit of liberty that was second to none in the colonies. In her own "Independence Hall" or State House, the "People of Providence in Town Meeting assembled" were the first authorized body to recommend a permanent Continental Congress, and here the Rhode Island Colonial Assembly declared its independence from Great Britain two months before similar action was taken in Philadelphia.

Providence has the most beautiful examples of Colonial architecture in the country. Nowhere else have so many houses in that pure Georgian style that had its full fruition about the close of the Revolution been erected. Their happy situation on College Hill and the solid fortunes of their builders have preserved them in all their aristocratic beauty. The John Brown house was called by John Quincy Adams the most magnificent private mansion in America.

And many of these houses have stories connected. In the Talbot house is a room which was cut from the old Sabin Tavern and transferred bodily to its new quarters. In this room the Brown brothers, together with some fearless seamen, planned a bold enterprise.

The British schooner *Gaspee*, chasing a Providence packet boat, had run aground a few miles beyond the city, and, in the dead of night, with muffled oars, a party of men under Abraham Whipple carried off the crew and burned the vessel. Shortly after this exploit the leader received the following note:

"You, Abraham Whipple, on the 10th day of June, 1772, burned His Majesty's vessel, the *Gaspee*, and I will hang you at the yardarm," to which this reply was sent, "Sir James Wallace—Always catch a man before you hang him."

In the very center of this Colonial district is the Athenaeum, one of the few proprietory libraries remaining in America. It was founded in 1753 according to Benjamin Franklin's plan, and it is still flourishing, providing a personal and homelike atmosphere that a public institution acquires with difficulty. In its art room is Malbone's famous miniature of "The Hours," a Van Dyke, a Reynolds, and a portrait of Sarah Helen Whitman, "Poe's Helen."

It was in the alcoves of the Athenaeum that the courtship of the Rhode Island poetess and that brilliant but ill-starred genius took place. Among its treasures is a copy of "Ulalume" signed by the author at the request of his kindest critic. Poe thus mentions their meeting when, after lecturing in the city, he strolled through the streets at midnight and paused to admire a rose bush:

"Was it not Fate that on this July night—
Was it not Fate (whose name is also Sorrow!)
That bade me pause before the garden-gate
To breathe the incense of the slumbering roses?"

The wooing was brief, but tempestuous. Friends warned Mrs. Whitman against her lover, Poe made an attempt at suicide, and finally left in bitterness. After his death "Helen" wrote a book defending his art against the attacks and slights that have always pursued his name.

Much might be written about the libraries and collections of Providence, for there are several which are absolutely unique. Colonial House, a part of the School of Design, shows the perfectly appointed home of a luxury-loving gentleman of the eighteenth century. The Historical Society offers a fascinating museum, and, until recently, the Shakespeariana of Marshfield Perry was unsurpassed except by the British Museum. (Concluded on page 28)

Is the U. S. "The Chosen People"?

(*Continued from page 8*)

Charles M. Schwab, who made that statement, is an authority on steel, and it is presumed he knew what he was talking about, but the Scriptures made these statements several thousand years before Schwab appeared on the scene. When Britain decided to take Egypt from the unspeakable Turk in 1882, Brother Jonathan fortunately had a section of his navy on the spot and helped to capture these early home acres despite your rulers' decision not to mix in European affairs before then and since. When Admiral Dewey was in Manila Bay and threatened by the German Admiral, the British Navy appeared on the scene and anchored between the German and U. S. ships so that the first shot would hit the British. In the late war America came to the assistance of Britain and her allies and so it has been down the ages and will continue to be until the last war is fought, probably a few years hence.

Israel was bidden to "set ye up waymarks that ye might know the way Thou wentest." Has Israel done so? Well, a waymark from the City where Manasseh was born is to be found in New York in Central Park where it is known as Cleopatra's Needle. The mate of it is on the Thames Embankment in London, England. The offspring of Joseph each has a waymark in the leading City of their respective lands.

How does it come that the government of the United States, when it made its great Seal of State, placed upon the reverse side of it the Great Pyramid of Egypt (which Ephraim and Manasseh could see from the City of their youth) with the all-seeing eye above it and the motto "one out of many" engrossed under it which means "one tribe out of many tribes"—how comes it that America with Britain has all the Hebrew heraldry about evenly distributed among them?—the Lion of Britain, the Eagle of America. How comes it that when one brother is menaced the other brother always comes to his assistance? Because many people, all Northern France, the Bretons of Brittany, the Normans, et cetera, are Israel stock as are many of the Belgian and Scandinavian people, and even the Saxons of Germany, and perhaps the Bavarians. Israel is not a close corporation.

Real Significance of the Number Thirteen

These facts of the Bible and of present-day observation are worth any business man's attention. When America knows and operates her inheritance as the eldest of Joseph's sons she will not stand for some of the present iniquitous things that International Jewery has put across Anglo-Saxondom of which that false measuring stick, the gold standard, is a fair example.

There is another thing you American business men ought to consider. Your number is Thirteen. Unlucky? That shows how little you know about it. There were 13 Tribes in Israel—in Sunday School you probably heard only of the Twelve Tribes of Israel. But there were thirteen. Twelve political Tribes, and one ecclesiastical Tribe, that of Levi. When the nation split, the Tribes that bore upon their shoulders prophecies of world destiny, split from Judah. Judah was only one tribe out of thirteen. The split left Judah with two Tribes, that of Levi and that of Benjamin. Benjamin was only loaned to Judah, as a "light," to help keep Judah straight. At the time of Christ, Benjamin began to draw away from Judah, deserting wholly when Jerusalem was about to fall in A. D. 70.

America and Britain Only Active League of Nations

Joseph became two Tribes, Ephraim and Manasseh. Manasseh was the thirteenth Tribe. And students of this question who have identified the seed race of the United States with Manasseh are not at all surprised to find that the Number of the United States is Thirteen. Your nation has always unconsciously run to Thirteen, and your President Woodrow Wilson, openly gloried in that number.

Look! There were *thirteen* Colonies. There are *thirteen* stripes in your Flag. Your Declaration of Independence is signed by *thirteen* names. In your national coat of arms the Eagle holds an olive branch of *thirteen* leaves in his right talon, and a sheaf of *thirteen* arrows in his left talon. In the azure above the Eagle's head are *thirteen* stars. If you doubt it, take a dollar or a half out of your pocket, and see. Your national motto "E PLURIBUS UNUM" contains *thirteen* letters.

Take the Great Seal of the United States, you will find the symbolism of the olive leaves, the arrows and the stars thereon, but *on the obverse side*, which citizens seldom see, there is an unfinished Pyramid built of *thirteen* tiers of masonry. Suspended above the thirteenth stone is the All-Seeing Eye inclosed in a pyramidal triangle. Over the Eye are *thirteen* letters "ANNUIT COEPTIS" (He has prospered our beginnings). Go to your House of Representatives and examine the National Mace, that symbol of authority, and you will find it to consist of *thirteen* ebony rods bounded by silver bands.

Your Number and your Emblems are all of Israel—not Judah.

Nor is this a mere coincidence growing out of the fact that there were Thirteen Colonies, for the Number persists throughout your history. Your Civil War began on April 13, and Fort Sumter surrendered April 13. You captured Manila August 13 and broke the power of Spain on two oceans. You conquered Mexico September 13. Your first troops in the Great War sailed for France on June 13, in thirteen ships, transports and convoys. And they were just thirteen days in crossing. The Great War was really won on September 13, when American troops cut the St. Mihiel line, and the same day was General Pershing's birthday.

If this signifies anything to you, you can make the list much longer.

Upon Joseph's tribes great destinies fell. When clergymen mistakenly call Judah "the chosen people," which the Bible never does, one feels like counseling them to take the Tribes of Israel one by one and see what their individual destinies were. On Joseph's Tribes fell the destiny of ruling the world by superior service.

When you regard the British and American peoples, their unique place in history, their foundation in principle, their boundless service to all other peoples, their unquestioned power and influence everywhere, doesn't it move you to ask how all this is to be accounted for? Why is it that the strongest, indeed the only active League of Nations in the world today is comprised of the British Empire and the United States of America? Who are these peoples? My answer is, They are the Chosen People about whose destiny the Bible is written; they are fulfilling the prophecies of power and service spoken concerning them; they are the key to the Book, so far as concerns its foretelling of earthly history.

International Finance, Jew controlled, is today preparing for the next international war by placing all nations on the so-called gold basis and presumably, as German Jewish bankers raided Britain's gold supply for weeks before the declaration of war in 1914 until they had her gold reserves reduced to £18,000,000, so again they will arrange for their next war raid which is only a few years away. America can offset such actions, foretold centuries ago, when she realizes the wisdom and truth contained in the sure word of Prophecy which foretold her rise and destiny as a nation. Your forefathers placed "*In God We Trust*" on your coin of the Republic. 'Twere better to follow that injunction today than to place your trust on International finance and their gold standard because, like your mercantile marine, both within a few years will be ready for the scrap heap and at very cheap prices.

Britain Is Hebrew for the Covenant Land

America is British! That will sound strange to many of your readers who think they are 100% Americans. Well, they may properly be both because the

word "British" is made up of two Hebrew words—"Brith" which means Covenant and "Ish" which means man—the two words meaning Covenant Man, and Americans are quite as much "Covenant Men" as are those of the Isles who did not come over with George Washington, who was also a Covenant Man. Brith-ain is Hebrew for Covenant Land—the place where Jehovah said he would plant his people Israel in the Isles North and West of Palestine. These are not political terms, whose use you would probably resent, they are ancient racial terms. They are as inclusive as the term Anglo-Saxon. For we are two nations, Sovereign, independent, but we are *one people*—the only people who have erected an enduring and serviceable civilization.

In the "City of Pleasant Greetings"

(*Concluded from page 26*)

On the campus of Brown University are two notable collections, the John Carter Brown Americana and the Annmary Brown Memorial. This is a collection of "first presses," examples of the cradle period of printing in each city where the art had its beginning before 1501. The catalog for the collection was prepared in 1910 by Alfred W. Pollard of the British Museum and he credits it with being an illustrative history of printing unexcelled by any in the world.

The museum most recently opened to the public is the Shepley collection pertaining to the early history of Rhode Island, with Roger Williams the center of interest. The most valuable memento is a copy of his "Key into the Language of America," an Indian dictionary published in London. Williams was a faithful friend and teacher of the savages, and one of the few to insist that they had a moral right to their lands.

Just outside the city, Roger Williams Park is a beautiful memorial to his name. There are more than 400 acres of woods and hills, with a natural chain of lakes and dainty islands. The original gift was made by Betsy Williams, a direct descendant, and her quaint cottage, wistaria-covered and shaded by mulberry trees, still stands within the grounds, sheltering objects of interest in connection with the Williams family.

But the greatest memorial to the founder of Rhode Island is kept in the city hall. It is the "Compact" drawn up by Roger Williams and his companions in 1638, and it has been called the most precious document in existence. By its influence civilization has been refashioned, embodying a principle hitherto untried—that of religious liberty.

Who Started the Riots in China?

(*Concluded from page 15*)

Whatever the future of China may be, her course will now be worked out from within rather than determined so largely by outside forces. The Chinese people are not easily aroused but they do not easily forget. No doubt the riots in Shanghai and Canton, and also the demonstrations at Peking and Chungking—and other cities—are backed not only with feelings of protest against the shooting of a few students by foreign policemen, but also by slumbering emotions aroused over grievances harbored since the opium war; remembered in the "concessions" of her principal cities; remembered through foreign control of her tariff and through the continual struggles for more than a half-century for foreign spheres of influence.

The day of the "Sleeping Giant" is past. We thought the sleep would last forever because it lasted for so many years. Will there be foreign intervention in China now? Such an expedition would end as ingloriously as Napoleon's expedition to Moscow—perhaps not so speedily, but just as surely. China has swallowed up every one of her conquerers.

The hope of China is for her conquest of herself. If America and Britain and France, and Japan, and Italy, and Germany will coöperate in helping her attain this end, the future of the Far East is bright. If, however, these nations do not recognize the new day in the land of the "Rainbow Flag," there will be more trouble for the Western nations in China—and, unfortunately, plenty of it.

Down Mah-Jongg—Up Kbhoo!

Mah-Jongg, in the United States, is being replaced by another game from the wilds of Central Africa, called Kbhoo, played by two persons. The maneuvers of the game take place between a valley and a mountain, and is a representation of a battle. The "men" are quite different from any existing pieces used in a game, and are wonderfully carved models of native warriors of the Cameroons, Tanganyika, and the Congo. African names are used for the situations, and the "Great Spirit" is a prominent feature of the game.

A Low Rate for Executions

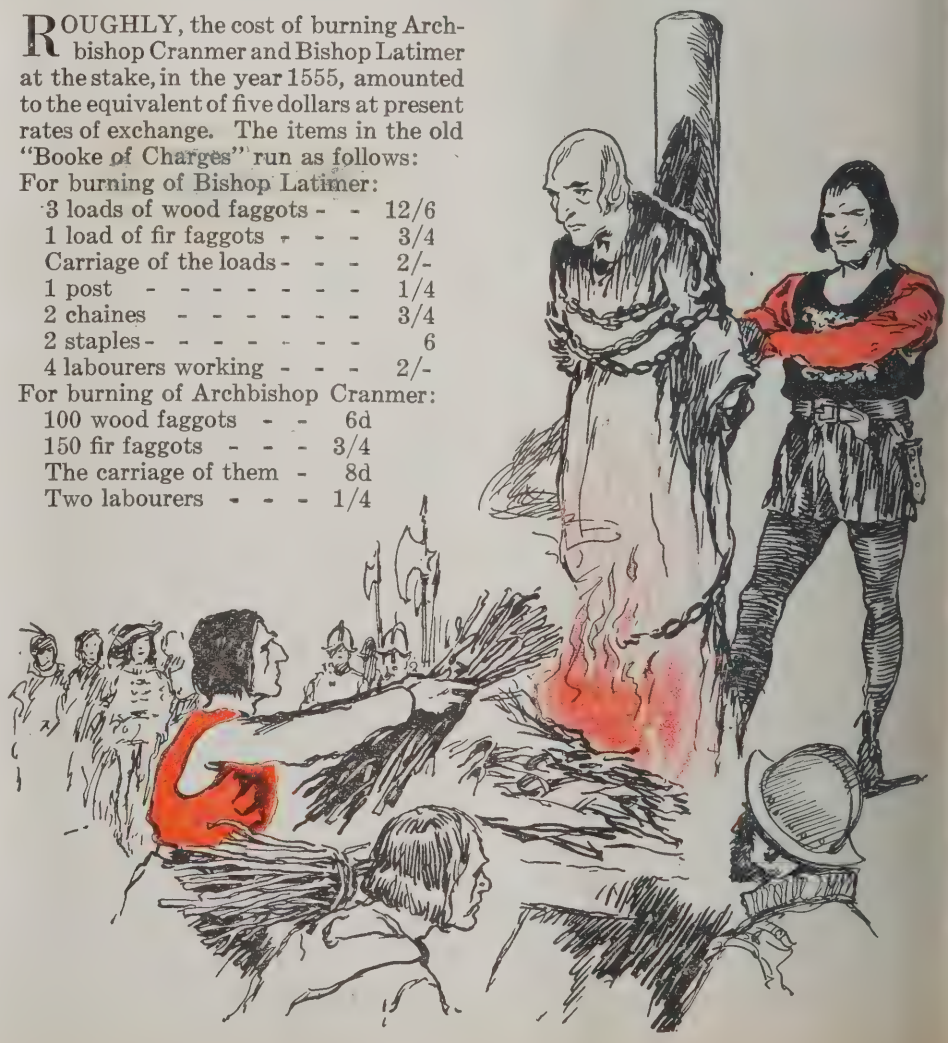
ROUGHLY, the cost of burning Archbishop Cranmer and Bishop Latimer at the stake, in the year 1555, amounted to the equivalent of five dollars at present rates of exchange. The items in the old "Booke of Charges" run as follows:

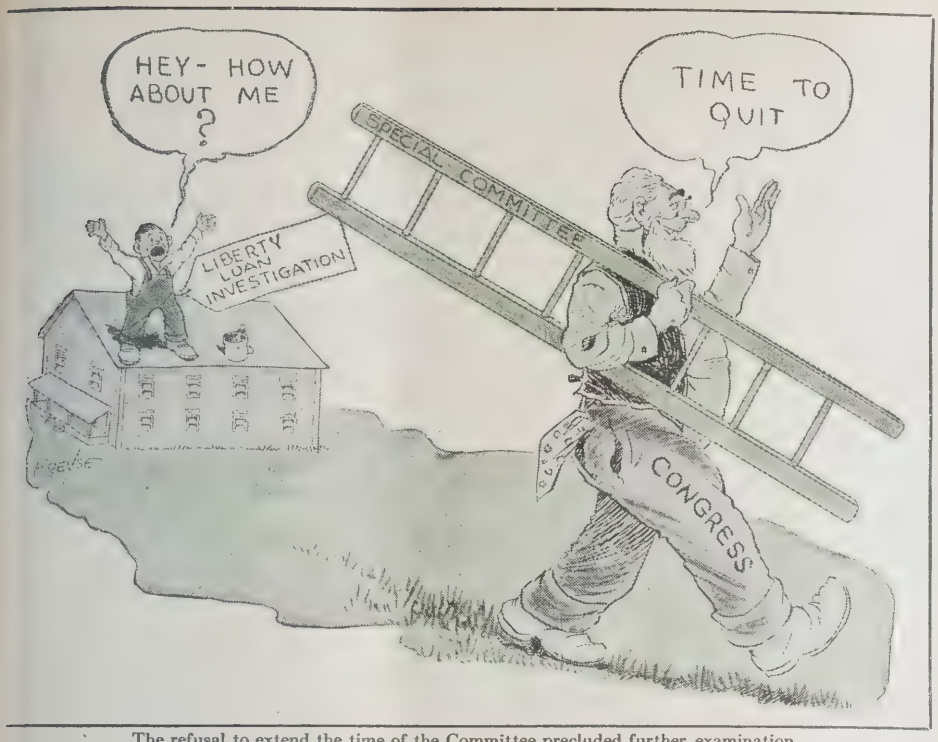
For burning of Bishop Latimer:

3 loads of wood faggots	12/6
1 load of fir faggots	3/4
Carriage of the loads	2/-
1 post	1/4
2 chaines	3/4
2 staples	6
4 labourers working	2/-

For burning of Archbishop Cranmer:

100 wood faggots	6d
150 fir faggots	3/4
The carriage of them	8d
Two labourers	1/4





The refusal to extend the time of the Committee precluded further examination.

Liberty Bonds From the Inside

(*Continued from page 4*)

hrough the War Finance Corporation, ›onds of *the same identical issue on he same day;* and *the bonds would be :old to outsiders at a very much lower igure than they would be sold to the Government,* to whom they really ›elonged. Liberty bonds accumulated, ›resumably for retirement, were sold :o various New York banks at prices ranging from $82.50 to $85 per ıundred, and at the same time the ›onds which were transferred to the Government were sold to it at from 390 to $95 per hundred. This, too, in :he face of the fact that the Governnent was to be regarded as the whole:ale purchaser and the banks the re:ail purchasers.

For example: on the twenty-eighth lay of May the War Finance Corpora:ion sold to the Hanover National Bank 3790,000 Second 4¼% bonds at prices ranging from $85.50 to $86.50 per ıundred. *The next day,* on May 29, :he War Finance Corporation sold to :he United States Treasury $51,923,000 worth of these *same bonds* and charged :herefor $92.13 per hundred!

On May 20 the War Finance Corporation had sold $1,045,000 worth of these same bonds to the Hanover National Bank at a price as low as 382.40 to $82.56 per hundred, for which a few days later they charged $92.13 :o the Government.

On the first of June the War Finance Corporation sold $1,000,000 worth of :hese same bonds to Salamon Brothers ınd Hutzler at $87.28. *This was the lay after* the sale to the Government at $92.13.

The highest market price for these ›onds during May was $87.56 (see Secretary's Report for 1920, page 121).

Likewise the War Finance Corporation during the month of May, 1920, sold many bonds of the Third 4¼% Issue to this same bank, the Hanover National, at several dollars less per hundred than they sold to the Treasury Department.

On May 28 it sold to Hanover 600,000 Thirds at $90.10 to $90.90.

On May 29 it sold to Government 11,625,000 Thirds at $94.95 and on June 1 it sold to Hanover 1,000 Thirds at $91.40.

In addition to the direct loss shown by the difference in sale to these New York banks and to the Government where the dates are such that a comparison can be made, the Government will, of course, suffer a very much heavier loss than indicated by the figures. For example, *all these bonds, which were sold at $85 and $82 per hundred, must eventually be redeemed by the Government at one hundred cents on the dollar*—the same bonds that the Government had in its hands and the War Finance Corporation disposed of.

The testimony showed that these various losses were absorbed by the Government. It did not appear on the surface. The Government paid it nevertheless. Defenders plead that the sale to private parties had to be at market prices, while the Government had agreed to pay "Cost." The books of the War Finance Corporation, kept by itself, show *they charged the Government more than cost.*

In commenting on these transactions the Special Bond Committee of the House reported:

> "During the period of these transactions and up to until quite a recent date the Managing Director of the War Finance Corporation (Mr. Eugene Meyer, Jr.,) *in his private capacity,* maintained an office at 14 Wall Street, New York City, and through the War Finance Corporation sold about $70,000,000 in bonds to the Government, and also bought through the War Finance Corporation about $10,000,000 in bonds, and approved the bills for most, if not all, of these bonds *in his official capacity* as Managing Director of the War Finance Corporation."

The report of the Bond Committee continued with the recitation of some peculiar proceedings which it stated had happened during its investigation as follows:

> "When these transactions just referred to were disclosed to the Committee in open hearing, the Managing Director appeared before the Committee and stated that while the books of the War Finance Corporation disclosed the fact that commissions were paid on these transactions, they were in turn paid over to the brokers, selected by the Managing Director, who executed the orders issued by his brokerage house, and immediately after this disclosure to the Committee the Managing Director employed Ernst & Ernst, Certified Public Accountants, to audit the books of the War Finance Corporation, who did, upon the completion of their examination of these books, report to the Committee that all moneys received by the brokerage house of the Managing Director had been accounted for.
>
> "While simultaneously with the examination being made by the Committee, the Certified Public Accountants, heretofore referred to, were nightly carrying on their examination, it was discovered by your Committee *that alterations and changes were being made in the books of record covering these transactions,* and when the same was called to the attention of the treasurer of the War Finance Corporation, *he admitted to the Committee that changes were being made.* To what extent these books were altered during this process the Committee have not been able to determine."—Page 7, H. Report No. 1635, of Sixty-eighth Congress, Second Session.

In view of the Chairman of the Committee declining at the last moment to sign the same, there was attached to the report of the Special Bond Committee, and marked "Ex-

hibit A," an earlier report which had been agreed to by Congressman McFadden, Chairman, and also approved by two other members of the Committee forming the subcommittee appointed to draft same. In this report it was stated: "All transactions of the War Finance Corporation must be thoroughly audited to ascertain the manner by which and the parties through whom and to whom the Government lost the money which the record proves was lost." It was to prevent just such questions being raised that Congress in its wisdom long ago prohibited Government officers from having any interest direct or indirect in transactions which they were called upon to approve and for the same purpose was written into the War Finance Corporation the following. Section 3 states:

Mr. Meyer Testified That He Made No Profit

> ". . . . No director, officer, attorney, agent, or employe of the corporation shall in any manner, directly or indirectly, participate in the determination of any question affecting his personal interest, or the interests of any corporation, partnership, or association, in which he is directly or indirectly interested."

And Section 300 states:

> ". . . . That whoever wilfully violates any of the provisions of this act, except where a different penalty is provided in this act, shall, under conviction in any court of the United States of competent jurisdiction, be fined not more than $10,000 or imprisoned for not more than one year, or both."

The bulk of the bonds purchased during 1918 were purchased either through the house of Eugene Meyer, Jr., 14 Wall Street, or J. P. Morgan & Company. The investigation was discontinued before the Committee was definitely able to determine whether or not a profit had been made on these bonds. Mr. Meyer testified that he had made no profit. He also testified that the following were some of the brokers he employed: Asiel & Company; Prince & Company; Mabon & Company; Seasongood, Hass and McDonald, and Salamon Brothers and Hutzler.

The Committee's Report Was Nonpartisan

The report of the Committee was strictly nonpartisan. It was signed by a majority of the Committee. Congressman Edward J. King, Republican, of Illinois, and Congressman Henry B. Steagall, Democrat, of Alabama, and Congressman Wm. F. Stevenson, of South Carolina, composed the majority.

Romantic Rascals

(*Concluded from page 17*)

though his ship was, he stood in for Cape Blanco, captured and burned the only ship there, then made for Guayaquil. What followed was really a sudden attack upon an unarmed and unsuspecting town. A couple of shots from the long gun did the business and before a stand could be made against the invaders, the pirates had invested the place. But what soldiers could not do, disease very nearly did. For that night the pirates slept in a church in which plague sufferers had been kept and buried, and soon the physician-pirate had his hands full. But he bled them liberally and he dosed them liberally. Especially the last. For the medicine chest had run low, but what remained he administered, throwing together his powdered opium, his powdered ipecachuana and his sulphate of potash, and so discovered a sudorific medicine which he afterward bestowed on a waiting world.*

The Treasure Ship "Acapulco" Was Captured

Soon after the sack of Guayaquil came the most wonderful event in the physician's eventful years. It was when the treasure ship, the *Acapulco* was sighted. When the short battle was over, the pirate-physician was amazed beyond words at what he saw. For the *Acapulco* not only carried two men to the *Bachelor's* one, but her guns were in every way superior and she might have outsailed the *Bachelor* with the ease with which a hawk outwings a crow. But a chance shot took the *Acapulco* below the water line and she surrendered. By that, Captain Dover gained a treasure in gold, and silver, and precious stones, amounting to more than six million dollars.

After that, the local financial drift was quite optimistic and the doctor could have found those ready to prepare an armada. But his thirst for adventure had been abundantly gratified and he had visions of a quiet life in cheerful company. So he went to London and, for a while, lived a life of easy contentment, enjoying the companionship of the town wits and the poets Prior and Gay and Young. There was one short visit to Bristol where he went to do what he could for Alexander Selkirk. For that strange character, after playing recluse in a cave near Largo, had eloped with a young lady to Bristol and there somehow fell foul with a shipwright, the quarrel ending in a prison sentence for Selkirk. His man being again free, the doctor returned to his quarters in Cecil street, where, with great industry, he set himself to the writing of a book which he called "The Ancient Physician's Legacy to His Country," and so passed to his end in the year 1742, a lovable, gentle and sweet-tempered old gentleman.

* Dover's powders, a preparation still used to produce sweating.

Camping Out the Best Cure-All

EVERY person, regularly employed, occasionally feels rebellious toward the monotony of life. There comes a period when humdrum tasks pall upon one, and business success fails to satisfy. Then is the time to get out in the open and regain a part of that country freedom that was once the daily life of most of our native-born people. A person who has no holidays in the open, who never takes a trip to the mountains or the seashore, becomes cramped and narrow-minded. He is more of a liability than an asset.

A holiday in the open sends one back to work refreshed and with a different outlook on life. The word recreation is taken from the word re-create meaning to give fresh life to; reanimate, revive, refresh, divert, amuse. The most successful men in any business are those who take necessary vacations. Problems solve themselves to the man who is rested, whereas he who takes no vacation becomes so confused by the details that keep piling up before him that he loses the faculty of discernment. He fails to get the right perspective, his decisions are faulty, his insight imperfect, he is easily embroiled in petty contentions.

Several million Americans spend an average of more than two weeks at the seashore, the mountains, lakes and rivers, the summer vacation being an established institution. Those who cannot get away for two weeks or more resort to the popular "week-end," and owners of automobiles spend a day or two almost every week in the summer season driving in the country.

The Great Value of Pure Drinking Water

The children of the city are becoming more and more familiar with green fields, trees and waters. Bathing, boating, hiking, and woodlore are becoming part of the child life of our nation. With the many new inventions for the camping tourist one can be almost as comfortable in the open as at a hotel. In this connection I wish to stress the necessity of obtaining only pure drinking water at each camping point. Many a sparkling brooklet crossing the road has its source far up the country, and while it may appear pure and clear it often leads directly through refuse heaps and garbage from some point upstream. Many a picturesque old oaken bucket hung from a sweep harbors the deadly typhoid bacillus. It is best always to boil water, for surface seepage will creep into the rivulets. Clean food incased in cartons may be bought at the groceries; but the water supply is even more important.

Camping out makes for a vigorous and healthy race without which no nation can ever hope to prosper.

A Quaint Bit of Old Edinburgh

THE work of Robert Hopkin, artist, who died in Detroit in 1909, is not so well known as it ought to be. Hopkin was a modest man. He exhibited very little outside the city in which he spent his latter years, but where his pictures were seen, both in oil and in water color, they were much admired and sought after. As a water colorist, Hopkin displayed a breadth of style and freedom of treatment that gave his work a character of its own. In his search for subjects he never forgot his native Scotland, and it was here that he did some of his best work.

Robert Hopkin was born in Glasgow, Scotland, in the year 1832, and came to America with his parents when he was 14 years of age. He spent the most of his life in Detroit, but paid an occasional visit to his native land. In the earlier part of his career he was engaged as a decorator. He soon displayed his artistic ability and studied nature assiduously, like Turner, the great master of water color technique. His pictures attracted much attention from connoisseurs and critics, but he was not so much in search of fame as the pleasure which his studies brought him.

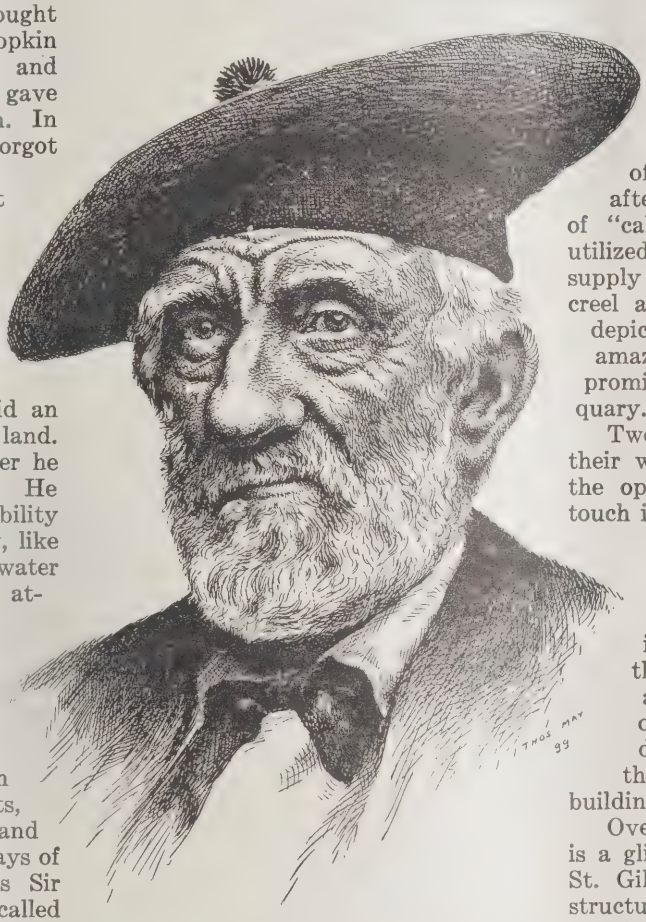
During a visit to Edinburgh he found, among other subjects, that there was a certain quaint and picturesque beauty in the byways of the "old romantic town," as Sir Walter Scott affectionately called it. One of these pictures we reproduce on the cover.

The picture portrays one of the rapidly disappearing bits of old Edinburgh. It is not typical of old Edinburgh alone, but of those old medieval byways that are found in most of the ancient cities of Europe.

In those days they built for stability, they thought of the generations to come. When these quaint buildings were erected they were not the houses of the poor and humble, but of the rich and mighty. They were frequently the town residences of the nobility and gentry, or the homes of merchant princes who in those days did not scorn to have their places of business and their homes as near each other as possible.

It is because these houses were built to last that they are standing today. They generally form a close or court to which access is gained from the main street by an archway, as shown in the picture. These archways were at a remote period protected by gateways, traces of which remain in the massive rings or hooks on which the gates were hung.

The windows are "wee" just as they were in the olden time. Glass was dear, and for purposes of defense it was not advisable to have the window openings too large. The quaint little dormers shown on the roofs were those of the attics or sleeping apartments, or, as they are still sometimes called, "garrets." The roofs were covered with slabs of slate so thick that they almost partook of the character of paving stones, but they were fine for keeping out the weather, and are in as good condition today as they were centuries ago.



(C) Detroit Photographic Co.
Robert Hopkin, portrait by Thomas May.

In the left foreground is the corner of a more pretentious building. Probably the residence of some city magnate, perhaps a bailie, as a Scottish magistrate is called, a provost, or a town clerk, but now apparently devoted to the storage of merchandise of various kinds, the ground story being used as a coal store. A bag of coal stands on one side of the door, while an empty "scull" or wicker basket stands on the other. Just round the corner the artist has given us a glimpse of the proprietor having a gossip with a fishwife, apparently his last customer.

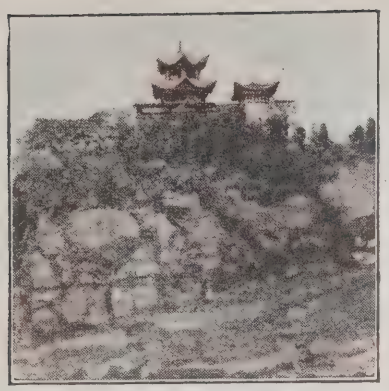
This buxom lady is arrayed in the striped petticoat, apron, and white "mutch" or cap, so typical of the Newhaven fishwives, and others from the fishing villages along the Firth of Forth. Slung over her shoulders is a "creel," a kind of fish basket made of "waufen willows," which after being filled and emptied of "caller herrin'," is now being utilized to transport her week's supply of fuel. In such a costume, creel and all, it would be safe to depict Maggie Mucklebacket, the amazon of the sea who figures so prominently in Scott's "Antiquary."

Two other customers are making their way through the archway to the open street. A characteristic touch is given to the picture by the pole thrust forth from the building on the left, to which, by the aid of a rope and pulley, the week's washing is being dried, in spite of the smoke and soot that hovers about such congested parts of the Scottish capital. The drying of the clothes shows that at least part of the old building is inhabited.

Over the tops of the houses there is a glimpse of the crown tower of St. Giles Cathedral, the venerable structure from which Knox thundered his anathemas, and inside which there took place that memorable scene when Jenny Geddes threw her stool at the head of the Dean of Edinburgh, and thus precipitated a riot which led to the withdrawal by Charles the First of the objectionable Laud's Service Book.

It is indeed a characteristic bit of "Auld Reekie" as it existed in days gone by. Closes of this nature still shelter beneath the shadow of the ancient castle or by the old cathedral, but they are rapidly disappearing forever to give place to more modern structures, and more sunlight and fresh air.

This gloomy little alley is but the backwash of the life that stirs through the more modern city, but it stands as a symbol of things that have been, of the civilization of a much earlier day, of a period when men built more for strength and security than for beauty and comfort.



Pagoda and crag—China.

Temples and Rare Shrines

Glories of China and Japan

By WILLIAM L. STIDGER

Two Korean shrines.

IT IS an awe-inspiring thing to stand before some sacred shrine, or temple in the Oriental world and to have the sudden consciousness that that temple has had millions of human feet crossing its threshold, millions of lips kissing its idols, millions of human hearts pouring out their prayers within its shrines before a single temple or cathedral was erected in Europe.

"Indeed Europe was a wilderness of savagery when the Temple of Heaven was built in Pekin," said a friend of mine with whom I was seeing the things that interest a journalist in that distant city.

When Napoleon stood beneath the pyramids of Egypt he said to his soldiers, "Forty centuries are looking down upon you here," and that sentence has gone down in history like a thunderclap. But if he had stood with his armies on those ancient steps that lead up to the Temple of Heaven he could have said, "Soldiers of France, untold ages, eighty, a hundred centuries look down upon you here."

That day will stand out forever; that sun-kissed winter day in Pekin when I first looked upon this great structure, with its impressive bulk, and its strange architecture. No European could ever dream such a massive and yet so beautiful a flower as this.

The Temple of Heaven literally throbs with historic romance. Strange and gorgeous pageants in the days of the Manchus passed up and down these wide marble steps and into the sacred precincts of this crimson-roofed place of worship.

The Manchu emperors were supposed to be the "Sons of Heaven" and therefore they were crowned in this sacred edifice; and even so recent an official as Yuan Shaih-k'ai, when he assumed the presidency, went back to this old Manchu custom and arranged to be inaugurated in the Temple of Heaven and to worship there. A gorgeous procession was formed one morning at daylight and both European officials and Americans were present.

The most interesting temple that I visited was the birthplace and burial place of Confucius, the great Chinese sage, in the Shantung Peninsula. This famous shrine is located at Chifu. On the way we visited Nanking and the famous ruins of the Ming dynasty tombs. When the revolution under Sun Yat Sen began, the Imperial City near Nanking was literally wiped out. This is the way that the Chinese have of doing when they wish to get rid of an enemy.

In this little village of Chifu is a mound about the size of a house. In this mound the great Confucius is buried. Mencius, his chief and first disciple, is also buried here; so it is a double shrine.

The Japanese temples are different in architecture, color, and general atmosphere from the Chinese although there is no doubt that Japan learned all the architecture and art that she knows from the Chinese.

In Japan there are several centers where there are famous temples or groups of temples. These are in Tokyo, Kyoto and Nikko—with beautiful architectural gems at Nara.

But of all the temples in Japan the most loved and by far the most beautiful are the temples of Nikko. "See Nikko and die" is the famous phrase of the Japanese themselves and no traveler in that country has seen the most beautiful things in Japan if he has not viewed the temples at Nikko.

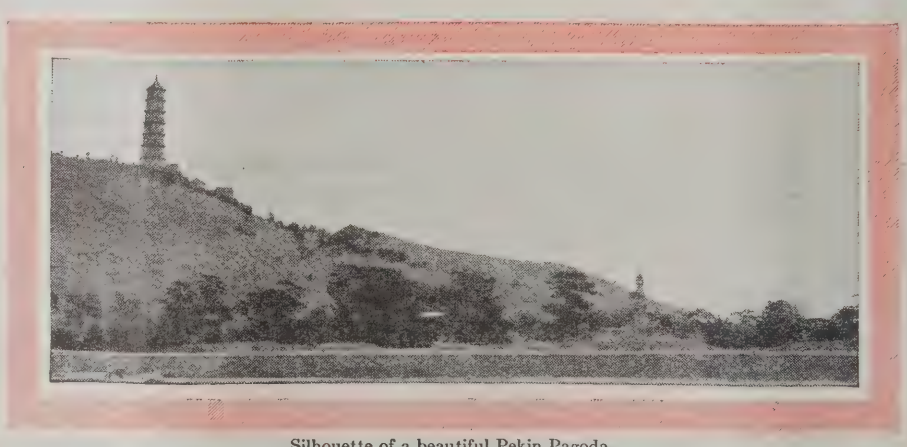
Fujiyama, the white mountain, is beautiful and one cannot help seeing it. Tokyo is a marvelous city with its strange combination of the old and the new, with its rickshas; with its aviation field and its modern hotels. Yokohama is a fascinating port of entry and one will never forget the street fairs, the shops, the color and beauty of its little houses; but "See Nikko and die" is a phrase born of the spirit of reverence, beauty and truth.

Word descriptions and photographs carry but a faint impression of the beauty of these ancient temples of the shoguns. They are covered with a brilliant sunset red lacquer, hundreds of layers put on by the greatest artists of the realm with a sacred religious devotion and passion, and they stand as the *summum bonum* of color in art. These Nikko temples are set down in a forest of cryptomeria trees, brothers to our gigantic redwoods of California, and with their brilliant red decorations in this forest of emerald one can hardly imagine a more beautiful contrast or a more gorgeous setting.

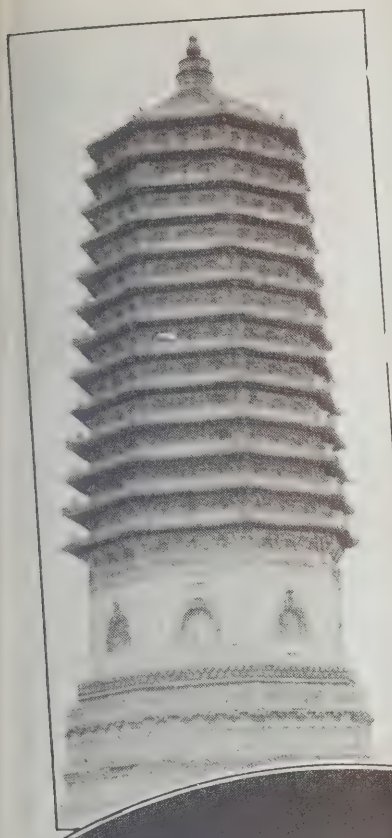
Leading up to the temples is the red lacquered bridge that spans the Nikko River. This bridge arches a stream that finds its source in beautiful Lake Chuzenzie, which is about twenty miles from Nikko, and it tumbles down a mountain gorge past these temples and under this red lacquered bridge which is called "The Emperor's Bridge" because no human being up to the time I visited that spot, save the emperor, is supposed ever to have crossed that bridge. We were told that any person save the emperor who crossed that bridge would die. I did not die. This shrine is the shrine of the Tokugawa, a famous shogun family.

We saw there the world-famous three monkeys, "Hear No Evil, See No Evil, Speak No Evil," and the just as famous sleeping cat, carved by a one-armed man so realistically that it has driven the rats from the temple.

The God of Winds and the God of Thunders which guard one of the Buddha temples were impressive but ugly. Gold, red, lacquer, grace, symmetry were everywhere.



Silhouette of a beautiful Pekin Pagoda.



The Temple of Heaven, Peking (erected before Europe had a cathedral).

"How the tall temples,
As to meet their gods,
Ascend the skies!"—Young

Illustrating the article which faces this page.

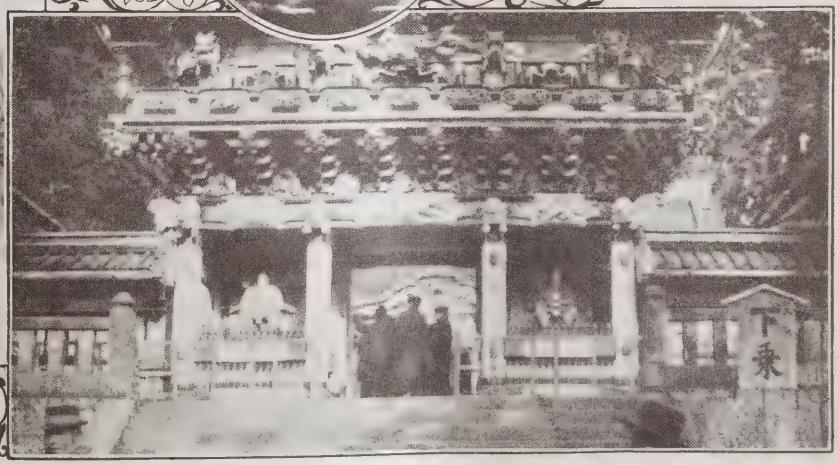
Above—God of Thunder and Lightning which figures prominently in the Nikko Temples.

Upper left-hand corner—Thirteen-story pagoda (one of the largest in China).

Above—Beautiful red lacquered pagoda resting among the trees and temples of Nikko, Japan.

Left—One of the sacred urns in the Temples of Nikko.

Below—Ornate entrance to the Nikko Temples.



Above—Entrance to the beautiful Temple of the Llamas, Peking.

THE LIBRARY OF TH
UNIV OF ILLI
URBANA ILL

WHOEVER will study the character of the earliest immigrants to this country will find that they were alike unquiet under ecclesiastical and civil abridgements of their rights; he will find the same indomitable love of liberty among the Episcopalian adventurers on the Roanoke, the Puritans, who, in their fear of God, established their congregation upon the rock of Plymouth, the Quakers on the Schuylkill, the Catholics on the Susquehanna, the Netherlanders on the Hudson, the Germans on the Lehigh, and the Swedes and Finns at Cape Henlopen. He will be ready to say that God in His providence seems to have collected from the nations of Europe, men of sturdy limbs, free minds and bold hearts, to lay broad and deep the foundations of a State. . . . Degenerate descendants of such ancestors should we indeed be, did we not value above all other blessings the boon of liberty—above all other distinctions, that of self-government.—*William H. Seward, 1846.*

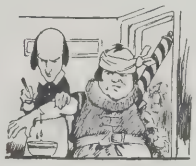
Special accommodations for tall persons are being made by a New York hotel which is converting part of its twenty-second floor to take care of 50 "oversized" guests.



The sign of the barber, a pole with spiral bands of white and red, symbolizes the ancient function of the barber—blood-letting.

In its early history coffee was held by some to be an intoxicating beverage and severe penalties were threatened to those using it.

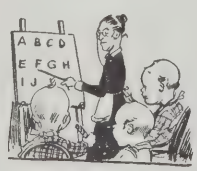
Slavery was abolished in Brazil in 1888, there then being about 750,000 slaves in the country.

Though he became one of the world's great orators, as a boy Daniel Webster was so shy that he found it impossible to "speak pieces" before his schoolmates.

Queen Victoria had no prejudice regarding the evil influence of opals and it is said she always gave them as marriage gifts to her daughters.

Sponges are the beehives of the sea, being in certain places occupied by whole colonies of tiny snapping shrimps that always come back to the same sponge which is their hive-like home.

The world's annual wool production is two pounds per capita, but five pounds per capita is used in the United States.



Beginning of the public instruction of children when they are two years of age is advocated by a Yale professor.

It is said that Rembrandt painted sixty portraits of himself.

Should Chile be placed on the west coast of North America it would extend from Sitka, Alaska, to a point opposite the City of Mexico. In length it is 2,600 miles and the average width is about 90 miles.

When the natives of a grain-eating district in India migrate in search of work to a region where the natives live on ox blood and milk or bananas, they suffer from digestive troubles.

Among the rare animals which are in danger of extinction is the gorilla, though between 100 and 200 still remain in the Belgian Big Game Sanctuary in the Congo.

Almost as many horses were exported from the United States in 1790 as in 1923.

Lewisia, the bitter root and state flower of Montana, was named after Captain Lewis.

Thirty per cent of the world's supply of tin comes from the Malay Peninsula.

Nag's Head, North Carolina, got its name from the tricks of the wreckers of olden days who plied their nefarious trade along this historic coast. They conceived the idea of tying a lantern to the head of a horse whose legs were fettered with hobbles. The storm-tossed mariner at sea, taking the light for that of a ship sailing in safety, would hold up his helm for what he thought the calmer waters inside, which eventually landed him in shoals where he was wrecked, his cargo falling a prey to the vandals ashore.

Aristotle's essay on the constitution of Athens was found written on the backs of the farm records of an Egyptian estate during A. D. 78 and 79.

Quests for the pole began in 1527 when Henry VIII sent Robert Thomas to find the North Pole "where there are odde beasties and great treasure to be had."

Strictly speaking, a bungalow is a single-story building with a thatched roof and a veranda all around. It is of Indian origin, the name being a corruption of a word meaning "of Bengal," India, the province where this type of building was first used.

Snake bites in British India alone cause about 22,000 deaths annually.

X-ray is now being used successfully in the treatment of whooping cough and for the infant's disease, rickets.

Briar pipes are not made of briar but of "bruyere," the French word for a species of heather root.

A tame elephant eats more than one thousand pounds of green fodder and twenty-five pounds of unhusked rice daily.

Some 500 years ago the Scottish people made known to the world wool knitted hosiery. The following century the same people learned to knit silk in the necessary shape.

Dr. Hayford claims that the earth is precisely 7,926 miles and 678 thousandths of a mile in diameter and 78,999 miles and 964 thousandths of a mile through the poles.

The apple was a native of Central Asia. It was introduced into England in 1629 by the government of Massachusetts Bay Colony.

A strange peculiarity which characterizes a species of South American tree frogs is that the parent carries the large eggs on its back until they hatch and the young remain there for some time after.

Card games of the Middle Ages required much more time than the same games of today because the brains of the players were slower than the modern mind.

"Radium necrosis," is the name of a new type of occupational disease common to workers painting watch dials with a radium preparation.

In New Zealand, after a recent heavy rain storm accompanied by heavy wind, the streets and gutters were filled with small fish that had been blown from the streams and water holes nearby.

Ohio banks are offering 5 per cent on savings deposits as against a former rate of 4 per cent. Competition from building and loan associations is assigned as the cause.

Presented in This Issue:

Mr. Ford's Page this week discusses standardization, what it is and when it is harmful.

Catchwords as collars lead us around; we are slaves to the slogan. If a thing sounds well, it must be true. Iteration lures. What is *your* particular collar? The time a man can be labeled—except in a great crisis when he must adopt a side—he is ready for the self. Maybe your particular slogan is in this list. (p. 2)

Why put God in the Constitution, our only changeable national document, when God is already in all our fundamental and unchangeable national documents? Another view of an old question. (p. 13)

Tom Masson, humorist and wise man, has been looking over the younger generation and finds it not half bad. But it is not as progressive as it fancies itself to be, at that. The younger generation is, in many particulars, as old-fashioned as the hasles. Worth perusal by flappers and sheiks. (p. 16)

A White House in the West has been the dream of some Americans for years. The question of location may not be important, but it is interesting. (p. 12)

Some express doubt that it is worth while trying to save fools from fake stock salesmen. They think that those who can be victimized should be. Maybe. But we feel easier in conscience when we forewarn good people concerning the wiles of fakers. Public confidence is more precious than the billion dollars a year that victims lose; but cooperation of decent men would save both the confidence and the billion. (p. 18)

What is to be found 1,000 miles from a railway? And where in the world can one get that far from steel? In China, of course. Most travelers have seen the old quaint China. Others have seen the new China, girding itself under the silk of its ancient past. From this time forward, the world will have only the new China to deal with, and the situation will show whether in moral and intellectual integrity we of the West are equal to the needs of the new East. (p. 4)

This magazine was one of the first to make an issue of the mountainous masses of law which have been loaded on the patient backs of the American people. The campaign is now general, with hopeful results promised. People who called us radical five years ago are now advocating what we were first to suggest, namely, special sessions for the abolition of useless, imperfect or incongruous laws. (p. 5)

Down among the cotton men they have their leaders who know Aaron Sapiro and his schemes. Some interesting facts may just as well be published now and then while waiting for Aaron to bring on his million-dollar lawsuit. (p. 14)

John Fox, Jr., and his Kentucky stories are still fondly remembered. But few of us knew much of the man himself. Here is a strange picture of the last phase. (p. 32)

Knowledge increases by men opening their eyes. We don't create, we discover. Here is a man who finds that disease bacteria are overcome by health bacteria, that convalescence germinates as disease does. A really thrilling view of the defensive forces of life is given in this article. (p. 7)

There's a story about Portland, up in Maine (p. 22); a story about a soldier's home in "Glad Valley" (p. 24); a story about the first Christian Indian church (p. 15); and one about the Signers of '76 (p. 20). Then there are Editorials, Briefly Told and I Read in the Papers.

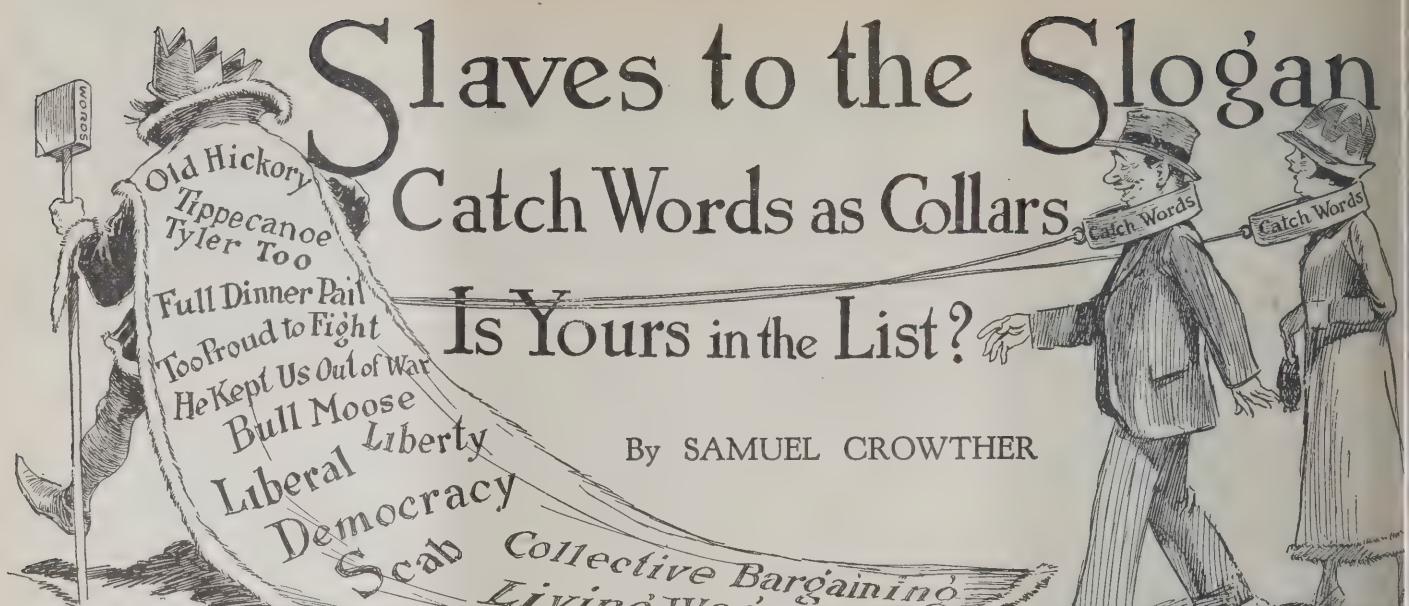
Slaves to the Slogan

Catch Words as Collars

Is Yours in the List?



By SAMUEL CROWTHER

"YOU take the arguments, take all the right and justice in a political campaign," said a shrewd and seasoned politician to me the other day, "and if I can get a catch word or a slogan, I don't need any right or justice to make a good run against you and maybe to beat you. Even if I don't get a slogan for my man, but I do get a first-class epithet for yours, I will rustle you then, too.

"The arguments, the campaign speeches, and all that do not much matter. Men and women do not reason their votes. They do not reason much about anything. They think in headlines—in words that are snappy. But nobody knows in advance how a word or a phrase is going to catch on.

"The last Presidential campaign was bare of catch words. Neither Calvin Coolidge nor John W. Davis had nicknames. 'Cal' is a good, friendly sort of a name, but it does not fit President Coolidge. 'Fighting Bob' for La Follette had no appeal, for most people had no idea what he was fighting about. In addition, his party made the mistake of taking the name 'Progressive,' and the force of that name had died with Colonel Roosevelt.

"Just compare 'We want Teddy' with anything in recent years and you will see just what I mean! Colonel Roosevelt had the gift—it was nothing short of that—of both epithet and slogan, and especially of epithet. He demolished the colorless Taft campaign in 1912. The name 'Bull Moose' exactly fitted him and his Progressive party. He broke up the voting habits of the Republicans.

"Four years later, in spite of 'Too Proud to Fight,' Wilson won on 'He kept us out of war.' Mr. Hughes had no slogan and no popular campaign personality, but President Wilson did not have to beat Hughes. He had to beat 'Too Proud to Fight' with 'He kept us out of war,' and so closely did the two run together that one state, California, decided the result.

"Most of our big issues have been decided on catch words. 'The full dinner pail' carried the Republicans to victory when the tariff was a political issue. Bimetalism could never have been an issue had not the purely economic discussion as to the advantages and disadvantages of the gold standard been turned into an emotional issue by Bryan's 'Crucified on a cross of gold,' and the slogan 'Free Silver'—which subtly conveyed the notion that by following Bryan you might get something for nothing.

"Go back into the old days. Andrew Jackson probably had as few qualifications for the Presidency as any man ever nominated, but as 'Old Hickory' he got in. Harrison and Tyler were not much of a combination, but 'Tippecanoe and Tyler Too' carried the day."

Take another phase. I was talking with a legislative agent—that is, a lobbyist. This is another illustration of the same thing. We call a man a "lobbyist" and it is inconceivable that he could be advocating the passage of a bill in the public interest, but if we call him a "legislative agent" or an "executive secretary" there is a chance for him. So we no longer have lobbyists. "Publicity man" and "public relations counsel" in practice mean exactly the same thing, but there is no comparison between the respectability of the two titles. In the public mind a publicity man is merely a chronic liar.

"The title of a bill," said this man to me, "has nearly everything to do with its success. I do not mean the official title but the popular title. An act which gave the railroads more trouble than any other single piece of legislation has been the 'Full Crew' law, and solely because of its name. The name implies that railroads must be prevented from running trains with less than full crews, but as a matter of fact the law provides for extra a entirely useless men and is a mak work law. If you were against this la then of course you wanted trains to out with less than enough men manage them!

"The 'pure food' law is on somethi the same basis. In part that law pr vides against harmful adulteration a misrepresentation, but it also bars sor harmless and some beneficial co pounds, yet if you object to the b parts of that law then you line yours up as being against pure food for t people. The 'Seamen's Act' attempt to do for ships what the 'Full Cre law did for the railroads, but becau 'Seamen's Act' means nothing to mo people there has been no public prote over its suspension by executive ord from the time of its passage.

"All taxes are nuisances—or wors But because some ingenious perso grouped a lot of the smaller tax under the general head of 'Nuisan Taxes' these taxes no longer exis The 'Sherman Anti-Trust Law' today a hindrance to the reorganiz tion of many kinds of business alon lines where they could raise wag and also lower prices, but the wor 'anti-trust' have saved the law and w continue to save it for a long tim For 'trust' has come to mean a con bination against the interests of th public.

"The Volstead Act is badly name I can conceive, if this law had a tit which would imply moral turpitude its violation, it would be better ob served; as it is, many men of substan are afraid to oppose it only becau then they will be dubbed 'Wets' which carries opprobrium.

"During the war, England had th 'Defense of the Realm Act,' giving th broadest and most arbitrary powers the Prime Minister, and a great de of injustice was perpetrated und that act. But the act was popular known as 'Dora'—which took th

ing out of everything done under it!

"Our own civil service laws need mendment in a great many particulars. hey were originally designed to curb 'o the victor belong the spoils,' it now in many instances they serve ly to keep incompetent men in fice. For a long time any effort to ange them was met with the cry at you wanted to return to the spoils stem. Now, however, instead of 'vil service employee' people are ginning to say 'bureaucrat'—which eans that before long the laws will revised!"

Robert Louis Stevenson wrote: 'Man lives not by bread alone but incipally by catch words." Take te word "diet." When a man says lemnly: "I am on a diet," it is almost crilegious to suggest that the diet is rting him and not helping him. obably more men and women have en killed through wrong diets than rough overeating. Some of the pre-iling weight-reduction diets are so akening that they break down all sistance to disease. Yet the word 'iet" implies a healthful selection of od!

Take some political terms. The rd "progressive" is exceedingly attractive; we all like to think that we e making progress, but merely changing things is not progress, and neither jumping up and down on one spot. reactionary is supposed to be going ck into the past and a progressive ing forward into the future. Presently progressives nearly always advocate the punitive taxation of wealth ad the encouragement of intense mpetition by small business units. you tax away capital, then there is thing left over to provide the power ad machinery which bring about higher ges. High taxation means low wages, ad so does excessive competition—r it is very wasteful—therefore, gressivism may easily be reactionary.

The reactionary, on the other hand, ually believes in low taxes—which eans the accumulation of capital and e competition of capital for labor—hich means higher wages. In the same y "Tax the rich and spare the poor" unds well but works out to mean mething very different. The taxatn process is one of subtraction, and, although the money may em to come from one ss, actually it comes m the whole community; the wealthy become s wealthy but the poor come destitute.

Take "liberal" as a litical designation. ce upon a time it meant t for a gentleman" or efitting a man of free th." But now, oddly ough, in this country find that a liberal—t is, a man who calls nself a liberal—is not so much concerned with any liberty excepting that which permits him freely to talk socialism or even communism—both of which doctrines have in them nothing whatsoever of liberty. In them individuals are just cogs in a machine.

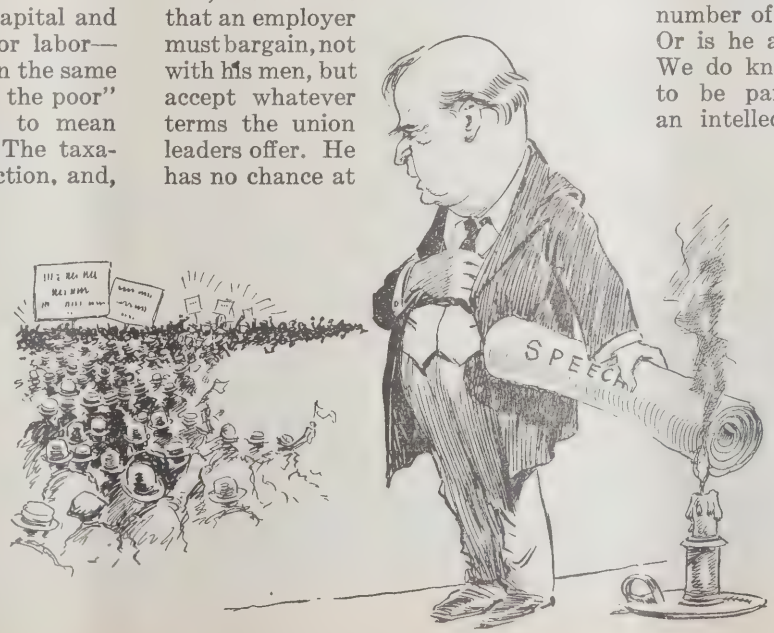
It is much the same with "liberty" and "democracy." Liberty is a perquisite of the "ins" and never of the "outs." It is purely a question of where you sit. Ours has never been a democratic government and was never intended to be—it is a representative government. Indeed, democracy cannot exist on a large scale, for it implies continuous referendum and would be entirely too cumbersome—it also implies that human beings reason and ponder on public questions, and they do nothing of the sort. They play follow-the-leader.

The labor catalog is filled with terms which do not mean what they seem to say. The "organization strike" sounds harmless, but what it really means is the calling out by professional organizers of men and women, not because they have a grievance but to force them into joining the union.

If a works employs five hundred persons, at least fifty or a hundred of these persons can be pursuaded that they have wrongs, and then they can further be pursuaded to strike and bring out with them a hundred more workers who have a dim idea that if there is a strike they ought to be in on it.

The strikers yell "Scab" at men going to work. Few men have the moral courage to stand out against being called a scab. It is the most useful word in the whole trades union vocabulary, and so, just because a union needs members and dues and the organizers want to earn commissions, the factory is closed down and sometimes bankrupted and weeks of wages are lost.

"The right to collective bargaining" sounds imposing. It seems to imply that an employer ought to bargain with his men concerning wages, and connotes a certain level fairness. In fact, it means that an employer must bargain, not with his men, but accept whatever terms the union leaders offer. He has no chance at all to bargain—he is simply told what he must pay and instead of being able to reward men according to their efficiency, he has to pay the first-class man and the worthless man alike.



"Living wage" seems to mean something but does not. It has its foundation in a standardized system of living, and there is no such standardized system. A wage earner with an intelligent wife may live well on twenty-five dollars a week, while another wage earner with a shiftless, slattern wife will get nothing out of twenty-five dollars a week. The whole idea of the living wage, while it sounds humanitarian, is not humanitarian at all. It is a European importation growing out of a static society. Here in America we do not want wages which will merely pay for existence—we want the highest wages which well-managed production can pay.

"Class conscious" is another European importation. The preaching of class consciousness is to the end that workers must consider themselves workers for all time and act accordingly—and incidentally duly obey the labor leaders who want to exploit them. The "democratic control of industry" is a high-sounding phrase which means absolutely nothing.

We know how far a gang gets without a foreman; we know how far a factory gets without an organization to distribute its product; but under democratic control, leadership is presumed to amount to nothing and every question of product, wages, and hours is to be argued out and voted upon by the men. Even Russia had to abandon this notion of democratic control, for, although talk flowed freely, production quit cold.

"Intellectuals" and "Intelligentsia" are words we hear often and they ought to mean something. But what do they mean? They have something to do with being educated. But what is an educated man? Is he a man who has received collegiate degrees? Is he a man who can remember a great number of things taken out of books? Or is he a man who can use reason? We do know that it is not necessary to be particularly intelligent to be an intellectual or a member of the intelligentsia. Probably they are just words to classify odd specimens who neither work nor spin but who it would seem ought to be labeled.

The list is endless—the list of words which seem to mean one thing and which actually mean something very different. But this we know—"a rose by any other name" would not smell so sweet. Nobody would take the trouble to find out what it smelled like. It is words—not what is back of them—that control.

1,000 Miles from a Railroad

China as the Land of Topsyturvydom

By STANLEY HIGH

Part of the Great Wall of China, north of Pekin.

ON THE outward voyage from Vancouver to Shanghai "an old China hand" remarked to me:

"You may not like the sights and the sounds and the smells of China, but you can't help loving the Chinese people."

One day in a Chinese city provides all the proof one needs for the first part of that statement. It requires a considerably longer time, and journeys away from the smug environs of the International Settlements, to demonstrate the truth of the latter part. In fact, instead of falling immediately in love with the Chinese people I concluded, at the end of the first week in the country, that the Oriental atmosphere, in some way or other, had probably distorted the outlook of those individuals whose affection for the Chinese was so apparent.

My own first impression of the Chinese was that they do everything exactly the opposite from the way in which it is done in the Western world. Being new to the country this discovery was irritating. I decided that things were twisted, doubtless, merely for the purpose of aggravating foreigners who might be passing through. At any rate I made a list in my diary of the things which Chinese do "backward."

In reading a book a Chinese begins in the back and reads toward the front, and instead of reading across the page he reads up and down. When a Chinese rows a boat instead of sitting down with his back toward the point for which he is rowing he stands up and faces forward. A Chinese boy, if he pares an apple, does not hold the apple still and move the knife, he holds the knife still and moves the apple. The most desirable beds in China are not soft but hard. When introduced to a Chinese instead of shaking your hand he shakes his own, and instead of being introduced as "Mr. Jones" you will be introduced as "Jones, Mister." And when you are ushered into a high-class Chinese home one of the greatest compliments that you can pay your hostess is to ask her her age.

Hankow is the Pittsburgh of China. The stacks of its mills rise above the city in as impressive a sky line as on can see in many Western cities. Larges of these factories is the Han Yang Iro and Steel Company, which employ 5,000 men and is under a strictl Chinese management. Dr. Woo, th general manager, was educated i England and America and, after a tou of his plant, he explained—in term like those of any far-seeing America manufacturer—his plans for his em ployes.

"Housing is our first problem," h said. "After that we will have Y. M. C. A. in the plant. Already w have begun lectures and schools for th men. That land over there"—and h pointed to a great plot of ground som distance from the mill—"we are makin into a playground for the children o our employes. Work has already be gun on our day school. Once our mode homes are finished we can go forwar more rapidly with these other plans."

Not all of China's factories have management so up-to-date as that o the Han Yang Steel Company. Bu among Chinese directed companie there is less and less of industrial ex ploitation and a greater degree of fai play.

Up from Hankow we traveled o the Yangtze, by comfortable rive boat to the city of Ichang, locate just below the world-famous Yangtz Gorges. There is an increasing amoun of steamer traffic through the gorges— for the upper Yangtze (Continued on page 30

A characteristic part of China's younger generation.

The Suffocating Load of the Law

Is American Justice Being Smothered Beneath a Mass of Statutes?

By AARON HARDY ULM
ILLUSTRATED BY W. W. CLARKE

AT THE Capitol in Washington there is the best library of its kind in the country. It is maintained for the use primarily of the Supreme Court of the United States. Embodied in thousands of books on the library's shelves is the law of the land—the law which, according to the first of legal maxims, everyone is presumed to know.

"A fairly intelligent lawyer might read them all in about twenty-five years," says a noted judge regarding these books. Then he would face a new accumulation that would occupy him for another period of five to ten years, that is, unless meantime the flood be checked.

The beginnings of this accumulation of law lie in vague antiquity. Some go back to primitive man, some to the annals of Old Testament peoples, some to the ancient Greeks, a great many to the Roman Republic; but, chiefly, they are rooted in the traditions of the Anglo-Saxon race.

Flows from some of the tributaries to the main stream have at times been checked and clarified, as when Justinian caused the Roman law to be reduced to a few simple volumes and, according to legend, directed that all the other law books extant in the Empire be burned. But there never has been any drastic checking of the main flow, which has swelled as time passed, and in recent years, in this country, has reached the proportions of a flood. There has been less impeding of the flood, and even less effort to keep it within reasonable bounds, in this country than in any other whose system of administering justice is built around the English common law.

In fact, many students of the subject—among them some of the ablest living lawyers—seriously are asking the question if the law isn't in danger of being smothered in this country under a growing mass of books filled with statutes, precedents and formulae, so numerous, so complex, so dispersed and often so contradictory as to threaten a complete breaking down of the courts.

"The enormous increase in legal literature and the intolerable maze of precedents through which we wander has alarmed every thoughtful student and has placed upon the profession burdens which only supernatural power can support," declared John W. Davis when president of the American Bar Association. "Instead of receding from the brink of chaos, are we not daily hastening toward a precipice?"

"The Kent centenary offered an occasion to contrast the 180 volumes of reports and the dribble of statutes which made up his (that of the author of the greatest of American Law classics, *Kent's Commentaries*) working library with the 18,500 volumes of reports and the inundation of statutes that constitute a complete American law library today. . . No law office, however numerous its force, can pretend to sift a mass of material so vast."

The "inundation of statutes" has been widely discussed of late and is now the subject of agitation in many quarters. This commentator was among the first laymen to write of it currently—in THE DEARBORN INDEPENDENT more than two years ago. The legislative mills of the country have been grinding out from 15,000 to 20,000 new laws every year, a large number of them containing extraneous matter in the form of "riders" and others embodying hidden matter in the form of "jokers." It is the common opinion of lawyers that most of them are badly drawn, making it all the more necessary that the courts "rewrite" and supplement them. The aggregate would be doubled by adding to statutes the regulations, orders and ordinances, having the force of law, that are put forth by administrative bodies.

Though it is a big one, the flood of statutes is not the most important phase of the problem.

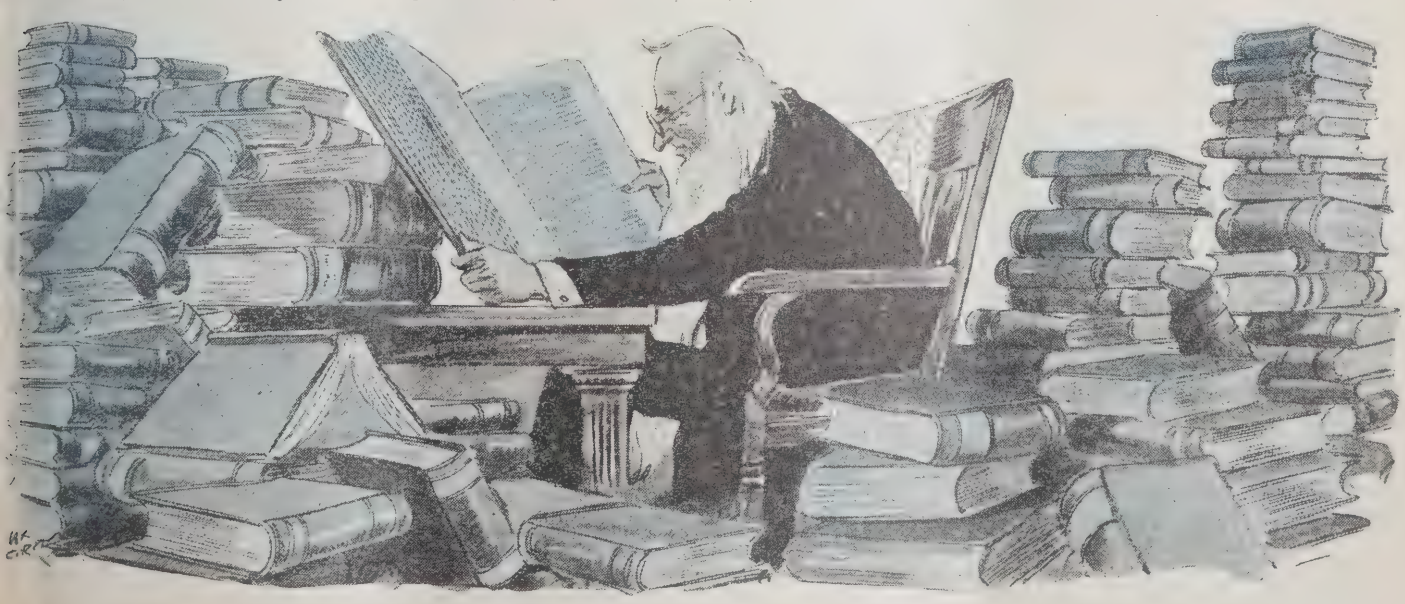
"While the layman often thinks of law in terms of statutes," says Harlan F. Stone, recent United States Attorney-General and now a justice of the Supreme Court, "much the greater part of law is in fact made up of those rules which are declared by judges and which have the force of law only because they are so declared."

These rules are scattered through nearly 20,000 volumes of Appellate Court reports. In 1917 there were 175,000 pages of these reported opinions—each of which might contain a precedent—in the United States as against only 7,000 in Great Britain, the parent source of our system of law.

Several results flow from the condition of which the foregoing is an illustration. One undoubtedly is in great part the lax enforcement of the criminal laws. Another is the declining worth of the courts as agencies for procuring justice under the civil laws. Another is the growing cost, which for a great proportion of the population is becoming more and more prohibitive, of not only litigation but of the non-litigious legal service that is becoming more and more necessary in the ordinary conduct of affairs.

A few paragraphs as to the first.

"The administration of the criminal law has practically broken down of its own weight . . . In all the States of



the Union, with one or two exceptions, (it) is a disgrace to civilization."

Who says that? Some wild agitator? No. The words were uttered only a year or two ago by William H. Taft, former President and now Chief Justice of the United States Supreme Court.

"From a careful estimate, I conclude that we have at large in the United States at least 135,000 crimson-handed women and men who unlawfully have taken human life," writes Judge Marcus A. Kavanagh, of the Superior Court of Cook County, Illinois, in the journal of the American Bar Association. "There never was any other condition like this in the civilized world. Competent observers reckon that there are in this country 352,000 men and women who live partly or entirely by crime and the number is increasing with incredible rapidity."

Why?

Listen further to this judge of a quarter century's experience on the bench. The expression "adjective laws" relates to procedure.

"The substantive laws of all civilized countries are about the same; in that regard, no one in 3,200 years has added much to or taken from the Ten Commandments. But an intraversable expanse spreads between the adjective criminal laws of this country and those of other lands. If an explanation can be found for the difference in criminal conditions between the United States and Canada and European countries that cause must be discovered in the ropes, pulleys, gearing and tackle which transmit the power from the substantive laws to the crime itself. Now our adjective laws are a century behind this age. Seventy-five years ago their abandonment commenced in England, the land of their origin. The ancient system continues with us, worn-out, ramshackle, loose, ill-fitting and in such rattling and uncertain adjustment that the wonder is not that justice so often fails but that it so often succeeds."

Another sentence penned by this judge:

"The law which now exists as an insurance for criminals is for most part Judge-made law."

If space permitted, an astonishing array of evidence might be put forth in support of that statement—evidence taken from that great mass of law books under which real law pants for the breath of life—such as the great number of cases in which appeals are permitted and the extraordinary number in which they are sustained, often on frivolously technical grounds.

The average state of affairs as to the laws involving property or civil rights is perhaps worse than that of the criminal law. After all, the criminal law is reasonably simple; the civil law has become so infinitely complex that practitioners are being forced more and more to confine themselves to a single one of the multiplying branches of it. This complexity makes the course of the average court case so costly, so uncertain, and its settlement so remote that persons in many lines of industry are finding it necessary to set up private courts for adjustment of disputes outside of the machinery of law. In one big industry 5,000 cases were so disposed of in a recent year, during which time only two suits lying within the range of these private courts—called boards of arbitration—were carried into the law courts by persons in that industry.

"If one considers court action in New York City, he should be advised that he cannot have a trial of the issues before the first of 1929 if the case is docketed at once (extraordinary cases, advanced on certificates of special importance, excepted)," wrote Wesley A. Sturges, a professor of law, in the March, 1925, number of the *Yale Law Journal*. Four years between the filing and the trial of an ordinary law suit! Then as long, or longer, period may be absorbed if the loser be able to pursue all the avenues of appeal.

Meantime . . . "Rights suffer irreparable wrong; wrongs go unrighted; parties and witnesses die, scatter and disappear; evidence is lost or destroyed; memories fail and testimony loses its distinct value; frauds and perjuries evolve and mature; insolvencies and bankruptcies intervene, so that when the tardy day of judicial trial drags the often seriously weakened case to the bar of justice, justice ofttimes cannot be had or is very ineffective."

Aside from all that, the average case must run the gamut of infinite technicality.

A committee of the American Bar Association, in a report made within the last few years, declared that the growing lack of respect for law is "due to the law's uncertainty," which in turn, the committee held, is due in most part to "lack of agreement among the members of the legal profession on the fundamental principles of the common law, lack of precision in the use legal terms, to conflicting and bad drawn statutory provisions . . . t great volume of recorded decisions, t ignorance of judges and lawyers a the number and nature of novel leg cases."

The last Federal census disclos 122,000 persons in the active practi of law, or occupied as judges, in t United States—approximately 1 f every 800 of the population. While t number of doctors, hitherto about t same as that of lawyers, fell off duri the last decennial period, that of lawye increased about 8,000. Members of t legal profession tell the writer that t average earnings of lawyers have gro more than those of any other profe sionals and beyond those of most no professionals in recent years. Whe he used to have to set up for hims and wait—as Woodrow Wilson d unavailingly—over an extended p riod for clients, or go out and hust for patronage, the average graduate the law now has little trouble in getti profitably situated at the start. This because of the growing demand, necessary demand, even a legitima demand, for capable legal service.

Might not a similar question raised as to the legal profession a law reform? For example:

Is it reasonable to expect a lar group of the population to expend mu energy toward correcting conditio that are highly profitable to itself?

Undoubtedly it would be unfair express doubt on this score as to a members of the bar, or, perhaps, t bar as a whole.

There is much that runs counter such doubt. For instance, the literatu of the profession, as foregoing excerp indicate, is replete with demands f reform.

Some of these demands have bee transformed into action. An America Bar Association commission that h been working with that end in view f many years has achieved considerab by way of promoting the adoption uniform statutes on certain phases the law by different states. But only modicum of the admittedly desirab has been achieved there.

The biggest move toward law r form now being made is more fa reaching than any of those alread noted. And it comes wholly from t legal profession itself. It is the or being promoted by the American La Institute, a protégé (Concluded on page 2

Microbes That Devour Microbes

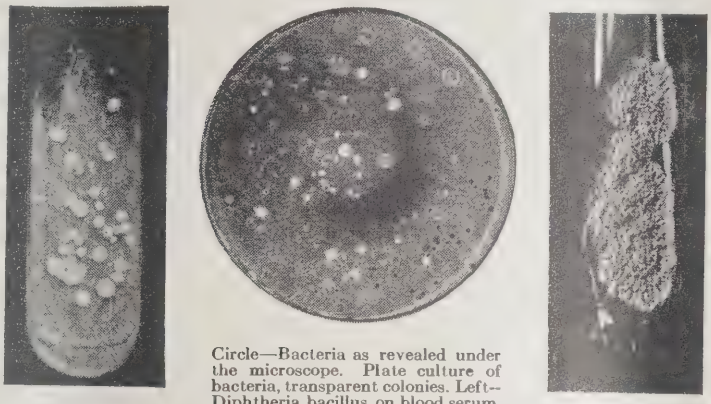
D'Herelle's "Bacteriophage"— Canadian's Discovery at the Pasteur Institute

By HENRI PEYRE

THREE years ago the whole of France, her men of science and her politicians, her professors and even her most famous actors celebrated the hundredth anniversary of the birth of one of her greatest geniuses, Pasteur. France can indeed be proud of this child of hers. To him, and to the impulse he gave to biology, are to be traced most of the discoveries made in that field these forty or forty years. Among the new paths he opened in the forest of dark ignorance and stubborn prejudices, the most fruitful is undoubtedly the study of the world of the infinitely small creatures, microbes and bacteria. He has been followed in that way by several brilliant disciples, one of whom, Felix Hubert d'Hérelle, who was born in the province of Quebec, Canada, is now becoming famous in the scientific world for his discovery of the *bacteriophage*.

When, less than fifty years ago, the new word "microbes" was coined to denote those infinitely small creatures that man, the complex self-destroyer, feeds in his own body, physiologists little deemed that those tiny living particles they had succeeded in perceiving through their microscopes would soon appear like giants compared to other creatures which received the name of *ultramicrobes*. The latter are living beings so small that none of our present optical instruments can betray their existence. They are distinguished from microbes not only by their diminutiveness, which enables them to pass through the pores of filters, but also by special properties with which they are endowed. Thus they cannot be cultivated apart from the being of which they are parasites. They are "intracellular parasites," that is to say, they can live only inside the cells. Many diseases of man, animals and vegetables, are to be set down to those ultramicrobes—for instance, rabies, smallpox, mumps, scarlet fever, measles, perhaps the common coryza, even all animal plagues.

But, the great and hopeful fact is that those invisible creatures are not all of them our foes. Parasitism, as well known, is a necessity and a general law for all living beings, who must borrow from other living beings the organic matter that they cannot themselves create. But the higher forms of animal life are endowed with certain means of defense against their enemy: some insects and reptiles secrete several poisonous liquids, some fishes possess organs producing electricity, others emit a stuff that makes the water around them turbid. Microbes, being the smallest, are the most dangerous of all parasites. They find in the organism of animals an environment favorable to their growing and developing; they soon multiply, and their presence in the organism creates a disease. Against them, our human system finds a means of defense in the phagocytes, those white globules of our blood that stand like soldiers on duty, whose task is to guard the body against foreign invasions. As soon as microbes attempt to attack our tissues, there is a general signal for action; the struggle begins. According as the globules are stronger or weaker than the assailers on such or such a point, the system resists or gives way. Good health is merely the ability to resist the enemy, and all that tends to keep the body in tone is an effectual preventive of disease.



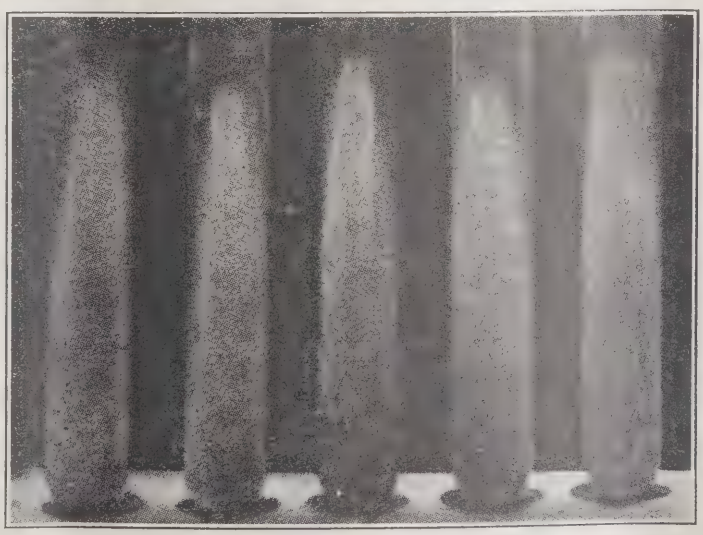
Circle—Bacteria as revealed under the microscope. Plate culture of bacteria, transparent colonies. Left—Diphtheria bacillus on blood serum. Right—Bacillus tuberculosis on broth germ culture

This has been well known since the works of one of Pasteur's disciples, Metchnikoff. *But another phenomenon has since been discovered, the importance of which may well prove equal to that of the phagocytose.* This is due to the long and patient researches which Felix Hubert d'Hérelle undertook twenty years ago; they resulted in 1917 in the discovery of the "bacteriophage" to which his name is given: *D'Herelle's Bacteriophage.* The term indicates "bacteria eaters."

The process of the discovery is this: eliminated matter *from a patient recovering* from dysentery, typhoid fever, or plague, is mixed with broth germ culture and filtered through a candle-shaped china tube. After the filtration, the mixture is perfectly clear; it is then pure. Then matter from a *patient still in the throes of the disease* is taken, and four or five drops of the former mixture *from a convalescent patient* is mixed with it; after a certain time, 18 or 24 hours, the broth is again quite clear. The microscope shows that the disease bacilli have disappeared.

What has occurred? Obviously the bacilli of convalescence have overcome the bacilli of disease.

One drop only, not of the original mixture, but of the broth that grows clear under the influence of that mixture, will produce after a few hours the same phenomenon that took place in the first experiment, that is to say, the disease bacteria are dissolved and destroyed, and the whole is quite clear and pure. The process can be repeated; one drop of *the clarified broth obtained after the second experiment,* introduced into a third group of disease bacteria destroys them even more quickly than before, within 8 or 10 hours. There is a long series of such experiments. The dissolving process takes place without the later mixtures losing anything of their strength; on the contrary, after the first few experiments, an (*Concluded on page 26*)



The bacteriophage is introduced into a bacterial suspension. Small amounts of this suspension are spread on broth germ culture, and then incubated. Tube 1—immediately after inoculation; 2—after 1¼ hours; 3—after 2½ hours, the layer of bacterial growth shows three colonies of the bacteriophage; 4—after 3¾ hours, confluent colonies of the bacteriophage are disseminated throughout the bacterial growth; 5—after 5 hours, the bacterial elements have been destroyed.

How British Control Rubber Flow

Restriction of Output in the East Means High Prices in the West

By OTTO WILSON

FOR thirty-five years we have had on our statute books a law designed to protect us against domestic monopoly. But the danger we have partially curbed at home threatens us more and more from foreign shores. For many years we have been paying a small tribute to certain foreign monopolies. Recently the tribute has been much enlarged, and in the years to come it promises even greater expansion. If present tendencies continue American consumers may be paying hundreds of millions of dollars a year over a fair normal to a few small groups of foreign producers.

"I am impressed," wrote President Coolidge recently, "with the fact that there is a general tendency for consolidation of control in price and distribution in many commodities upon which we are dependent for import."

Some of these foreign monopolies are due directly to whims of Nature, which has piled up in one spot great stores of particular kinds of material useful to men. Some are the result of purely artificial restriction. But in all cases it has gone beyond the legitimate point, and it is not very comfortable for the consuming public, which often means largely the American public, to be forced to "pay through the nose" or go without.

Last year one-seventh of the total imports into this country were subject, in a high degree, to such foreign monopolistic control. *The goods whose flow was thus regulated represented a value of half a billion dollars.*

For the moment rubber is the most conspicuous example.

Every motorist who has had recently to stop at the dealer's and buy new tires knows how prices have been jumping. The dealer himself probably could not tell him why. Word had been passed along to him that "tires were up again" and he had pushed his price up accordingly. But if the motorist could follow back along the trail which the tires and the rubber had traveled, through the dealers to the tire-makers and thence to the traffickers in raw rubber and finally to the grower on the plantation, he would see that these price increases ran like a wave along the whole course of the rubber trade and that the wave was started at the source of the rubber itself—the plantation in Southern Asia.

If present prices continue to prevail, a great golden flood will keep pouring into the strong boxes of the growers—enough in many cases to repay the whole cost of the plantation in a single year.

Three-fourths of the world's rubber production is in the hands of British growers, and when they act together on a policy that policy is likely to prevail. For two and a half years they have been *restricting their shipments of rubber* to raise and maintain prices, and that restriction, according to one estimate, in 1924, cut down the world's output of rubber *by more than 25 per cent.* To that restriction and the immense demand that continues to go out from America the present high prices are directly due.

Agents of the United States Government have been making a close study of rubber growing on the plantations of the British and the Dutch in the East Indies. They have found that growers can make a very fair profit when rubber sells for 25 to 30 cents a pound in New York. During the price rise of recent months rubber has gone to considerably more than $1.00 a pound. Stocks of rubber are now low. If a severe shortage occurs in the next few years, as has been predicted, the resulting prices and profits can only be imagined.

Putting the screw on the foreign supply.

How does it happen that these growers of the Middle East have the world rubber situation in their hands? British enterprise and British capital, it must be admitted, and not merely the favor of Nature, have brought about this near-monopoly of rubbe

Until well along in the prese century nearly the whole supply of t world's rubber came from the gre depths of the Amazon forests in Sou America. But fifty years ago S Henry Wickham, an Englishman livi on a Brazilian plantation, managed get a shipment of rubber seeds England—a difficult job, since the oi seeds turn rancid quickly. Out of t lot of 70,000 forwarded in 1876 abo 2,700 germinated when planted in t Kew Botanical Gardens near Londo Seedlings from these seeds were se the same year to Ceylon, and *tho seedlings lifted one of the world's maj industries from the new world to the ol* For from them came the trees whi have built up the vast plantatio of the East.

When the automobile came alo early in this century it tremendous increased the demands for rubbe A mania for rubber planting swept t East. Year by year the outp mounted in great leaps, but t motor car was growing fast a our tire and automobile factori absorbed the rubber flood almo as fast as it rose. Graduall however, production gained consumption. Prices went low and lower. By 1920 so mu more rubber was offered than w needed that the bottom fell o of the market entirely, and pric went below cost of production.

The crisis led directly to t now famous Stevenson Restri tion plan, which was passed a became effective November 1922. This is the measure which the British rescued the rubber industry, an object itself laudable enough, and p it in the way to reap a golde harvest at the expense of t rubber users of the world.

Under the Stevenson plan grower is allowed to expo more rubber from his plantatio than a certain proportion—thre fifths at the start—of the amount exported in the rubber year 192 Every three months the average pri of rubber is computed. If it is 30 36 cents the grower may ship additional five per cent of his 19 output. If it is approximately 36 42 cents the added amount allowed hi is 10 per cent. But if it is less than cents he must cut down his shipmen by 5 per cent. The demand for rubb grows greater, with the usual tra fluctuations, year by year. What ma the American buyer of tires expe when the world cries out for mo rubber than the plantations can supply

MR. FORD'S PAGE

A WORD that shares with "efficiency" the dislike of those who think their mission is to keep life free, is the word "standardization." In its practical aspect and without the name, it wins approval, but the name itself suggests hard setness, sameness, prevention of growth.

The attack is made from several angles, but most vigorously from the point that standardization is the enemy of initiative. The plea is made that young men come into a fully standardized world and can only mold themselves upon the foreordained plan and cease to develop.

No hesitation need be felt in admitting that there are conditions which seem to confirm the truth of this charge. There is a kind of standardization that would stem progress; there is another kind that makes progress possible.

The wrong kind of standardization is likely to be found where financiers control instead of engineers. This is worth considering, since it is usually engineers who are charged with being the creators of obstructive standardization. This is not the case; the blame, in this instance, goes to the financiers.

Understand first of all that anything worthy the name of standard is the result of a long progressive series. It is the product of growth. Had growth been prevented, the plane of any given standard would never have been reached. There would not be even so much as a standard door knob unless a long experimental series had preceded it. So that a standardized utensil or process of any sort is itself the fruit of development.

And this development was the result of men who worked at *the thing itself*, for the sake of its perfection in usefulness, and not exclusively nor even primarily for profit.

Then, the development having reached a certain useful degree, it is capitalized. Men of money see the opportunity to make more money by utilizing a standard process. They set up their plants, install their machinery, and go to work. But the real product they aim to make is dividends, not commodities. Commodities are a means to the dividends. If, in a pinch, anything must suffer, it will be the commodity, not the dividends. Every exertion will be made—wage reduction, quality reduction, quantity reduction, price increase—anything to save dividends. Which, of course, proves that dividends are the principal product of the business.

Engineers have another interest altogether. Today's standard represents for them the level of today's achievement; they hope to excel it tomorrow. It is just here that engineering science is judged to be the enemy of shortsighted finance. A group of money-brokers have installed a battery of expensive furnaces—to produce dividends! Now, furnaces are not designed for that; their purpose is to produce metal. A poor furnace will produce dividends just as well as a good furnace will; but a good furnace will produce better metal, at less cost to the public.

So the engineers produce the better furnace. It is then up to the financial controllers of business to say whether they will scrap the old "standardized" furnaces and put in the new, giving the public the benefit of lower costs, or cling to the old and prevent the new. They usually refuse.

That is an instance where "standardization" works against progress. But it is not due to anything in the standard—for it is the new and higher standard that is being rejected; it is due to the financial control which cannot see that a plant exists to produce the best commodities at the lowest cost. Industrial leaders, engineers, see that readily. They scrap the old and install the new.

But it costs money? Of course it costs money. The money, however, has been previously provided by the public. Every concern which deals well with the public has money to keep up with progress. The surplus of any industrial firm is a fund to insure future progress far more than it is a payment for past performance. The financial controller of business, having no vision on this side of the matter, protests the unnecessary expenditure. The engineer makes the expenditure out of a sense of due fitness and self-respect.

No need, however, to grow tragic over these occurrences. Financial control is the sign of the end. All the ailing industries are under financial control; the others are under engineering and industrial control. These latter thrive because they obey the law of progress. It is not what is taken out of a business, but what is put back into it that determines its worth and success.

So that certain criticisms are just if it be remembered that the thing criticised is not properly standardization. What it is, we shall see.

THE difference between standardization that looks toward yesterday and that which looks toward tomorrow is great. Critics who condemn standardizing a process because it shuts out progress prove that their observation has been limited to finance-controlled business. Standardized processes always have an open door toward tomorrow where engineers and industrialists control. Because commodities are their principal product, and not dividends, they readily scrap the less good for the better process. They raise the standard. They conceive it as part of their duty to the public to do so.

EDITORIALS

Shall We Reduce Wages?

THE progressive path that industry will take is clearly marked, but not all of industry is within it. That part which clings to the old formula is headed in the opposite direction; it is on the way out. Not even denunciation need be wasted on it; its doom is certain. It may be identified at the present moment by its movement to reduce wages.

Financial and industrial influences which favor reduction of wages as first aid to business are stupidly unconscious that thereby they deal business its first staggering blow. They are curtailing business at its source, the source being buying ability on the part of the people.

When the public go on a buyers' strike; when workmen go on a production strike; when employers go on a wage strike, precisely the same thing occurs in all cases. Wage Reduction is the same as Work Reduction, and both result inevitably in a Buying Reduction.

The helplessness of any business is proved the moment its managers agree that nothing can be done except reduce the pay envelope. No concern is entitled to the description of "leader in industry," no manager should be called "a captain of industry" who resorts to such contemptible methods as financing themselves out of the wages of their employes, forcibly taken.

Yet it is being proposed all over this country that buying power be reduced by the reduction of wages, and this proposal is seriously made with the purpose of helping business!

It is not only being proposed, it is also being defended by "financial writers." A 10 per cent cut occurring in the woollen industry is justified on the ground that "next spring" woollens are to be reduced 22 per cent, and that the woollen company has already reduced its employes' house rents 25 per cent.

These figures are used to make it appear that they balance the 10 per cent wage cut, since "22" and "25" look so much bigger than "10." But analyze it. Suppose the weekly wage to be $40. A 10 per cent cut amounts to $4. Suppose, under the paternalistic system of the factory, the rent to be $10. A 25 per cent reduction in rent would only be $2.50. If the rent is $30 a month, in four weeks the wage reduction would be $16.00 as against a rent reduction of $7.50. Consider further that this 10 per cent represents one of several reductions during the year, and then consider what would happen to the woollen industry if all other industries followed suit.

The system represents such a stupid and self-destructive fallacy that it is astonishing to meet it still operative in this enlightened age.

The Thirst for Office

THE thirst for office is a terrible affliction. It is said that few ever leave Washington without wasting the rest of their lives contriving to get back. One ex-President's life is said to have been deeply embittered by the fact that the country seemed to get along with him out of office. Over in Great Britain today there exists a situation which for difficulty equals anything in Europe, and the helplessness of public leaders in the face of overwhelming problems is frightening to contemplate. No man in his senses would wish to exchange places with the Premier of Great Britain, unless that man were divinely endowed with infallible light as to the way out of the present wilderness. Yet there are in Great Britain at the present moment two ex-premiers who know from experience the enormity of the difficulty, who have proved to the world their own incapacity to cope with it, and these two men are using every political wile to become Premier again! What poison there must be in public office so to destroy a sense of proportion, a sense of the solemnity of responsibility, in men.

Woodrow Wilson once said that a man was a fool to desire to be President. There is much in that. Yet, here and there throughout the country are men who have angled for the office with every conceivable bait. A thirst for the office is probably a sign of unfitness for it. This goes for incumbents as well as would-be incumbents. It is easily understood how a man with a purpose and a plan should desire the office as the means of working out his plan, but we have seen very little of that in recent years.

The amazing part of the present clamor for attention on the part of would-be presidents is that none of them tells us why he wants the office, or what he would do with it should he get it, or why he thinks he is so much better than anyone else that he feels justified in asking us to look upon him as the future Chief Magistrate.

Memorials

A MAN'S work is his best memorial. What he has done no admiration can enhance, no enmity debase. In this sense every man erects his own memorial. If his work melts insensibly into the mass of human effort, no sculpture can prolong its individual fame. If its quality thrusts it forth, if the achievement dwarfs the work of little men, no sculpture can add to its grandeur. Lincoln is not remembered for the monument on the Potomac, nor Columbus for bronze casts of his features. Lincoln's monument, like Columbus', is his work.

There is always that in the minds of a useful man's friends which seeks to give him a fame beyond his own when he is dead, because a man is never dead to his friends. It is from this quality that there arises the various "memorial schemes" that vex the land from time to time. Mr. Roosevelt was scarcely dead before a movement was begun, an ill-concealed political purpose within it, to build his monument. Mr. Harding's death released another movement for a mighty memorial to his name. And now the newspapers daily report suggestions hither and yon for works commemorative of Bryan.

Greater men than these have flourished even in this Republic, and have grown dim with the years. The once warm eulogies carved for them on shaft and monument seem extravagant now. Extravagant—unless we bear in mind this fact, that most monuments are memorials to the friendship which a man's contemporaries bore for him. They are monuments to a friendship rather than to a fame.

This fact is needed to balance the monument-building spirit: *the monument is essentially to the builders thereof,* and not to him whose name it bears. He has built his own monument in his works of whatsoever nature they are—"gold, silver, precious stones, wood, hay, stubble." But living emotion demands an object. The vibrant personality is gone, there remains the memory; men proceed to deck that out—*their* memory!—with all the trappings of veneration.

The Collapse of the City

IS THE American city falling down? Has it passed the limit where efficiency is possible? Other units, especially in the commercial world, have collapsed because of their very size. There comes a point where expansion turns from contribution into drain, what formerly assisted becomes a burden. In municipal service this is the general rule. Telephone companies begin by advertising service and end by demanding curtailment· the load becomes too heavy. Recently one of our largest cities was incapacitated because it rained for one day. In most large cities the people are drinking doctored water. Police protection has broken down everywhere. Transportation is a form of daily torture the Dark Ages never dreamed of in any delirium. Municipal politics, while more respectable outwardly, has scarcely changed from the old days, as municipal scandals everywhere testify.

And yet there is a tendency on the part of all great cities to stretch farther. This, however, is not the pressure of growth, but the need of greater taxable areas to bolster up the collapsing structure of municipal finance. People in the suburbs wonder at the feverish desire of great cities to gobble up the little towns—the answer is taxation.

City conditions have already driven millions beyond the city limits into suburban communities. City governments seek to reclaim these emigrants by including them in greater "metropolitan districts." It is possible for one with a sunny philosophy to believe that this too may be an excellent step, since it may tend to drive millions still farther into the country beyond the utmost reach of municipal inclusion acts. The American city has passed the point where it can teach anything further about community living. All its benefits may now be established in the country districts, where most of its disadvantages can be prohibited.

Fifteen Thousand—Up in the Air

SOME time ago, an editor out in the West wrote an editorial for his paper complaining of the slow progress being made by the railroads in the matter of speed. Quite truly he pointed out that the best time across the continent had only been reduced by some ten to fifteen hours during the last thirty years. But is he looking in the right direction?

In the future, more rapid transit, it seems likely, must be looked for in the heavens above rather than on the earth beneath. And certainly it is coming. The latest report of Britain's air transportation company, "The Imperial Airways," may be taken as the proverbial straw showing the set of the wind.

"The Imperial Airways" came into existence in May, 1924, and by the May of this year had completed 1,000,000 miles of flying; had carried $10,000,000 worth of bullion, 1,000 tons of freight and 15,000 passengers across the English Channel at 100 miles an hour. And these figures, as to mileage, are very small compared with what has been done in this country of greater distances.

There is plenty of progress, if we know where to look for it.

A White House in the West

Should the President Be Bound to the East?

President and Mrs. Calvin Coolidge at White Court, Swampscott, Massachusetts, where they are expected to spend two months or more.

By McKEE BARCLAY

THE annual exodus of White House forces for the purpose of escaping the scorching, enervating heat of Washington brings up again the Summer Capital question. The recent hegira involved the movement not only of the President's secretary and stenographers but Secret Service men, the White House servants, 42 picked men from the Marine Corps and, of course, the crew of the *Mayflower*.

Beginning with the occasional summer trips of our Presidents, the custom of setting up a Summer White House has become a fixed one. President Cleveland, bulky and full-blooded, found Washington unbearable during the summer months and sought relief from its sweltering humidity either on board his friend Whitney's yacht or at Buzzard's Bay. President McKinley spent one season at the Hotel Champlain, at Bluff Point, on Lake Champlain, near Plattsburg, where the great army officers' training camp was established during the Great War. In the other years of his Administration he spent part of each summer in his home town, Canton, Ohio. He had with him during his absences from Washington only his secretary and one or two stenographers or clerks.

President Roosevelt spent the hot months at Sagamore Hill, Oyster Bay, Long Island. It was his habit to take with him his secretary and four or five others from the White House office force, whom he installed in temporary executive offices in the village, not far from his home. President Taft selected Beverly, Massachusetts, as the location for the Summer White House during several of the years of his term. The clerks and stenographers who accompanied him occupied offices in the Chamber of Commerce Building in Beverly, which is six or eight miles from Swampscott, where President Coolidge is now enjoying the North Coast breezes. In the seasons when he was not at Beverly, Mr. Taft summered at Burgess Point.

President Wilson, with the Mexican troubles as a legacy from Mr. Taft, and later having the Great War problems thrust upon him, did not have much chance to enjoy summer vacations. He spent one summer at the home of Winston Churchill, at Cornish, New Hampshire, taking with him only his stenographer, who was quartered at Windsor, Vermont, a town just across the river from the Summer White House. During the hot months of 1916 he occupied Shadow Lawn, the McCall home at Asbury Park, New Jersey.

Every now and then the offer is made to the Federal Government of either a site for a Summer White House or a completely furnished house and a tract of land for the use of our Presidents during the summer season. Sometimes the offers come from private individuals and at other times from states, municipalities or public-spirited organizations, but the projects always die before reaching the point of seriousness because of the many contingencies to be considered in making a move of such importance.

The City of Washington, or rather, the District of Columbia, was selected as the seat of government and the home of our Presidents by our first Congress. Alexander Hamilton's need of the votes of southern delegates was the chief factor in the location of the capital. He wanted backing for his plan to have the Federal Government assume the debts of the states and swapped his support of a southern location for votes for his measure. The choice of the actual site was left to George Washington and the necessary land was given by Maryland and Virginia. The Virginia tract, which is now Alexandria County, was ceded back to that state in 1846.

During the early days Congress refused to provide the money for government buildings and the Commissioners of the District borrowed $120,000 from Virginia and $72,000 from Maryland. Later they again appealed to Congress, were refused, and Maryland again came to the rescue with a loan of an additional $100,000 accepting the personal notes of the Commissioners as security.

The cornerstone of the White House was laid in 1792 and it was finished in 1799. It had as its first occupant John Adams. Few Americans realize that George Washington never lived in the White House and that the seat of the government was not moved to Washington until the year 1800. At this time even the Atlantic seaboard states were but sparsely settled, but whatever of real development in the way of towns and cities was east of the Great Lakes and the Appalachian Mountains. It was later that Bishop Berkeley wrote "Westward, the course of empire takes its way." For years past the center of population of our country has been moving toward the Rockies and the economic and political importance of the country beyond the Appalachians is increasing as that imaginary point moves toward the setting sun.

Frequently the wail is heard from a thoughtless critic that the fathers erred in the selection of a capital for this country, which stretches nearly 3,000 miles west of Washington, but regardless of the question of the banality or the soundness of the criticism the patent fact remains that if the choice of location was a mistake, it was an irreparable one. Washington has been burned once by a foreign enemy and may be burned again but it is fixed on the banks of the old Potomac and there it will stay. On the

The West (to the East): "Understand the West!"

Why Put God in the Constitution?

The Divine Name Is in All Fundamental National Documents

MR. BRYAN just before his death denied what he rightly described as the vicious report that he intended to write an anti-Evolution amendment to the Constitution. Whatever might have been lacking in Mr. Bryan's knowledge of science, he was not a complete ignoramus in the field of politics.

The report, however, calls to mind the campaign, which never entirely dies out, to "put God into the Constitution."

Numerous excellent people continue to assert that the United States is a Godless nation because Diety is not acknowledged in the Constitution.

I think they are quite beside the point. The Constitution is not the fundamental document of the Nation. It is our working blueprint of Government, susceptible to amendment and change; it is not the unchangeable, final and irrevocable document that declares us to be a People and a Nation.

People who clamor about "putting God in the Constitution" labor under the misapprehension that Deity is not acknowledged in our basic national documents.

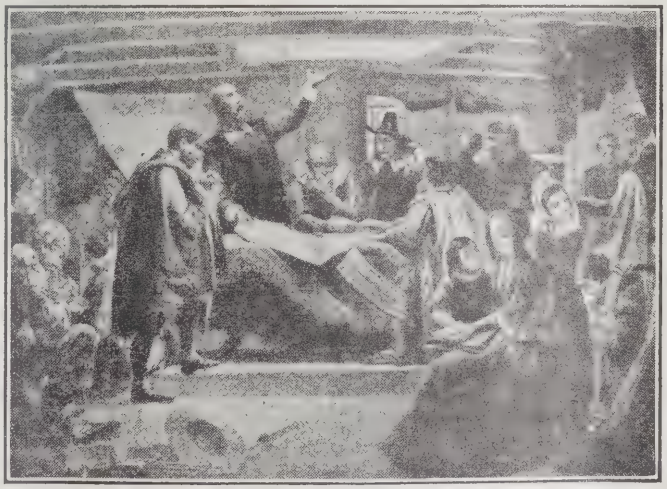
A little excursion through the unchangeable records may serve to refresh their minds on this point.

The Fathers who planted this Nation and gave it the dominant character which it will never lose, made a covenant with Deity. They had come to these shores *as* Christians. They came here *because* they were Christians. They came on a *specifically* Christian venture. Fix it in your mind beyond the power of any false historian to erase, that the planting which determined the genius of the nation was a Church—not a town, not a colony, not a trading or exploring expedition—but a Church. A little Pilgrim church crossed the sea for the sake of its church life. After a journey fraught with consequence to the world, equal only to that "when liberty came to Europe in a little boat with St. Paul," these adventurers of the spirit came to anchor beyond the point of Cape Cod. And there, encompassed by the waters, before a foot was pressed on Plymouth Rock, they called a solemn convocation in their stuffy cabin, and drew up the Mayflower Compact:

> *In the name of God, amen. We whose names are underwritten . . . Having undertaken for the glory of God, and advancement of the Christian faith . . . a voyage to plant the first colony in the northern parts of Virginia; do by these presents, solemnly and mutually, in the presence of God and one another, covenant and combine ourselves together into a civil body politic . . ."*

This document, beyond the power of any Congress to amend or of history to destroy, made us a Civil Body Politic, in the name of God.

Its date stands high in our Calendar—November Eleventh. American organized life began November 11, 1620. World civilization was saved November 11, 1918.



Pilgrim Fathers signing the Compact in the cabin of the *Mayflower*. After a reproduction from the painting by Edwin White.

The colonies grew in number. Closer relations were desirable. Dangers without and common desire within pressed the various settlements toward union. When the Articles of the New England Federation were drawn up and signed, they stated as follows:

> *"Whereas, we all came into these parts of America with one and the same end, namely, to advance the kingdom of our Lord Jesus Christ and to enjoy the liberties of the Gospel in purity, with peace; and whereas by our settling, by the wise providence of God we are further dispersed upon the sea-coasts and rivers than was at first intended . . . we therefore conceive it our bounden duty . . . that as in nation and religion, so in other respects, we be and continue one."*

Thus were the United Colonies of New England born—in the name of God. The Articles of Federation made us a People. "The New England Confederacy of 1643," said John Quincy Adams, "was the model and prototype of the North American confederacy of 1774." It was the American idea, in germ. These Articles also are beyond the power of any Congress to amend or of any political convulsion to annul.

Established as a People, our forefathers grew steadily toward the status of Nationhood. They desired to be fully launched on the sea of nations. So presently there appeared the last of our fundamental Documents—The Declaration of Independence.

This Document, more fully than the others, wrote Deity into the very structure of the Nation. It is somewhat of a surprise that this has occasioned so little remark. The Four Supreme Aspects of God in relation to mankind are here expressed. Once seen, they are not likely to be overlooked again.

> *"When, in the course of human events, it becomes necessary for one people to . . . assume among the powers of the earth, the separate and equal station to which the Laws of Nature and of Nature's God entitles them . . ."*

(Here is the God of nature, God in his aspect of Creator of heaven and earth.)

> *"We hold these truths to be self-evident, that all men are . . . endowed by their Creator with certain inalienable Rights."*

(Here is God, the Father of mankind.)

(Concluded on page 27)

An Agrarian John the Baptist

J. S. Wannamaker, One Who Is Crying in the Wilderness of Abuses

From Which the Farmin Community Has Suffere for Several Yea

By JOHN MARSHALL

TO MENTION the name of J. Skottowe Wannamaker on the floor of the Cotton Exchanges of this country is to provoke derisive anathemas. To mention it in a hundred thousand humble farmer-homes in the cotton belt is to call forth earnest benedictions. In the Senate, or House of Representatives, of the Federal Congress, its mention is provocative of wearied resignation, blended with trepidation; for J. Skottowe Wannamaker is not only an insistent proponent of laws, but is president of an agricultural organization, the name of which conjures throughout the cotton-producing states, and is not without influence wherever cotton is spun into cloth, or used as a fabric in manufacturing establishments.

And the subject of all these conflicting emotions lives in the village-like municipality of St. Matthews, South Carolina. A more extraordinary personality you might scarcely hope to meet. To look at him, he might be anything else than what he is—by preference, poet, preacher, professor, dreamer or scientist—but certainly not a dynamic force in agriculture, banking and general industrial affairs.

Slight of build, and slouching of carriage. An abnormally large head, decorated with long, dark hair, usually all awry, and forever straggling about his face in elflocks, sags forward in meditative, brooding fashion. Burning black eyes gleam from cavernous sockets overhung with tufted eyebrows. A pallid countenance composed of irregularly molded and erratically arranged features. A manner distrait, because of absorption in whatever project is for the moment paramount in the Wannamaker mind. A body ceaselessly racked with a multitude of infirmities.

An indomitable brain that recks not of physical agonies. An energy that is ceaseless, and has the driving power of a turbine engine. A mind that whirls and churns and foams and cataracts with many purposes. A mania for being in the midst of things. Forever crusading against existing orders. An agrarian St. John the Baptist crying in that wilderness in which the agricultural classes suffer. These are but some of the impressions a stranger gains upon seeing the president of the American Cotton Association, for the first time, at close range.

Because of the multiplicity of his interests, and the consequent ceaseless demands made upon his attention, interviewing Mr. Wannamaker would be a rather difficult task, unless performed some time subsequent to midnight. And it could be the more readily done then because he sleeps but a few hours at a time. President of the American Cotton Association; president of a large banking institution; president and proprietor of an extensive mercantile business; director in numerous educational and religious activities; director in the Coöperative Cotton Growers Association, of South Carolina; guide, philosopher and friend to a hundred or so thousand farmers; himself a cotton planter, who has tilled thousands of acres and has employed thousands of Negro laborers; promoter in general of all legislation, Federal or State, that seeks the reform of existing legal abuses of the agricultural classes.

In daily telephonic and telegraphic communication with all the leading commodity markets of the world; a voluminous correspondent with Senators, Congressmen, Governors, and lawgivers at large; suing and being sued in many courts in many disputed civil causes; local celebrity and idol of his own town and its countryside for leagues about; reconteur of many inimitable Negro stories that have come to pass in his own personal experience—yes, certainly, quite a busy man, and one passing hard to interview prior to the wee small hours of the morning.

Mr. Wannamaker was born shortly subsequent to the Civil War, of a widely known South Carolina famil and is related, by blood or marriag to many of the people who have re dered that little gamecock commo wealth of the South famous, both war and peace—for courage in t former and for a disposition to quarre someness in the latter. That mea that his early years were spent duri the South's terrible period of pro tration and impoverishment. It was a ordeal for all boys of his generatio but it was a peculiarly arduous on for an ambitious, but a sorely afflicte one such as the young J. Skottow Wannamaker was. It was his di tressful lot to have to try to make living and a name for himself despi the agonies and disabilities of rheumatism-racked body.

His first job of any consequenc was that of a telegraph operator an local railroad agent of what wa little more, at that time, than a wa station on what has subsequentl become the Southern Railwa trunk line between Columbia, th capital of the State of Sout Carolina, and Charleston, th state's chief seaport. For years afte he secured this job young Wannamake had to be wheeled in an invalid' chair, or oftentimes on an ordinar baggage truck, to and from the offic in which his duties were performed

The youthful agent and teleg rapher knew nothing about child labor laws, and cared less. He wa concentrating upon an entirely worth ambition to make money for hi family, and a man of himself. Durin his spare time—which was for the mos part before or shortly after sunrise— he undertook to overcome his cripple condition by the very simple metho of declining to be crippled. It was task that required courage, endurance patience and hardihood. But th boy Wannamaker did it. By perse vering effort he got so he could wal to his work; and then he specialize in walking and running (all in that spare time of his, of course). There are still living many Calhoun County farmers who recall seeing him, with clinched teeth and a pain-distorted face, doing a staggering sprint of four miles before breakfast, and the arduous duties that followed it. It was a clean-cut fight between a crippled boy, and a Fate that sought to relegate him to the human discards.

And the boy won. The man to whom the boy was father does not now have to run the country roads of Calhoun County, but he walks whenever and wherever he pleases; and the walking carries him (Concluded on page 25)

The First Christian Indian Church

Rebuilding Schoenbrunn, Former Outpost of the Middle West

By EMERSON ROBINSON

THE town by the "beautiful spring" is to be restored and should those Indians who followed the white man into he first town in Ohio return to their ld hunting grounds in a few years, ney would recognize Schoenbrunn. Schoenbrunn! Ordered destroyed y its founder because he did not want ome apostate red men to get control! ost for almost a century and a half, s actual location being a matter of adition and dispute! Its buildings ized to the very foundations and the inds and the storms of many years obliterating every outward trace f it, that excavations were necessary determine where it stood!

But Schoenbrunn is to come into s own as a shrine to which the people f America and the world may go to onor those early settlers who blazed ie way of civilization and Christianity the Middle West.

Schoenbrunn was located near the resent New Philadelphia, home of hio's Governor, Vic Donahey. The gislature twice has appropriated oney to aid in the excavations made rough the Ohio State Archeological ociety and the churches and schools re making contributions to promote ie work of restoration. This will be one as funds permit and when completed, the site will, isofar as it is possible, e a replica of the first choenbrunn.

In 1770, David eisberger, a Moravian issionary, began to y plans for a trip om Pennsylvania into ie Northwest Terri- ory and in the following ear he visited the ibe of Delaware In- ans at their capital hich was on the site the present New- omerstown, Ohio. He turned home the same ear but again in March 1772 he was with ie Delawares. The ief of the tribe had ggested that he estab- sh a mission and on his way he espied ie Big Spring and the chief again ggested that he have his mission on at site. Zeisberger was pleased with ie outlook and returned to Pennsyl- ania for a few weeks, returning with veral Indian Christian families, the rty consisting in all of 28 persons. n May 3, 1772, he arrived on the site the proposed mission and work was gun at once on the building of the omes, the church and the school. August another party of Indians and missionaries arrived from Pennsylvania. The church was completed and first service held on September 19, 1772.

There were many small lakes near the site of the town which, according to "The Life and Times of David Zeisberger" by De Schweinitz, was situated on a high cliff at the bottom of which a huge spring gushed forth into a most wonderful lake.

The missionary was a hard worker and set the pace for the Indian converts but whenever Indians appeared who had not accepted Christianity, he would lay down his ax and tell to them the story of the Redeemer of the World.

The town was immediately platted in the shape of a T and laid out into 40 lots each about 50 by 100 feet. There was a paling fence about each lot and in addition a fence about the entire town.

From the very beginning the mission was unusually prosperous. The Indians not only were taught the faith of the missionaries but they were given instructions in cultivation and each Indian had his plot of ground which he tilled. Everything that they required for the table was raised in abundance and the future of the village seemed unusually bright.

Church at Schoenbrunn, from description in Moravian historical records.

Visiting Indians were surprised at the herds of cattle, the chickens, the church, the school, but most of all at the Indians working and they could not understand why any red man should be content to remain in one place and farm.

Schoenbrunn was the first "dry" town in Ohio; probably the first in America, for according to history its Indian inhabitants subscribed to a strict code of laws which included: "We will not admit rum or any other intoxicating liquor in our towns. If strangers or traders bring intoxicating liquor, the helpers shall take it from them and not restore it until the owners are ready to leave the place."

Also they were pacifists, the first in the Northwest Territory for their rules provided that "we will not go to war and will not buy anything of warriors taken in war."

There were also laws or rather pledges as follows:

"We will rest from work on the Lord's day and attend public service.

"We will not take part in dances, sacrifices, heathenish festivals or games.

"We renounce and abhor all tricks, lies and deceits of Satan.

"A man shall have but one wife—shall love and provide for her and his children. A woman shall have but one husband."

The streets of the town were kept clean by the Indian women who swept them every Saturday.

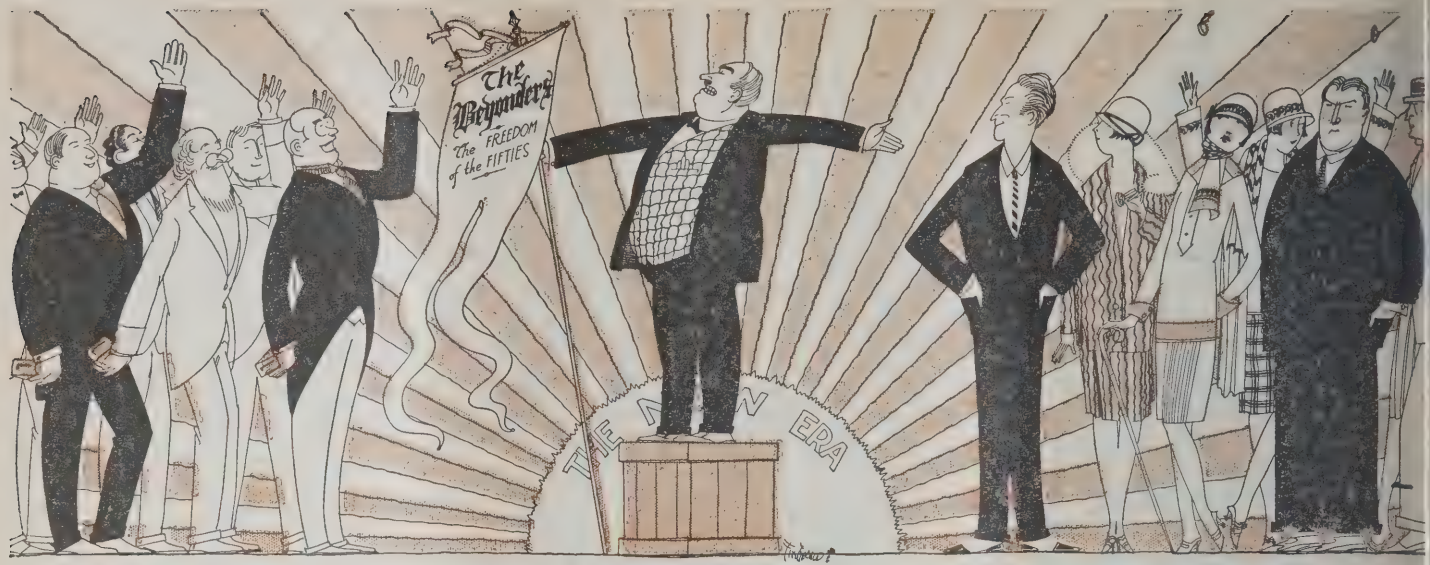
Schoenbrunn was founded in 1772; it grew rapidly, rapidly at least for those days, and in a few years there were more than 60 homes.

Discontent, however, developed among the Indians and a clique plotted for the overthrow of the missionaries. Zeisberger knew that rebellion was brewing and he made repeated attempts to stem it but without avail. Finally he determined upon the course he would pursue and called a meeting of those who remained loyal in the church on April 19, 1777.

After the service had been concluded, the missionary ordered that the church be torn down that it might not be desecrated by the apostates who had plotted against him.

The Indians and Zeisberger and the other missionaries soon left and the fields and gardens and orchards were laid waste and the herds of cattle, horses and hogs were driven away. The early settlers of Tuscarawas County completed the work of destruction so that they might till the soil and the site of the village itself became indistinguishable among the surrounding fields.

But Schoenbrunn (Concluded on page 27)



"Old Boys, this is the rallying cry for the Freedom of Fifties! Let us put some of these tender (some of these pretty tough!) blossoms where they belong."

Listen Youngsters! You're All Right—But Still—

Men in the Fifties Resent Being Called "Wrecks Fit for the Ash Heap"

By THOMAS L. MASSON

ILLUSTRATED BY W. O. FITZGERALD

THE Younger Generation myth has been going on now for the past seven years. What I mean specifically and directly is that for the past seven years the younger generation has been putting it all over on us. And we have been shamelessly submitting. We elders, who are supposed to be about to pass out, have been told over and over again on the campus, from the rostrum, in headlines and in the memorabilia of psychologists that we are senile, decrepit, bores, back numbers and human wrecks fit only for the ash heap, to be chloroformed and carted off to a merciful oblivion. We are, certainly, living longer than ever. And I think these kids rather resent that. Why should we have the impudence to stick around any longer than the old boys of previous generations did? What nerve!

But isn't it about time we old boys rose up and asserted ourselves? There must be a limit to this "youth calls to youth" business. We Beyonders (and by Beyonders I mean all the best or worst minds and bodies over forty) have been patronized, bulldozed, humiliated, flouted and pushed off the map long enough.

Old Boys, this is a rallying cry for the Freedom of the Fifties! Let us put these tender (some of them are pretty tough!) blossoms where they belong.

While this boom of youth has got its chief impetus only since the war, an initial impulse was given to it by Dr. Osler in his 1905 Baltimore chloroform speech in which (while he was at the time misquoted) he emphasized "the comparative uselessness of men above forty years of age." That remark stuck in the crops of a lot of people and gave these coming infants a handle to go by. Then came the war, in which all these young fellows showed their prowess. In a former article I have touched briefly on this problem and now beg that at this point you will not misunderstand me. I am by no means depreciating youth. As a boy, I had a good deal of fun—not comparable of course with the high old time I am having at present. Unhampered by degenerative influence, all boys and girls are wonderful creatures, to be studied and adored reverently for whatever native simplicity they may possess. I am all for the young people, be they flappers or good fellows, and I glory as much as anyone in their gifts, their alertness, their unerring disposal of so many humbugs, their recuperative energies. All these things should be noted. Here I introduce a personal experience.

I was staying at a Maine summer resort which was precisely 366 miles from my office. A sudden railroad strike necessitated my using my car to make this run to town. We left at 7 a.m., and made the run of 366 miles in 12 hours. My eldest boy of 20 volunteered to drive. Just before we started came another youth of about his age or older, who had driven an ambulance in the war and who also for the ride volunteered. I said to them: "Boys, I will drive for the first few hours. The fresh morning air will keep me going."

During the first 92 miles, which was covered in two hours, those two kids could scarcely keep their hands off the wheel, so anxious were they to take my place. We got to New York at dusk. One of them had already passed out and was nodding in his seat. The other, driving, was so groggy that he steered the car like a Virginia rail fence. We still had to drive across the Hudson to my country place. I mean I had to. When I steered into my garage both of those husky kids were fast asleep on my respective shoulders and the Old Boy was still going strong.

I mention this in no boastful spirit. In about an hour they were chipper as larks, while it must be confessed that the Old Boy was ready for bed. Still any intelligent person will get the idea from this incident.

Recently I sat in the center of a group of young college men from one of the biggest universities in this country. There was nothing these boys didn't know—history, philosophy, science, literature, religion, everything. They reminded me of what was said of a celebrated clergyman who once visited and preached in Boston, the subject of whose coming sermon was gleefully announced by a *Transcript* writer as "A bird's-eye view of God."

These boys had disposed of all the problems of the universe. They understood women so utterly and completely and told me so much (mostly in short gestures) that it took me three days before I could look my own wife in the face without cringing. After listening to these boys talk about Freudian complexes and James Joyce and the Loeb case and other various neurotic dispensations, I was so mortified with myself to think that I still lingered on in the low coarse imbecilities of old-fashioned matrimony, that for nights after I muttered in my sleep.

Now then, what are the facts? William Pitt was Prime Minister of England at 24 and they haven't recovered since. Alexander conquered the world at 32, and look at it! Cato learned Greek at 80. And it is still being taught. I myself have been taking a fling at Hebrew. It is getting to

be necessary in order to find one's way about New York. These four things I have just emitted are merely feeble jokes. The reason is that this whole problem is much too serious to be treated seriously. You must cut under what I am writing because it is important.

Two or three years ago Ellery Sedgwick, the able editor of the *Atlantic Monthly*, encouraged a young man to write an article explaining, and as I now recall it from memory, defending, the younger generation. This article was smarter than all outdoors. Of course it only made matters worse. Even when these young people patronize us and make a show of mildly depreciating themselves, all this is merely to state that they tolerate us because there seems no form of relief; also because we *do* pay a good many of their bills.

This article I mention was widely quoted and a whole lot of young fellows who had no real idea of how important they seemed to be sat up and took notice. It is one thing to know everything. It is another thing to be aware that others are aware of it. There is such a thing as being unconsciously modest about your own sense of superiority. This young *Atlantic* man was a sort of herald, announcing the glad tidings. Thus, in one way or another, the younger generation by word of mouth, by published flattery, by the hopeless imbecility of a good many parents and generally by a kind of slavish acquiescence in everything they say or do, on the part of their elders, have come to believe that they can get away with anything. Certainly murder. The statistical sharks tell us that most of the crimes committed in this country are by young fellows, from sixteen to twenty.

Even men like my friend Dr. Joseph Collins adds his mite by blandly remarking in his book, *Taking the Literary Pulse:*

"Mr. Sherwood Anderson has now passed the creative years of his life: he is forty-six. Anything he will do from now on will be a rehash of what he has thought and done."

Well, Boys, brace up. Ibsen wrote his *Doll's House* at fifty-one. Bernard Shaw, who was born in 1856, wrote his *Joan* within the past few years. If you don't think that is creative work, then go back to his *Doctor's Dilemma* and *Fanny's First Play*, both written after fifty. Moliére wrote his *Tartufe* at forty-six. Wordsworth, if we may take the word of his best critics, did his best work between forty and fifty and his *Prelude*, which is by far the work of his greatest maturity, was written much later.

Would anybody dare state that *Robinson Crusoe* is not a work of the creative imagination? Certainly one of the greatest. Be shocked when I tell you that Defoe did not begin it until he was fifty-five, taking apparently four years to write it. Can anyone doubt that Bunyan's *Pilgrim's Progress* is one of the greatest works of the creative imagination? There is some doubt as to the exact date of writing, but certainly he did not begin it until after thirty-eight (probably later) and the second part was not published until he was fifty-six. Charles Dickens did his first noticeable work when he was 24. But his *Tale of Two Cities*, which is acknowledged to be one of his greatest books, was written when he was over forty-five. Lincoln's Gettysburg Address may not be considered a creative effort by some of our present-day intellectuals. Yet for brevity, restraint, singleness of design and completion of thought and expression it is acknowledged to be one of the greatest pieces of oratory of all time. He composed it at fifty-four.

I have no intention of inflicting further statistics upon my readers, but must refer them to the encyclopedias. One of the best short treatises on the subject is *The Age of Mental Virility* by W. A. Newman Dorland (The Century Company). There are, contrawise, plenty of cases of youthful precocity—Keats, Shelley, John Stewart Mill, Edison, and a lot of musicians, besides infant prodigies. I might mention one of the latter—Boris Sidis. This infant prodigy, the son of a distinguished psychopathologist, passed all of the examinations and entered Harvard at a very early age—I think eleven or twelve. He had wide publicity in the papers at the time as an example of super-brilliance. Somewhat later, this boy chanced to be at the same hotel with me, and I had opportunities to observe him. In spite of the assertion that he was a natural boy, he seemed to me abnormal, especially in his manners.

In January, 1924, at the age of twenty-two or twenty-three he was discovered by the newspapers in a New York boarding house—unkempt, and seemingly unable to take first-class care of himself. The New York *Times* of January 11, the first column of the nineteenth page, in an article entitled "Contrasting career as a child prodigy with present status as clerk," contains a full account of this boy's later life.

"I do not ask the attention of men and women of the world. Nothing will give it to me. I do not ask for the attention of clergymen and doctors and scientists and teachers. *I demand it.* . . . . Will the future historian be able to place a triumphant finger on a single man among all those clever men, who has had the infinite courage and wisdom to jeopardize a successful career by dealing intelligently and humanely with the problems of the younger generation? No."

The fact is that beneath the mask of this jazz-loving, sport-loving, complacent, over-smart, patronizing and spiritually thin younger generation, we have to dig too hard to get at their real selves. We owe it to them and to ourselves to throw aside personal ease and if necessary to give up our salaries as educators, in order to find out what is the matter. Our men teachers are often self-sacrificing enough, but not big enough.

One of the specific reasons why I write this article is that some few years ago (I was something or other over fifty then) I was taken aside by a friend of mine about my own age and told that we were both back numbers. "These young people," he said, almost bursting into tears, "are taking our places. We are through, and don't know it. We only make asses of ourselves when we try to carry on."

Up to that moment I had been so busy that such a thought had never occurred to me. Overcome with a sense of shame at my impudence in being alive, I determined to learn the truth. Staggering home from the interview I called a family conference.

"Boys and girls," I said, "tell me the fatal truth. Am I a back number? From this time forth, will you support me in the comfort and indeed luxury with which I have more or less surrounded you during your tempestuous careers?"

"Good Lord!" they exclaimed, "No such luck! You'll live to be a hundred." The thought that the time had approached when they could no longer wheedle a few dollars from the Old Boy in emergencies which were always coming along gave them all a sinking spell. Then they rallied and gave me a rousing cheer. Still I was not wholly con-

(Concluded on page 29)

"Cupid hasn't even a license to park anywhere."

Hunting the Wildcat Stock Salesman

Crooks Have No Use for Einar Barfod, But Investors Have

By WILLIAM A. M'GARRY

A BATTLE of wits and dollars that will go down in history as the first overwhelming victory for the average citizen in the age-old war against financial fraud and exploitation has just been completed in Pennsylvania. It was only the first engagement in a new method of attacking stock swindlers, bucket shop owners and other forms of get-rich-quick thieves, but in a single year it has saved nearly five hundred million dollars for the people of that one state. More than that, it has pointed an easy and simple way to rid the entire nation of stock swindlers, and it has made this prospect so attractive to legitimate investment interests that plans for national warfare against the crooks are now being made with powerful financial backing.

Einar Barfod is known as the "Durable Dane" of Philadelphia.

He is an adept in the art of running to earth wildcat stock promoters.

As chief investigator of the Pennsylvania Securities Bureau he has been the main instrument in saving the public $400,000,000 in one year in that state alone.

His Viking blood has been proof against the powerful assaults of political wirepullers and high-placed stock promoters.

He says that the people who lose money to stock swindlers are always the ones that can least afford it.

Einar Barfod, the "Durable Dane" of Philadelphia, is primarily responsible for those achievements. As a newspaperman Barfod was a thorn in the side of stock swindlers for twenty-five years. He specialized in exposure of these swindlers, drove thousands of them out of Philadelphia, and sent scores to jail, but at the end of a quarter of a century of unremitting effort and devotion to the duty of exposing fraudulent investment schemes, the crooks were still doing business. Everywhere Barfod went people marveled at his inexhaustible enthusiasm, and every time he met a friend he was asked, "What's the use?" and told that he could never get them all.

Einar Barfod, deputy secretary of banking, Pennsylvania.

But in August of 1923 Barfod got the chance he had been looking for when he was named association deputy and chief investigator of the Pennsylvania Securities Bureau, established by the legislature earlier in the same year. From the viewpoint of many experts it wasn't much of a chance. The Securities or Blue Sky Act was regarded as one of the most toothless ever put in a set of statute books. Crooks who knew Barfod as a dangerous antagonist laughed openly and predicted that within a month the Dane would be bound hand and foot in official red tape and parboiled in political hot water if he tried to cut his way out. Ten days later the battle started, and ever since then some of the cleverest financial minds of the country have been trying vainly to find a loophole in the law that was supposed to be full of them.

The situation existing today is important to every citizen in the country because these same minds have been manufacturing loopholes by the dozen, and within the next six months desperate efforts will be made to insert them into the Pennsylvania Act. If that measure is shot full of holes the entire national campaign against stock swindlers based on its achievements will come to a halt, or at least it will be badly weakened. Saving the act as it stands, and extending it to all other states is worth something more than thirty dollars cash to every man, woman and child in the country—every year. That is the amount now being taken by the crooks from the people outside Pennsylvania.

Heretofore it has been impossible to make more than a rough estimate of the annual losses due to stock swindlers. Barfod and his associate, Walter J. Fallows, with their chief, Peter G. Cameron, banking commissioner of Pennsylvania, have reduced the problem to a matter of simple arithmetic, in spite of the large figures involved. In the first year of the Securities Act they were asked to authorize the sale of $625,000,000 in stocks, bonds, debentures, notes, and other forms of securities. Of that amount only a little more than one-fourth was found to be fair and equitable to the buyer. Specifically, the bureau issued permits legalizing the offering for sale of $150,000,000 worth of securities. It flatly turned down dealers who wanted to unload $400,000,000 in wildcat stocks of various kinds and at the end of the year it was still holding for investigation $75,000,000 more. Since then nearly all of that seventy-five million has been rejected.

An amazing thing about these dollar records is the way they tally with the records of promoters who make a living by selling stocks to the public. On the basis of the dollar figures, three stock propositions out of every four offered for sale are fraudulent in one respect or another. This ratio holds good also as to salesmen. The bureau got 7,073 applications for licenses to salesmen, and found only 2,847 could qualify. The others were rejected for a wide variety of reasons, but primarily because they had been mixed up in the sale of questionable stuff. Some of them had jail records. In the same year 1,550 dealer applications were filed and only 860 issued. These figures indicate that while crooked stock offices are not quite so numerous as honest ones, the crooks put on more pressure by employing nearly three salesmen to every one employed by an honest investment dealer. The figures also show that real business asks for capital only a third to a fourth of the amount sought annually by crooked business.

It has been stated that the method by which these results were achieved is quite simple. But it should not be assumed that the work was easy. That part of the battle is an unwritten story, and only the few things that have come to light may be told. Barfod went to Harrisburg expecting to be attacked savagely and relentlessly by the crooks. He had enough experience to know that scores of politicians could be bought up by the swindlers—when they were not already engaged in the same business—and that nothing would be left undone to tie his hands. He knew also that there would be some opposition from misguided honest men duped by their crooked friends. But he did not expect to be fought by the courts. A naturalized citizen, he has all the zeal for America of the convert, and all his life he had been convinced that the judiciary was above reproach.

But the first ruling of any consequence made by a Pennsylvania court in relation to the Securities Bureau was a peremptory order prohibiting Barfod from making public the records of men seeking to compel him to register

them as dealers and salesmen. The Securities law is quite plain about these records. It holds that the test of an applicant's fitness to sell stock in Pennsylvania shall be first of all his own record. If it is shown by his record that he has sold fraudulent stocks he cannot get registration. Another test is that the proposition he wants to offer to the public shall be fair, just, and equitable.

Naturally, every crook whose first proposition was rejected amended it and tried to slip through by making changes. On this point, too, the law is quite plain. It provides that a man refused registration may not apply again for one year. That provision was put in so that the bureau would not be overwhelmed by promoters offering one scheme after another.

Under the law the bureau is self-supporting. It must get enough money from fees to pay all its expenses, and consequently its force of investigators is small. Therefore, its chief means of enforcing its edicts is publicity. Accordingly, when a promoter tried to force his way into the fat Pennsylvania market, Barfod promptly blocked him by publishing the man's record and telling the people exactly what sort of swindle was being cooked up for them.

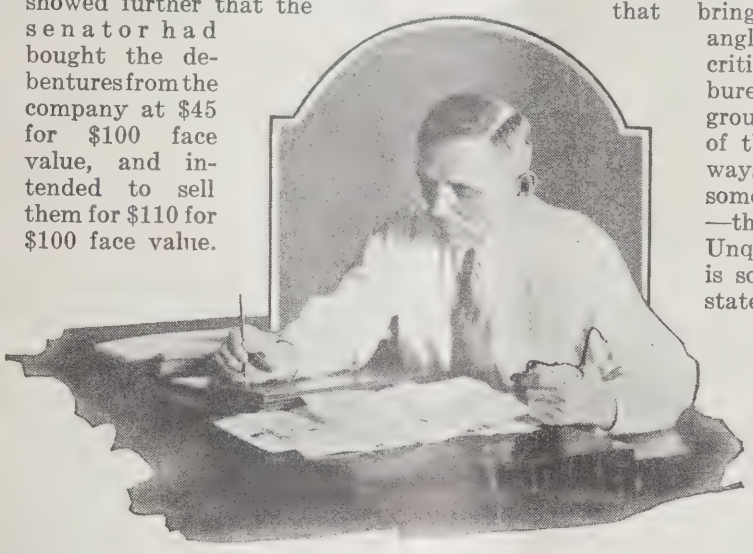
The Dauphin County court not only ordered that this practice be stopped, but went to the extent of threatening Barfod with punishment for contempt of court when he persisted in answering legitimate queries concerning public records. One case in point was that of a promoter who tried to unload Canadian stock of a large motor company, quoted at $450 a share, for $600. A Philadelphia newspaper asked Barfod for his opinion of the proposition. He promptly replied that the promoter was operating illegally, since he had not applied for registration. He also pointed out that the promoter was not connected in any way with the motor company. The man had simply bought, or promised to buy, shares of its stock on the open market. His plan was to deposit these shares in trust, issuing 100 certificates against each share. The certificates were actually worth $4.50, but he offered them for sale at $6 each.

Secret pressure to blockade the bureau was even more oppressive.

"A state senator came to our office and after complimenting us on our good work," said Mr. Barfod, "complained bitterly of the delay in securing registration for a project in which he was interested.

" 'Now here is a case I want hurried up,' he said. He wanted permission to float a debenture issue of two million dollars, which he termed a bond issue, but which really constituted nothing more than promissory notes. While he was insistent that the matter be hurried, we decided to investigate. We found that his company owned a good coal mine in Pennsylvania. But it was a small mine that produced only 3,200 tons of coal a year. It was worth $120,000—not $2,000,000 and more.

"But the company had bought up a lot of coal-less lands in Tennessee, West Virginia, and Ohio that were valueless, and combined all the properties into a 'great coal company.' We told the senator that we could not grant registration. He took us to the banking commissioner, Mr. Cameron, who backed up our judgment after investigation. This showed further that the senator had bought the debentures from the company at $45 for $100 face value, and intended to sell them for $110 for $100 face value.



Mr. Barfod at his desk.

That would have given him a pretty nice profit, but anybody can see that it would not be fair, just, or equitable to the buyer.

"One of the most frequent criticisms of the Pennsylvania act is that it is paternalistic. Men say that a man has a right to throw away his money on fraudulent stocks if he wants to, and that we have no right to stop him. We don't. There isn't a word in the act about what you shall buy. What it does is to regulate what you shall sell. 'Buy anything you like,' says the Pennsylvania act, 'but sell fraudulent stocks at your peril.' "

At the outset the bureau also had trouble with many individual bankers whose institutions were apparently being conducted on a legitimate basis. Since then the Investment Bankers' Association has discovered the obvious fact that every time a crook is driven out, the market for good securities is increased, and it is easier and cheaper to sell them. Accordingly that association has given unqualified indorsement to the operations of the bureau, selecting its methods for praise over thirty-three others operating in various states. But in spite of that individual bankers still try to pull political wires to put through their pet schemes.

A survey of the men who have sought registration for questionable projects would make the average citizen gasp. One is a relative of a noted American army officer. Another is a former governor of a mid-Western state. A dozen Congressmen have turned up at Harrisburg in the hope of overawing Barfod, and have gone away empty-handed. Quite often men of unimpeachable records for business integrity are found mixed up in questionable schemes. On investigation it is found that some clever promoter has been playing on their credulity and is using them for a cat's-paw.

The desire for profit is natural. "Greed," as some cynics have it, "is universal." And that brings up another angle. Many experts criticize the work the bureau is doing on the ground that the victim of the swindler is always trying to get something for nothing—that he is greedy. Unquestionably there is some truth in that statement. But Barfod has had more experience with stock swindlers and their victims than any other man alive, and his point of view is therefore worth something.

"I know a woman of 60," he said, when he was questioned on that point. "She scrubs floors in a Philadelphia office building. She was well-bred and educated. In her earlier life she was a school-teacher. At 50 or thereabout she wanted to retire. Her health was failing. She had saved almost but not quite enough to provide for her old age. Just about that time a smooth stock salesman came along and got all her savings in exchange for some gilt-edged paper covering a Mexican plantation. It wasn't worth a cent. You couldn't call that greed.

"In my experience the impulse that drives the majority of people to buy from the swindler is pure generosity. Thousands of workingmen want to send their boys through college and find their savings not quite sufficient. They furnish easy money for the blib-tongued, high-pressure stock salesman who gets them to talk about the problem and then shows them the difference between 4 per cent and 8 per cent interest. The people that lose money to stock swindlers are always the ones that can least afford it. Bucket shops are another matter. Many of their victims can afford to lose.

"If business men generally could only grasp what it would mean to drive all the stock swindlers out of the country it would be accomplished within a year. The worker still represents the big market, and it is in that field that the stock swindler operates.

The Signers of '76—Connecticut

By CARL SCHURZ LOWDEN

(Copyright, 1925, by Carl Schurz Lowden)

THEY were buying and selling nutmegs in Connecticut when the colony's delegates to Congress voted for and subsequently signed the Declaration of Independence. Even then had been made the allegation that some sons of commerce palmed off wooden nutmegs instead of the genuine. The people were, however, honest and shrewd; like the four men who represented them at Philadelphia in 1776.

Of the little group two had educated themselves, one was a product of Harvard and another of Yale. The oldest of the quartet was Roger Sherman who had known fifty-five years; Oliver Wolcott at forty-nine ranked next in venerableness; Samuel Huntington qualified as the baby with a mark of forty-four which William Williams topped with a margin of only one year.

Was there ever a public speaker more clumsy and less graceful than this man Sherman? John Adams would have answered this question bluntly with a stentorian "No." Adams enthusiastically admired his friend, gave him credit for possessing a clear head and sound judgment but ranked him oratorically as the personification of lamentable awkwardness.

"Sherman's air," the Massachusetts man maintained, "is the reverse of grace. There cannot be a more striking contrast to beautiful action than the motion of his hands. Generally he stands upright with his hands before him, the fingers of his left hand clenched into a fist and the wrist of it grasped with his right. When he moves a hand in anything like action, Hogarth's genius could not have invented any motion more opposite to grace. It is stiffness and awkwardness itself, rigid as starched linen or buckram."

The people of New Haven agreed generally with John Adams. They averred that whenever their fellow townsman became interested in his subject he gestured like a shoemaker draws a thread. Right they were; for Roger Sherman had been a shoemaker, first at the place of his birth, Newton, Massachusetts, and next at New Milford in Connecticut.

Roger possessed pluck. He schooled himself. As he drew the thread he formed the principal gesture (awkward though it was) of his life as a speaker; also as he drew the thread to fashion shoes he fashioned his mind by reading books which ultimately prepared him for a public career. If he daydreamed, he did it judiciously at the right time and place.

The boy was an accommodating sort. A neighbor requested a favor when he ascertained that Roger had occasion to go to the county seat. Would it be too much trouble for him to stop at the office of an attorney and attend to some legal business? Roger promised to do the best he could; so the neighbor explained all and Roger wrote it down on paper to be sure that he would not omit anything.

The attorney noticed that the boy frequently glanced at the paper he had brought along. As it was necessary that a petition be prepared, the lawyer asked for the notes. The youth modestly demurred, asserted his jottings would be of little value and then bashfully complied with the request.

"Why," declared the member of the legal profession after he had finished reading the memorandum, "with a few changes this will be equal to any petition I could have prepared."

Roger was elated. He had done well and, now that he had consulted with the attorney as he had promised, he would go. But he was called back by a voice imperatively demanding:

"Young man, what is your business? Just what prospects have you?"

The boy told his age, the place of his birth and the time, April 19, 1721; rather a prophetic date, it was, as the Battle of Lexington eventuated precisely fifty-four years afterward. He described his work as a maker of boots and shoes. He named over the books he had read, also those which he hoped to read. His prospects were vague, but he desired to fit himself for something better than benchwork. The attorney quizzed, and the boy answered faithfully. Those were wondrous moments, for the youth came away with a stimulating message burning his ears.

"You should study law," the man had advised. "You have a strong command of the English language, and some day you may be a great statesman."

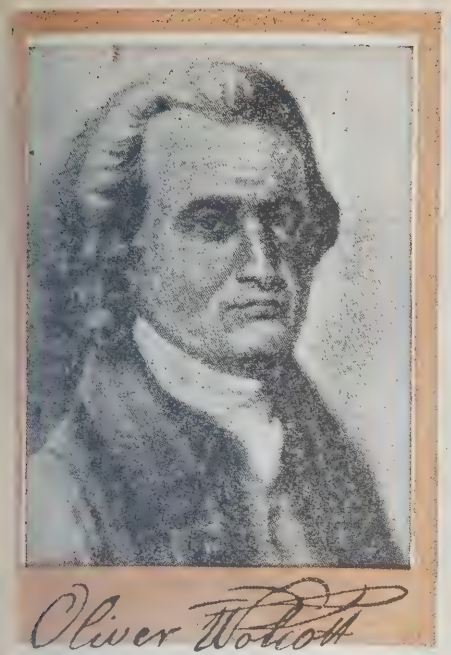
The awkward lad quit the shoemaker's bench and became a merchant; but he did not give up the idea of studying law, with the result that he was admitted to the bar in 1754. The next year he was chosen as New Milford's member in the Connecticut assembly. This election opened his political career which continued with only slight interruptions until 1793 when he died.

Roger Sherman never attempted to swim with the popular current. He practiced what he believed regardless of whether it would advance his interests or increase the people's estimation of him. With him, rightness ranked above everything.

Thomas Jefferson, the author of the Declaration of Independence, admired the man who had helped him in the molding of it. When Dr. Spring, of

Sam'l Huntington

Succeeded Jay as president of Congress.



Helped persuade Burgoyne to capitulate.

ewburyport, came up from the South
ıd stopped off at Philadelphia to take
the city and see Congress in action,
ɔfferson served as his guide. When the
irginian pointed out the former shoe-
:aker, he informed the physician:

"There is Mr. Sherman of Con-
ecticut, a man who never said a
:olish thing in his life."

Sherman's defects of awkwardness
ıd the stiff, shoemaker gesture did
ɔt blind Adams from seeing the real
ıan underneath. Adams did not care
ɔw rough the exterior might be if there
'as, as it were, a pearl inside the shell.

What would you do and what would
ɔu say if a woman boxed your ears?
herman's mother treated him in that
ishion when he touched one of his
ildren which had not heeded his
ıquest to cease making a disturbance
the family worship.

"There," she declared as she de-
ɔered the blow, "you strike your
ild and I will strike mine."

The blood rushed to his face; yet
e only paused and raised his spectacles.
e looked at her a moment, then re-
med his reading from the Bible.

At New Haven his house was
ɔposite the college grounds. He liked
sit at his desk in the front room. One
light day a roguish student caught
ie sun's rays on a small mirror and
ished them into Sherman's face.
id he rush out, collar the culprit
ıd give him a sharp scolding? No,
merely lowered the shade and then
mplacently proceeded to continue
ls work at the desk.

A farmer desired to sell come cider
the statesman. Always careful and
nservative, he first made inquiry
ɔout the quality of the beverage. The
ıan became peeved and entered upon a
ade of swearing; but this had no
fect whatever upon the sedate listener.
hen the farmer saw that his ranting
ɔuld evoke no response, he desisted.

"The devil himself," he burst out
last, "could not provoke you."

A young fellow who was starting upon a legislative career asked Roger Sherman for a bit of advice. Whereat the wise man of the Revolution said: "When you are in a minority, talk; but whenever you are in a majority, vote."

Congress passed a resolution to build a monument at Yorktown, Virginia, to commemorate the surrender there of Lord Cornwallis and his army in October, 1781. When a member of Congress complained at the delay, the signer shrewdly replied, "The vote is the monument." The rejoinder proved remarkably prophetic; for the memorial was unveiled just one hundred years after the capitulation of the British enemy.

During his final sickness the relatives and friends of the shoemaker statesman expressed a desire for a consultation of the physicians. Wishing to deal squarely with the patient, they

Spent his life in public service.

asked him if he had any objection to the plan.

"No," answered the awkward orator, "I do not object. But I have noticed that in such cases the sick person generally dies."

Apparently the consultation was held. Assuredly Roger Sherman did not survive. But did his opinion or mental bent have any bearing upon the result?

Now let's look at the other self-made signer from Connecticut. Samuel Huntington had no college education. His father said his son must till the soil; and a farmer he was until he reached the age of twenty-two, a year beyond legal manhood, when he abandoned agriculture to study law. His early training stayed with him, however, so that even after he had won his numerous honors he still liked to repair the garden and household utensils with his own hands.

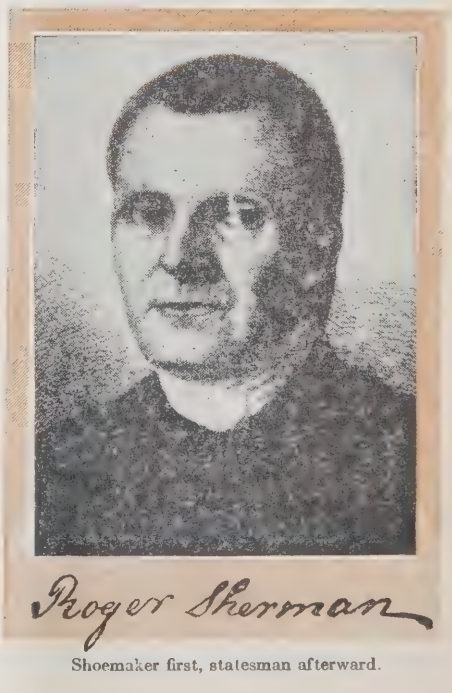
There was in Windham, Connecticut, a minister who bore an unusually snug-fitting name. He had two daughters with whom Samuel Huntington and his brother, Joseph, fell in love. Samuel married Martha Devotion who truly adored him; but there were no children, and they adopted two of Joseph's who had wed her sister.

Samuel became a famous lawyer. In October, 1775, the general assembly of Connecticut selected him as one of the delegates to Congress. He served so capably that on the twenty-eighth day of September, 1779, he was elected president of Congress to succeed John Jay who had resigned to negotiate a treaty with Great Britain. Two years afterward he asked a leave of absence as the constant cares of public life had made a rest desirable. Congress delayed. Two months later he again broached the matter. His resignation was then accepted while Congress presented its thanks "in testimony of their approbation of his conduct in the chair and in the execution of public business."

A rest of ten months restored the health of the statesman, and he returned to Congress where he remained a year and a half. He next served as chief justice of his state's supreme court, stepped from this honor to that of lieutenant-governor and then to the governor's chair. He was elected governor ten times consecutively; and when he died, he died literally in harness as the Connecticut leader.

On the engrossed copy of the Declaration made on the second day of August, 1776, Huntington's name follows that of Roger Sherman and immediately precedes that of Williams.

There is a peculiar coincidence in the life of Williams. The engrossed or official copy of the Declaration bore his name which he penned on the second day of August along with the other members of Congress. Now, here is a fact not generally known: this signer died on the second day of August, 1811, precisely thirty-five years afterward. This circumstance is one more to be added to that of John Adams and Thomas Jefferson going (Concluded on page 27)



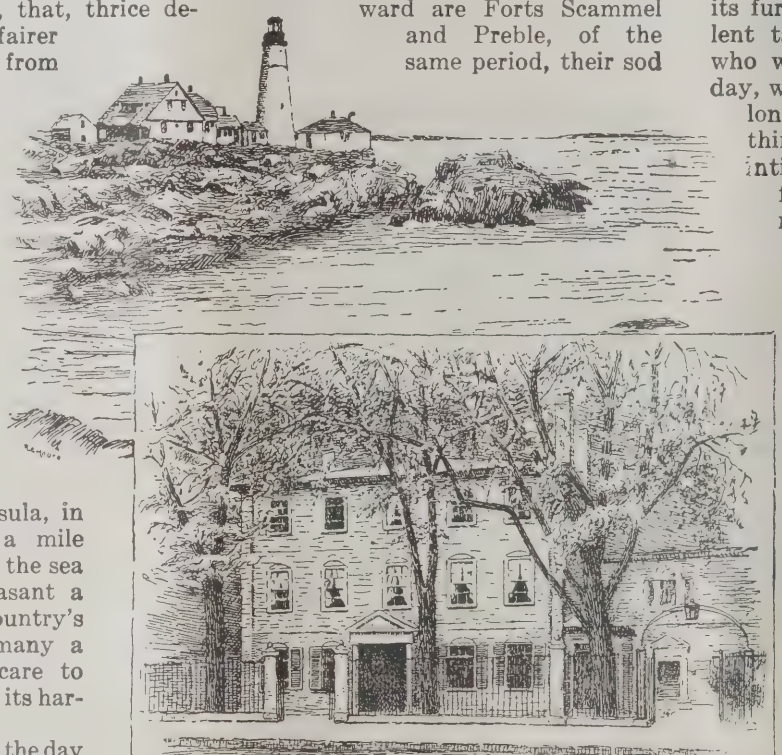
Shoemaker first, statesman afterward.

Portland, Gate to Vacation Land

Magic City Which Has Thrice Risen From Its Ruins; Portal of White Mountains and Lovely Lake Country

By MAY B. WHITING
ILLUSTRATED BY A. E. MOORE

A SEAPORT town down East! What words to conjure with and how they stir the fancy! But the delights of our imagination cannot surpass those that the city of Portland, Maine, offers her thousands of summer visitors. So truly a magic city it is, that, thrice destroyed, it rises fairer and more vigorous from the ruins. So alluring its beauty, so strong the race of men that founded it, that each time the descendants of those overwhelmed in the catastrophe return again to build up the city, and thus to its natural beauty are added the charm of history and of legend. Seated on a peninsula, in some places not a mile wide and far above the sea level, it is so pleasant a gateway to the country's playground that many a tourist does not care to stray beyond it and its harbor.



Above—Portland Headlight, first on the Atlantic Coast. Below—The Longfellow house.

One should start the day at Portland on the Eastern Promenade where the sun, newly risen from the Atlantic, gleams on the blue waves of Casco Bay with its myriad islands spread before us like a vision. At our feet drops a cliff of 150 feet; in back, a wooded park shuts off the city. One feels a curious remoteness from the world and only the harbor sounds reach the ear, the swish of the waves in the trail of a tug, the barking of a dog and the laughter of children on board a tramp freighter, the song of a sailor aloft in the shrouds of a five-master, the muffled pound of fishing boats coming up from the islands, and the boom of an ocean liner making Portland Head and out the narrow channel to the sea.

From the Promenade we descend past the monument to Cleeves and Tucker, the first settlers, to Fort Allen Park, for a nearer view of the harbor. Before us, like some fortified island abbey of the Middle Ages, rises the gray stone walls of Fort Gorges, built by Jefferson Davis on the plan of Fort Sumter in Charlestown Harbor. Farther seaward are Forts Scammel and Preble, of the same period, their sod parapets of vivid green a sharp contrast to the steel bastions of Fort M'Kinley on Great Diamond Island, and Fort Williams, where Cape Elizabeth thrusts out her long arms to hold back the sea. Modern warfare has rendered these old forts useless and now their only duty is to render more picturesque one of the most beautiful views in the world. No wonder Longfellow loved his native city and expressed its charm in some of his finest verses. "My Lost Youth" tells of his boyhood and is a sort of heritage he left to Portland.

Longfellow's birthplace is still standing, a three-story frame house on the corner of Fore and Hancock streets, but the house where he was brought, an infant, and which was his home until his marriage, is on Congress street, in the center of the city. It was built in 1785 by the poet's grandfather, General Peleg Wadsworth, of the Revolution, and was the first structure of brick in Portland.

It is such a house as we should fancy the poet would be brought up in, comfortable, spacious, dignified, its furnishings simple, but in excellent taste, a fitting home for one who wrote for those who work by day, who love their friends, and who long to see the beauty in the simple things of life. The house is full of intimate memorials of the Longfellow family, but what seems nearest to the poet is the den, with the desk where he wrote "The Rainy Day," the window overlooking the garden and the stock of the vine whose "leaves still cling to the moldering wall." There still flourishes an ivy which the poet brought from Abbottsford, the home of Sir Walter Scott. The poet's sister, Mrs. Pierce, gave the house to the Maine Historical Society, and members of the Longfellow family still live in

> ". . . . the beautiful town
> That is seated by the sea."

Portland has other memorials of her favorite son. Deering Woods, a park from the native wildwood, is "more fresh and fair" because the poet has written of them and in the Square named for him there is a bronze statue of Longfellow, done at Rome by Franklin Simmons, a Maine sculptor. Nearby are the homes of Neal Dow, the apostle of temperance, and of Speaker Thomas B. Reed, the parliamentarian.

Garden door, Longfellow house.

Longfellow's ancestors sleep in the old Eastern Cemetery, the most historic spot in Portland. There is a

monument to his mother's brother, Lieutenant Henry Wadsworth, for whom the poet was named, and who, at the age of 19, voluntarily sacrificed his life at Tripoli, in the fire boat *Intrepid*. The graves most often visited are those of the young captains of the United States brig *Enterprise* and the British brig *Boxer* which, one September morning, 1813, had a sharp encounter off Portland. Both captains were killed, and, each wrapped in his country's colors, were buried side by side with equal honors. Here sleep, too, many Revolutionary heroes and victims of the French and Indian wars, for the most part in unmarked graves. In 1690, when the settlement was annihilated by savages, the bones lay whitening in the elements for two years until Governor Phipps, on his way to build a fort at Pemaquid, stopped and put every man to work, burying the bones in one big grave.

Something About Portland's Historic Heritage

Portland is the natural way of approach to many places—the White Mountains, Old Orchard, Sebago Lake, Poland Springs, and Rangeley Lakes. Besides that, it is nearer by half a day's mail to Europe than any other port on the Atlantic Coast, and, being never icebound, it serves as one of the winter harbors of Canada.

This very advantage of situation was the cause of great sufferings during the struggle between the French and English for possession of the land. The Maine Historical Society preserves many relics of those days. There is the strong box of Father Rasle, a Jesuit missionary among the Indians for forty years, but a plotter with the governor of Canada to drive away the English. There is also the letter book of Benedict Arnold, presented by Aaron Burr, in which the former kept a copy of letters written on his expedition to Quebec.

In fact, the Maine Historical Society is a treasure-trove of unexpected riches. There is a pot of gold coins of the time of Queen Elizabeth, found buried on Richmond's Island, a lock of Washington's hair set in a locket by Longfellow, and one of the finest collections of autographs in the world, containing those of all the signers of the Declaration of Independence and of the British sovereigns from the time of Henry VII, with the date 1497, to Queen Victoria. There is a miniature, set with diamonds, of Don Juan VI of Portugal, presented by that monarch, out of gratitude for having his life preserved, to General Henry Dearborn, that romantic and farseeing hero of the Revolution, from whom many western places are named, including Dearborn Street, Chicago, and Dearborn, Michigan.

The city is situated on a peninsula of great natural beauty, in view of many small islands which are popular summer resorts. The drives around the two hills at the extremities of the peninsula are not surpassed in this country. Sloping from the water front to two heights, the city forms a natural amphitheater which is most picturesque from the sea.

A boulevard connects the parks, which have a total area of 115 acres, and afford extensive views of sea and mountain, thus enhancing the charm of this delightful city.

The fact that its very efficient and extensive educational system ranks among the first in the country, that she boasts fifty-two churches, and that no city of her size has more benevolent societies, vouches for the character of the citizenry of Portland today. She is one of those faithful daughters who is living true to her heritage.

As we peer further into this historic heritage, it is interesting to learn that as early as 1623 Christopher Lovett, of York, England, under a patent embracing the present site of Portland, built a fort in the harbor, in which he placed ten men. This site he called York, from his native city. Shortly afterward, however, he returned to England and on account of the war between England and France, the project failed.

The site remained uninhabited until 1632, when George Cleeve and Richard Tucker, of England, made a settlement on the eastern extremity of the peninsula. The Indian name of the place was Machegonne; in the patent to Cleeve and Tucker it was entitled Stogomor, from Stogumber, the birthplace of Tucker. This was shortly changed to Casco Neck, and in 1658 the name was again changed to Falmouth.

In 1676 the Indians attacked the town, burning houses, killing some of the inhabitants and making many captives. It was completely destroyed by French and Indians in 1690, but in 1714 the General Court authorized its resettlement, and in 1716 it was settled by Samuel Moody, who gathered around him fifty other families.

An Exciting Incident of the Revolution

Many of the streets of Portland preserve their old-time aspects. State street, with its "balancing trees," was Longfellow's favorite. The First Parish Church on Congress street is a fine example of early architecture. In its chandelier is a cannon ball thrown by Mowatt's fleet, and which lodged in the church which stood on the same site.

This destruction of Portland was one of the most cruel and unnecessary episodes of the Revolution. Mowatt had been held a prisoner for several hours in Portland, and for this indignity he brought four boats into the harbor, bombarded the city for nine hours, and burned all the boats except two, which he towed away. Nearly all the private residences were destroyed and every public building except the fashionable tavern of the town, kept by Dame Alice Greele. That energetic lady refused to leave her property and saved it by extinguishing the flames as they lighted. One ball landed in her back yard and set fire to a pile of chips. As she removed it by aid of a frying pan, she remarked to some one fleeing, "They will have to stop firing soon for they have got out of bombs and are making new balls and can't wait for them to cool."

The city was again rebuilt and received its first city charter in 1836.

With all its stories of the past, Portland is a very modern city. Its third catastrophe was by fire, in 1866, and, while it lost many of the fine trees which gave it the name Forest City, its buildings rose up statelier than before. In the auditorium of the fine city hall is the third largest organ in the world, and a municipal organist, Edwin Lemare, gives recitals every afternoon throughout the summer.

A Panorama of the Rarest Beauty

But in a seaport town one's feet wander to the shore,

"the black wharves and the slips
And the sea-tides tossing free."

Queer, foreign-looking little streets lead down to them, all dusty white and glaring, with odd-shaped buildings and fascinating signs.

When the sunset gun booms from the forts in the harbor we seek the Western Promenade, a butte 175 feet above sea level, from which the panorama almost surpasses that of the Eastern. For ninety miles the view extends, past farms and villages, with the white spires of New England churches flecking the landscape, and Fore River winding majestically through the picture, to where the White Mountains raise their mist-crowned heads, Mt. Washington above them all, gray and purple against the golden sunset.

And still our day is not complete until, from some vantage point, like Cape Elizabeth, we have seen the harbor lights, for Portland, besides being one of the best fortified harbors on the coast, is the best lighted. Most picturesque is Portland Head, the oldest lighthouse on the Atlantic Coast, authorized by Washington and first lighted January 10, 1791. Almost beside you are the two lights of the Cape, Ram Island farther seaward, and Spring Point Ledge and Breakwater lights for the inner harbor. Perhaps, as we look, through the narrow channel between Cape Elizabeth and Cushing's Island, there passes to the open sea the Boston or New York boat, while, from its wake, the water shimmers in phosphorescent green and golden fire.

Can anything be added to call it a perfect day? Ah, yes, what about those lobsters? Nowhere else are they so savory as on their native shore, and we are in a mood to count a broiled one, together with a plate of steaming clams dug that morning, as not among the least of Portland's charms.

A Home in "Glad Valley"

A Place Where Lingering Disease Is No Bar to Happiness

By W. M. DANNER

Mr. and Mrs. O. G. Willett.

FAR up in the Rocky Mountains of Montana lies "Glad Valley," so christened by the man and woman who have made it their home for some years, and who expect to have no other home so long as that man shall live. There is a high fence about their cottage and the gate thereto is closed and over it is a great sign that all may know that this is forbidden ground. Reading that sign the casual passer-by would be moved to greater speed. To him it would spell Bad Valley, and the sympathetic might look at the lonely cabin with a sigh and think of this as a Sad Valley for the sign says, "Quarantined on Account of Leprosy."

Only this man, who is a leper, and his brave wife think of this spot as "glad"; "passing through the Valley of Baca" they have found there a well-spring of content. It is inconceivable, but it is true.

The story of O. E. Willett is short, but it is one of bleak tragedy. After the Spanish American War, young Willett served with the army of occupation in the Philippines from October, 1901, until October, 1904, returning to his home in Montana at the close of his enlistment. He had been a good soldier, was popular with the people of his community and they elected him to the State Senate.

The change from the tropical climate of our far-off island possessions to the rigors of Montana would prove trying to anyone, and when Mr. Willett found his health steadily declining he was not specially worried. When months went by and he grew steadily worse he went farther afield for medical advice. There was more than one consultation, with the doctor growing graver each time and at last, almost as the judges of other days adjusted the black cap before passing sentence for capital punishment, he brought in the verdict, *leprosy*.

There was the usual result—with some modifications. His neighbors were frightened, but not heartless. He must go from among them, but he was not to be driven out. Provision must be made for his care and maintenance. It must be done speedily, for in the case of a malady so insidious and so mysterious no chances are to be taken. Some of his fellow senators wanted to burn all the furniture in the senate chamber on the mere chance of possible infection, but they did not go quite so far.

He found a little cottage, in a mountain glen, and volunteered to go into exile. A high fence was constructed, not so much to keep him in, but to keep others out who might tarry there unless warned away. To the inclosure there is a closed gate, and the sign proclaiming the presence of the plague was put up to warn the passer-by to "Keep moving."

Two friends went with him, accepting his isolation, the long days and the lonely nights, the silence, unbroken by friendly voices and laughter and the light crisscross conversation of the good world that goes on beyond Glad Valley. His wife said she had married for better or worse; if the worse came it was her part to meet it with him. In the days ahead of him, when even this worse should grow to a dreadful worst, she would be there. He argued with her but his arguments were of no avail. They went together. The other friend? There was

The Willetts' home in "Glad Valley."

no discussion in that case. The collie went along as a matter of course.

The next problem was some means of subsistence, for one cannot live on air and scenery alone, even when it is the wonderful air and scenery of Montana. The man was an ex-soldier, and the government was appealed to and responded. There was a reasonable doubt in the minds of some people whether the disease had been acquired in the Philippines, but the government is a good deal more generous than some people think it is, and the application for a pension was granted. Even with no rent to pay and fuel at hand, $30 a month is a slender sum for two persons to subsist upon. A garden and chickens helped some, but Montana in the region of Missoula has rather more winter than some other sections of the Far West. There were no luxuries in the solitary cabin of Glad Valley.

The American Mission to Lepers took a special interest in this subject. There was never any doubt on the part of the Mission that the leper bacillus had been acquired in the Philippines. Technical testimony of experts was carried to the Pension Bureau of the Government, and the pension was increased to $72 a month, which was almost wealth compared to the sum on which this man and woman had lived.

The Russians have a proverb, "God never closes the door without opening a window." Just recently, so recently that we have hardly grown accustomed to all the wonder and miracle of it, a new window has been flung wide through which comes, not the echoing, but the living, vibrant voices of men and women, speech and song and story, glorious symphony and rollicking "jazz," bedtime tale and joke and the last new marvel that science is working for the world. With their larger resources was it not possible to bring the radio to Glad Valley? It was.

A really fine set was shipped to Alberton.

Why does not Mr. Willett go to Carville, where he can have the best medical skill attainable? It is a natural question, and if there had been a Carville when his condition was first discovered he would certainly have gone thither, but there was not and "Glad Valley" is home now, has been home for years past and unless one's case is desperate indeed, even leprosy does not make the complete segregation of an institution comparable to the comfort of one's own home.

"Home spells the supreme incentive in me to live here on earth at all," writes Mrs. Willett. "Not simply a place to stay, but home, privacy, home-cooking and home-life in its every detail. Certainly I would love to be of help to others, but to me home is a sort of generating plant, a power house where one gathers the necessary strength and morals wherewith to aid others. Nothing soothes, quiets, relieves and brings the feeling of security like a home."

It is about time that we realized that leprosy does not change men and women essentially, or make them less human.

An Agrarian John the Baptist

(*Concluded from page 14*)

ıto a veritable mêlée of human affairs nd far-flung activities—among others ll those presidencies and directorates ıentioned heretofore.

The Wannamaker up-bringing hav-ıg antedated compulsory educational :atutes, and having been otherwise ampered by bread-winning restric-ons, the Wannamaker brain does not ·ork after the best accredited and most rderly and precise rule-of-thumb ıethods. It is rather prone to go at bstacles with its head down, so to ɔeak, and win its way through by attering-ram processes.

You cannot conceive of him "punch-ıg a clock"—but you can readily nagine him smashing a clock with a rick if it and its hour hand tried to ɔp him from working. So you may nagine what a veritable terror he has ecome to time-serving lawmakers nd holders of time-killing bureaucratic ɔbs. One imagines them as protesting s the young and attractive member of ıe Barnacle family did in "Little)orrit," was it not, whose job was in ıe Circumlocution Office: "He wants ɔ know: don't you know," plaintively rotested the young Barnacle. Mr. Vannamaker is forever and a day anting to know why something or ther is, or is not, done, that concerns ıe cotton-growing industry of America.

Just now, for instance, he wants to now why the Government has, for ears, been carrying on its books as visible supply" some hundreds of ıousands of bales of cotton *that ther never existed, or else were consumed ng since.*

And he further wants to know why rtilizers, under State and National ıpervision, have for years been dished ut to agriculturists, carrying sup-ɔsedly a given per cent of ammonia, nmediately available for plant food, ut a large part of which, in final nalysis, will only help the cotton ·op of 1935.

These are but two instances of the nes along which the Wannamaker ınd works. It seems to have an ıdless stock of lances to break in any ɔust, and on any lists. It is all very ell for the Agricultural Department :atisticians, and their brethren of the ensus Bureau, to issue statements at ıe same time as to the visible supply of ɔtton in the world, that conflict to the ·ifling extent of 2,000,000 bales of the eecy staple. That might get by at Vashington. But not with the cease-ssly watchful and busy human in-errogation point down at St. Matthews. o Congress has been made to sit up nd take notice; and the Barnacles, ig and little, are going to have to ıow cause why there appears that ariant of two million bales in the isible supply of cotton.

"I Read *in the* Papers"—

I read in the papers that both Bibles and booze have been boycotted in China, because they are Western. The Chinese, of course, have learned to put the Bolshevist interpretation on the Bible as an opiate of the people, although its history shows it to be more like dynamite than like opiate. China is now reacting to the ideas she accumulated in Bible countries, the ideas of personal liberty and human rights. But linking booze with the Book is illogical, for the Bible has blown up booze, along with feudalism and other things. The Bible will yet blow up surviving vestiges of slavery: it does so by liberating men's minds beyond the point where they are content with suppression. But it is possible to understand how in the present crisis China combines booze and Bibles as typical of Western influence, and boycotts them both. It is a position the reaction from which will be beneficial.

Can P sychology be internationalized? This is the question which Dr. Donald A. Laird deals with in next we ek's issue. He points out the diffiiculties in the way. Can they be overcome?

I read in the papers that Representative Madden has outlined to the President a $350,000,000 tax cut. That, of course, is interesting. But Mr. Madden is interesting, too. He is one man in politics to whom one hesitates to apply the name of politician. He is an expert in public business and his whole tone in discussing public affairs is that of an efficient manager in charge. And yet Madden is just a plain representative, a member of a committee—but he works at his job, and he knows. After every meeting with him I feel that he is the type which after all justifies our political system and our electoral method. No doubt the system of the Republic is right; but our potential public servants are crowded out by mere politicians. A man like Madden is worth to the country more than the country pays any hundred men in its employ. A man like Madden is in public work because he was born to it and because his constituency has discernment enough to recognize it.

I read in the papers that a widow who sought removal of flesh from her ankles is suing a couple of so-called plastic surgeons for damages because something went wrong and both of her feet had to be amputated. It is needless to say that few surgeons will attempt operations upon persons who merely want to better their appearance and are not suffering from a disease which an operation may serve to relieve. It is strange that a hesitancy to consult legitimate physicians and surgeons should exist side by side with unbounded confidence in quacks that promise great things.

I read in the papers that Mr. Scott, once sentenced to be hanged as a perfectly sane murderer, has now been remanded to the asylum as an insane murderer. I have no objection to Mr. Scott saving his life. Hanging was not invented by me, nor have I ever voted for it. But there is a puzzle connected with this Scott case. It was not until $5,000 was raised that insanity was talked about. It was not until more money was raised by sensational methods on the streets of Detroit that the plea got across. What I should like to know is this: How does it come that the absence or presence of $10,000 should make so deep a difference as life and death? Why should Russell Scott minus $10,000 hang, and Russell Scott plus $10,000 remain alive? It may be perfectly right that he remain alive; I am not questioning that; it is the difference which the $10,000 makes that puzzles me. Who can tell me how and to what extent one dollar or a million can affect justice? I don't mean judges or juries or lawyers, but Justice. Now, either the absence of $10,000 permitted justice to be done, or it permitted injustice to be done. Either the presence of $10,000 permitted justice to be done, or it permitted injustice to be done. What I am asking is, Why money should make a difference? For most of us haven't $10,000.

I read in the papers that Dr. Paul Monroe, of Columbia University, has given the Philippine legislature a report upon educational affairs that will create a stir there and cause Americans to wonder if our colonial administration is absolutely perfect. Dr. Monroe and a group of American educational experts who surveyed the Philippine school system for the Manila government, found that of the teaching staff of 27,000 there were only four Americans who had been adequately trained. The average Filipino child, it is said, spends less than three years in the schools and obtains less education than is given in two years in the United States, and no lasting command of the English language is obtained.

The Bacteriophage

(*Concluded from page 7*)

infinitely small quantity is enough to cause the dissolution of the bacteria, and within a shorter lapse of time than before. The curative power gathers strength from its contacts with disease.

Such were D'Hérelle's first experiments. They lead to the conclusion that the curative principle which causes the dissolution of the bacteria necessarily comes from the matter eliminated by the convalescent: that the principle passes through the china pores of the test tube and is in the filtrated mixture poured into the first lot of dysenteric bacteria. After a thousand such passages though the china pores the principle is still to be found in the last tube, more abundant than in the first one.

How the Devouring Process Is Accomplished

One of the broths *once* filtrated and clarified, as has just been described, is taken, and a drop of it is poured into a growth of dysentery bacilli. It is stirred and a small drop of the mixture spread over a surface of a sticky, solidifying foodstuff in a tube. Thirty minutes later, the process is repeated—a drop of the same mixture being spread over another tube containing the same stuff as before. The same thing is done every half-hour. When eighteen hours have elapsed, the growth of dysentery bacilli is pure.

But a new fact now comes in. The surface of the first tube, over which the first drop of our microbian mixture is spread, is covered by a sheet of dysentery bacilli; except for one or two circular spaces about a tenth to fourtenths of an inch in diameter, where no bacteria are to be found and nothing to be seen. The tubes spread half an hour and one hour later offer the same appearance: they contain a sheet of bacteria with two or three circles apparently pure and unsoiled. The tube spread one hour and a half or two hours after the first show many more such circles, from 20 to 50. Finally, *after four hours, the whole surface is bare and pure: no trace of bacteria appears.* The curative principle is thus seen to have become stronger with each half-hour of observation.

What do those pure circles mean? When the center of one of them is touched with a platinum wire and that wire dipped into a vessel full of dysenteric bacilli, the dissolution of bacteria takes place, just as before when bacilli were mixed with a drop of broth in which other bacteria had already been dissolved. It is concluded, therefore, that the dissolving principle exists on the surface of the tubes, and *has multiplied there.* The apparently pure circles are in truth a colony: it is in these colonies that the principle which causes the dissolution of the disease bacteria is deposited. That principle very probably exists in the shape of particles, of small masses, since it is concentrated in certain circles only.

Besides, the experiment already described shows that the regeneration of that principle is simultaneous with the multiplication of the corpuscles: the dissolution of bacteria is performed more and more quickly as the circles made by corpuscles grow more and more numerous. The principle that dissolves the disease bacteria is therefore concluded to be a living being, that passes through china pores, an ultra microbe parasite of bacteria; it is D'Hérelle's Bacteriophage (*Bacteriophagum intestinale*) discovered in 1917.

The existence of that beneficent ultramicrobe being proved, the next problem was to define its nature. D'Hérelle naturally tried to solve it. He published the results of his researches in a book printed in 1923 entitled "The Defenses of the Organism." There, among other considerations too technical to be related here, he showed that the bacteriophage is an internal parasite. Death is the condition of life; nature is eternal destruction and birth. Microbes and bacteria are no exception to that law.

When a certain number of bacteria inoculated with ultramicrobes were closely watched, many of them were seen to be swelling, growing bigger and assuming a round shape. At the same time, fine bright spots were to be seen inside them; then, all of a sudden, the round bacterium burst and nothing but the bright particles remained. The explanation of the phenomenon is simple: the bacteriophages penetrate inside the bacterium, multiply there and become as numerous; then the bacterium bursts and sets free the young ultramicrobes that go and parasite another bacterium. The whole process takes place within two or three hours.

Opens the Way to Other Discoveries

But D'Hérelle who is careful, as most scientists are, to banish from science any notion of finality or preordained function considers this phenomenon of the defense of our organism by bacteriophage as one particular instance in a whole series of others. If bacteria alone had escaped parasitism the same task would have been fulfilled by some other means, and immunity would have been obtained all the same. The bacteriophage exists because, in the course of time, an ultramicrobe appeared and parasited microbes just as the latter had parasited animals. The same may perhaps be said in a few years of the bacteriophage itself: for D'Hérelle's discoveries cannot but open the way to many others to be made in a near future. Other experiments of his have already led him to admit that some bacteria can acquire immunity against the ultramicrobe that devours them. For it is true that *some of the disease microbes*—a very few, five or six out of sixty million—resist the action of the most *virulent bacteriophage* and can very well coexist with them. Thus, during an epidemic, we commonly find members of the same family left untouched while others fall a prey to the disease; for there in this respect seems to be no fundamental difference between microbes and the most complex organisms.

The bacteriophage can only be trained through the presence of bacteria; and as the presence of those devourers is very often to be noticed in the intestine, we are forced to admit that the absorption of bacteria is also very frequent, but remains unnoticed, because they are destroyed by their foes before they have time to cause any distemper. Whenever the disease develops, it is either because the bacteriophage has not acquired a sufficient virulence, or because the bacterium has become refractory, that is to say, has acquired a power of resistance in the organism of another animal in which a struggle has already taken place between the two microbes.

Immunity Will Be Contagious

But the latter case is comparatively rare, and the part to be played by D'Hérelle's discovery remains essential. Since the history of any intestinal disease is that of a struggle between two agents, a microbe and an ultramicrobe, and since both are transmissible, it is clear that immunity will be contagious just as the disease is. Observation and experiments can only be practiced on animals, man being practically unavailable for medical sciences: such observation and experiments have showed that the beginning of an epidemic of murrain or epizooty, for instance, is marked by the diffusion of the bacterium, and the end of that same epidemic by the diffusion of the bacteriophage virulent against the bacterium. A sick animal is *a propagator of the disease,* and an animal that has acquired an active resistance is *a propagator of the immunity;* such would be the mechanism of most epidemics.

The remedy has already been used against dysentery by D'Hérelle who, having injected a certain lot of bacteriophages, stopped the disease within 24 hours. In the case of typhoid fever, one of his disciples noticed, after the injection of the bacteriophage, a slight increase of fever and a crisis of perspiration, followed after 48 hours by the beginning of the convalescence. The same splendid results have been observed in the case of boils, anthraxes, and also in septicemic diseases, diseases in which the blood is infected.

Signers of '76—Connecticut

(*Concluded from page 21*)

out precisely half a century after the passing of the independence resolution on July fourth.

Williams participated in the French and Indian War as a staff officer to Colonel Ephraim Williams, a relative. The Harvard graduate was disgusted with the British commanders. They did not sympathize with, nor try to understand, the people. He was plainly dissatisfied when he returned home at the end of the war; perhaps he then foresaw the inevitableness of a clash with Britain.

Oliver Wolcott, the Yale graduate among the Connecticut signers, had a similar experience to that of Williams; for he also served in the defense of the northern frontier before his regiment was disbanded in consequence of the peace of Aix-la-Chapelle. At that time he had the rank of captain, but he stayed in the militia until he became a major general.

After writing his name beneath the Declaration he returned to Connecticut where Governor Trumbull gave him command over fourteen regiments for the protection of New York City. He went back to Congress late in 1776; but subsequently he deserted that body to go with General Gates whom he assisted in obtaining the surrender of General Burgoyne. He appeared in Congress again in February, 1778.

The irony of fate figured in the life of Wolcott. From 1786 to 1796 he was annually elected as lieutenant governor; chosen governor of his state in the latter year, his enlarged career terminated with his death in December of 1797.

The Connecticut signers were "four good men and true." The Nutmeg State can look back at them with gratitude for the work they so ably did.

Why Put God in Constitution?

(*Concluded from page 13*)

"WE, THEREFORE, THE REPRESENTATIVES OF THE UNITED STATES OF AMERICA, IN GENERAL CONGRESS, Assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions . . ."

(Here is God, the Moral Governor of the world.)

"And for the support of this Declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other our Lives, our Fortunes and our sacred Honor."

(Here is God, the providential guide and protector of peoples.)

The Declaration of Independence is thus opened with the God of Power and closed with the God of Goodness.

The Mayflower Compact made us a Body Politic, in the name of God. That Document is irrevocable.

The Articles of Federation made us a People—in the name of God. That Document is irrevocable.

The Declaration of Independence made us a Nation—in the name of God. That Document is irrevocable.

The Constitution contains no mention of Deity, and expressly provides within its terms for its own amendment and change.

It is an interesting study of what Americans are pledged to by their Basic Documents. And a complete answer to the question, Are we a Christian Nation?

The Suffocating Load of the Law

(*Concluded from page 6*)

jointly of the American Bar Association and the Carnegie Institution, the latter only providing the funds. Under the direction of William Mather Lewis, groups of experts are undertaking to do, insofar as practicable, for the laws of the United States what Justinian brought about for those of Rome and Napoleon for those of France. They are rewriting the common law. The vital things in that mass of books which threaten the law with suffocation are being isolated, coördinated and reduced to the simplest and most exact terms possible. The result will be a restatement rather than a codification of the law. What they hope for is the acceptance by the courts and the lawyers of the restatement, to be put forth in perhaps a dozen volumes, as a substitute for the thousands of reports and digests through which the law of the land now rambles, crisscrosses and often contradicts itself. The work will cover a period of at least ten years and will cost around a million and a half dollars.

It cannot, however, parallel Justinian's and Napoleon's feats, for they were established by sumptuary decrees. Lawyers, disagreeing among themselves, no doubt would prevent the adoption of the restatement as a code by all the legislative bodies that would have to pass upon it. Note the history of thirty years' effort to bring into existence a new Federal code. The last failure was prompted by a committee headed by the man who generally is recognized as the ablest practicing lawyer in the United States Senate. So the American Law Institute's work must be accepted voluntarily or not at all. And, of course, it remains to be seen whether it will be only another addition to the tons of "authorities" under which the law already is being crushed to the point of extinction.

The reason for this intimation of doubt is history, which, the writer believes, shows that no great amount of law reform ever has come directly from lawyers, though, by necessity, they have framed the changes that have been made. Most of the great moves in the premises have been precipitated by laymen, as when Charles Dickens, by excoriating it in a novel, caused chancery court practice in England to be reformed.

This is why the subject is preëminently one for the attention of laymen, who, also, are the persons most vitally affected; as they are the ones who support the courts and play the parts of plaintiff and defendant in the great drama of the law.

First Christian Indian Church

(*Concluded from page 15*)

was kept alive in Moravian history and later the Archeological Society became interested in preserving the first settlement in the state; rather in restoring it.

The Ohio legislature in 1923 made an initial appropriation of $10,000 to purchase the site and in 1925, at the session recently closed, appropriated another $7,500 to buy some adjacent property. The first appropriation was followed by the appointment by the governor of the Schoenbrunn Memorial Commission.

Also in 1923, William G. Mills, a director of the Archeological Society, definitely established the site of the lost village as one and one-half miles southeast of New Philadephia. With the aid of maps furnished by the Moravians, they have also uncovered the cellars and discovered many relics of interest: brightly colored glass which traders evidently used in transactions with the Indians, parts of clasp knives, flintlocks, tomahawks, baked clay, wrought-iron nails, and pottery.

The town virtually has been uncovered as it was originally laid out, down to the perfect streets. The work of restoration which is in charge of the Memorial Commission is being carried on and it is hoped to build replicas on the exact sites of the first chapel, the first school, and the Zeisberger residence. If possible, a museum also will be built, or the school itself may be used for this purpose. If feasible, the homes will be replaced on the very foundations on which they stood when the town was destroyed in 1777.

Progress of this work, however, depends on the sums received from schools and churches and persons interested in conserving for future generations the accomplishments of the pioneers.

The Art of "Electing" a Sucker

How Fraudulent Stock Concerns Flatter and Corner Certain Victims

By GEORGE GARRETT DE MORE

THERE comes a time in the history of every American who reads the financial page of the newspaper and knows that a bond constitutes a mortgage while a stock is a partnership with full liability as well as the right to participate in the profits, unless otherwise stated on the certificate, when he reads of boards of directors meetings and has a secret longing to attend one of these affairs. After all, it is a mark of merit for an American to be listed in the directory of directors equal perhaps to being knighted by the king, or some such magnificent ceremony in a foreign country.

A genius in the art of swindle—some enterprising Son of Wallingford—taking cognizance of this, a few years ago devised a scheme to make a number of small business men and professional men temporarily happy through what is known among the financial parasites as "Electing." Expanding it a bit, we have called it, "Electing a Sucker."

"Electing" calls for a limited amount of capital. Back in the dark days of 1921 when no one else seemed to have it the smooth swindler managed to accumulate what is technically known as a "stake." With this he would advertise for a company needing additional capital. His play was for one of the smaller companies started on the crest of the wave of prosperity after the war and now meeting hard sledding.

When he found such a concern he would promise additional capital upon a 25 to 50 per cent basis and secure the list of stockholders.

From this would be picked those who looked as if they would appreciate being "elected."

Soon after, Mr. Blank, a stockholder in the X. Y. Z. corporation, would receive a call from two representatives of Bunkem & Bunkem, fiscal agents for X. Y. Z.

"Oh, yes, the affairs of the X. Y. Z. corporation are picking up in fine shape. The company will make an additional million profit this year. Why, even now there is an inquiry for stock from leading eastern financial interests."

Then Mr. Blank was informed that under a new plan X. Y. Z. corporation was depending upon a limited number of its best-informed stockholders for advice about its financial affairs. The plan was to elect a select few of these stockholders directors or at least members of this or that advisory board. There would be free trips to the city where the corporation held its quarterly meetings, and, of course, Mr. Blank was aware of the prestige he would gain in the financial world by being a director of X. Y. Z.

Mr. Blank is in doubt. He will think it over. Well, the representatives won't urge him. But in case he did decide to avail himself of this great opportunity, the officers of the company would have to know something of his financial standing and his business prospects.

The representatives of the fiscal company produce a long questionnaire and proceed to toss questions at Mr. Blank from every quarter of the compass.

When they leave they know the bank balance he carries and the amount he has invested in gilt-edged bonds as well as approximately the amount his bank might carry him for in a pinch.

They leave him a week or so to tell his business associates that a large corporation desires to elect him to its board and back they come to tell him that X. Y. Z. cannot do without him.

Modestly, Mr. Blank agrees to help *his* corporation move forward to success and agrees to become a director. But, of course, in the capacity of director he must be in a position to vote a larger block of stock. And when Mr. Blank comes to, he discovers he has twice as much X. Y. Z. stock as before. The company is not bound by the promises of its fiscal agents who are here today and in Timbuctoo tomorrow. Even if it were, it is doubtful if Blank's stock would be increased in value by his addition to the board of directors. And he awakens to find that the old X. Y. Z. stock has decreased in value in ratio to the amount of new stock sold prospective directors. This is the Art of Electing Suckers.

I once heard a court reporter refer to a man coming to trial as a peterman. "Been selling fake stock?" I inquired, for I had heard the term petering in connection with fraudulent stock sales. A peterman, I was informed, was a safe-blower using nitroglycerine or dynamite. The term, I subsequently found, had drifted into the realm of the financial parasite, where it was applied to the artist in reloading which is to sell stock to a person previously swindled—as the "trade" has it, dynamiting or petering.

When Smoking Was Illegal

It was recently announced that the government of Tibet had placed a ban on the introduction of tobacco into that country. But regulation and prohibition of the use of the narcotic weed by the law of the land is by no means new.

The following is taken from the court book of Methwold, Norfolk, dated October 4, 1695.

"We agree that any person that is taken smoaking tobacco in the street shall forfitt one shilling for every time so taken and itt shall be lawfull for the petty constables to distraine for the same to be putt to the uses of the towne."

A few pages farther there is the record of the first arrest under the tobacco prohibition law.

"We present Nicholas Barber for smoakeing in the street and do amerce him one shilling."

—*C. J. F.*

"Just looking at them is much the safest and indeed the most enjoyable plan."

Listen Youngsters!

(*Concluded from page 17*)

inced, so I determined to go out on y own hook and consort with the ounger generation myself and find it.

I did. This is not a personality ticle. I am not looking for trouble round home, where my reputation as already had a few bad crimps; nd names and dates must therefore e reluctantly omitted. But in a large, eneral way I can state that the result my investigation among the younger eneration is that they take their leasures not only very sadly but mpestuously and in many cases agically. The discomforts they unergo to achieve what they think a good time are too often pathetic their barrenness and their repetition.

One young man confided to me that e had been caught one night without y coin, was obliged (for some esoteric ason) to go a long distance in a rry and in order to do this had ven the taxi driver a ring which a rl had presented to him. The problem as to get enough coin to get back the ng. I suggested that in the crying nergency, as a last desperate resort, e might go to work.

"But I can't work for less than $25 a eek; it would hardly pay me," he id, "and nobody has yet offered me at."

I think he rather liked me, not so uch for my conversation as because was cheerful, a good listener and fed m up when he came to the house. o I said to him: "Look here, you get a b at any old thing, no matter what ey pay you, or beat it out of re."

He saw I was in earnest and in three ys he telephoned he was working for 0 a week. That was about three ars ago. The other day he showed , driving his own car. He was making—earning—$5,000 a year. That boy had no father.

As for the girls, fancy making love to any so-called flapper of the present day! (That is a horrid name, a disgrace to womanhood and ought to be abolished by law.) What could be said to them? My ignorance about woman in general and also in particular increases permutatively as I advance to decrepitude. But so far as I gather from a rather careful perusal of our contemporary literature and a moderate indulgence in parlor conversation, anything you could think of to say to any young girl of the present day, be she highbrow or lowbrow, is entirely superfluous. There seems to be nothing left to be said. Just looking at them is much the safest and indeed the most enjoyable plan.

The old-fashioned, back-number Love, in which people held hands and got married and lived together happily, had a fairly good run. A few of us do not yet realize that it is all over, we are so stupid about it. Talk to the younger generation and learn where you get off. Cupid hasn't even a license to park anywhere.

It is my first-hand experience that the best women to make love to are all over thirty-five. You see, they all started so far back before this younger generation, that you can talk to them without feeling you are on a busy wire. In three years I haven't met a single girl under twenty-two, outside of those regularly employed, who had time to sit down anywhere. They are all in a fierce hurry. Maybe it's Me. I should like to check up on this with some male member of the younger generation, but what would be the use?

The tragedy of youth is one of the most moving spectacles of the present period. In thus issuing a definite challenge to our younger generation, I am not making sweeping condemnatory charge, or indictment, I am reporting a pronounced tendency which should be properly understood, none more so than by these young smarties themselves. They will discover that what they think is new and important was thrown into the discard before Solomon got off some of his celebrated bromides; that their own opinions about Art, Literature, God, women and their elders all had to be turned down successively by each younger generation that preceded them and that, by and large, no substitute has yet been discovered for character, and that character is maintained only by hard work, honesty, persistence, obedience, humility and moral courage. At present this younger generation of ours, making due allowances, is somewhat out of hand.

Who is to blame? Everybody and nobody.

We elder boys are to blame when we let these youngsters put over too much on us; and also (I speak from observation and guilt) from too much trying to imitate some of their didoes. Our educational system is to blame when making it too easy to learn things which cannot be learned too easily. Our newspapers and motion picture promoters are to blame for making crime too alluring and individual irresponsibility just a nice sort of game for all to play at.

On the whole, the real trouble is not that we go out too much after money, but that we think money will carry us farther than it can.

I see no objection to being well off. I believe in being well off.

I see no objection in young people having a good time, keeping themselves fit through exercise and sports and certain adventures.

I see great objection, on the part of too many, in thinking that money will buy us much more than shelter and food and clothes and transportation, and the occasional removal by operations of some part of our insides. Beautiful objects of art, nature in its fullest splendor and expression, music, wonderful poetry, moments of tranquillity—all these things and more are quite free. We overlook them too much because we have the idea that we can buy so many artificial substitutes.

Boys and girls, it can't be done. The last rattle I make will be to echo this old truth.

The modern petting party is no substitute for the old-fashioned courting bee. Let us drag out the poor old simple life from its consecrated, cobwebbed retreat and look it over again. It's good stuff, believe me.

Legends of the Crimson Poppy

In associating poppies of Flanders with those who fell in the Great War, the old Flemish legend, that poppies sprang from the soil where heroes fell during the historic Battle of Waterloo, is revived. This, in turn, recalls the old legend that poppies sprang from the blood of the dragon slain by the holy maid Margaret, as mentioned in an early calendar of English flowers:

"And poppies a sanguine mantle spread
For the blood of the dragon St. Margaret shed."

And as today our poppy wreaths are laid on the cenotaph, so the ancients adorned statues with poppies, and offered flowers to their dead.

1,000 Miles From a Railroad

Travel in many parts of China is still by sedan chair and coolie caravan.

(*Continued from page 4*)

is an artery that connects the outer world with the province of Szechuan, the richest province of all China. But boats do not navigate the gorges unless they are especially built for that traffic, with powerful engines to carry them through the terrific current. Beside our helmsman, for the four days of that journey, there stood an old Chinese—with long, flowing beard, a silk skull cap set jauntily on his head, and an absolutely impassive face. He was our pilot. For thirty years before the Standard Oil Company hired him this Chinese had piloted junks up and down through the gorges. He knew the river, its whirlpools and its hidden rocks, and a move of his finger from right or from left guided us for four days as we picked and roared our way up past countless Chinese junks; skirting great cliffs, plunging—with the waves washing the decks—through great whirlpools along one of the most dangerous waterways in the world. Arrived in Chungking after a successful voyage the entire crew set off great bunches of firecrackers in tribute to the river gods who saw us safely through.

A word needs to be said about the river junks of the upper Yangtze. They, even now, are the usual method of transportation, and a perilous method they provide! Coming downstream, from Chungking to Ichang, the way of the junk, though dangerous enough, is not so difficult as the upstream voyage. Every foot of the four hundred miles the great boat is drawn against the current by Chinese coolies, trackers they are called, who are tied to a bamboo rope, often a quarter of a mile in length, which is fastened to the mast of the junk. No picture of Chinese life is more vivid than that of these trackers, perhaps a hundred of them, straining against their ropes, singing a shrill rhythmic chant as they pit their strength against the river current. Rushing back and forth along the rope, his lash held aloft, the overseer shouts and threatens and urges them to greater effort. Only rarely, however, does he use the lash that he brandishes so threateningly.

It is said that between Ichang and Chungking there are 75,000 of these trackers. It required from four to six weeks to make the upstream journey and for this labor each tracker receives approximately 4,000 "cash," about five dollars, in addition to a ration of poor rice and poor pork. On the downstream journey the trackers receive no pay—only the rations. One in every ten of the junks is lost on the journey.

Arrived in Chungking we realized, suddenly, how far we had come from the foreign atmosphere of the treaty ports. Chungking is a city of approximately 1,000,000 population. It is built upon an island located at the junction of the Yangtze and Kialing rivers. There is no lighting system in the city; no water system; no traffic system. Lights are furnished by private plants or by candles. Water is supplied by coolies, 20,000 of whom earn a scant livelihood by peddling water, which they have dipped from the Yangtze below the city wall—water that no one dares drink until it has been boiled. The traffic system of Chungking is all on foot or in sedan chairs. The streets—perhaps thirty feet wide on the "boulevards"—make any other sort of transportation impossible.

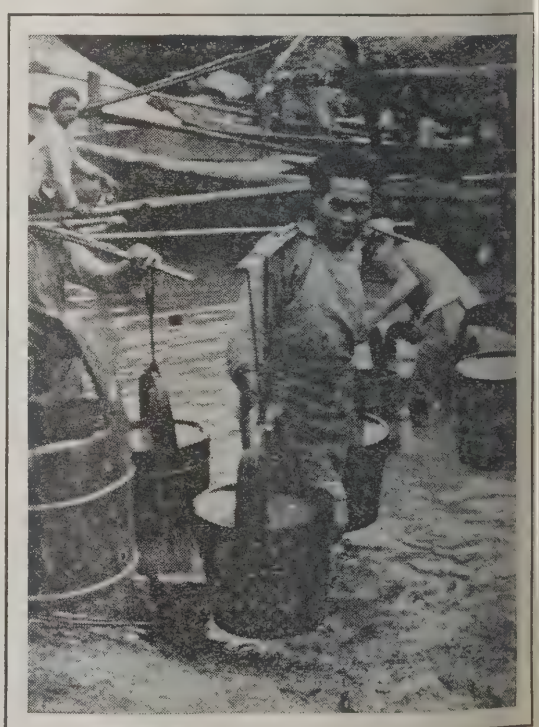
But the missionaries have penetrated to Chungking. They have set up schools and hospitals there and, slowly, year after year, a little more of enlightenment is entering. It is an interesting fact that, whereas the illiteracy of the average Chinese in Chungking is probably not less than 95 per cent, of the Christians over one-half can read and write. The fame of the mission hospitals is spread throughout this whole section. Due to a lack of funds one of these hospitals was obliged to close several months before our arrival in Chungking. Yet every day from ten to fifteen Chinese—who had heard of its wonder cures but had not heard that it was shut down—still applied at the mission gate for treatment.

From Chungking our journey was of a different sort. We traveled toward Chengtu, not by boat, but by coolies caravan—carried in sedan chairs swung on long bamboo poles across the backs of three husky Chinese. Out here, 2,000 miles from the place that visitors usually think of as China, we began to learn something about the Chinese.

We learned something, for instance, about the religions of China. There is much of superstition in these beliefs. For a long time foreigners found it impossible to build any three-story buildings. The Chinese protested on the ground that buildings so high disturbed the spirits as they flew through the air and prevented their approach to the earth. Sewage systems were likewise opposed because they might cut into the dragons that lay beneath the earth's surface. On a high hill near almost every Chinese city one sees beautiful pagodas, erected to attract the good and drive away the evil spirits. There are, according to popular belief, three souls in every individual. At death one soul goes to Hades to pay for earthly sin. Another soul resides in the grave or on the ancestral tablets which the family worships. The third soul wanders ceaselessly up and down the earth. In theory the good go to heaven but actually none are believed to be really perfect enough for that reward.

The preaching of China—what there is of it—is largely ethical. Along the streets of Chinese cities I have often seen great crowds assembled to hear the ethical teachers as they expound the classics and hold before the people the ideals of justice and right living. Particularly are the virtues of filial loyalty emphasized. Confucius stressed the importance of these relationships and the sayings of Confucius, who lived five hundred years before Christ, have gone into the foundation of China's social structure. There are five important human relationships, said Confucius; those between father and son; the relation of the younger to the older brother; of the husband to the wife; of the prince to his minister; of a friend to a friend.

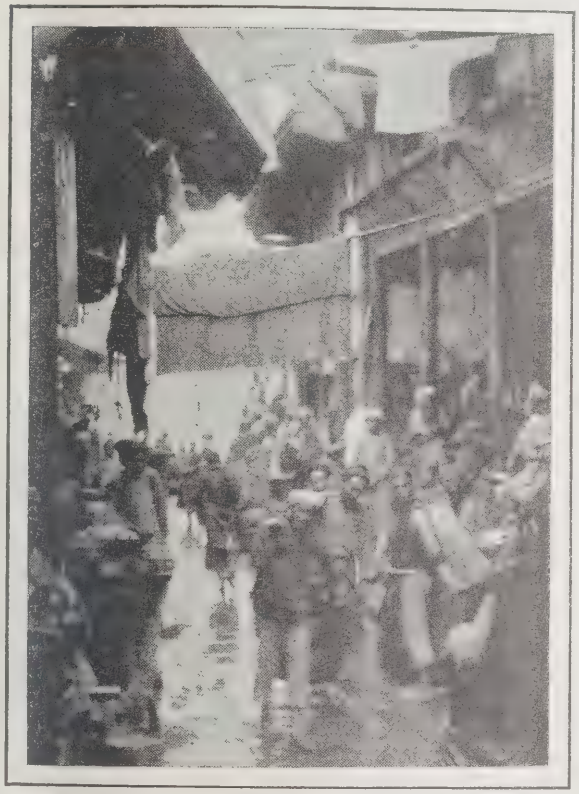
In no country of the world are family ties so binding as in China. The cook who traveled with our party in



About 20,000 coolies provide the water supply for the city of Chungking.

South China—although he was traveling far and receiving extraordinarily high wages—insisted, after a few weeks, that he must immediately return to his home in Central China. When inquiry was made we discovered that his mother was eighty years of age, that her birthday was near and, therefore, a filial son was under obligation to make any sacrifice to be with her on that occasion.

Not only do the Chinese have this filial loyalty, they also have a deep sense of independence and democracy. Confucius declares that "to honor the lowly is the way to win the people," and this principle is frequently illustrated. The Chinese will labor impossible hours at even more impossible wages, but they seldom tolerate what they recognize as injustice. I heard of a foreign steamer, on which the engineer, angered at one of his Chinese stokers, struck him with a wrench. Within an hour not a stoker was left on the boat. The injured man was transferred to another boat, and there, too, the coolies walked out in protest. Everybody in China, even the thieves, belong to guilds—the oldest and most closely organized labor organizations in the world. An injury or injustice to one member of the guild involves all of the other members. One can argue prices with a Chinese coolie and usually effect a satisfactory compromise, but no Chinese can be browbeaten into the acceptance of less than his just due.



Street scene in typical Chinese village.

It is this effective organization of Chinese workmen and their belief in justice that gives significance to the present uprising in China. A general strike is not difficult to bring about when all the workers—regardless of their work—belong to some guild. And when a general strike occurs its effectiveness is unparalleled. The strike against the Japanese in Shanghai in 1919 was so effective that the Japanese residents of the city had to appeal for foreign aid to get rice for their meals.

It is partly as a result of this overorganization of labor that things move so slowly in China. The average Chinese is not particularly worried about his job. Everybody in the family works. If one individual loses his job he lives at the expense of the rest until a new job turns up. Filial loyalty provides support during unemployment and guild organizations make it likely that new work, eventually, can be found.

But hard is the lot of the Westerner who goes to China, resolved to live at the pace which he travels in the Occident. Kipling tells of the man's sad fate who tried to hustle the East. I tried the experiment, and found that success was impossible. I kept a record of one experience which indicates the handicaps of the man who seeks to hurry. In Chungking, on the return trip, I went to the offices of the steamship company to buy seven tickets to Ichang. Nine men turned up to do the work for me. It took these nine men exactly twenty-seven minutes to make out my tickets. On one train—not much different from others—I counted six officials and two soldiers collecting the tickets. While each official examined each ticket the soldiers surveyed the passengers. The average shop in an interior city probably has an area approximately sixteen feet square. Usually in such a shop there are as many as eight or ten, never fewer than six, clerks. The ensuing confusion—when one steps in to buy—is bewildering. These are a few of the customs of the Chinese. There are many others, making them a people very different from the people of the West.

With all of these differences between China and the nations of the west it is apparent, however, that when western transportation and western machinery have opened up the country and education reached the people, the Chinese Republic will stand as one of the world's great powers. It is merely a matter of expediency that at this period, when China needs help, western peoples should seek to understand the Chinese and western governments establish with China the basis for permanent good will.

A White House in the West

(*Concluded from page 12*)

other hand, the Summer Capital, so far a merely informal title given whatever place our President may select for his vacation retreat, eventually may become a real capital by legislative enactment.

It has been our habit since the day when we borrowed the services of a Washington from the Old Dominion to look to the Eastern states when we were in search of presidential timber. It is true that the Democratic Party tried three times to put a man from west of the Mississippi in the White House, but the West has been sadly neglected and its voters feel that its problems are never thoroughly understood nor its needs recognized by the men who spend the four years of their terms in the tidewater country of the effete East.

But there is only an intimation of the full truth in what Wilson said. West versus East sectionalism is growing stronger with the passing years and it must soon call for the active interest of our Presidents.

When we divorced ourselves from the Britishers who had ruled us we had a clean slate on which to work out a new form of government. We have been trying ever since, hampered by a certain amount of self-consciousness, to demonstrate to the rest of the misgoverned world that ours is the best system yet devised by man. Nature, climate and soil differences gave us sectionalism, the greatest of all stumblingblocks in the path of a nation which is striving to perfect a republican form of government. A cotton-producing soil gave us a South politically solid. Climate and an unkindly soil did its part in making New England a segregated section of the nation. For a century its historians wrote interpretations of our history in partisan New English.

The filial yearning for paternalism in the heart of the sparsely settled West is drawing a longitudinal line of sectionalism while the monuments which mark Mason and Dixon's line are becoming more and more coated with the lichen of oblivion. Reclamation projects, Federal road loan measures and similar legislative schemes befog a conception of our States' Rights Doctrine, while such phenomena as the Farm Bloc, the Non-Partisan League and the defunct Populist Party have kept us reminded that ours is a country of zones which are swayed by inimical interests and guided by cross-purposes.

When the East Faces the West

Our literature is made in the East. Naturally it is shot through and through with Eastern self-revelation rather than broad Americanism. The hinterland beyond the Father of Waters is almost a terra incognita to many of our Eastern philosophers and publicists. And then, many men of the West look on the Atlantic seaboard dwellers as mere fractional Americans.

When John Fox Danced His Last Dance

Novelist, Whose Partner Was "Queen of Forty-Nine," Died With Dream Unrealized

By BRUCE CRAWFORD

GALLANTLY danced John Fox with Beula, "queen of the Forty-Nine," on that night which was his last of gayety. How imperious he was as his sharp, aristocratic face, resembling an Indian chief's, moved through the maze of romping Forty-Niners in the carnival dancing tent.

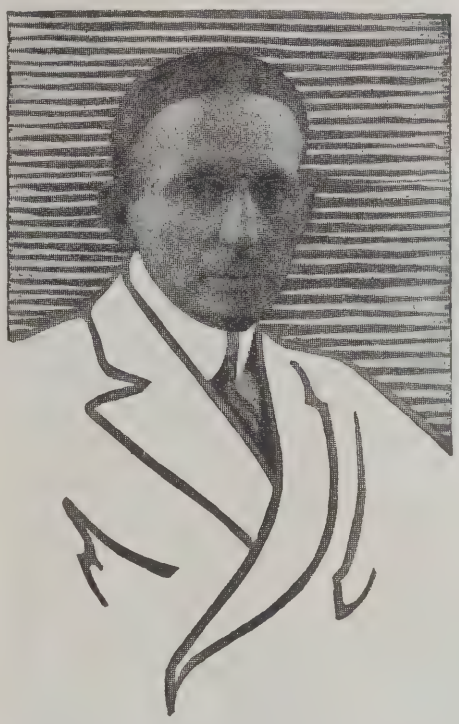
Tragedy seemed to stalk his latter days, haunting his proud face even in moments of frivolity. This is news, perhaps, to his celebrated acquaintances who saw him only in the East's atmosphere of culture and knew him principally as the author of "The Little Shepherd of Kingdom Come," "The Trail of the Lonesome Pine," and other popular romances laid in the mountains of Southwestern Virginia and Eastern Kentucky.

Others saw him in a vastly different setting at his home in Big Stone Gap, down in the picturesque hills of Virginia. They knew more of the tragic moments of this novelist who dreamed of writing a classic and who nearly achieved it in his novel, "The Little Shepherd of Kingdom Come," and in his short story, "The Purple Rhododendron."

It was in the early nineties that Fox, then a young Kentuckian just out of college, landed in Big Stone Gap, full of the spirit of adventure that was agog during the days of the "big boom." Eastern capital had undertaken the development of the vast coal lands of the region, and Big Stone Gap sprang into a little city overnight. Fox helped to organize the Citizens' Police, which sought to maintain order among the polyglot population, as well as among those mountain people who regarded the newcomers as intruders. In those days murder was common, and romance and adventure beckoned at every turn. Naturally, when Fox turned to the writing of fiction, he set his stories in these mountains and selected his quaint characters from among the inhabitants. This followed his experience as a war correspondent with Jack London and Richard Harding Davis in the Russo-Japanese War.

Here in these hills, like a lost tribe, he found a remnant of the true Anglo-Saxon stock, still preserving the customs and the vernacular of Revolutionary days. Here were men, gaunt and hardy, who had absorbed something of the durableness of the rocky slopes, ready to die for what they believed to be their rights. They distrusted all forerunners of the advancing civilization.

John Fox had discovered a literary gold mine. He was to be a pioneer in a new field of literature. His work would be largely that of depicting these



John Fox, from one of his last photographs.

rugged mountain folk in conflict with the progressive, effete Easterners. And the more he wrote of these mountains and their inhabitants, the more deeply interested he became in them, and so he made his home here.

With the success of his novels came financial security. At the Gap he built an idyllic rustic bungalow, and to this he brought Fritzi Scheff, a well-known actress, of Austrian parentage, whom he had met at a ball in New York and married soon afterward. He also purchased a beautiful poplar grove in the Gap, expecting to erect there a handsome mansion for Fritzi's especial delight. But she "flew" before the coop was started. And coop it would have been for her.

What to her were the uncouth mountain characters whom her literary husband made so much over! And how Puritanical were the more intelligent people of the community who had come down from Pennsylvania, and how gossipy! Constantly had she besought John to accompany her on her stage tours up and down the country, but he had no liking for that sort of life as a regular thing.

Her departure, soon followed by a divorce, dated from the night when her husband's father lay a corpse in the Fox home.

After this adventure in matrimony John Fox went about like one lost. He made frequent trips to New York for social and business reasons. But h writing he did at his home in the Ga

Part of the time he played golf nea his home-place. Often was he seen wit his neighbor, Bascom Slemp, recen secretary to President Coolidge. Fo hobnobbed with coal operators an lawyers and mining engineers. Onc in a while he would go on a solitar ramble in the mountains and hea some homespun philosophy from hill billy, or study a wild flower. An occasionally he would attend a loca dance. Always was he a great frien of the ladies, who found him charming Imperious though he was, it wa second nature for him to be kind an courteous, even at convivial moment when others lost their heads.

During these last days it seeme that Fox wanted to live as a boy again to be as fancy-free as a child at play He was often seen at the Big Ston Gap motion picture theater.

The last time the public saw Joh Fox was the night when he dance with the Forty-Nine girl, at the end o a week of Fourth of July celebrating Fox and several friends, all gay an looking for novelty, entered the Forty Nine, accompanied by a curious crowd The tent must have made a good profi that night, for the famous John Fo was naturally an added attraction.

In the midst of this noisy animatio appeared John Fox, eyes merrily li in a face otherwise somber. Beula queen of the carnival, approached him Nor did she take him by the lapel, a the other girls did when they wante a partner, but merely held out he hand.

"Will you dance?" she asked pleasantly.

"Why certainly, my girl," said Fox, stepping upon the stage. They did not do the jazz stuff. They talked as gentleman and lady. Others leered, and yodeled inane songs, but Fox was courteous, gentlemanly. And surprising to all was the girl's quiet recognition of the gentleman in her partner. His gallantry had brought to the surface unsuspected refinement in her. Again and again she returned to him after dancing with others.

Late that night Fox climbed heavily into a motorcar, dog-tired, spent. More, he was sick, it was later learned. To the home of a bachelor friend he went for the night, to awake next morning with double pneumonia. Carried to his home in the Gap, he died two days later, "Erskine Dale" unfinished and his dream of a classic forever unrealized. It was to have been a book largely historical, calling for greater compilation of material than any of his earlier books.

Thus John Fox quit life with a dance.

A GREAT part of that order which reigns among mankind is not the effect of government. It had its origin in the principles of society, and the natural constitution of man. It existed prior to government, and would exist if the formality of government were abolished. The mutual dependence and reciprocal interest which man has in man, and all the parts of a civilized community upon each other, create that great chain of connection which holds it together. . . . Common interest regulates their concerns and forms their laws; and the laws which common usage ordains have a greater influence than the laws of government. In fine, society performs for itself almost everything which is ascribed to government. . . . The more perfect civilization is, the more does it regulate its own affairs and govern itself.—*Thomas Paine, 1791.*

CHRONICLER OF THE NEGLECTED TRUTH

BRIEF ... LD

To aid the color blind in noticing light signals at railroad crossings, the Swedish State Railways have decided to abolish the green light in favor of bluish-white and to adopt a special shade of red.

Loud speakers are to be installed on Japanese railways so conductors will not have to shout so loudly in calling stations.

An appropriation of $160,000 made by the Tennessee Legislature for additions to the Negro state normal school at Nashville brought the available funds up to $320,000.

In Pattani, nearly every hut has one or two monkeys chained in the doorway, and the natives walk about followed by monkeys attached to long coir ropes.

An eclipse of the sun reveals to historians of the Bushango tribe in the Congo that the 98th king in a succession of 121 rulers sat upon the throne in 1680.

The University of Pavia, in Italy, claiming the distinction of being the oldest European university, recently celebrated its eleventh centenary.

The garden petunia in England was developed from two wild species from Argentine and Uruguay, seed having been sent to Scotland in 1831 by John Tweedie.

A piece of linen, 6,000 years old, recently examined by the chairman of the Irish Linen Society, was found to be as perfect structurally as are the linens made today.

Jim Bridger was the first white man to explore the Great Salt Lake; he was the first to describe Yellowstone Park's natural wonders and he discovered the South Pass in Wyoming, by which emigrants crossed the Continental Divide at that point before the building of the railroads.

Parts of the great province of Kansu, China, are so dry that records recently found printed on silk and covered by only a few feet of gravel are still in good condition though made nearly 2,000 years ago.

Though there is a widespread belief that stars can be seen from a mine shaft or wall in the daytime, no one has ever reported seeing one.

A case of twins in Mullusca is very rare but three pairs of such "twins" were found on the Pacific Coast in the summer of 1923.

Vitamine "C," the preventive of scurvy, a disease which used to be a terrible scourge in the old days of sailing ships, has been isolated in crystalline form from the juice of cabbages.

In the matter of getting rid of a tail, some species of apes have "out-evolved" man, they having less of a tail than man himself.

Postmen of Northwestern Alaska often drive reindeer to haul their load of mail.

By attacking newly hatched birds, ants are making the problem of saving the rapidly disappearing colonies of gulls, terns, and herons on the shores of Massachusetts more difficult.

The stilt sandpiper has been seen in Washington only twice since the city was founded.

No one knows who discovered that the world is round, but it was after the time of Thales and before the time of Aristotle.

According to ancient Chinese geographers, the Island of Formosa was formed when fire dragons swam out into the China Sea, plowing the bottom until a series of hills were heaved up. This is a highly poetic and yet true description of volcanic action.

Indians of Glacier National Park raised enough wheat last year to keep two government-built flour mills grinding this grist

Though more than a thousand kinds of fossil insects have been discovered near the base of Pike's Peak, no trace of the common house fly has been found.

"Bicycles and saddle horses shall carry one lighted lamp which shall be so lighted as to throw a red light visible in the reverse direction from which said bicycle or saddle horse is traveling." Thus reads the terms of the ordinance, introduced by Alderman Donald S. McKinley of the nineteenth ward of Chicago.

Iron, the characteristic coloring matter of the "Garden of Gods," is also thought to cause the red tints in the planet Mars.

Papier-mâché originated in Paris as a means of utilizing the paper collected nightly after tearing down public notices.

German farmers are putting electricity to a new use, many of them now sweetening beet silage by passing the current through the feed.

Delaware still uses the ancient whipping post.

From the Armistice of 1918 to the end of last September, £192,713,-000 have been expended on unemployment doles by the British.

Fierce savages guard the approaches to the unexplored wilderness on the middle courses of the River of Death, a branch of the Araguaya in Brazil. From the jungle they fire long arrows tipped from the thigh bones of animals, ground to a razor edge and poisoned with a plant distillation so deadly that even a scratch will cause death in a few minutes.

Presented in This Issue:

Mr. Ford's Page this week discusses the right sort of standardization.

I have a question I want someone to answer. We are flooded with psychological data and conclusions which we shrink from, cannot believe, and eventually doubt to be true. Most of this data comes from abroad, from alien investigators. What they say may be psychologically true of their race. I want to know: Is this psychology of alien origin a true report of our American psychology? Is the world of mind so much at one that it can be described in the same terms and interpreted by the same rules? In my laymanly simplicity it seems to me a worth-while question. An interesting article on p. 3, by Professor Laird slightly touches the lines of the question.

The story of how Mr. Sapiro butted in on the cotton growers. They wanted to be better growers of better cotton; Sapiro system put emphasis on the marketing end. Quite characteristic! That is important, but the growing end comes first. (p. 14)

The Chinese people have many friends, and they deserve it. Here is a "close-up" of the people. China will get the square deal if the United States has anything to say about it.

Old Samuel Pepys won enduring fame by setting down day by day his ordinary actions and his honest reactions. Here he is, Recorder of the Ordinary. (p. 16)

England is not the easy country to visit it once was. As in America, alien conditions have worked havoc with the old liberties. Quincy Kilby went to England, forgot to hand in his police card, and Scotland Yard had a "case." Kilby tells it in humorous vein. (p. 12)

"I am certain that today there are a score or more Jews in the House of Lords," says this writer in describing the power and prestige which the sons of Judah have attained in the British Empire. It is certainly a remarkable record. (p. 18)

One of the interesting sights at Annapolis is the museum in which so much naval history is suggested. (p. 31)

John Burroughs, as the wistful Celt, is impressively described by one who knew him well in his daily habit as he lived. How different is fame when closely viewed! Mark Twain was one of the most pessimistic of men in his thoughts; his wit was really lightning through an ever-deepening gloom. (p. 2)

A compendium of fake business practices which prey upon the public could be made of the articles we have published in this paper. Here is another. We want the plain man and woman to be just as "wise" as the multitudes of sharks who lie in wait for their money. (p. 6)

Eugene Leuchtman is a young newspaperman who has his own ideas about our musical education; he thinks we get results altogether inadequate to the millions we spend. (p. 8)

A little-known resting place of the dead in Washington—the Old Congressional Cemetery. (p. 13)

Your morning coffee and some things you are not likely to know about it. (p. 7)

"Things seen in old Cairo" (p. 21), and the story of how "American Honor Crosses the Ocean." (p. 24)

Editorials (pp. 10 and 11) are not designed to tell you what to think, but to provoke you to do some thinking about certain public matters of importance.

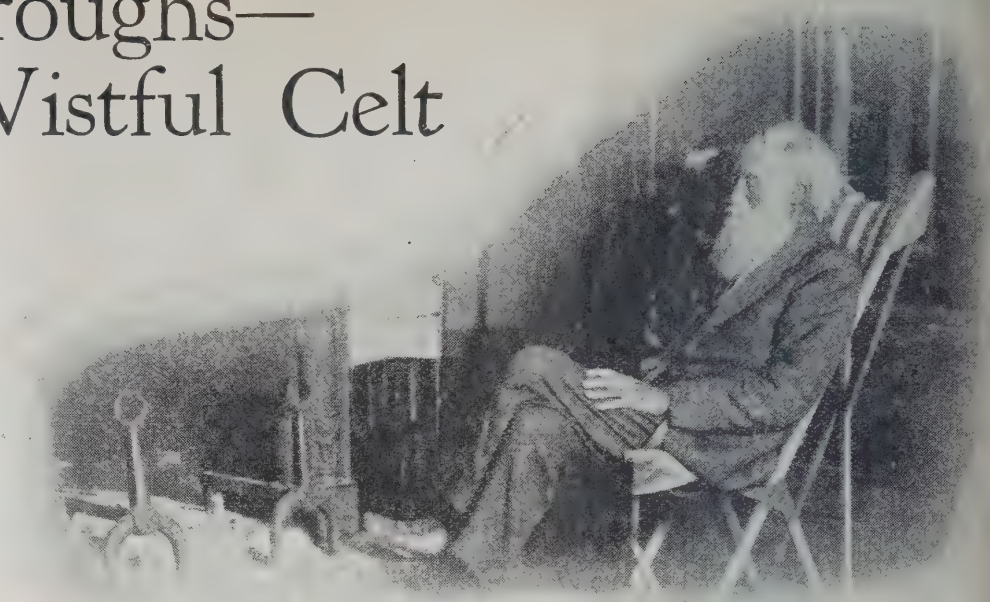
John Burroughs— The Wistful Celt

By CLARA BARRUS



John Burroughs at Woodch ck Lodge, Roxbury-in-the-Catskills

THE dominant note in the temperament of John Burroughs was retrospection. His persistent yearning for his lost youth, and his childhood home amounted to an actual nostalgia, but it was a homesickness that home could not cure. Anything which called up the past sent a mournful thrill through his soul. His *Spell of the Past* (*Literary Values*), the saddest thing he wrote, leaves one with an ache in the throat, and eyes full of unshed tears. Something of the same feeling is evoked by the following passage from his *Journal*, written, I think (but cannot at present verify), in the closing years of the nineteenth century:

> How the days accumulate behind us and turn their beautiful sad faces toward us. Here we stand upon the marge of time, with all that growing past behind us, like a fair land idealized by distance into which we may not enter, and to which we may not return. The future is unknown to us, in fact, does not exist, but the past is a part of ourselves. The days are our children which we have for a little time and then they are taken from us. One by one they step across the line into that land from which there is no returning; and not till they are gone do we see how beautiful or pathetic they were, and how deeply we loved them.

Here is the true Celt who, seeing a thing, or even imagining it, ever after possesses it. Forever it dwells in those recesses of his soul where lies romance. The Celt who never quite knows what he wants, but does know that he does not want what he has; the Celt with clouds of glory trailing after him, and moving before him, and always leaving him midway! Well that he can never reach the rainbow's end! If he could, he would needs sigh that he could no longer sigh for the Unattainable. Poor Celt! do we smile at you? Perhaps it is only that we shall not weep.

Mr. Burroughs was pretty evenly balanced between interests in the world without and within. He could turn and look in upon himself with the scrutiny of the trained observer. His very introspection was objective. He was wont to say that he had so invested himself in Nature that he became the objects he looked upon, and they became a part of him—symbols of himself, especially of his youth. No wonder, then, that his joy in the recurring seasons and their gifts was three-parts pain. The day was nearing when he could be identified with them no more; spring and the birds would come again and again, but he was passing. This wistful retrospection began in middle life. Often and often in the *Journals* one finds him peering wistfully down the Street of Lost Time. The marvel is that so little of this yearning crept into his books, since he was so accustomed to sit in the gloaming of a pensive memory. He has voiced it in two of his poems, *In Blooming Orchards*, and *The Return*. In the former, thrilled as always with the apple bloom, he sings its loveliness seen through

> "eyes
> That have grown sad in growing wise,
> Through Mays that manhood ne'er forgets."

Woodchuck Lodge, midsummer home of John Burroughs.

And in the three stanzas of *The Return* he condenses his incurable homesickness of the soul:

> He sought the old scenes with eager feet—
> The scenes he had known as a boy;
> "Oh, for a draught of those fountains sweet,
> And a taste of that vanished joy!"
>
> He roamed the fields, he wooed the streams,
> His school-boy paths essayed to trace;
> The orchard ways recalled his dreams,
> The hills were like his mother's face.
>
> Oh, sad, sad hills! Oh, cold, cold hearth!
> In sorrow he learned this truth—
> One may return to the place of his birth,
> He cannot go back to his youth.

He admitted that his habit of retrospection was "almost a disease." Like an unfulfilled wish in the subconscious, the vision of his lost youth hovered about him, having what psychologists call over-valuation. This might be interpreted by some as his way of avoiding the battles of his own soul. One critic *has* said that it was the expression of an unfulfilled longing for spiritual attainment. It is not a thing to dogmatize about, and one assuming to appraise or interpret it needs to weigh nicely not only the many evidences of self-conquest and achievement which his life reveals, but his brooding temperament as well—that heritage from Welsh and Irish forbears.

He was not a fighter. He did not always struggle for "the treasure difficult to attain," but he did work steadily and faithfully to compass clearness, truth, and excellence in his art. To have attained these, and also honesty, sobriety, industry, and adherence to truth and beauty; to have yielded reverence to things worthy of reverence; to have dealt fairly with one's fellows, and to have won their love—are not these (Concluded on page 27

Can Psychology Be Internationalized?

National Traditions That Will Not Blend, the Greatest Obstacle

By DR. DONALD LAIRD

BACK to England went Dean Inge. Back with nothing but kindly words about America. So unusual was this that ewspaper readers on both shores of he Atlantic almost gasped when they ead that the Gloomy Dean really did ot thoroughly chastise the country he isited.

This not because the Dean bears pute of being a faultfinder. Rather as it because we have found that isitors from other lands have from me immemorial been out of sympathy ith customs and costumes new to iem. "A great big country," they y upon leaving. And with a shrug the shoulders add, "Your food is, h-h, as you say it, 'rotten.'" And ie shrug and the rotten are what we ave learned to expect.

America does differ from most nds in many ways. Many a boy in urope tills soil that was trod in the me fashion by his family a thousand ears ago. The same boy—and he is pical of millions—is also governed by system of laws rooted directly in the me aged soil. Social customs, dress, nd, at times, most important of all, ought have roots as archaic. And, one may say, as stagnant. Here we e not bound so closely to the soils of e past. The traditions and pettiness a remote thousand years do not rve as fetters. Thus are we helped in dapting ourselves to the miracles of ie modern century in a way that ther lands perhaps never can. Of urse it makes a difference, noticed education, social conduct, attitudes, ad thoughts. The foreign visitor no has matured in centuries of tradtions is oftentimes centuries removed in vantage point; his mind does not supply glasses for obtaining the right mental focus.

German Books About America

Yet we find a German visitor ending exactly thirty days on our sores and writing at least twenty-ven long articles on America for ilies and magazines in his fatherland. doubt if anyone can write a single ue paper on the United States with ss than ten continuous years of sidence and participation in our life. o wonder that Erich Posselt writes fter years of incessant search I nture to state that among the mberless German books on the subct of America not one is trustworthy." is applies quite likely to all travelers America, regardless of their home nd. Americanization cannot be acuired in three months' visiting of nsulates and living in hotels.

International misunderstandings can ve their origin traced in many instances to the failure of one people to understand the traditional thoughts and attitudes of another. The English, for example, are so famed for settling by compromises that the phrase "English settlement" means to accept a compromise. With the French, however, differences are something that occasion the glove to be thrown and the challenge issued. One with half a psychological eye can trace the riffs in reparations and war debts to the traditions of centuries by which most peoples are hog-tied in their thinking and attitudes and from which America has many reasons to be free, and for which she has more reasons to be thankful.

Bernard Shaw and the "Lusitania" Affair

So one is not surprised to find George Bernard Shaw quoted as follows:

"I did not conceal my contempt for the people who had taken the frightful slaughter of our soldiers in Flanders as if it were a cinema show got up to please their patriotism, but who went stark raving mad when one of their favorite pleasure boats—actually with first-class passengers on board—was blown up. The truth is that the *Lusitania* catastrophe—much too big a word for it, by the way—was the first incident in the war that was small enough for their minds to take in; they suddenly realized that at last the Germans meant to kill them . . . Their frivolity infuriated me."

There are differences in mental qualities from race to race. What makes these differences? It may be they are born different. On this point we have some data, but not enough to form even the first leg of an hypothesis. Centuries of accumulated social traditions would be required to explain the observable mental differences.

When Jewish garment workers through their organized labor bodies present demands for a 30 per cent raise in wages, employers with experience know that they expect about a 10 per cent increase. The Jewish labor organizations enter into the competition with a mind set by centuries of traditions on bargaining. But when a body of Italian garment workers in the same city presents a demand for the same raise, the employer with experience knows that it must be met in a much different way. Tell the Italian spokesman that the demanded raise is ridiculously impossible and you have insulted him. Point out some overlooked details and you have satisfied his points of honor. But never would an experienced employer treat the identical claims of Jewish and Italian garment workers in the same way, although the final result might be the same.

In science, and especially psychology which is much to the fore at present, we find the same variance. One may be justified in feeling that here the differences are as marked and more significant than those relating principally to international affairs. Of more moment because they become a part of the textbooks from which the children of the world gain their knowledge, unaware of the serious possibility of their books, while dubbed science, reflecting traditions in thoughts and attitudes that are ten centuries old.

I was pleasantly amused to have a Scandinavian friend of mine—a serious and trained psychological worker who had done independent work in American universities—lament over the hopelessness of the way in which we build our windows. "In my country," he illustrated, "the windows open, so, on hinges." And he demonstrated a casement window action. "But here the windows are foolish," he continued. "The first one I tried to open like ours I tried for a half-hour. Then someone giggled and showed me how they shove up and down instead of swinging on hinges, as they should."

Steeped With Centuries of Tradition

This, I say, amused me. I could picture him trying to find the combination for securing fresh air using a casement window tradition on a window that is not casement. I was not prepared for the change in his voice when he continued after a pause, "Your American psychology and other science is just the same. It slides up and down like this, while it should open, so."

He had been started on a psychological career in a university steeped with centuries of scientific and religious traditions. Since these traditions opened out, so, he looked upon it as being almost heresy when he found that here they slid up and down, like this. First impressions are our lasting impressions and when these first impressions have ancient, and oftentimes stagnant, roots, the newer and more virile seem to be entirely wrong.

It may seem to be entirely wrong even when the newer have the support of all scientific evidence, largely because they do not fit in with the attitudes and habits of thinking into which one has been trained, even as his fathers, and their fathers were trained.

The fault lies with our thinking,

oftentimes looking backward rather than forward. In America we have the opportunity for a long forward look since there is not so much to occupy us in looking backward.

We are especially prone to this fault in psychological work since it is a new field. *Experimentally we are looking forward*, but when it comes to *writing a textbook or teaching classes we look backward*, and in so doing draw upon the experience and teachings of psychologists from all lands. The result is that traditions of thought, which have been given a psychological phraseology by, for instance, a Viennese, are very apt to be found unsubstantiated when critically examined. Especially when critically examined for their fitness for holding the American mind. I imagine that in no other field deserving of the name of a science has this been so marked as in psychology. At least I hope not.

Within the past half-dozen years we find American psychologists breaking away from what foreign psychologists say and write. Take these hypothecated "springs of human conduct" known as instincts. The leading champion of these almost universal and all-influencing, but at the same time rather mysterious and suspicious, instincts has been William McDougall, an Englishman. Social life, mental disorder, and normal life have been explained to students *a la McDougall* for a decade or more.

Harvard called McDougall to come to Cambridge to take charge of the department of psychology there. One of the first fruits of this was for an American psychologist at Harvard, a man with a forward scientific look, to pack up his belongings and leave. It is now coming to be realized that instincts are not valid data but the merest of hypotheses. From the armchair it seems that the notion of instincts might be valid, but from the laboratory they take on a different aspect.

Now, with the exception of the Germans, the laboratory is rather an innovation psychologically. Most of the German psychological work even when laboratory-born is dull, detail-ridden, and beside itself. In English work the laboratory is in straits similar to that in Germany except that it is not detail-ridden, and more unusual on the whole. An Englishman, Ward, wrote several hundred pages on psychology for the Encyclopedia Britannica, for instance. Whereupon an American psychologist published an article listing briefly almost hundreds of relevant and *known* matters about the mind that Ward had omitted in his article. Scarcely a tenth of Ward's material was substantiated or relevant to psychology, but it was a splendid example of the best of English traditions.

It should be added with emphasis, however, that in one field of psychological work it is very likely that the English have outstripped all countries. This is in their experimental work on industrial psychology under the leadership of Dr. Charles S. Myers. In practically all of their other psychological work they are behind the times.

The result is that in many instances English psychologists find our ways as lacking in understanding as we find theirs provoking. Yet they inquire if America is psychologically safe for democracy.

Canada is American, geographically speaking. Her universities are bred in the English tradition, however. So a psychologist at a Canadian university epitomizes his lack of understanding by looking shrewdly at me and remarking:

"Some of your American psychologists are like your American psychology—they make love to their gi students!"

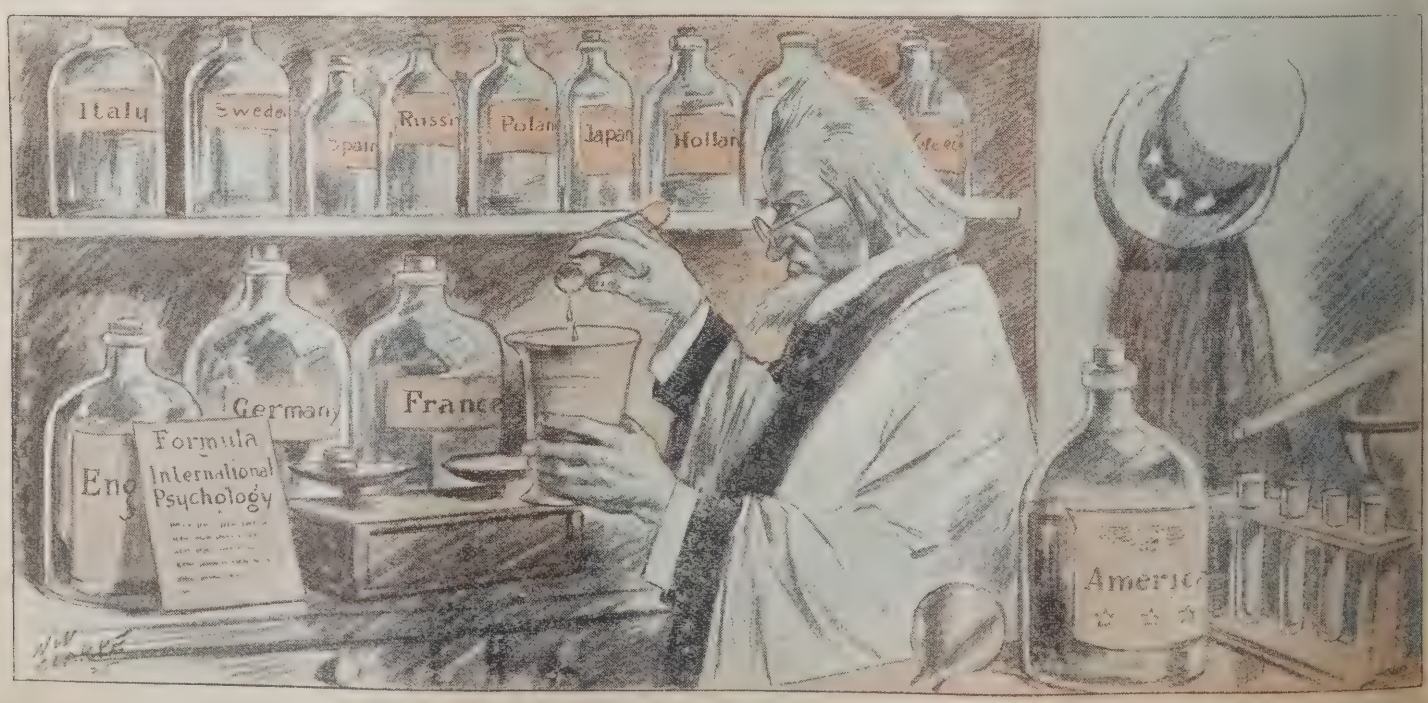
This lack of understanding is give further emphasis by the publishe words of a leader of American psychol ogy in commenting upon the remark of a foreign psychologist who is no teaching here: "If he gets on the ban wagon, here is where I get off."

Psychology is still being written in fact, most of it is probably yet t be written. In America there exis ideal conditions for solving the prob lems of the mind of man, condition one finds reflected in the leadership o American laboratories and the grea amount of experimental work being published monthly. It can never b written—as has been tried in the past— from the armchair. It must be writte from the laboratory bench. It cannot b written—as has been attempted—by citing the tradition-infested opinion and beliefs of foreign teachers. It must be written from the notebooks o the laboratories.

Ideal conditions in America for solving the problems of the mind o man? Yes! Not being bound to a state religion, or a predominant religion, we do not have to defend the canons of the church even unconsciously. Neither are we limited to the study of a group of persons with mental characters perhaps the result of a uniform social heritage. All social traditions are blended in the subjects of varied ancestry we may study. We are not thus forced to hypothecate sex as the basis of mental life since the subjects we study are not uniformly of a social tradition which makes much of this factor.

An ideal condition because we also have the forward look with no cloistered intellectual traditions to foster, protect, and justify.

Ideal conditions for psychology especially, and for other sciences also.



So These Are the Chinese People?

They Are a Nation of Contraries, But Not So Contrary As Other Nations Think

By STANLEY HIGH

THERE is hardly any denying the fact that Chinese workmen are among the cleverest in the world. Without tools o modern machinery, with no educa-inal advantages, deprived of modern nans of communication, the efficiency othe Chinese laborer and his achieve-nnts are perhaps unequaled. What th Chinese have done with bamboo sves as a good illustration of that fat. Bamboo wood is common through-ot much of China. Upon bamboo wod, therefore, the Chinese have ried for an amazing number of thngs.

For example, the Chinese wrkman sleeps on a bamboo nt, with his head resting on a bamboo pillow. In the rning he puts on bnboo shoes, eats a breakfast of rice a bamboo sprouts wh bamboo chop-sticks. He smokes a amboo pipe, sits ir a bamboo chair, wars a bamboo ha, packs his be-lcgings in a bam-bo box and ties th box to a bam-bo pole with bam-bo rope. If he has a mattering of edu-cion he may write o bamboo paper wh a bamboo pen. Te boat on which h navigates the rivers is propelled by a bamboo pole, and covered with bnboo thatch. His little plot of ground issurrounded with a bamboo fence, which he may cultivate with implements partly of bamboo. I even visited a mission school in China where the students, short of equipment, constructed for themselves a basketball out of bamboo.

Transportation by Chinese coolie.

But the Chinese workman is more than resourceful. With the materials at his disposal he has organized the economic life of the individual community with remarkable success. Most Chinese communities are almost wholly self-supporting. Spinning, manufacturing, barter and exchange are carried on within the walls of every city with little dependence on the world beyond the city wall. Communism, if it exists anywhere in the world, can be found, in practice, in many of these Chinese villages.

There is much talk about the success of Soviet propaganda in Russia. Unquestionably, among the student classes there has developed a strong feeling of friendship for the emissaries of Moscow and for the doctrines that they preach. The influence of these student classes is very great in a country, such as China, where learning is reverenced above all other gifts. But Communism—particularly revolutionary Communism—will make little headway in China where, under the present organization, a true and natural communism is so widely practiced. The Soviet example, doubtless, is finding acceptance because it offers a possible source of help in throwing off foreign influence. But it is altogether unlikely that the Chinese will follow in the path of the Russian radicals.

The excellence of Chinese workmanship, as I have indicated, is seen in other directions than in the maintenance of self-supporting community life. China's city walls, for example, are architectural achievements seldom surpassed. There are said to be 1,700 walled cities in China. The longest of these walls is that surrounding the old city of Nanking, which is twenty-eight miles in length. I have walked a good many miles along that wall and, throughout most of the distance, its width would easily allow two automobiles to pass. In certain places, the top of the wall is sixty or seventy feet above the city streets. All of the countless stones that went to the building of this—and all of the 1,700 walls of China—were hand-hewn and carried into place without machine aid but by the toil of great coolie armies. Against the attack of modern artillery Chinese city walls could not long exist. But in a country where bandit bands are innumerable and where bandit weapons are seldom heavier than rifles, they afford a very real protection. So great is the reliance of the inhabitants of interior cities upon their walled defenses, that once the great gates are closed at sunset the late wayfarer is

Fake Sales and Business Pirates

How the Credit Crook Fattens on Good Reputation and Gullibility

By PIERCE CUMINGS

THE other day I stopped in a store which had long been one of my favorites. For years the place had specialized in handling only goods of the highest quality; dependability had been one of its strong characteristics.

As I entered I noticed large signs proclaiming that the firm was going out of business, and that all articles were being sold at "cost and less than cost." The minute I stepped inside I noticed a change in the atmosphere of the store. The familiar faces were gone. In the place of the former quiet, courteous clerks were salesmen of the aggressive, high-powered vintage.

One of them approached, demanding my wants. To my surprise none of the articles he spread before me bore the manufacturers' names. Most of them were without labels of any kind; in others tags bearing the lone and obviously insincere word "Quality" had been stitched.

My salesman was oily and unctuous. He had a trick of rubbing his hands together to emphasize his remarks.

"Where are the standard makes you used to carry?" I asked. "When I buy anything I like to know what I am getting."

He massaged his hands as though to give me assurance.

"Oh, as for that," he exclaimed, "when you buy from an old reliable concern such as this you don't need to know what you are buying. The name of our firm is guaranty enough."

His answer irritated me so much that I left without making a purchase. Subsequent inquiry revealed what I had suspected—that the firm had passed from its former owners into other hands and that the new proprietors were making a killing by disposing of shoddy articles at exorbitant "sale" prices on the strength of the firm's name and reputation.

Working on the Old Firm's Reputation

Further investigation led to discoveries of which I had not even dreamed. I learned that such transactions were being carried on in all parts of the country, and that they had reached the proportions of a highly specialized and technical business.

There are numerous groups of men whose sole occupation is the wrecking of old-established firms. They obtain control of a store by various means. Perhaps the company is in financial straits; perhaps the sons of the founder have been unable to carry on the business with the same aptitude as their father, and they are glad to convert it into ready cash. They do not realize that they are selling their name as well as the stock and goodwill of the store.

As soon as the new proprietors are in complete possession they start moving the old stock. Some of it is sold legitimately; some of it is disposed of in other ways; and it soon disappears.

Manufacturers Are Duped by Credit Crooks

Soon the standard quality goods which sold at a standard price are cleaned out and the new owners are ready for the slaughter of the innocents.

They bring in a quantity of cheap, shoddy stuff, prepare their newspaper and billboard advertising, and open their "sale." This lasts as long as the gullible public remains unsuspecting. It may be for two weeks or it may be for two months, but whatever the length of the "sale" the fly-by-night promoters have made fat profits before they fold up their tents and quietly move away.

In different sections of the country different methods are used.

Out in the great open spaces where men are men, for instance, the promoters do things in a bigger and better way. In a large Western city one enterprising proprietor tossed pennies into the morning crowd as it passed on its way to work the opening day of his "sale."

A mad scramble of *the great American populace* ensued.

The next day the wily proprietor climaxed his newspaper advertisements with "actual pictures of the crowds storming our doors on the opening day of the sale!"

Closely akin to the night-flying business wrecker is the credit crook. The *modus operandi* of the business wrecker and the credit crook is at times startlingly similar.

Credit crooks are trained to a high degree of efficiency.

A formidable gang will learn that a concern which has earned for itself a reputation for honest dealing through the years of its existence is in financial trouble.

One of the members of the gang will approach the owner and offer to buy the business, always making the smallest initial payment possible.

As soon as the pseudo-owner is in control enough of the stock is sold, usually through an auctioneer, to raise the amount of the initial payment. Then the gang is ready to begin operations.

Agents of the new proprietors—highly trained specialists in their work—are sent to all the market centers as buyers. They acquire goods worth hundreds of thousands of dollars.

The wholesalers and the manufacturers, unaware of the change in the affairs of the concern, believe they are dealing with the former owners and ship the merchandise without question.

It is then a simple matter for the crooks to dispose of their loot. Often this is done through a "fence" at 40 or 50 cents on the dollar.

In the course of events a fire may come, and the merchandise will later be reported as "destroyed." In the subsequent bankruptcy proceedings the creditors, if they are lucky and if they show fight, may receive as high as 20 or 25 cents on the dollar.

Over a Widely Distributed Area of Credit

One reason it is so hard to catch the credit crook, and to prosecute him when he is caught, is that while his operations may be on a large scale, he scatters them among so many different firms that the loss is not great enough for any individual creditor to warrant that creditor going to the expense of carrying the case into the courts.

Thus a firm recently failed in an Atlantic seaboard city owing $101,148. Investigation showed that this loss was distributed among one-hundred and fifty-five creditors, scattered in twenty-seven cities and in twelve states.

The largest creditor was owed only $6,705, and the smallest only a few hundred dollars. Furthermore, the creditors were in many trades and occupations so that concerted action on their part was unlikely.

And, on top of all this, only $468 was owed in the home city, providing comparatively little incentive for local prosecution.

May Clear "Bluebeard"

NEARLY five hundred years after he was hanged at the town of Nantes, France, for heresy, and for being suspected of the murder of 150 women and children, Marshal Giles de Rais, or Retz, whose name is associated in France with the story of Bluebeard, may be cleared of guilt as a result of a suit for his rehabilitation which is to be brought in the French courts by a group of historians and lawyers.

Marshal de Retz who was one of the most faithful companions in arms of Joan of Arc, possessed magnificent castles in the region of Nantes, to which he retired after the death of Joan.

He had amassed an immense fortune at the wars, but he rapidly dissipated it. He had 44 private chaplains and maintained a huge retinue.

When he saw his fortune dwindling he called into his service sorcerers and alchemists to find gold for him. He was accused by public rumor of murdering women and children to wring gold from them. He was brought to trial, and after he had been placed on the rack and subjected to many forms of torture a confession was wrung from him and he was hanged at Nantes in 1440.

The movement for his rehabilitation springs from the discovery beneath the castle of Machecoul, one of the marshal's strongholds, of a gold vein which experts declare must at one time have contained gold to the value of several million francs.

It is pointed out that, contrary to the local legend, no remains of his supposed victims were ever found. Disappearances were very frequent in the days of wars, raping and adventure in which he lived, and his modern defenders maintain that he was the victim of political enemies. An association of defenders of his memory has been formed. Eminent counsel declare that, under the law which permits the reopening of a case when a new fact is discovered, a suit can be brought even after the lapse of five centuries.

Biggest Coffee Consumer

American People Take Bulk of Brazil's Supply; They Drink Five Hundred Cups Per Person

By OTTO WILSON

THE great rich American public is the big coffee consumer of the world, and a single foreign country dominates the world's supply. For many months now the man or woman with the market basket has been paying prices for coffee which are almost without precedent, while reports of high prosperity come from Brazil.

It would be unwise and perhaps unfair to jump to the conclusion that Brazil has been using its position as the world's chief coffee source to manipulate prices. Certain natural forces such as drought, short crops, a damaging coffee pest, and increasing plantation costs have helped to push prices up. No one can say positively just what part these agencies have had in raising prices and what has been due to artificial control. But the important feature of the situation is that there is now established in Brazil a system of coffee control which can, if it wishes, prevent big price declines over a long period, and perhaps keep prices indefinitely at a high level or even increase them.

Brazil Is the Great Coffee Country

This firm grasp of the Brazilian hand on the world's coffee trade is due partly to natural advantages and partly to organization. Nature did her part when she provided in the Brazilian highlands conditions of soil and climate which make them the ideal home for the coffee tree. So joyfully did it flourish there when once started that Brazil long ago left the rest of the coffee-growing world behind, and in spite of all competition she holds her lead to the present day.

Year after year Brazil gives to the world 65 to 70 per cent of its coffee. We in the United States drink about five hundred cups of coffee a person from one year to another. Two-thirds of this comes from Brazil. One state in that country, São Paulo, grows 70 per cent of Brazil's coffee crop, or about one-half the annual crop of the world. São Paulo's crop every year is the key to the coffee position of the world, and São Paulo prices set the pace for all others.

The government, acting for the coffee interests, was first led to exercise the power given to it by its semi-monopoly, to avert threatened ruin to the industry. In 1906, when great overproduction had sent prices to disastrously low levels, the Brazilian government "valorized" coffee by borrowing tens of millions of dollars and buying up and storing great quantities. It repeated the experiment in 1918 and again in 1922. In latter years it has also regulated the flow of coffee to the market by storing large quantities in interior warehouses and restricting the daily amount which can come into the chief shipping port of Santos.

These measures have tided the planters over serious emergencies. But many of them have not been satisfied with that, and there has been a strong sentiment in favor of some arrangement by which a permanent, day-by-day control should be exercised over the ever-shifting local coffee situation.

Planters Combine to Control Coffee Supply

This spring such a plan was put into operation. A permanent board, made up partly of officials of the state of São Paulo and partly of representatives of the coffee planters, now holds in its hands the levers which govern the movement of coffee in São Paulo. With a working capital provided by big loans based on a tax on every bag of coffee shipped by rail, this board, known as the *Institute for the Permanent Defense of Coffee*, buys coffee at will, stores it in any amount thought necessary, holds it back or doles it out to the market, loans money to planters to enable them to hold their crops, registers every bag of coffee shipped, and collects that which the coffee trade hungers after always with a great craving, accurate statistics as to output. Says the New York *Tea and Coffee Trade Journal:*

Sao Paulo Leads the Rest of the World

"If on any day the quoted price of coffee in Santos is x, it is because the Institute, which is indisputably an arm of the government, permits or wills that x it shall be . . . . Henceforth coffee prices will be made not in Santos or Rio, but in a government office in the city of São Paulo, where the Institute has its seat."

Since São Paulo leads the way for all the rest of the coffee world the prices which prevail there will in large part determine the prices in the rest of America, in far-away Java, and Arabia.

"From now on," says the *Journal* further, "barring exceptional conditions, price oppression of coffee consumers may always be laid at the door of the one conspicuous factor known to hold the master key to the coffee situation."

Millions for Music—Few Results

American Children Get Lots of Music Schooling, But Forget It

By EUGENE LEUCHTMANN

AMERICA spends more for music than any other country in the world. By the same token it spends more to teach its children the rudiments of the musical art than any other nation. This expenditure is repaid, in a measure, by a deeper respect for, and perhaps a greater familiarity with, the more elementary works of the lesser classicists, but, paradoxical as it may seem, America has produced very few artists, or even musical technicians of a high order. Why is this return on the tremendous musical investment so small?

It would be easy to say, and no less untruthful because a goodly number of light-hearted critics say it, that Americans have no talent for music. This assumption is obviously false. The high average of intelligence of its people would justify America in expecting more for its efforts in striving after music than is returned for infinitely less in European nations. An inquiry into the status of the music student is thus necessarily narrowed down to an inquiry into the home life and the economic life in the United States.

Perhaps the mass attitude of Americans differs not at all from the attitude of any national mass toward music. With that possibility we are not concerned for the present. The fact yet remains that with all its huge outlay for musical education very little is accomplished in the way of producing or creating a national musical consciousness, or of giving the world more than an extremely meager quota of artists.

The argument that the degradation of American musical taste is caused by the "substantial" qualities of jazz may be refuted with a simple analysis of jazz music. A senseless tune of the most elementary nature usually forms the basis for a jazz song. To those who have no technical knowledge of music, jazz may appear to be highly complex. This apparent complexity is effected by sophisticating the original senseless tune with a sharp syncopation of rhythm, the employment of cross-rhythms, and the embellishment with gypsy-like bravura which we have been taught to associate with the so-called Hungarian music.

Jazz is the A B C of music. This becomes self-evident when one takes the trouble to strip it to its essentials. Unless the theme is pirated from the classics it is banal, and when the syncopation and embellishment are stripped away jazz stands out in its truly representative form, the product of musical morons for morons even less musical. Embellish Foster's beautiful "Home Sweet Home" with the frills and follies of jazz, rack its sweet accents with syncopation not unlike the movement of an unfortunate victim of St. Vitus' dance, and you will have made of one of America's real musical treasures a stark and unbearably ugly tune.

The cause for this apparent poverty in musical appreciation may be said to lie halfway between two causes which interlock. The first is the apathy of Americans as a mass to the purely esthetic, and the second an economic life, which, in its reflection on the home life, is indirectly the fountainhead of that apathy.

The American standard of living is high—much higher than that of any other land. As a class, Americans are not patient enough to overcome the obstacles that lie in the way of the artist. The standards of living and the keen competition in commercial and industrial life bring a sharper desire to get ahead in commercial and industrial pursuits. The business of making a living is, after all, the most important business in the world, and where there are opportunities of "getting ahead" it is distinctly worth while to bend every effort to the mastery of some industrial, commercial, or scientific pursuit—but these efforts make no headway for art.

Music demands a lifetime of study. Innate ability needs more than desultory effort to blossom into art, and where one may within four or five years master a profession which is almost certain to insure a steady and desirable income, there is little urge to spend many years of patient effort in the mastery of a technique which in the end may not bring such monetary rewards as those gained by comparatively unskilled labor.

Thus Americans view music as more or less of a nonessential, and the view is given support by the practical application of the problem of musical careers as against industrial and commercial careers. An excellent musician earns very little, when his income tax returns are compared with those of men of commensurate ability in other lines of endeavor. Music is rather a stepping-stone to a cultural accomplishment which very few care to pursue to the point where it taxes their minds or their imaginations to an extent which handicaps them in their real work of earning a living.

For the most part, American music teachers are capable enough. The country gives them little support, however, and there is no urge for them to perfect themselves to the point where they will be capable of producing musicians which could even approximately compare with the skilled and competent musicians of Germany or France or Italy. These European countries give the great American orchestras their best players, but few native Americans find the income from such positions adequate enough to repay them for their efforts and their long years of study.

Where do the huge sums of money America spends for musical education go, and where is apparent the benefit reaped from the extensive musical schooling American children undergo? Almost every child in the public schools of the country is taught to read music and to sing. Very few families with children stand in the way of youngsters who wish to play the piano or the violin. Thousands of them are taught to play these instruments, and millions of dollars are spent yearly to teach these children to play, but seldom does one of even a thousand of them adopt the profession of music, because more lucrative positions are to be had by application of less effort to progress in industry and commerce.

Commercial and industrial progress, the miracle of world leadership in a nation which is the youngest in the world, all have contributed their share in the destruction of the art ideal in America. The suppression of the art instinct in the child and even in the adult goes on merrily as pride in money and position are taught to the children in the schools and in the homes.

On every hand the rise of an industrial genius, a political genius, or a great financier is made the subject of laudatory orations, of "object lessons" and sermons. The fact that these leaders *possessed genius in their own chosen endeavor* is forgotten in the "education" which seeks to inculcate in every child the lesson of industrial progress and monetary success. Teachers and parents and ministers forget that among their children may be boys and girls who have in them the seeds of great genius, as well as potential financial and industrial wizardry.

(Concluded on page 22)

MR. FORD'S PAGE

IN LAST week's page false standardization was described as that which put dividends first and development last. That it exists there is no doubt; it is one of the usual accompaniments of the financial control of industry. But that it really prevents progress is not true. It merely removed out of the stream of development the organization which is so unfortunate as to be under such control. This explains the failure of so many concerns when they come under financial direction. Money men are not business men; the two fields are distinct.

Standardization in its true sense has none of the elements against which the theorists have complained. This becomes clear with a little examination. What is this principle which we call standardization?

It is the union of all the best points of commodities with all the best points of production, to the end that the best commodity may be produced in sufficient quantity and at the least cost to the consumer.

To standardize a method is to choose out of many methods the best one, and use it. Standardization means nothing unless it means standardizing upward. It is impossible in the very nature of things to standardize anything lower than the best. The best automatically becomes the standard and possesses inherent power to overcome all standards that fall below it.

What is the *best way* to do a thing? It is the sum of all the good ways we have discovered up to the present. It therefore becomes the standard. To decree that today's standard shall remain tomorrow's is to exceed our power and authority. Such a decree cannot stand. We see all around us yesterday's standards, but no one mistakes them for today's. The utmost financial power is too weak to hold a standard in the industrial world for the space of one day, unless it is a genuine standard, representing the best known method up to the present moment.

It cannot be done. Finance has tried it by "pigeonholing" the future. No pigeonhole is strong enough to imprison progress, nor wide enough to inclose the future. They break through, as many a friend of dividends-against-development has discovered.

Now, unless it is wrong to give the people the benefit of the best method, standardization is not only justifiable but beneficial to society.

Today's best which superseded yesterday's will be superseded by tomorrow's best. That is a fact which theorists overlook. They assume that a standard is a steel mold by which it is expected to shape and confine all effort for an indefinite time. But how could that be done? If it were at all possible, we should today be using the standards of 100 years ago, for certainly there was no lack of resistance to adopting the elements which make up the present standards. But the better thing won.

Industry today, under the impulse of engineering ability and engineering conscience, is rapidly improving the standards. Finance may complain that these changes subtract from dividends, but mechanical genius will assert that they add to service. And that is the sole purpose of business.

TRUE standardization is the bringing up of yesterday's haphazard, wasteful and therefore costly methods to the level of today's best knowledge and skill. It is a leveling upward. Some minds distrust any process of leveling, and rightly so if the direction is downward. But a leveling upward, instead of preventing further progress, produces the necessary foundation on which future progress must rest. The very act of bringing up the stragglers and destroying a comparison downward compels an advance and creates a comparison upward. Man is a comparative being. Sub-standard things must go before super-standard things can come.

It is not strange that the word "standardization" has come to mean many things to many minds. Theorists who condemn it and the propagandists who make it relate only to styles and designs are both directing attention to the thing itself, but they are not telling what it is. Standardization of styles, as an actual policy, indicates a point where it will have to cease, or, perhaps, cause a violent reaction. The strongest objection to large numbers of styles and designs is that they are incompatible with economical production by any one concern. But when concerns specialize each on its own design, economy and variety are both attainable. And both are necessary.

There should be, on the part of those who ask public attention for their remarks, a willingness to scrutinize what they discuss. In this case such scrutiny would result in an admiration for the practical, daily and high-spirited service which standardization has been able to render the world. It is the very force which destroys those elements of which the theorists complain, it is the very force which tends to bring into being what they desire.

Its greatest service is that it compels all yesterday's methods to come up to today's best knowledge. It compels industry and service to keep marching. And having kept the laggards on the move, it clears the road for still further advances. Today's standardization, instead of being a barricade against improvement, is the necessary foundations on which tomorrow's improvement will be based.

"Ford Ideals," 452 pages, cloth bound, contains 98 of these articles. Postpaid $1.00.

EDITORIALS

Send That Picture

WE HOPE Europe gets the picture. There on a farmhouse porch, by the side of the road, so close to the highway that bed sheets were tied from tree to post to screen the porch from passers-by, the President of the United States and the Secretary of the Treasury met to discuss Europe's indebtedness.

Let Europe get that picture. Not in a gilded international bank, where financiers habitually think of money and not men, but in a farmhouse, by the side of the road, in the midst of the fields, surrounded by the plain folk of the Vermont hills, the President took steps to formulate his plans concerning the war debts.

Send that picture to Europe.

Tibet and Tobacco

TIBET, "the land of the medieval," has just handed out a piece of wisdom which may well make Western nations ponder. An enterprising tobacco firm in Calcutta wrote to the Tibetan Government suggesting that the meager revenue of the country might be increased by permitting the importation of cigarets, and the imposition of a duty.

In a courteously worded reply the government pointed out that the tobacco habit might seriously displease the powerful gods of the country, while the smoke might be reasonably expected adversely to affect the health of the people.

My Lady Nicotine has therefore been banned from the veiled land of the lamas.

In any case, the refusal of the wise men of Lhassa is much more dignified than the zeal of American cigaret manufacturers whose agents thrust sample "fags" into the mouths of Chinese children. Our tobacco and nasty film propaganda is costing us our respectability before the "heathen."

Empire and Dominions

BORDEN, former prime minister, says that Canada could become a separate and independent nation tomorrow if its people so desired, but adds that such desire would be wholly wanton. Only those whose wish must be under suspicion of being father to the thought can prophesy the collapse of the Empire by secession. The dominions are not held in thrall and even Ireland is not an exception to the statement that most of them fully appreciate the advantages of membership in the Empire.

But changes in the relationship are inevitable, as in every growing family. The daughter lands are maturing. Canada itself, to take one example, is in itself an Empire. She produces public men and public sentiment of a character that only the most supercilious sense of authority could rank as inferior to ability and sentiment abroad. It, therefore, follows, as Sir Robert across the border truly says, that the dominions are being more and more consulted in imperial affairs and ought to be, especially in questions which involve the issues of peace and war. The Empire has become, and officially, the Commonwealth of British Nations. Perhaps even Kipling's "I am daughter in my mother's house, but mistress in my own" is somewhat outdated. Partner-peoples come nearer expressing the relationship which shall exist between the great Anglo-Saxon groups into whose hands world rule has come, and in whose path world enlightenment has followed.

The League and the Jews

THE *Jewish Daily Bulletin* reports that the first steps toward getting "anti-Semitism" as a world question before the League of Nations have been successfully taken. This is not surprising, since one of the most distinguished "gentile fronts" among world statesmen has declared that the main purposes of the war was the establishment of Zionism and the League of Nations. That the League of Nations can be so readily promised for such service by one group may help to explain the tardiness with which the League commends itself to the confidence of the world.

It would, however, be of inestimable benefit if the question could be brought before a world tribunal. But it would have to come in proper form. Anti-Semitism is *not* a world question. There are whole sections of the world where anti-Semitism is unknown. There is none, for example, in the United States, none in Canada, none in the British Isles, none in India. But there is everywhere in the world pro-Semitism. What is called "anti-Semitism" is a non-intelligent, stupid, helpless resentment of people who have awakened too late to the fact of Semitism. People who awaken too late and discover that their strength was stolen while they slept are not likely to practice calmness and capacity as do those who awake in time. Ruling Jews have been so long accustomed to working without any special public attention being given their

designs, so long accustomed to the sleepiness and stupidity of the Goy, that any sign of intelligent scrutiny of those designs is immediately labeled "anti-Semitism."

So that when the League of Nations takes up anti-Semitism, it will of necessity inquire its source, and its source will be found to be Semitism. Thereupon the League will have to inquire what elements in Semitism account for anti-Semitism, and thus the Jewish Question will be brought before the court.

With this course inevitable, the demand that the League of Nations take up the matter may be expected to subside in Jewish circles.

Summer Solace

CONSIDER the bee.

She flits happily through the summer sunshine, pausing where she will to sip nectar from a hundred blossoms, and all that—but—

To gather nectar for a pound of honey she must make forty thousand trips, and then throw half of it away as unfit; and, so say the naturalists, that little frame of honey represents *twenty thousand miles of travel.*

85 for Overhead; 15 for Service

WILLIAM McFEE, writer of sea tales, settles on land and finds life as novel as most of us would find it were we to settle at sea. Writing in *The Nation's Business,* he discusses the cyclones of mail, from all quarters of the globe, that swirl around anyone who possesses a post office address. It is something all of us have felt the pressure of, but were too lethargically familiar with to complain. We have only dimly wondered. So Mr. McFee will be thanked by many for doing them the service of bringing to energy and expression their half-dead impressions.

Once in his article the celebrated author takes a turn at fact with a marlin spike, and puts all plain-speaking, fact-loving men in his debt.

"I can produce a business man, who knows exactly what he is talking about, who will show that of every dollar given to a certain organization the ultimate beneficiary receives something less than fifteen cents, the other eighty-five going in 'overhead,' stationery, salary of staff, purchase of mailing lists and an elaborate propaganda that swamps the ordinary citizen until he becomes callous and drops the whole mess in the waste-paper basket."

This is a description of many organizations. Most of us pay a high premium for the privilege of assisting worthy objects. Money-raising is now a business, whose brokerage rates are high. If the editor of *The Nation's Business* will induce Mr. McFee's business friend to write the story, it will go far to carry on the good work which Mr. McFee has begun. THE DEARBORN INDEPENDENT does that sort of thing occasionally, but there is no need of exclusiveness in this particular form of service. There needs to come a wholesale exposure of all sorts of professionalism in every kind of so-called "welfare" work, industrial, educational and religious.

The Comparison

IT IS always a little dangerous to judge a situation on the facts. For facts have other facts behind them. To denounce British labor would be quite possible on the showing of the facts today. But the labor facts of today are the fruitage of the capital facts of yesterday. Yet, when humanity becomes sufficiently enlightened to see this, when Labor recognizes it and Capital recognizes it, there would seem to be a simple way out—confession, a good understanding, and a new start. Two individuals would contrive it that way; why not two social groups?

But stubbornness is the original sin; men seldom budge until pushed. And in the British industrial system, the push is being invited.

A Briton has looked over industrial England, with this result:

"In a coal mine where every American method is employed, 3,000 tons less are produced in a year than before the war.

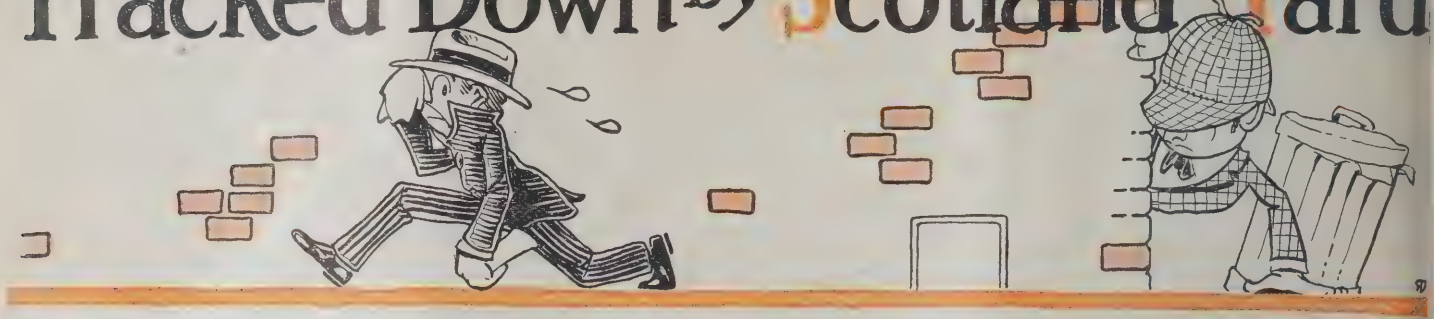
"The actual price of coal produced in this country at the pit's mouth is 24 shillings a ton. In America it costs 12 shillings a ton.

"Three hundred bricks are laid in a day as against 600 in America.

"Three hundred tons of coal are obtained as against 600 in America."

These figures may be more palatable to Britain than words of advice from this side. "Actions speak louder than words." But it is rather curious to see the reaction of a noted British editor to the above. The only solution he suggests is "the nationalization of mines and railways." But there is no nationalization in the United States, and if there were the production record would go down. Are Governments such supremely good managers that we can safely turn great industries over to them? In its hidebound capitalistic class and its equally hidebound labor class, both British capital and labor are, for all practical purposes, nationalized, with results that neither likes.

Tracked Down by Scotland Yard



Adventures of an American Who Kept His Landing Card

By QUINCY KILBY

TO MAKE you thoroughly understand the reason of my being hunted down by sleuths from Scotland Yard on my recent trip abroad, I must go back several years to the time when J. C. Percy, publisher of the *Irish Cyclist* of Dublin and author of three separate volumes of *Bulls and Blunders*, himself a well-known humorist besides, visited Boston as the guest of the Boston Bicycle Club, the second oldest cycling organization in the world.

We did everything we could to make him enjoy himself and he and I struck up a friendship warranted to stand all weathers. He was past president of the Pickwick Bicycle Club of London, the oldest in the world, and through him I became an honorary member. In that club every member takes a name from some character in *Pickwick Papers*, and at all club functions is addressed only by that title. Percy was Sergeant Buzfuz and I, Mr. Wardle. During the war he did great service in recruiting in Ireland for the British Navy, being therefor rewarded by a knighthood, so that now he is Sir James Percy.

"To Ireland! Ha! Ha!" Says the Government

In 1923 I made up my mind to go over and become acquainted with my club fellows who thereupon resolved to give me the time of my young life, which they certainly did. Arriving at Liverpool on the morning of July 3, I found there a letter from Sir James, saying that he was expecting me in Dublin forthwith and that he had arranged a dinner of literary men in my honor at his house on the evening of the fifth.

As I had not been across for several years I found many changes in the disembarking regulations, one of which was that we had each to fill out a card stating full name, age, place of birth, present nationality, London address, if any, and reason for visiting England. The address I gave was Care of Thomas Cook and Son, Ludgate Circus, London. As I had never been through this before I didn't know to whom I was to hand the card, so I held it in my hand as I descended the gangplank, for anybody to take who wanted it.

I was met on the landing stage by a friend who helped me with my baggage and called a taxi for me. When I was comfortably established therein I discovered that landing card still in my hand and put it in my pocket with the thought that it would be good for the scrapbook at home. Then I proceeded to forget it, thus nearly causing another World War.

By ferry to Birkenhead and by train to Chester, I changed to the Irish Mail for Holyhead and the Irish Channel boat, and was in Dublin before six. Three delightful days with the Percys and back to London where John E. Young, the Tom Wilkspart of the Pickwick Club, whisked me off to his home in Sussex for another wonderful three days. Back to London I was established at the Engineers' Club. So that though I had been on land a week I had not yet been registered at any hotel, which made my trail a difficult one to follow.

On Tuesday I went to Cook's at Ludgate Circus to inquire for mail and was informed that the steamship line had been sending for me; my landing ticket had not been given up and consequently there was one alien roaming loose about the country, and the government was demanding that I be produced in Liverpool. The government was demanding that the steamship line produce me in Liverpool or forfeit 70 pounds. The purser, who was about to start for a short holiday on the Isle of Man, was held up and made to devote a whole afternoon toward the solution of the problem.

"Oh, I know Mr. Kilby," he told them. "He sat at my table on the way over and is coming back with us on August 22. He's all right. I heard him say he was going to Ireland."

"To Ireland! Ha! Ha!" says the British Government, and forthwith sends a Scotland Yard sleuth after me. He reported that I did go to Ireland and was given a dinner there, but after that he lost track of me. There used to be an old play called *Hunted Down* or *The Two Lives of Mary Leigh*. I was hunted down, too, only I didn't lead any two lives.

I went to the offices of the steamship line to see what was to be done. "It's all right, Mr. Kilby," I was told. "You won't have to go to Liverpool at all. You'll simply need to mail your passport there."

"I don't let go of that passport," said I decidedly, knowing how valuable such a document was, especially since I should need it when I took my aviation trip to Paris the next week.

"But you are likely to be arrested," he argued.

"I'll not let go of that passport," I repeated.

"Then you'll have to go to the Home Office about it," he warned. But I was obdurate, thinking the talk about arrest was a bluff, which it was not, and I stalked out of the office and made a call on a friend with whom I made an appointment for 4:30 that afternoon when we should leave his office on Roseberry avenue, E.C., for a ride in his car to Chalfant St. Giles and Amersham.

But after lunching at the club I felt I might as well look up the Home Office, so I took my passport and that landing ticket, called a taxi and told the driver to take me to the Home Office. Do you know what a Home Office is? Well, neither do I, even now. He took me across Trafalgar Square and toward Whitehall, where he deposited me at some stone steps leading to a doorway through which I passed to a room on the ground floor where I found three imposing officials in uniform to one of whom I stated my cause. The three consulted together and then one said, "That is for the Home Office. This is the Foreign Office."

What Happened on Going to Room 138

So I found my way to the Home Office and told my little story all over again. Then I was informed that the office wouldn't be open for business till three, its hours being from eleven to one, and three to half-past four. It was then 2:30 and my engagement was for 4:30, and I didn't know how long it would take to straighten out my affair after I reached the proper authority, so I was about to postpone my visit to another day when the official said, "You might try room 138. It is only up one flight and they may possibly help you."

So up to room 138 I went and walked boldly in, (Concluded on page 27)

The Abode of the Illustrious Dead

Congressional Cemetery at Washington Where Statesmen and Heroes Rest

By TOM EVERRITT

THREE years after the laying out of the chief cemetery of Paris, that of Père la Chaise, in 1804, the Congressional Cemetery at Washington, District of Columbia, was laid out.

Congressional Cemetery derived its name from having been the burial place of Senators and Representatives who died in Washington during the early history of the government, or to whom memorial cenotaphs were erected. It was the parish cemetery of Christ Church, a Protestant Episcopal organization, that projected the enterprise on April 4, 1807, with the general idea in mind that those in humble circumstances could avail themselves of equal advantages with their more prosperous friends and neighbors.

An instance, showing that that idea did not miscarry, may be given when it is revealed that just a few steps from the grave of Elbridge Gerry, of Massachusetts, signer of the Declaration of Independence, and Vice-President of the United States, who suddenly died on November 23, 1814, while on his way to the Capitol, lies the remains of one of the humbler citizens. The epitaph on the venerable headstone, though somewhat illegible after more than a century's stand against the elements, reads:

"Here lies interred
WILLIAM SWINTON
Stone Cutter
who was an honor to his profession he was born in Scotland and died at Washington 11th. of April 1807 Aged 48 years."

Every phase of American history is written somewhere or other in this interesting spot.

George Clinton, of New York, Vice-President of the United States, who died in 1811, lies not far from Tobias Lear, whose aged stone slab is inscribed:

"Here lie the remains of
TOBIAS LEAR
He was early distinguished as the Private Secretary and familiar friend of the
Illustrious Washington
and after having served his country with Dignity, Zeal and Fidelity in many honorable stations died accountant of the War Department
11th. of October, 1816 Aged 54
His desolate widow and mourning son have erected this monument to mark the place of his abode in the
CITY of SILENCE"

Like gray hairs, old cemeteries are always venerable, and command the silent respect of thoughtful people. Congressional Cemetery is visited by few persons. It lies off the beaten track. Tobias Lear is, indeed, abiding in the "City of Silence."

The Congressional Cemetery. In foreground, cenotaphs in memory of Henry Clay, John C. Calhoun, and others.

The grave of Commodore Tingey, second in command to Commodore Stephen Decatur in the Algiers expedition, lies there not far distant from the monument erected to the unknown number of young women who were killed by an explosion in the Washington arsenal in the early days.

Probably the grave and monument in Congressional Cemetery that attract the most attention of visitors mark the resting place of a Choctaw Indian. When first known to the early settlers, the Choctaws occupied the area now visualized as the southern part of Mississippi and the western part of Alabama. When Louisiana was settled by the French, the Choctaws became their friends and aided them in fighting other Indian tribes. Through the vicissitudes of history and fortune, the Choctaws finally recognized the supremacy of the United States in 1786, by what is known as the Treaty of Hopewell. As far back as 1838, the Choctaws had a written constitution by which they governed themselves, and they possessed a regular judicial system and employed trial by jury.

"The Eagle of the Choctaws" served with General Jackson through the perils of Indian wars in Western Florida. The monument over his grave is described as follows: "It is a rectangular block of sandstone now dark with age, resting on a pedestal, and surmounted by a pyramid."

Frederick Rogers, midshipman in the United States Navy, who was "drowned at Norfolk, Virginia, 1828, while making efforts to save Midshipmen Slidell and Harrison, his friends and companions in life and death," lies buried just a short distance from the grave of Abel Parker Upshur, Secretary of the Navy, 1841, and Secretary of State, 1843, who died in 1844. Within the reach of a whisper, a broken column stands over the grave of Major General Jacob Brown, Commander-in-Chief of the United States Army, who died in 1828. The big and the little lie buried here.

Across the walk is the imposing monument to William Wirt, who was Attorney-General of the United States from 1817 to 1829.

Congress makes no appropriation for the upkeep or maintenance of Congressional Cemetery. Numerous burial plots are endowed by friends or relatives of the deceased. Considering its age, it is in splendid condition, and it is probable that, owing to its having received incessant care during more than one hundred years, the expense of maintenance is not great at this time, its area being about 30 acres.

Most of these old surrounding landmarks are now wiped out, and Congressional Cemetery, on the bank of the Anacostia River, becomes year by year more and more revered by the descendants of the great and obscure buried there.

Sapiro Was Not Invited to Speak

But His Speech to the Cotton Men Exceeded the Limit by an Hour and a Quarter

By JOHN MARSHALL

THE story of past and present efforts to organize the planters of the South in coöperative cotton marketing associations is an interesting piece of agrarian history. Broadly speaking, the American Cotton Association is entirely responsible for the movement. Although this organization, or local ones in which it had its inception, did not hold its first South-wide educational convention until May, 1919, it had already before that time, through prominent men connected with the movement, engaged in various activities which had in view general coöperation in the marketing, culture and distribution of cotton throughout the belt. The leaders of the May convention of 1919, who became active officials of the American Cotton Association, were drawn from men of outstanding influence and business success in farming, banking, merchandising and manufacturing in sixteen cotton-growing states. The fundamental principles and educational activities of the American Cotton Association were based upon broad and liberal constructive work for the benefit of the cotton growers generally, through *improved cultural methods for cotton*, economic reforms in *baling, handling, warehousing, financing and marketing* the chief product of the Southern States. These were legitimate objects; they indicated a desire to improve methods *within* the industry. But they were later widely abandoned in favor of a method which sought the desired benefits from *prices* instead of *efficiency*, as if *marketing* could overcome the defects of *growing* and *handling*.

A Pioneer of Marketing Associations

The first South-wide and largely attended convention of the association itself, after its formal organization, was held at Montgomery, Alabama, April 13–16, 1920. Among the leading constructive measures which received especial attention from the officials and delegates of the conference, were the subjects of the *better warehousing* of cotton and the forming of actual coöperative cotton marketing associations.

Up to this time no attempt, or definite plan, had been inaugurated from any source to organize the cotton farmers for coöperative marketing purposes. There had, it is true, been some tentative efforts made in this direction of a purely local nature in isolated communities in the Mississippi Delta and in Texas. The records show that the first actual cotton coöperative marketing associations ever organized and operated successfully were two purely local associations which were personally organized by Colonel Harvie Jordan, subsequently Secretary of the American Cotton Association, at Greenwood and Greenville, Mississippi, as early as 1911. The intervening years between 1911 and 1920 were largely devoted to occasional articles in weekly newspapers and by agricultural speakers indorsing in broad terms the economic principles of coöperative marketing as it had been successfully developed and applied in European countries, and among some of the citrus fruit and nut growers of California.

Aaron Sapiro Requests a Hearing

It was contended, by students of the American cotton industry, that raw cotton typified the most important as well as the most attractive staple agricultural product in this country, which could be successfully handled through the medium of coöperative marketing, *provided the organizations formed for this purpose should be wisely administered and strictly managed in the interest of the growers themselves.* The progress made in this direction was extremely slow because between 1910 and 1919 the Southern farmers had no well-defined educational association of their own.

The official program of the annual convention of the American Cotton Association, which met at Montgomery, Alabama, in 1920, specifically provided for the appointment of special committees on *cotton warehousing* and on coöperative marketing associations. On the subject of warehousing of cotton and high density gin compression the following nationally known speakers were invited to deliver addresses: D. S. Murph, Washington, D. C.; Honorable A. F. Lever, then of the Farm Loan Board, Washington; the Honorable Harry D. Wilson, Commissioner of Agriculture of Louisiana; Dr. B. S. Kilgore, Director of the Extension Service, at Raleigh, North Carolina, and the Honorable Joseph E. Ransdell, United States Senator from Louisiana. (Gin compression relates to packing cotton more tightly, thus making the bales smaller in size.)

Those who were to speak upon the coöperative marketing of cotton, and the formation of associations for that purpose, were the Honorable J. R. Alexander, President of the Arkansas Division of the American Cotton Association; the Honorable Hoke Smith, United States Senator from Georgia; Colonel W. B. Thompson, of New Orleans; the Honorable W. P. G. Harding, governor of the Federal Reserv Board at Washington, and the Honor able George Livingston, Chief of th United States Bureau of Marketing a Washington.

The official record of this progran and the personnel of the speakers wh were to constitute it are given her to show *that Mr. Aaron Sapiro had n place on it, and was as far as the record show not even specifically invited as delegate to the convention.* It is a matte of record, however, that he communi cated with the President of the Ameri can Cotton Association, who was t be the presiding officer of the con vention, requesting that he be given hearing. As a matter of courtesy J. S. Wannamaker, president of th American Cotton Association, finall gave him a position on the program fo a speech of thirty minutes in duration The brevity of time allowed calle forth much dissatisfaction and sub sequent protest by Mr. Sapiro.

As it subsequently developed Mr Sapiro and his adherents accomplished by one means and another, an exten sion of the time allowed him whic enabled him to deliver the very length address, a copy of which is now in th possession of THE DEARBORN INDE PENDENT.

On April 14, 1920, at a meetin of the Board of Directors of the Ameri can Cotton Association, the followin resolutions were adopted and ordere spread upon the minutes:

"We further believe that th greatest opportunity for constructiv service and actual results to the grow ers lies in the promotion of *bondin warehouses, elimination of weather dam age*, and in the solution of *problem peculiar to cotton marketing.* As th Federal Depart-

Concentrating on Local Bonded Warehouses

ment of Agriculture and our State Agri-culture Colleges and Experiment Stations with their extensive department and local farm bureaus are admirably fitted to handle the diversified farming problem and educational needs we should for the immediate future at least, *confine this association's attention to specializing on warehouses and to the problems peculiar to the profitable handling of the cotton crop.*

"That the business efforts of the association be devoted exclusively to cotton marketing and that the Association refrain from duplicating the activities of other farmers organizations, formed for other purposes, and worthy state and national services already organized, but that it coöperate with all such organizations and services.

"That this organization be urged to *center its entire plan and effort on local*

bonded warehouses where needed, local coöperative organizations for farmers, *to produce uniform types of cotton*, and utilize the warehouses, local paid classers of cotton and collective local financing and gradual and orderly coöperative marketing.

"That the Association in all of its branches use every power to *improve ginning, baling, handling and storing*, especially the problem of *better wrapping* and *protection against indiscriminate sampling* and the general improvement of the condition of the American cotton bale as it reaches the markets of the world.

"That the relations between local, County and State organizations with the National organizations be carefully defined and stated.

"The permanence of this association, not only in Arkansas, but in the entire South, depends upon the adoption of a definite program such as that here outlined."

It will be noted that here the predominant program was to improve methods *within* the industry. Marketing was not made the principal concern, as it is in the Sapiro system.

At a meeting of the Executive and Finance committees of the Association held at Atlanta, Georgia, June 2, 1920, the following action was taken as duly appears in the records:

"The Committee believes that the farmers would have to come more and more to place greater confidence in *their own local leaders* and *managers selected by themselves* and through *their own institutions* pool their products for mass sale in even running lots.

"The Committee feels that its final plan which will recommend to the American Cotton Association the development of local selling agencies as the Association's most prominent project through its county and State branches, will mark the beginning of the most prominent reform in cotton marketing in the South.

"In this plan, which will be announced to the public in June, all of the fundamental principles of real coöperative organization will be embodied.

Plan to Work Out a Marketing System "The plan will include such questions as voting power, patronage, dividends, pooling, collective selling and all of the other basic principles of coöperative business organizations upon which the success of organizations in other sections of the country has been founded."

Before the adjournment of the Board of Directors, April 16, 1920, in the session at Montgomery, Alabama, the following named gentlemen were appointed as a special committee to study, assemble and compile a constructive working plan for organizing coöperative marketing associations throughout the cotton states, and present their report to a called convention of the Association, for its ratification, in the autumn of 1920. The following is the special committee and its duties:

"At the first annual convention of the American Cotton Association held at Montgomery, Alabama, in April, 1920, the convention's committee on coöperative marketing submitted a report which among other things called attention to the uneconomic and wasteful conditions in methods of cotton marketing followed by producers; pointed out the desirability of producers marketing their cotton coöperatively; and recommended that the Association's committee on coöperative marketing 'work out a national marketing system for cotton' and report its findings to the Board of Directors by June 15, 1920; that the Board of Directors should then take preliminary steps for organization, as suggested, and for publicity regarding the plan proposed; and that a meeting of the Association be held during the fall, or early winter, of 1920, for the special purpose of effecting organization for coöperative marketing."

Men Appointed to Carry Out the Design The men appointed to carry out this design were as follows:

D. S. Murph, Specialist in charge, Division of Cotton Marketing Bureau, Bureau of Markets, U. S. Department of Agriculture, Washington, D. C., chairman.

S. G. Rubinow, Secretary of North Carolina Branch American Cotton Association, Raleigh, North Carolina.

A. F. Lever, Federal Farm Loan Board, Washington, D. C.

J. F. Duggar, State Director of Extension, Auburn, Alabama.

Bradford Knapp, Dean, College of Agriculture, University of Arkansas, Fayetteville, Arkansas.

Clarence Poe, editor, *Progressive Farmer*, Raleigh, North Carolina.

O. B. Jesness, Specialist in Coöperative marketing organizations, Bureau of Markets, U. S. Department of Agriculture, Washington, D. C.

J. S. Wannamaker, President of the American Cotton Association, St. Matthews, South Carolina, ex-officio.

Harvie Jordan, Secretary of American Cotton Association, Atlanta, Georgia, ex-officio.

L. L. Hardin, President, Bank of Columbia, Columbia, South Carolina.

F. O. Hooton, State Bureau of Markets, Montgomery, Alabama.

L. B. Jackson, Director, State Bureau of Markets, Atlanta, Georgia.

R. S. Wilson, State Director of Extension Agricultural College, Mississippi.

L. M. Rhodes, State Marketing Division, Jacksonville, Florida.

D. E. Lyday, President of the Texas Branch American Cotton Association, Forth Worth, Texas.

Adolph Felsenthal, Merchant, Camden, Arkansas.

Carl Williams, Editor, Oklahoma *Farmer-Stockman*, Oklahoma City.

C. M. Barnes, Farmer, Marston, Missouri.

Lem Banks, Farmer and Attorney, Memphis, Tennessee.

L. I. Guion, Farmer, Lugoff, South Carolina.

W. S. Stevens, Farmer, Phoenix, Arizona.

C. H. Teal, Farmer, Colfax, Louisiana.

T. O. Walton, State Director of Extension, College Station, Texas.

J. A. Thompson, Farmer and Banker, Corcianna, Texas.

These details have been given at considerable length to show the comprehensive nature of the plans originally formulated for the coöperative marketing of cotton in the South under the auspices of the American Cotton Association; and incidentally to show that while prominent men from all sections of the cotton belt participated in the original movement *Mr. Aaron Sapiro was not among them.* (But Mr. Rubinow was.)

The report which was formulated by the above named committee was unanimously adopted at a call convention of the American Cotton Association held at Montgomery, Alabama, on September 2, 1920. This constitutes the first comprehensive plan ever devised for the organization of coöperative cotton associations among the cotton farmers of the South. Its provisions contemplated making the county the unit, federated into statewide organizations. Several thousands of these reports were published, were distributed throughout the cotton belt and were called for as textbooks for use in teaching in agricultural colleges after approved and practical coöperative marketing methods. They were, as a matter of fact, used to a certain extent in almost every university and school of agriculture in every state in the Union.

Enactment of Favorable Laws Were Sought Preparatory to the educational campaign which the American Cotton Association intended to launch in 1921, in behalf of coöperative cotton marketing, that Association actively used its influences with the various general assemblies of the cotton states to secure the enactment of favorable laws for the organization of sound coöperative marketing associations. A great educational campaign was to be inaugurated and the Association was to be the driving power behind the publicity given the plans that had already been worked out as shown above for organizing coöperative cotton marketing associations in the various states.

This plan contemplated the control and handling, on the markets, of at least thirty-three per cent of any normal cotton crop in the South. There were to go with this, as before indicated, activities which contemplated *warehousing, financing*, building up membership throughout the belt and in *educating the producers of cotton in the most approved methods of cotton culture.*

(Concluded on page 23)

Pepys, Recorder of the Ordinary

Story of a Diarist Who Became Great Simply Because He Wrote the Truth

By CHARLES J. FINGER

ILLUSTRATED BY W. O. FITZGERALD

SOME essayist, Belloc perhaps, once expressed his wonder that certain things of the past had utterly and entirely disappeared, and gave his opinion that it was a tragedy that no one, except a few specialized students, ever recorded anything. And, when you come to think of it, few of us do. Events blaze out and we see, to forget immediately. New questions are astir, we are excited for a moment but make no note. We see great historical figures, an hour later they become dim as dreams. Old things that must soon be curiosities strew our path and we kick them aside for the scrap heap. An epoch-making invention bursts on the world and we accept it as we do the rising of the sun, careless as children. I know that in my years some wonderful inventions have changed the face of things, have created new industries, have changed the lives of men, yet, though blessed with a retentive memory, I should certainly make a colossal failure of an examination by which my first connection with them was sought. To be sure, as it happens, I can say with certainty when and where I heard my first phonograph and when I first saw a motion picture, because my memory happens to be stimulated, the attendant circumstances having been rare and the impression keen as though I had noted the fact in a diary. Thus, I first heard the phonograph on February 12, 1896, when a man with a wooden leg brought a clumsy machine fitted with ear tubes, to a rancho south of Buenos Aires and charged each of us there a dollar to hear three records. And my first motion picture was exactly ninety days later, for, fired with the showman's tale and description of the wonder, I went to Paris where Lumiere was exhibiting, and it took exactly that length of time to travel from the Argentine pampas to the French capital. But when it comes to my first experience of other things far more important, I am all at sea, lost, very foggy and uncertain. Nor are most men much better off.

Consider a moment. The consideration will help to a better appreciation of old Pepys. Imagine a questionnaire with some such queries as these: "On what date did you see your first airplane?" Or: "When did you first taste an ice cream cone, a banana-split; and what were your sensations?" Or: "Under what circumstances and when did you listen to a radio for the first time?" Or: "On what day and month and year did you first ride in an automobile? What was the make? Who were your companions? To where did you go and at what speed?" Or: "When did you first receive or send a wireless message?" Or: "What was the date of your first use of the typewriter, the dictaphone, the camera, a paper cup, a safety razor, liquid soap?" Or: "Describe your emotions when you first saw a carpet sweeper used, and state the name of the operator." Yet each and every one of these inventions listed, and thousands more, were unknown when men now of middle age were children. Most certainly before such a list of questions I should sit dark and gloomy, my only consolation being that millions of my fellow men who strongly and earnestly hold to the belief that they are exceptionally observant would be quite as easily crushed and confounded as I in similar case. Unfortunately, so many of us do not take in the significance of what is happening at our doors.

"I did step back and clap my breech to our pew door, that she might be forced to shove me to come in."

Naturally, in so careless and unobservant a world of men, he who does take note of the familiar things soon becomes one to whom we lift our hats. Old Holinshed, for example, who wrote of Elizabethan England and the price of corn, the food men ate, the clothes they wore, the pewter dishes they used—the writer of the Paston letters in the days when the War of the Roses raged—the shrewd and authoritative Evelyn—Judge Samuel Sewall of Boston with his diary not intended for publication—the writer of the Fugger news-letters—Wilfred Scawen Blunt who set down his impressions of men with unparalleled directness—Henry David Thoreau who told with particularity of his bean patch and his shanty life and his week on the Concord—but, in the forefront of them all, Samuel Pepys, son of a tailor, public servant, man about town, member of Parliament, author of a romance and a book of travel and a couple of songs and writer of the wonderful diary, witness of scenes in Restoration days when London burned and the plague raged—no one approached him in the vivid using of the very stuff of life. For what did he not record? Anything and everything. The absurd and the picturesque. The important and the trivial. Historical events and ludicrous incidents. The doings of men and their ways, manners, customs, and all set down without decorative tricks. Honestly amused with life, all was fish that came to his net. Wipe out the literature of his day and from his diaries it would be easily possible to reconstruct his contemporary world. Through him we know more of English society than from the histories of his time.

Samuel Pepys was like an observant traveler in a new land, one for whom nothing was unimportant or conventional. At times he rings out like a voice of joy and health. Each day he faced with a certain zest and a clear intention to constitute himself recorder

"Hearing of a new game called Pelemele, a sort of croquet, he has to hurry in the early morning to see it."

for posterity. Everything had to be set down in black and white even though it was a record of his own boorishness, or his whimsical or childish conduct. Thus, when a certain gritty and irritating Mrs. Markham loomed on his horizon, he sets down this entry: "To church, where I stood, in continual fear of Mrs. Markham's coming, and offering to come into our pew, to prevent which, soon as ever I heard the great door open, I did step back, and clap my breech to our pew door, that she might be forced to shove me to come in." Or, throwing chivalry to the dogs at another time: "To Mrs. Pierce's by invitation to dinner, where I find her painted, which makes me loathe her, and the nastiest poor dinner that made me sick."

Everything mattered, everything had to be set down: that he bored a spy hole in the wall so that he could see what was afoot in the next office; the prevailing fashion; his hearing "a very lewd song," with the name of the singer; that he learned to shave himself on a certain day; that a dull stranger in church "preached like a fool"; that the shoe mender left in his shoe a hole larger than that which he was ordered to repair; that on March 1, 1662, his household went to bed "without saying prayers it being washing day to morrow"; that he could not kiss a relative because his lips were sore from riding in the wind; that he stood looking at my Lady Castlemaine's laced petticoats on the wash line; that his wife powdered her hair, which "did make me so mad that I spoke not one word to her though I was ready to burst with anger"; that government officials sat "lolling with their heels upon another chair"; that he bought a nightgown for his wife. In short, he recorded the commonplace and the commonplace became the exceptional. He wrote of ordinary things and before long the ordinary became the extraordinary, so the diary is a mighty mine of material for contemporary history.

But Pepys was more than a mere recorder. He was one of those rare souls determined at all costs to make of life a frank and pleasant business. The oddities about him fascinated him. The peculiarities of those he met delighted him. Like a wise man he sought pleasant company, and like the pilgrim in the romance "when he awoke he sang" because every day was a new day full of golden prospects and crowded with possible adventure. Did he hear of a new thing, nothing would do but that he must see and experience for himself, then as promptly as possible set down in plain, unvarnished language what he saw; and, be it said, sometimes the passion to record exceeded the passion to see, as when he could not tear himself away from his diary to go to the place where was a firework display. But away from his book and pen he was all for grasping experience firmly.

"His wife seems to mind nothing but the dancing master, having him come twice a day, which is folly."

At a time when the new drink called *tee* was so rare and costly that, according to the *Quarterly Review*, two pounds and two ounces were formally presented to the king by the East India Company, Samuel Pepys, at the time husbanding his resources with somewhat meager economy, had to taste. "I did send for a cup of *tee*, a China drink of which I had never drank before," he writes.

Hearing of a new game called Pelemele, a sort of croquet, he has to hurry in the early morning to see it.

Was there a public execution, he had to be present, hurrying to be in time, hurrying back to record his impressions not without a suspicion of grim humor. Thus: "I went to Charing Cross, to see Major-General Harrison hanged, drawn and quartered; which was done there, he looking as cheerful as a man could in that condition." Learning that the body of a highwayman hung in chains, he drove to the place of the gallows with a lady friend to see the sight, expressing his horror that "the flesh was shrunk to the bones." For a certain curious morbidity was his sometimes, as revealed in the entry telling of the Scarborough party when the host took his guests "to see the body of a lusty fellow that was hanged for robbery." Pepys writes: "I did touch the dead body with my bare hand; it felt cold, but methought it was a very unpleasant sight."

"At night, I took much pleasure to have the neighbors come forth into the yard to hear me."

Any tale of wonder sends him off into excitement. For example this: "I heard of one Damford, a black man, who did scald his beard with mince-pie, and it came up again all white in that place, and continued to his dying day."

Sandwiched between such extraordinary entries are others affording glimpses of the life familiar, as that his wife, "making of pies and tarts to try her oven with, but not knowing the nature of it" managed to "overbake her things." He adds quaintly, "she knows how to do better another time." That remark means much, for Saintsbury the critic, who had an eye on the table, could have been no more fastidious than Pepys who is forever praising or condemning a meal. Hear him on one occasion when he falls into a kind of rapture at what seems to be a Gargantuan meal for a modest household, though everyone seems to have plyed a good knife and fork in those days: "Home from my office where my wife had got ready a very fine dinner—viz: a dish of marrow bones; a leg of mutton; a loin of veal; a dish of fowl, three pullets and a dozen larks all in a dish; a great tart; a neat's tongue; a dish of anchovies; a dish of prawns and cheese." At other times he praises to the skies "a noble dinner and a fine merry walk with the ladies in the garden"—lists the things packed for a picnic meal—dines twice in one day when invited. As to the other side, one hostess was placed under his ban and denounced because a calf's head was overdone—his wife was rebuked on a Sunday because a "sawce" too sweet was poured on the meat, and he adds "I was angry at it, and eat none, but only dined on the marrow bone that we had beside." Then there is a certain iciness of reflection on another day: "At dinner I was very angry at my people's eating a fine pudding made for me by Slater the cooke," and again when the quality of the home cooking falls off because his

Jewish Interpenetration of England

Isaac of York Would Probably Be a Member of the Peerage These Days

By PAUL TYNER

—London, April, 1925.

I HAVE not looked up the matter in the latest Debrett, but I am certain that there are today a score or more Jews in the House of Lords. For a little while past, I have been checking up the joyous emergence of Jewish names in the chronicles of the "Upper Ten." I noted that the Prince of Wales was host of His Excellency, Sir Gordon Guggisberg and Lady Guggisberg, better known in London as Decima Moore, the musical comedy star, Sir Gordon being governor of the Gold Coast. In this connection it is also to be noted that the Princess Marie Louise, granddaughter of Queen Victoria, went to the Gold Coast, where she was the guest of Sir Gordon and Lady Guggisberg. The latter accompanied the Princess on her return to England in May, when Lady Guggisberg resumed her control of the Gold Coast section of the British Empire Exhibition at Wembley.

The Rothschilds as Scions of the Nobility

About a year ago the Prince of Wales acted as best man at the marriage of his cousin, Lord Louis Mountbatten, to Miss Ashley, Jewess and a niece of the late Sir Ernest Cassell, the richest heiress in England.

In a list of the guests at a recent wedding of two conspicuous scions of nobility one finds in curious proximity the names of Mrs. Leopold de Rothschild and her sister, Mrs. Arthur Sassoon; Lord and Lady Stanley and Captain and Lady Victoria Bullock. The last-named lady is the daughter of the Earl of Rosebery and his late wife who was Hannah Rothschild, daughter of Baron Mayer Rothschild. Lady Victoria was first married to Lord Stanley, son and heir of the Earl of Derby, but divorced him a few years ago.

Speaking of the Rothschilds, it comes to light that Almina Countess of Carnarvon, widow of the discoverer of Tut-ankh-amen's tomb and wife of the Colonel Dennistoun who figured in a recent very sensational and unsavory trial, received her magnificent town house in Seamore Place, with its glass gallery overlooking Hyde Park, as a legacy from the late Alfred de Rothschild and with it a considerable fortune. It will be remembered that the lady testified during the trial that she sold several famous pictures from this Rothschild collection for some $600,000 and deposited the money to Dennistoun's credit "to give him a feeling of independence and dignity." The Dowager Countess is not, be it observed, among those who have passed the gates of the peerage by way of the musical comedy stage. On the contrary, she is related by birth to a number of members of the peerage, being a Wombwell and a relative of Julia Countess of Dartrey.

Mrs. Leopold de Rothschild, we are informed, has given up Gunnersbury Park, her beautiful place on the banks of the Thames near Richmond, and is entertaining week-end parties at Ascott, her country place near Leighton Buzzard. Among her recent guests have been the Earl of Balfour, Lord and Lady Carlisle, the Countess of Desborough, Lady Derby, Lord Hugh Cecil, and Sir Robert Horne.

An approaching wedding among titled Jews which will join two enormous fortunes is that of Miss Violet Levy, daughter of Mr. and Mrs. Walter Levy and granddaughter of Lord Bearsted, with the Honorable Stuart Montagu, eldest son of Lord Swaythling, head of the house of Montagu, of which the late Edwin S. Montagu was a conspicuous member. This Montagu was the Secretary of State for India and was responsible for the "Reform Act" for the government of that great empire which has stirred up so much trouble and unrest among the inhabitants. Lord Bearsted, who will give the bride away at the wedding which will take place in the West London Synagogue, is better known as Sir Samuel Samuels, the Rockefeller of England, having engineered the big petroleum combination that takes in Shell's, the Anglo-American, the Anglo-Mexican, and the Anglo-Persian companies. The Queen has sent an Oriental lacquered writing box as her gift to the bride and there will be six bridesmaids. Lord Bearsted recently returned from a visit to his co-racial, the Viceroy of India.

Some Other Banking Families Attain Distinction

The death of Dr. Ernest Joseph Schuster, K. C., LL.D., revives memory of his brothers the bankers, Sir Felix and Sir Arthur, whose loyalty was questioned during the war, a demand being voiced in the House of Commons for the canceling of Sir Felix's name from the members of His Majesty's Privy Council. Under fire, he removed his residence for the time being to New York, where a branch of his banking firm is conspicuous on Wall Street. The elder brother who has just died was a man of high character and wide influence. Retiring from the banking firm of Messrs. Schuster, Son and Company, in Cannon street, of which he had long been managing partner, he took up the study of the law and in time won the distinction of the silk gown of a King's Counsel. He was an able pleader and figured in many important cases involving fine points in corporation law, retiring from the bar a few years ago with a high reputation and a considerable fortune. The property disposed of in his will is valued at about two million dollars and will pay about $250,000 in death duties to the government. The style in which he lived and his generosity to those who served him are indicated by bequests of from £10 to servants less than two years in his service to £100 each to those who had been ten years or more with his family, with annuities of £50 to two superannuated servants formerly in his employ. After a few other personal legacies, the large residue of the estate goes to the widow. Dr. Schuster was a member of the Council of the International Law Association and lately legal adviser of the British Government on the Dawes Report.

A Doctor of Laws from Cambridge

Another Jewish banking family of enormous wealth that has a place in the limelight is the Wertheimers. Under a bequest of the late Asher Wertheimer, no less than eight portraits of himself and members of his family painted by that genius among American artists, John Sargent, now have place in the National Gallery in Trafalgar Square. Of course, it is the name of Sargent that they perpetuate, rather than that of the House of Wertheimer, yet the nation may well be grateful for a legacy that gives it so many examples of an artist whose works will now become priceless.

James Loeb, of New York and London, partner of Otto H. Kahn and of the late Jacob Schiff and of Paul Warburg in the international banking firm of Kuhn, Loeb and Company, was given the honorary degree of Doctor of Laws a few days ago by Cambridge University. The honor was in recognition of his service to literature in furnishing the funds for carrying out the fine idea of the now famous Loeb Classical Library which brings the finest translations of the rich treasury of Greek and Roman classics within the range of English readers of even slender purses. The published volumes in this library now number nearly 300 and none of them probably pays the cost of production by its sale—although it is possible that the Loeb heirs will one day find themselves additionally wealthy from the profits on the translations of Homer, Virgil, Caesar and Catullus.

Mr. Loeb, it is said, divides his leisure between translating the classics and collecting antique bronzes and terra cottas.

Advocates of a revival of the influence of the classics in modern education hail Dr. Loeb as a public benefactor in that his library of text and translation must bring extended study of the humanities within the scope of thousands who had hitherto lived without knowing their wisdom and beauty. It is pointed out that this benevolence is especially timely, in that the place of the classics in education has more and more tended to become crowded out. During the last generation or two, the field of learning has been so extended, and concentration on the problems of our rapidly developing civilization has been so intense that one of the undermining dangers of our age of innovation and experiment is an impatience of tradition, due generally to ignorance of the past. We are reminded that tradition is the great steadying power of democracies: a sense of the continuity of human progress its main bulwark against a hasty flying to extremes.

One Who Became Viceroy of India

While the classical library to which he has given his name would probably have been impossible without the million which Mr. Loeb has expended on it, and he claims the credit of inception of the idea, it is recognized that the library owes very much of its success to its three very competent editors, Drs. T. E. Page, E. Capps, and W. H. D. Rouse, all Christian scholars of the highest standing—the first named being the especially famous and loved Master of the famous Charterhouse School for thirty-seven years. Otto Kahn himself has come into the charmed circle of Mayfair by the marriage of his daughter to Lord Fermoy.

Rufus Isaacs, Earl of Reading, Viceroy of India, formerly Lord Chief Justice, of England, Attorney-General and Special Ambassador to the United States, is home for a conference with Lord Birkenhead, Secretary of State for India. The official announcement of his visit declares that Lord Reading is invited to come to England for a short leave, not exceeding four months, "in order to secure an opportunity of personal discussion with the Secretary." Delhi dispatches indicate that the Viceroy's mission to England is connected with the report of Sir Alexander Muddiman's committee on the proposed reforms. Sir Geoffrey Montmorency, the Viceroy's private secretary, prepared the way, and during the early summer the governors of Burma, Bihar and Assam with Sir Basil Blackett, the finance member of the committee, will visit England. It seems probable that deputations from various political parties in India will also come to London to place their respective cases before Lord Birkenhead.

Wnen Lord Reading was appointed to the viceroyalty, it was expected that he would clean up the mess into which the policy of his tribesman, Edwin Montagu, had thrown the country. Instead, it seems to have grown worse. It will be remembered that he owed his appointment to Lloyd George, then Premier, and that Lloyd George was notoriously under the influence of and in close and constant association with Sir Philip Sassoon of the family that controls the banking and trade of India and which is closely connected by marriage with the Rothschilds. Lord Reading and his brother, Godfrey Isaacs, are well known also as the controlling spirits in the Marconi Wireless Company and its numerous international subsidiary companies and interests. The "conferences" which will occupy the Viceroy's attention during his brief leave of absence in London may not be confined strictly to "government business," in view of the large financial "interests" demanding the aid of his legal astuteness.

American readers will get an idea of the "big money" represented by Solly B. Joel, when it is mentioned that his wealth, drawn from the South African diamond mines, about equals the fortunes of the four Big Bonanza magnates of old days, Mackay, Fair, Flood and O'Brien, rolled into one. Now one of the keys to social recognition in England is to win the Derby, the blue ribbon of the turf. That seems to be Mr. Joel's chief ambition. He runs a costly stable, is ever ready to pay fabulous prices for possible Derby winners and secures the services of crack trainers and jockeys quite regardless of expense. He is a prominent figure at all the big races and has won many of the minor events already. He lives in a palatial million-pound mansion on Park Lane and has a luxurious summer place near Brighton where the crowd gathers during the bathing hour to see one of his footmen giving his bull-pups their morning bath in the surf.

Is a Daring Speculator on the Exchange

On the Stock Exchange, he is one of the most picturesque and daring speculators. His interests, indeed, are wide and varied. The latest report concerning him is that he has obtained a concession from the Egyptian Government to establish a rival to the Casino at Monte Carlo in the Heliopolis Hotel near Cairo. The other day, he figured as best man at the wedding of his colleague, Jack Clifton Solomon, a stock broker who was married to Miss Phyllis Drayson, daughter of a well-known pearl expert.

A romance of the sudden rise of Barney Barnato to enormous wealth was revived by the recent suit brought in the Chancery Court recently against Solly B. Joel and his brother, J. B. Joel, by Captain Woolf Barnato, son of the famous Barney and nephew of the late Woolf Joel, under whose will he received £250,000 and, as he claimed, a share of the profits of the firm of Barnato Brothers in which Woolf Joel was a partner. Solly and J. B. Joel were appointed executors and trustees under Woolf Joel's will. The action was a purely formal one brought to get the sanction of the court for the final disposition of the enormous fortune involved and it was settled amicably.

The Barnato Brothers and the Diamond Mines

The settlement may be regarded as the dénouement of a drama in real life as sensational as any film romance. Here is an outline of it:

About fifty years ago two young Jews, sons of Isaac Isaacs of London's ghetto, went to South Africa to seek their fortune. They landed in the pioneer days of the great diamond rush that culminated in the boom when fortunes were made and lost in a day. The two brothers, Harry and Barney, once in the new country, adopted the surname of Barnato and became the founders of the colossal Barnato fortune of which the magnificent marble palace in Park Lane, which served as a convalescent home during the war for American naval officers under Red Cross auspices, today serves as a vivid reminder. Barney Barnato, a picturesque and romantic adventurer, worked like a slave when he reached South Africa, living like a Kafir, trading where he could and concentrating on the future. Saving and scraping, he soon got together a few thousand pounds with which he bought up four claims in the Kimberley Mine. The firm of Barnato Brothers in Kimberley, with a branch at Johannesburg, soon became famous, the business growing and prospering and its ramifications extending until it was pulled up sharp by running across the interests of Cecil Rhodes. Then followed a battle of giants for the control of the De Beers mines. Rhodes, supported by the Rothschilds, won the day, but Barnato gave way only on terms that insured for his partners and himself a very valuable interest in the great diamond monopoly.

With all the responsibilities and the wear and tear of his business struggles, Barney Barnato remained a light-hearted and genial soul and was immensely popular among the miners and gamesters, many tales of his generous prodigality being still told in Johannesburg and other South African centers. But tragedy was dogging his steps. He had made enemies and began to worry and suffer from fits of depression in which he imagined that foes who envied his success were plotting against his life. On a doctor's advice, he decided to return to England for the change and sea voyage and he sailed from the Cape in June, 1897, being then only forty-five years old. But he was not destined to reach England alive. One night,

worn out with his real or imaginary worries, he threw himself overboard.

Hardly had the echoes of this sensational ending died down when a second tragedy followed. The Barnatos had three young nephews whose careers were closely allied with those of the firm. They were Jack Barnato Joel, Solomon Barnato Joel and Woolf Joel. It seems that a certain Dutch-German miner named Van Veltheim, harboring a grievance against the Barnatos, followed members of the firm about the streets of Johannesburg, jeering at them and threatening them. On a spring day in 1898, Van Veltheim suddenly appeared at the offices of the Barnatos. Before any one could stop him he whipped out a revolver and shot Woolf Joel dead. Thus two members of the firm had fallen victims to tragic deaths within a year, the first leaving a fortune of more than five million dollars and the second about a million.

Some Who Made Fortunes in South Africa

Harry Barnato died in 1908. Although never so spectacular a figure as his brother Barney, he was equally brilliant in business and at his death left a fortune of more than $25,000,000. Of this he left about one-fifth for the relief of suffering in memory of his brother and his nephew. The wealth of the Barnatoes then went chiefly into the hands of the two surviving Joel brothers—"Jack" and "Solly," as they are commonly called. Today, they are princes of London finance, conspicuous on the turf and widely popular in certain sets. They can hardly vie with the Rothschilds, the Montagus, or the Solomons; but they are in the big ring for the control of the cotton trade. Solly B. Joel a year or so ago managed to organize a combination that obtained control of some thirty cotton mills in Lancashire to match the Sassoon's control of Indian cotton. Not long afterward, he secured control of London's great underground system. It is said that the Rothschilds have a respect for Solly Joel's financial genius since the time when his uncle and tutor in the game of high finance came out of the tussle with Cecil Rhodes the richer by a fat wad of Rothschild money. The next move on the boards will probably be an alliance between the international Jews already controlling 90 per cent of the raw cotton of the world and those controlling the mills which work up that cotton into cloth—be they in Lancashire, Germany, India, or the United States.

Then They Are in the Paper Business

Two very highly respected Jews in London are Viscount Burnham, editor and owner of the *Daily Telegraph*, and R. D. Blumenfeld, editor and part owner of the *Daily Express*. Both are genuine working newspapermen and *hard* working at that. Just now Lord Burnham is being particularly applauded from one end of the country to the other for his successful arbitration of a long standing dispute between the teachers of the national schools and the government in which his rare combination of brilliancy in ideas and practicality in action is well exemplified. Both men are extremely popular with the rank and file of the men who do the work of making the London papers, both writers and printers. As chairman of the Press Fund, Burnham has for years endeared himself by his interest in the welfare of the journalistic fraternity and in the pensioning of those aged veterans worn out in the service of the profession. Son of the founder of the *Daily Telegraph* whose name was Frederick Levy, to which he added the name Lawson, Lord Burnham has from the first steadily increased the prestige and value of the paper. Started as a penny paper and inclined to the sensational—it will be remembered for the successful stunt of its symposium on the question, "Is Marriage a Failure?"—it has developed into a model of substantial and serious dignity and commands very large influence for its excellent news service and the high character of its special literary articles, as well as its stately editorial leaders. It raised enormous sums for war charities by popular subscription and is well to the front in philanthropic and educational movements.

Lord Burnham's hobby is rifle shooting and as colonel of the London Rifle Brigade he has done much to develop the marksmanship of the various corps in the metropolis. He has not gone through the farce of "conversion" to Christianity and remains a good Jew in his religion. He has not much use for Zionism.

Blumenfeld of the "Daily Express"

Blumenfeld is popularly known as "Bloomy" and he began his career on the *Daily Express* when that journal was owned by the late Sir Arthur Pearson. He had previously served on the staff of the *Daily Telegraph* here and some twenty years ago was well known in New York, where he was for a time managing editor of the New York *Times*, having previously put in an apprenticeship on the *Sun*, under that Nestor of American Journalism, the late Charles A. Dana. The *Sun* office in those days proved an ideal school of journalism and its graduates have been among the stars of American newspaperdom. When Lord Beaverbrook bought control of the *Daily Express* he had sense enough to retain "Bloomy" and practically gave him *carte blanche* to run the paper as he saw fit. His confidence has been abundantly justified. Gradually new ideas were introduced, Mr. Blumenfeld adapting the best features of American journalism to the English mentality and making it a truly live sheet. It is now a formidable rival both in circulation and advertising to Northcliffe's paper, the *Daily Mail* and probably wields a greater influence on public opinion. In his efforts to make the *Daily Express* a truly up-to-date newspaper, Blumenfeld has had the active support and collaboration of Lord Beaverbrook who, as Max Aitken, came to England with a reputation as a brilliant working journalist, reporter, special correspondent and editorial writer. His ability in this field led to his appointment as official "Eye Witness" with the Canadian Forces during the first two years of the war and to the recognition of a knighthood.

A Successful Experiment in Journalism

Max Aitken, incidentally, had made several million in a big cement deal which laid the basis for the present International Cement Trust. He was selected by the Coalition Government (being a Conservative) to organize and conduct its widespread press propaganda and soon had his finger on the effective distribution of news and opinion for the vigorous pushing of the war throughout the British Empire and possibly in other lands. He certainly established a remarkable solidarity of interest, policy and action among the thousands of papers of Britain and the Dominions, and this continues in the form of the Imperial Press Association formed by Lord Beaverbrook at that time. Although a Conservative—the son of a Presbyterian minister in Ontario—he does not hesitate to criticize sharply and lucidly certain policies of the present Conservative government—notably the Palestine and Mesopotamian adventures and the neglect of Canadian and Australian interests. He is a strong imperialist and a relentless foe of the Zionists, although rather favorably disposed toward the Jews in other respects. Both Blumenfeld and Beaverbrook are ardent Free Masons—of the British type.

It had long been a tradition of English journalism that no reputable daily could publish a Sunday edition. It had been tried once by Lord Northcliffe and scored a failure. But the Beaverbrook-Blumenfeld combination solved the problem by issuing as a separate paper the *Sunday Express*, which, after trying and abandoning experiments in the distinctly American features of colored supplements and other supplements, has scored a decided success under the able editorship of James Douglas, the brilliant writer and editor of Cadbury's evening paper, the *Star*, from which Blumenfeld lured him by a princely salary and freedom to discuss philosophically but popularly the big sensations of the day in the shape of murder trials, divorce cases and the eternal questions of ethics and esthetics.

Seen in Old Cairo

Where Soap Is Rare, But Flies Are Plentiful

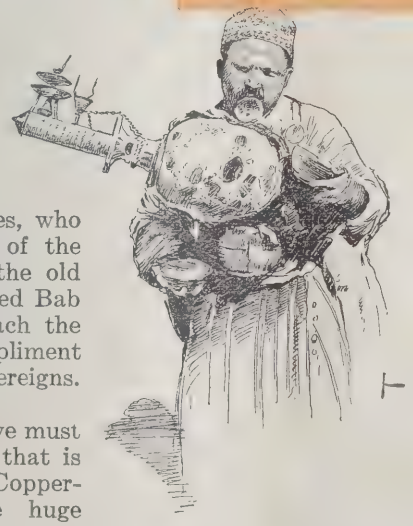
By WILLIAM H. WORRELL

IT IS one thing to buy a ticket for Cairo and follow the trail of tourists to the threshold of palatial hotels near the Ezbekiyyah Gardens. It is quite another thing to secure any contact with the natives of Cairo, and learn anything about their language, and their daily life and habits. Where soap and safety are, there you will learn nothing. So good-by to both, and a plunge into the eastern half of the city where, except for occasional signs of a sewing machine company, nothing much has changed since the days of Saladin.

But this heroic resolve is not enough. We are willing to live in Old Cairo, but the denizens of Old Cairo do not want us there. Why not? Because it is difficult for us to "legitimize" ourselves. We might be spies of the "Ingleez," the English. We might be thieves. We might have designs upon the domestic peace of impeccable Moslem families. We wear a hat, which shows that we never pray, for when you pray you must keep your headgear on, and touch the ground with your forehead. You can only do that with a turban. So we resort to a stratagem.

Old Mosques, with domes and minarets, as if in the "Arabian Nights."

We know a missionary, who knows a man in the Bureau of Religious Endowments, who has neither beliefs nor prejudices, who knows the sheik of the quarter near to the old gate which is called Bab en-Nasr. We reach the sheik with a compliment and a few sovereigns. Open sesame!



We find that we must go up the street that is called the "Coppersmiths', " where huge kettles and little saucepans are being beaten out by hand, to the accompaniment of droning songs. Here and there is a "whitener," who tins the inside so that they may be safely used for cooking. We turn into a little side street, very dark, with sharp beams of sunlight piercing the dusty air; for the houses are built out over the street until they nearly meet in places. The streets were never laid out; they just "came to pass."

At the corner is a grocery with a telephone. That is reassuring. We are introduced to our host. A bachelor is a menace to the neighborhood, and to take hire for hospitality is a disgrace; but terms are struck, and we enter. On the ground floor we find heaps of kerosene tins, broken furniture, worn-out baskets, discarded clothing: about what we should see on a vacant lot in a badly managed American small town. On the second floor lives the family. In passing upstairs one must clatter with his heels and call out "destur," "permission," so that the womenfolk may scuttle for cover and not be seen of men. In the third floor we take up our abode.

There is no furniture. We sleep on our own little mattress, covered by a canopy of cheesecloth to exclude the vermin. All the glass in the windows is broken, and covered with cobwebs, and darkened with wooden latticework. Below there is a courtyard where they keep a goat tethered, and where they throw their dishwater. We cook on a patent Swedish oil stove. The vermin crawl into the food if we do not eat it hot. They crawl in the cracks of the flagging on the floor.

We sleep with one hand against the canopy, and next day must have the hand dressed by a doctor. And then of course there are the flies, which breed without limit in this winterless land. They cover the food, the filth, the orbits of the sore-eyed children. To sleep one must roll up in a blanket, head and all. To brush them away is considered an attention beneath the dignity of mankind. Their origin is traced to the Biblical story of the Plagues.

To escape the insects of the house we seek the street. On the way downstairs we run into a woman of the house, without her veil. She drops the tub which she has on the head, and throws her skirts up over her head. She pours out upon us a torrent of abuse. We flee into the street, very much disturbed about the possible consequences of this encounter. We pass the little grocery. One of the young men approaches us and salutes. He speaks good Arabic and even a little English. He once studied at the American Mission. He is sympathetic. We tell him of our trouble. He laughs. Together we seek out my landlord, lolling in front of his tiny shop. He listens indifferently. We gather that he will attend to milady when he returns at night. But meanwhile we seek other lodgings.

The crowd of loungers in the corner grocery proves to be extremely interesting, and we learn a lot of things, of which I cannot here tell you more than a tenth part.

Do I know the art of palmistry? Certainly! A tall Nubian with a shiny frock coat and gold-rimmed glasses shows me his hand. I see that I am successful in my reading. He is amazed, and confides in me that his wife is possessed of a demon who speaks out of her mouth in a coarse masculine voice, demanding clothes and jewelry, and refuses to be appeased until these have been bought. How can he drive out the demon? Later we learn that such women hold nightly meetings in deserted houses, cultivating familiarity with such demons, to the music of tom-toms.

Everywhere and always one has to fear the "jinn," the mischievous spirits. That chicken over there, with queer feathers, is a transformed "jinni." We must not whistle for fear a cobra will come, a "jinni" in disguise again. Every stray dog and bob-tailed cat is suspected. Every ruined house is peopled by them. You meet them in the desert near the Pyramids. If you shoot one, in the proper way, of course, he shrivels up until he looks like an old shoe. You must not run headlong or throw things at random, for you might hit an invisible "jinni." A crazy man is "majnun," "possessed of a 'jinni.'" Midnight and midday are the worst times for such attacks, especially of the kind that is called "ghul."

Then there is the terror of the "eye," the evil eye of curiosity or envy. You must not stare at anyone, or admire anything, unless you pronounce a blessing at the same time. Some people have an eye that brings everyone bad luck, in spite of all they can do. So one must conceal one's wealth or beauty or good fortune: "Death loves a shining mark," as we say. To avert the effects of "the eye" one must wear an amulet, inscribed with strange signs and verses from the Koran, or at least learn some spells and verses for this purpose.

Everywhere, with the good and the bad, religion reigns supreme. The old man who keeps the coal and wood yard, who even takes orders by telephone, has for three nights past taken a violent spiritual purging by hiring a blind reciter of the Koran to sit up with him over a charcoal fire and "admonish" him of his sins and of the torments of Hell. He drinks coffee, smokes cigarets, beats his breast and weeps. A hundred times a day some beggar will ask for alms. The reply is, "I commend you unto Allah," or "God give you a reward."

Then one usually has to give something; but if not, one must risk the curses of the poor which are like poisoned arrows. Anything so given is a gift sent ahead to heaven. For that reason thanks are not desired, as they are part payment for the alms, and diminish the balance on deposit above. Nothing is stated positively without the qualifying addition, "But God knows best whether it is true or not." Nothing is promised without adding, "If it please God."

Egypt is the refuge of invalids from other countries, but it teems with disease among its natives. Probably not 5 per cent of the population has normal eyesight, and most Egyptians have only one good eye. The other one is generally held to be a kind of "spare tire." If you use that up, as many do, it is merely your fate, not your fault. There are many one-eyed men working on the railroad. Most of the hospitals specialize in eye diseases. The rimless headgear, the sand and dust, and the dazzling sunlight are partly to blame. The Egyptians have good teeth, however.

Along with the fatalistic stoicism of the Egyptians there is a strange dullness to pain, either of the mind or the body. One night we heard a dreadful powwow of lamentation in an upper room. A child had died. Its body was prepared for burial by friends who had to fight with the parents to keep it from their embrace. Three or four days later we expressed our sympathy. Said the father: "It was decreed by Allah. It had to be. Life is very sad, and it may be better to die than to live. Besides I have many more children, and enough are left for me to feed."

Picture to yourself then modern Egypt with two large cities, Cairo and Alexandria, a number of small ones, quite similar in their life and habits, and a multitude of tiny villages. That is the country which has secured its independence from the wise direction of Great Britain. That is the most important land of the great Islamic world. That is the present condition of the people of the Pharaohs, and of the civilization left them by the Arabs.

Mechanical Toys Not Modern Invention

ACCORDING to Sir David Brewster, in his *Letters on Natural Magic*, a French mechanic made a wonderful toy for the infant who became Louis XIV. It was a small coach drawn by two horses, and in the coach sat a little lady, while a coachman sat on the box seat and a footman and page stood behind. The inventor of the toy, M. Cadmus, wound up several springs then set the toy on a table. The equipage moved round the table in an oval course and halted before the young prince. Then "the page descended and opened the door, the lady alighted and presented a petition then reëntered the carriage. After a short time the page closed the door, mounted beside the footman, and the coach made the tour of the table again."

Millions for Music— Few Results

(*Concluded from page 8*)

Thousands of children who attain the shaky eminence of a reasonably secure technique in music lose that knowledge.

When the musical education ceases, the taste degenerates through inaction and apathy. A rough guess might place the average musical education of American children at a duration of four years, during which at least one hour a day is devoted to practice. Four years of even careless practice produces in impressionable youth a foundation upon which, in many cases, the magic of a virtuoso may be built in later years. The average boy stops taking music lessons when his other school lessons demand more of his time. Let us place this point at the end of the second year of high school—a rather generous allowance.

The cessation of enforced practice begets a revulsion against music. For weeks and perhaps months after he stops "taking lessons" the average boy will not touch his piano, or take his bow in hand for even a few minutes exercise. He forgets. It is easy to forget things learned very much against one's will, but his apprenticeship has laid the foundation for a love of melody and rhythm in his soul, and the young man finds the easiest expression of this in jazz music. Its rhythms are barbarous but compelling, its melodies simple, and "catchy."

When he does play, he essays popular music. It is much easier and requires less thought and less effort than real music. There is "life" and "snap" in it. And in time he loses touch with the little classics he knew and finds jazz more palatable because it demands less from him in thought and imagination.

But the age of industry has reached its full flower, and the pedagogs are slowly overtaking the last stragglers in the van of the march of centuries. Education is taking on less and less the mask of a licensed standardization of thought, and increasingly giving way to the individual demands and tendencies of the children to plot the curve of their own lives. There are in the high places of education today men who understand children, and who seek to teach them the things for which they are best fitted by temperament and mind. They are giving their support to the natural leanings of the child, and seek less to dam the wild stream of its ambitions than to direct the waters into parallel channels in which they might flow smoothly and steadily forward. When the day shall come in which their system is perfected and applied intelligently, America's musical genius will have come into its own.

Sapiro Was Not Invited to Speak

(*Concluded from page 15*)

But before these designs could be carried into effect, because of their extensive nature, Aaron Sapiro, aided by Carl Williams, of Oklahoma, stepped into the situation without notice and began, in the late autumn of 1920, to organize a coöperative association in that state after his own peculiar methods. It will be observed that while there was utilized some *portions* of the plan originally formulated by the committee of the American Cotton Association, the Sapiro plan dealt almost exclusively with the *marketing* of cotton. His associations have now spread throughout the South and they have superimposed upon them an overhead organization, which seems to control them to an ever-increasing extent. These associations, however, *have never succeeded in controlling more than ten or twelve per cent of any given cotton crop*, while Mr. Sapiro, himself, is on record in the speech which he insisted on delivering at the Montgomery convention of the American Cotton Association, as saying that the purposes of coöperative marketing could not be legitimately achieved *unless forty per cent of the product was controlled.* ("It can't be formed successfully unless you have forty per cent of the cotton behind you," were his exact words.) It is this fact that has brought so many people to believe that existing coöperative cotton marketing associations in the South are little more than sales agencies for cotton conducted in a very expensive manner.

The original movement of Sapiro and his personally selected associates, aided by the Texas Farm Bureau, organized a marketing association in Texas in 1921; in Georgia, Alabama, Arizona, South Carolina, Arkansas, and North Carolina in 1922; and in Louisiana, Mississippi, Tennessee and Missouri in 1923. These organizations were developed independently of any connection or association with the American Cotton Association; efforts looking to coöperation having been flatly refused by the officials linked up with the Sapiro plan.

It may be worth while repeating that Aaron Sapiro was not invited to be among the speakers selected to address the April, 1920, convention of the American Cotton Association. He appeared at the Montgomery convention when it opened and insisted upon President J. S. Wannamaker giving him a place on the program to deliver an address on the subject of coöperative marketing associations. Under the pressure of this insistence a limited period was granted, which Mr. Sapiro proceeded to exceed by fully one hour and a quarter. It will be seen from the stenographic report, made of that speech, that *he fully indorsed the plans and purposes of the American Cotton Association for cooperative cotton marketing and for economic reforms in the production and handling of the staple.*

It will be seen from the address that he emphasized the value and importance of using the American Cotton Association and its South-wide agricultural affiliations and influences for the purpose of publicity and driving power in the whole movement. He pledged, in his address, his hearty indorsement of the Association and repeatedly reiterated his opinion that the coöperative marketing of cotton should not begin until from thirty-three to forty per cent of the normal annual crop production had been signed up in memberships in the various states. He was well advised, at that time, that the American Cotton Association did not indorse or contemplate the organization of an interstate, or overhead, cotton exchange for controlling the marketing activities of the various state organizations to be created.

The American Cotton Association does not at this time indorse or approve of the heavy expenses and dominating influences of the American Cotton Growers Exchange, a creation of the Sapiro plan of interstate control of state coöperative cotton marketing.

The records show, therefore, that within a few months after having forced himself into a convention of the American Cotton Association, and having voluntarily pledged himself to hearty coöperation with it, he violated his pledges and repudiated his indorsement of the plans of the American Cotton Association and built up his own specially created state and interstate organizations, utilizing as a foundation all of the educational work, and such of the ideas as pleased him, of the American Cotton Association. In his own plan he neglected, or forgot, to advocate *economic and industrial reforms in the growing of cotton*, so carefully planned by the American Cotton Association, and so patriotically advocated by the students of southern agriculture, drawn from every section of the South. Whether intentionally or not, the outstanding results so far of the Sapiro organizations would seem to be to set up a machinery that has accomplished few benefits, other than those derived by himself and the large-salaried personnel by which he has surrounded himself. There were already a vast number of selling agencies and middlemen living upon the profits represented by the $14 difference per bale received by the producer of cotton and paid by the manufacturer of it. Controlling as they do sometimes less than ten per cent of a cotton crop, and selling but a minor portion of even such cotton as they do handle, to the manufacturers directly, the *Sapiro organizations have accomplished little more than to add an extremely expensive middleman to those who already existed.*

The records of the Sapiro organized and operated coöperative cotton marketing associations will also show that little or no effort is being made by them to control production through restricted acreage and intensive methods of culture; that there is little or no advocacy of economic reforms in baling, tare, freight rates, warehouse costs, country damage or other expensive methods of handling. No concerted efforts seem to be being made on their part to economize the cost of distribution by direct marketing to consuming mill centers or spinners organizations. Nor is it apparent from the record that any special efforts have been made by any of the Sapiro organizations to ascertain the average cost of growing cotton as a basis to endeavor to secure, for their membership, a price which would represent cost plus a reasonable profit over the actual cost of production.

A reasonable inference would seem to be, therefore, that the Sapiro Cotton Organizations appear to have accomplished little more, up to the present time, than the creation of cotton selling agencies operated at an extremely high cost to their membership.

Those who have read Allan L. Benson's articles in THE DEARBORN INDEPENDENT will agree that they are always good because they make one think along original lines. He looks at things from hitherto neglected angles and opens up new and unexplored avenues. In our next issue Mr. Benson will have something to say about "the greatest moment in a man's life." This is an attractive theme, because it concerns not only ourselves but our ancestors. Strange as it may seem, our ancestors are always with us, according to Mr. Benson, and they occupy quite an important part in our lives.

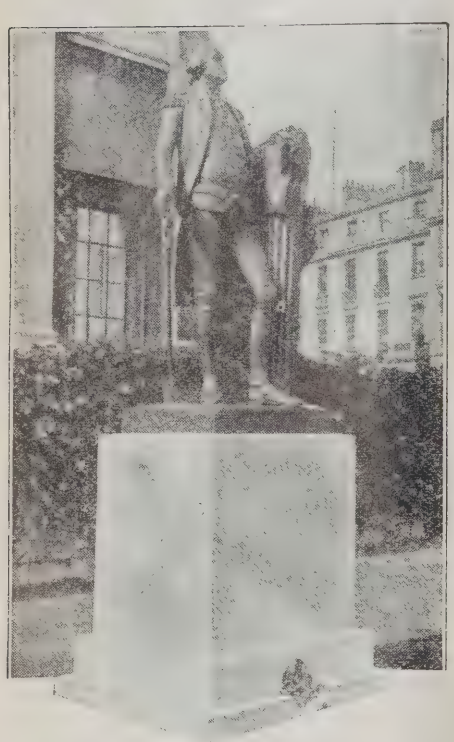
Statistics Extraordinary

A PRISONER in Newgate compiled some curious statistics from the Bible. He found that the word "Lord" occurs 1,853 times; "Jehovah" 6,855 times; "Reverend" once, "Girl" once. The eighth verse of the 117th Psalm is the middle verse of the Bible. The longest verse is the twenty-eighth of the ninth chapter of Esther; the shortest is the thirty-fifth verse of the eleventh chapter of John. In the 107th Psalm the eighth, the fifteenth, the twenty-first and the thirty-first verses are alike. There are, in all the books of the Bible, 3,586,483 letters; 776,693 verses; 1,189 chapters.

American Honor Crosses the Ocean

Ancient Churches Contain Memorials of Colonial Days; Monuments of American Presidents Adorn the British Metropolis

By THOMAS TONGE



Washington's statue at National Gallery, Trafalgar Square, London.

AMERICAN visitors to London can find in that great city many associations with their own country, besides the American Club in Piccadilly and the American Woman's Club in Hertford street.

In London's finest square—Trafalgar Square—there is a statue of George Washington bearing the inscription "Presented to The People of Great Britain and Ireland by The Commonwealth of Virginia, 1921," and in the same year a bust of George Washington, presented by American subscribers, was placed in the crypt of St. Paul's Cathedral, where it is surrounded by memorials of Britain's distinguished statesmen, poets, and so on.

Within sixty miles from London is the ancestral home of the Washingtons—Sulgrave in Northamptonshire. In Brington Church, Northamptonshire, are two sepulchral stones, one dated 1611 over the grave of the father of John Washington who emigrated to America, on which his heraldic arms appear impaled with those of his wife; the other covering the remains of the uncle of the emigrant and presenting on brass the simple Washington family shield, with the extraneous crescent, the distinguishing badge in heraldry of a younger son. It is supposed that the stars and stripes of the National flag were taken from the shield of the Washington family as no more than due to the "Father of His Country." In the Washington family coat of arms the stripes are alternate red and white as are those of the American flag and the stars are five-pointed, six points being more common.

At the time of the Revolutionary War only a small minority of men in Britain had votes, Parliament being dominated by the great landholders. With the extensions of the parliamentary franchise in later years and the growth of the press and democracy, British appreciation of Washington also grew.

Lord Brougham, the Titan of the British bar, once said:

"The test of the progress of mankind will be their appreciation of the character of George Washington."

The British historian Green wrote:

"No nobler figure ever stood in the forefront of a nation's life. * * * It was almost unconsciously that men learned to cling to Washington with a trust and faith such as few other men have won, and to regard him with a reverence which still hushes us in the presence of his memory."

There is a statue of Abraham Lincoln, the great unique American, facing Westminster Abbey, the final resting place of many of Britain's illustrious dead. Among the distinguished men buried there, with accompanying fine monument, is the great Earl of Chatham who, in the House of Lords, so nobly opposed the fatuous policy of George III and his dominant political clique toward the American colonies, using the memorable words:

"You cannot conquer America. If I were an American, as I am an Englishman, while a foreign troop was landed in my country, I never would lay down my arms, never, never, never!"

Chatham would have appreciated Lincoln as highly as Lincoln appreciated Chatham.

Abraham Lincoln's English ancestor was Samuel Lincoln from Norwich, who settled in Hingham, Massachusetts (named after Hingham, Norfolk, England) in 1638.

In the Royal Exchange (dating back to 1566), along with statues of Queen Elizabeth, Queen Victoria, the Duke of Wellington and others, there is a statue of George Peabody, American philanthropist, who, having made his fortune in London, left $2,500,000 to ameliorate the condition of the London poor. The statue was inaugurated by King Edward VII, when Prince of Wales, in 1889. The money was expended in up-to-date buildings with moderate rents, for homes for the working classes, termed "Peabody dwellings," which proved self-supporting. Mr. Peabody also gave large sums for educational purposes in the United States.

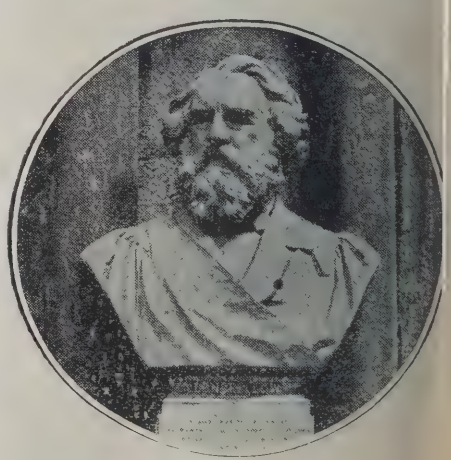
George Peabody's English ancestor was Francis Peabody, who emigrated from St. Albans, Hertfordshire, in 166[illegible] and settled at Topsfield, Massachusetts in 1667.

The Honorable Artillery Company with headquarters in City Road, received its Charter from Henry VIII in 1537, and has occupied its present ground since 1642. Four of its members emigrated to New England and in 1638 founded the Ancient and Honorable Artillery Company of Boston Massachusetts.

A distinguished American statesman, Benjamin Franklin, had quite an experience in London. Arriving there about 1725 without other resources than his ability to work for his own living, in his emergency he took lodgings in "Little Britain," Smithfield at three shillings and sixpence a week. It was then a center of the bookselling and printing trade and Franklin secured work at Palmer's, a famous printer in Bartholomew Close, the establishment extending into the Lady Chapel of St. Bartholomew's Priory Church, said to be the oldest church in London, dating back to A. D. 1123.

One house in which Franklin lived in London now bears a tablet to that effect.

In the Middle Ages in England a



The bust of Longfellow in Westminster Abbey.

'franklin" meant a "freeholder" as distinguished from the great feudal landholders and their tenants. Benjamin Franklin's ancestors lived in the village of Ecton, Northamptonshire, for at least 300 years on a freehold of about thirty acres, the head of the family following the blacksmith business, the eldest son being always bred to the trade. Benjamin Franklin's father, Josiah Franklin, emigrated to New England in 1682, the removal being made in company with a small Puritan colony made up in part of dispossessed Nonconformist ministers from Northamptonshire.

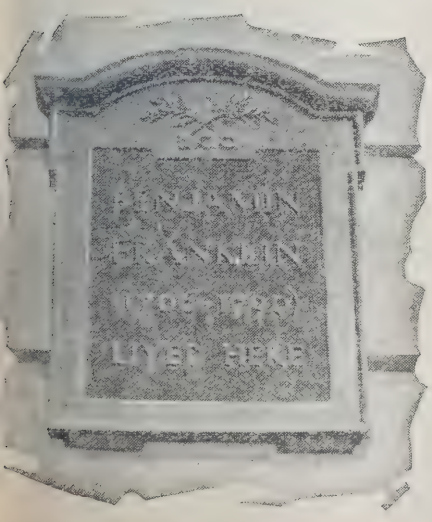
The churches of London furnish many associations with America as follows, beginning with two American residents:

All Hallows Church, Barking-by-the-Tower, dates back to the fifteenth century. The type of the locality is now very different from what it was more than a century ago. John Quincy Adams (afterward sixth President of the United States) in 1794, by appointment of President Washington, was American minister resident at the Hague. While holding that position he visited London where he made the acquaintance of Louisa Catherine Johnson, daughter of Joshua Johnson, then the American consul in London, and they were married at All Hallows Church, October 21, 1794.

The English ancestor of the Adams family, who furnished two Presidents of the United States, was Henry Adams from Devonshire who, with eight sons, settled at Mount Wolleston (now Quincy), Massachusetts, in the seventeenth century.

At the fashionable church of St. George's, Hanover Square, on December 2, 1886, Theodore Roosevelt married Edith Kermit Carow, daughter of Isaac Carow, a wealthy shipping merchant of New York City.

Christ Church (Congregationalist), Westminster Bridge Road, was opened July 4, 1876, the centenary of American Independence. The Lincoln Tower and spire, 200 feet high, shows the Stars and Stripes wrought into the stone and the American Eagle and British Lion at the angles of the tower. The cost of the tower and spire was largely defrayed by Americans in gratitude for Dr. Newman Hall's sympathy with the Union during the American Civil War.



Benjamin Franklin tablet of No. 7 Craven street, Strand.

Pilgrim Fathers' Memorial Church (Congregationalist), New Kent Road, the oldest Congregational church in London, dating back to 1616, was enlarged by American subscribers as a memorial to Southwark men who came to America in the *Mayflower*.

In Westminster Abbey there is a bust of Henry Wadsworth Longfellow and a colored window and tablet to James Russell Lowell, at one time American minister in London. They are in kindred company among Britain's illustrious dead, for the Abbey contains the graves of Geoffrey Chaucer, Edmund Spenser, John Dryden, Thomas Campbell, Lord Macaulay, Charles Dickens, Alfred Tennyson and other literary "lights," and busts, memorials or monuments of Shakespeare, Milton, Thomas Gray, Thackeray and others.

Longfellow's paternal English ancestor, William Longfellow, emigrated from Horsford, near Leeds, Yorkshire, to Newbury, Massachusetts (named after Newbury, Berkshire, England), in 1676 and his seventeenth-century maternal ancestors, the Wadsworths, also lived in Yorkshire.

Lowell's English ancestor, Percival Lowell, emigrated from Worcestershire and settled at Newbury, Massachusetts, in 1639.

In the Abbey also there is a tablet, erected by the English-Speaking Union, to the memory of Walter Hines Page, U. S. Ambassador to Britain, 1913-1918, bearing the inscription—"the friend of Britain in her sorest need."

St. Margaret's Church, Westminster, dating back to the twelfth century, has many American associations.

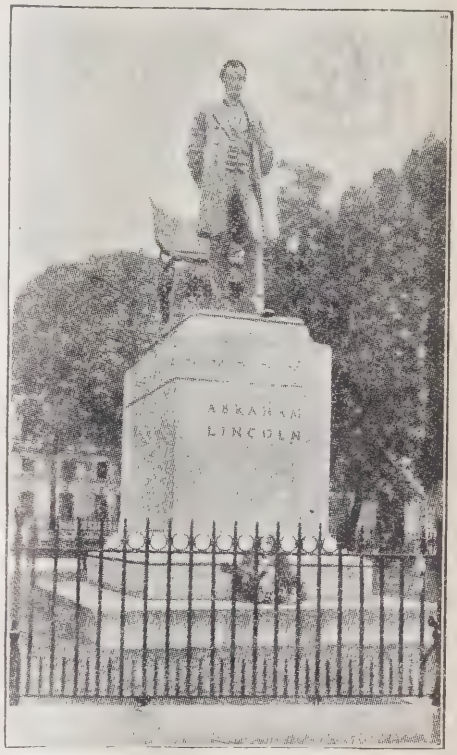
The window over the western door was put up in 1882, at the cost of Americans, to the memory of Sir Walter Raleigh, the discoverer of Virginia, who was executed (October 29, 1618) in the Old Palace Yard nearby and whose headless body and the body of his son Carew lie buried in the chancel of the church. The following quatrain below the window is by James Russell Lowell:

"The New World's sons from England's breast we drew
Such milk as bids remember whence we came;
Proud of her past, wherefrom our present grew,
This window we inscribe with Raleigh's name."

The window memorial of John Milton, at the west end of the north aisle, was the gift of G. W. Childs, of Philadelphia, and bears the following inscription by John Greenleaf Whittier:

"The New World honors him whose lofty plea
For England's freedom made her once more sure,
Whose song, immortal as its theme, shall be
Their common freehold, while both worlds endure."

On the south wall there is a memorial window to Phillips Brooks, fifth Protestant Episcopal Bishop of Massachusetts, the cost of which was defrayed by many who held him in honor, both American and English. He was descended from Thomas Brooks who emigrated from England to America in 1634. On his mother's side he was descended from Reverend George Phillips, a graduate of Cambridge University, who emigrated to New England in 1630.



Abraham Lincoln, facing Westminster Abbey.

In Southwark Cathedral, dating back to the thirteenth century, there is a Shakespeare memorial, with recumbent figure and window above, the gift of American and British subscribers. The Chapel of St. John the Divine, in the north transept, was restored at the cost of Harvard students, as a memorial of their founder, John Harvard, who was baptized in the church, November 29, 1607. Part of Harvard's estate was derived from the sale of the Queen's Head Inn, Southwark, inherited from his mother.

In the before-mentioned All Hallows Church, Barking-by-the-Tower, where John Quincy Adams was married, William Penn, founder of Pennsylvania, was christened and a tablet has been erected by the Pennsylvania Society of New York.

No medieval church in London has

undergone so quiet and conservative a restoration as All Hallows. All the fine old woodwork of the altarpiece, pulpit, pews and organ case having been scrupulously respected. Of unusual beauty are the railings of wrought brass inclosing the altar, behind which stand those candlesticks whose use has ever been retained in this church, and which in the days of the struggle between king and parliament gave great offense to the Puritan party.

St. Stephen's Church, Coleman street, has special memories. Reverend John Davenport (a native of Coventry, Warwickshire) who, with other refugees, landed at Boston in 1637 and founded the colony of New Haven, Connecticut, in the following year, was vicar of this church from 1624 to 1633. The colony was composed, in part, of former residents of Southwark. There is a tablet in the church to the memory of Reverend John Davenport erected by one of his American descendants.

In St. Helen's Church, Bishopgate, dating back to the thirteenth century, there is a Shakespeare memorial window presented by William Prentice, an American.

In St. Ethelburga's Church, Bishopgate, dating back to the fourteenth century, on April 19, 1607, Henry Hudson (the navigator who gave his name to Hudson's Bay and to the Hudson River), his son John and his ten sailors took communion "proposing to goe to sea foure days after."

Other instances could be given, but the foregoing are sufficient.

Pepys, Recorder of the Ordinary

(*Concluded from page 17*)

wife had commenced to take dancing lessons and "seems to mind nothing but the dancing master, having him come twice a day, which is folly." Yet his anger was always short-lived as a flying shadow and on an instant all is sunshine again, especially if a woman is pretty and smiles at him. One curious incident, which throws a light on customs, has to do with a visit to the theater where, when he was "sitting in a dark place, a lady spit backward by mistake, not seeing me; but after seeing her to be a very pretty lady I was not troubled about it at all."

Put the man down as one glad to be amused, who heartily enjoyed the wholesome exercise of laughter and the good things of life, the honest cakes and ale. His religion, and he was very religious according to his light, did not hold any superstitious fear of incurring punishment if he sought happiness. If he hated anything it was dull stolidity. If he was proud of anything in himself it was of his activity, his genuine interest in his work and his pastime. So his diary is full of such entries as "Up very betimes and at the office by five," "up at four o'clock and dressed by candle-light," "put all my accounts in order," "to dinner with my clerks, my head full of business," "up at three o'clock and to work," "all the afternoon among my workmen," and so on. Between whiles he does all kinds of things; learns to dance; to sing sailor chanteys; to recite Hamlet's "to bee or not to bee," to perform on the harp, the flageolet, the lute, the fiddle, the therbo. He becomes so proficient a musician that there are impromptu performances on occasion. "I took my flageolet," he writes, "and played upon the leads in the garden where Sir Pen came out in his shirt drinking great drops of claret and eating botargo and bread and butter until twelve at night it being moonshine and so to bed very nearly fuddled." Again: "At night to my violin . . . and after to my lute and *I took much pleasure to have the neighbors come forth into the yard to hear me.*" In another place, "To Drumbleby's, the pipe-maker, there to advise about the making of a flageolet to go low and soft; and he do show me a way which to do, and also a fashion of having two pipes of the same note fastened together so as I can play on one and then echo it on the other, which is mighty pretty."

In every way a vigorous, effective man was Pepys, always busy overcoming difficulties and mastering details. Everything is a matter of enthusiasm with him whether it be the study of the multiplication table for the first time at the age of twenty-nine, the purchase of a new camlet cloak and colored cloth suit, the wearing of silver shoe buckles, or the acquisition of a hare's foot to ward off attacks of the "colique."

Of such sort was the man to whose record we turn for our account of those days of change; those days when the stern and repressive rigidities of the Ironsides were thrown aside, but with them much of the Puritan discipline and devotion to duty and moral courage and unflinching integrity; days when, in the world of literature, there was something very much like a revolt inaugurated by the noisy ones and when the freedom of expression of the Elizabethans was exchanged for undeniable coarseness; when simplicity in women was laughed at and when there was ostentatious display of neglect for decent conduct; when the drama became corrupt and artistically poor; when in high places there were found envy, malice, ulterior motives; when a silly sensationalism ruled the roost and vulgar ostentation and rowdy manners marked fashionable society; when the stage ceased to be a medium for the expression of character as in the days of Shakespeare and became a mere amusement and a shallow distraction, a reflection of life quite artificial and sometimes vicious. Indeed in some respects they were days very much like ours.

Some Famous Venetian Bridges

THE Rialto bridge was designed in 1178 by Nicolo Barattieri, and was carried on pontoons. In 1264 it was rebuilt, still in wood, and was carried on beams and could be raised in the middle, as we see it in Carpaccio's picture of *The Miracle of the Cross*. The present bridge was the work of Antonio or Giovanni Contino and was built in 1588.

The Rialto Bridge across the Grand Canal.

The Rialto bridge is one of the most famous bridges in all Venice. It was for a long time the only bridge across the Grand Canal. The streets near here have always teemed with trade and it was the shopping district of Venice. Hundreds of years ago, when few people could read and write, the new laws were read at one end of this bridge. The Rialto mentioned in Shakespeare's *The Merchant of Venice* is the one on the Grand Canal. This canal winds through the city in the shape of a letter "S" and is more than 200 feet wide and two miles in length. Many places of interest are to seen from this waterway, such as the Doge's palace, the church of Santa Maria and St. Marks.

John Burroughs—The Wistful Celt

(*Concluded from page 2*)

steps in self-conquest? Have these no spiritual value?

Closely allied to his longing for the Past, was that for home and family. From these he never became emancipated. He was held to them by an invisible, inescapable prenatal tether. In one of his recorded dreams he saw Carlyle as a little boy, and *then regretted Carlyle's lost youth.* Especially significant this, in that he and Carlyle were so akin in their strong local and filial attachments. In his dreams, Carlyle was doubtless the surrogate of himself.

Mr. Burroughs wrote in a letter in the early nineteen-hundreds:

> The editors of a magazine called VIM have just been examining my head phrenologically. They say I have the greatest development of philoprogenitiveness, and those faculties that give sympathy and love, on record.

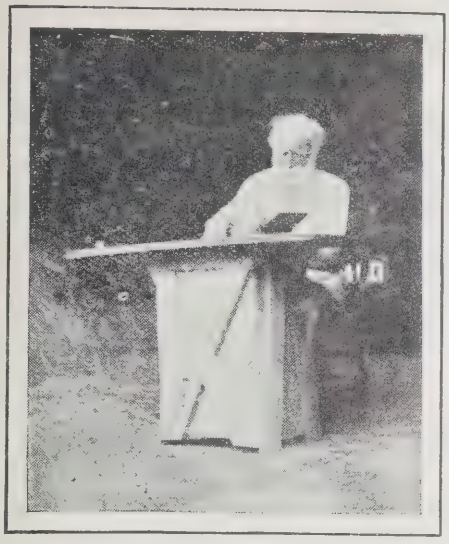
A passage from one of his books is, in this connection, apropos:

> I have missed certain domestic good fortunes, such as a family of many children (I have only one), which might have made the struggle of life harder, but which would surely have brought its compensations. Those lives are indeed narrow and confined which are not blessed with several children. Every branch the tree puts out lays it open more to the storms and tempests of life; it lays it also open to the light and the sunshine, and the singing and mating birds. A childless life is a tree without branches.

He himself was one of ten children; his parents were members of large families, and most of his brothers and

John Burroughs on a camping trip, washing his face in the Tuckahoo River.

sisters had large families, while, as he said, he had but one child. He always rejoiced when he heard of the birth of a child to any of his friends, and always exhorted them to let the good work go on. He was disappointed that his grandchildren numbered only three.



The nature poet in his barn study.

During the years that his brother Hiram was with him at Slabsides, his strong parental feeling had a vicarious outlet. Sheltering and cooking for the homeless one greatly appeased his heart-hunger; and the nearness of his son and grandchildren (at Riverby) relieved it still more. Struggling vainly with his innate yearning when his son went to college, he suffered far too acutely from the partings as each vacation came to an end. During the few years that his son lived but a mile distant from Riverby, he but poorly endured the stretching of the cord that far; while any plan of Julian's that looked toward going farther from home was painful in the extreme to the father.

Doubtless if he had had more effective outlets through early manhood and middle life—more of the sympathy and appreciation that came so abundantly in later years—this centering upon his childhood home and kindred, and upon the Past, would have been much less pronounced. More of the driving force of his nature would have found forward-flowing channels, thus preventing that reflux upon itself, in which his soul forever sought to retrace the path along which it had come,

> "with longings unappeased, and tears
> Drawn from the very source of life."

What bearing had these deep-seated needs, and their meager discharge into natural channels, upon his career? Little, if any, crippling effect is found in his intellectual life. Upon reality he ever kept a firm hold. He wrested strength from weakness, and steadily applied himself to the work which he had mapped out in youth. The most of his creative urge was diverted into his art; much overflowed to the birds and the animals (especially to his dogs), and much to his fellows. There was but little abatement of creative energy up to almost the close of life. The unstinted love he had invested in living things came unstintedly back to him. Thus was that prophetic line he wrote in early manhood fulfilled:

> "And what is mine shall know my face."

Through the homing instinct, then, this Child of Nature found his way back to the primal source of life. From the bosom of the Great Mother he drew his sustenance and, never outgrowing the child's need for guidance, by keeping firm hold of her hand, he also led others back to Nature.

Tracked by Scotland Yard

(*Concluded from page 12*)

not noticing what the sign above the door said. If I had read it I might have ducked, for when I did look at it on coming out I found that it said, Board of Prison Examiners. But I was courteously received there and the gentlemen heard my pitiful tale, took my passport and that odious ticket and went out. Presently he returned and led me to another office across the corridor, while I wondered whether it would be the guillotine or exile to Siberia. A gentleman there took me in hand, first apologizing for being in his shirt sleeves, though on so hot a day in our own country everybody would be in his shirt sleeves, from the mayor up.

"Did you come over first class?" he asked.

"I came in all the first class there was. The ship is what they call a cabin steamer, with only one class."

Then came the leading question. "What did you come to England for?"

"I came to bring a message of love and affection from the Boston Bicycle Club to the Pickwick Bicycle Club of London," I declared convincingly.

It was exactly the proper thing to say. He handed me back my passport, removed the halter from my neck, knocked the shackles from my ankles and the handcuffs from my wrists (figuratively speaking) and I walked out a free man.

About a month later I had another message from the steamship line to the effect that they had not heard from the Home Office about me. I wrote back and told them what I had done, and I was not further annoyed.

But when I was going aboard at Liverpool for the home voyage a quiet looking man who stood beside the ship's officers, and whom I afterward heard was a Scotland Yard detective, looked at me and said, "That's the man we were looking for."

The Lost Art of Walking

WALKING is gradually becoming a lost art in the sense of being practiced as a true health-giving exercise.

The original purpose of walking was for locomotion. The majority of us only use it for this purpose. But walking may be utilized as a means for other purposes. One may walk for exercise, for pleasure, for thought—but not in this day for safety. A young woman once asked a doctor for a recipe for a good complexion. He replied: "Get one pot of rouge, any kind of rouge, and one rabbit's foot, not necessarily a left hind foot. Bury them two miles from home and walk out and back every day, in every kind of weather so as to be sure these articles are still where you buried them."

Walking is indeed the best all-round exercise. It develops health, grace, and beauty of rhythm. It brings one out in the open air. It increases respiration, thereby bringing pure oxygen to the tissues which stimulates every organ in the body. It increases the action of the skin which tends to clear the body of its waste material and poisons. It makes the heart beat firmer. It clears the mind. Thoughts come more readily. One's thinking power is increased. There is a feeling of exhilaration, a sense of well-being which is only appreciated by the habitual walker.

The decrease in the amount of walking done has already begun to show itself in several ways. The number of persons who are consulting their physicians regarding foot trouble is on the increase. Why should this be? Our children are better cared for than ever. The medical profession understands the scientific principles of the feet better. Shoes and boots are more sensibly made to fit the foot. There is one exception. This exception is rather a delicate one to mention and pertains to some of the shoes with high heels worn by ladies. In attempting to argue on this question I have usually found that "Argument" falls defeated to whatever is "Style" at that time. Then why is foot trouble on the increase? The answer is found in the fact that walking is on the decrease. The use of the feet for their original purpose, that of walking, is Nature's means of keeping the feet strong and efficient to carry the body weight.

The North American Indian was noted for the amount of walking he did. He walked miles and miles following the lone trail. Foot trouble among the Indian tribes was practically unknown. The early settlers in America could readily distinguish the difference between the tread of the Indian and that of the white man. The Indian walked with his toes turned in, while the white man walked with his toes turned out. Walking with the toes out tends to favor the foot to rotate outward and to cause the arch of the foot to fall. One should endeavor to walk with the feet as near parallel as possible.

To compensate for the exercise lost by the decreased amount of walking done, the "Daily Dozen" has come into vogue. However, these exercises are not an adequate substitute. For those who do sedentary work, the physical exercise taken should be equivalent to a five-mile walk.

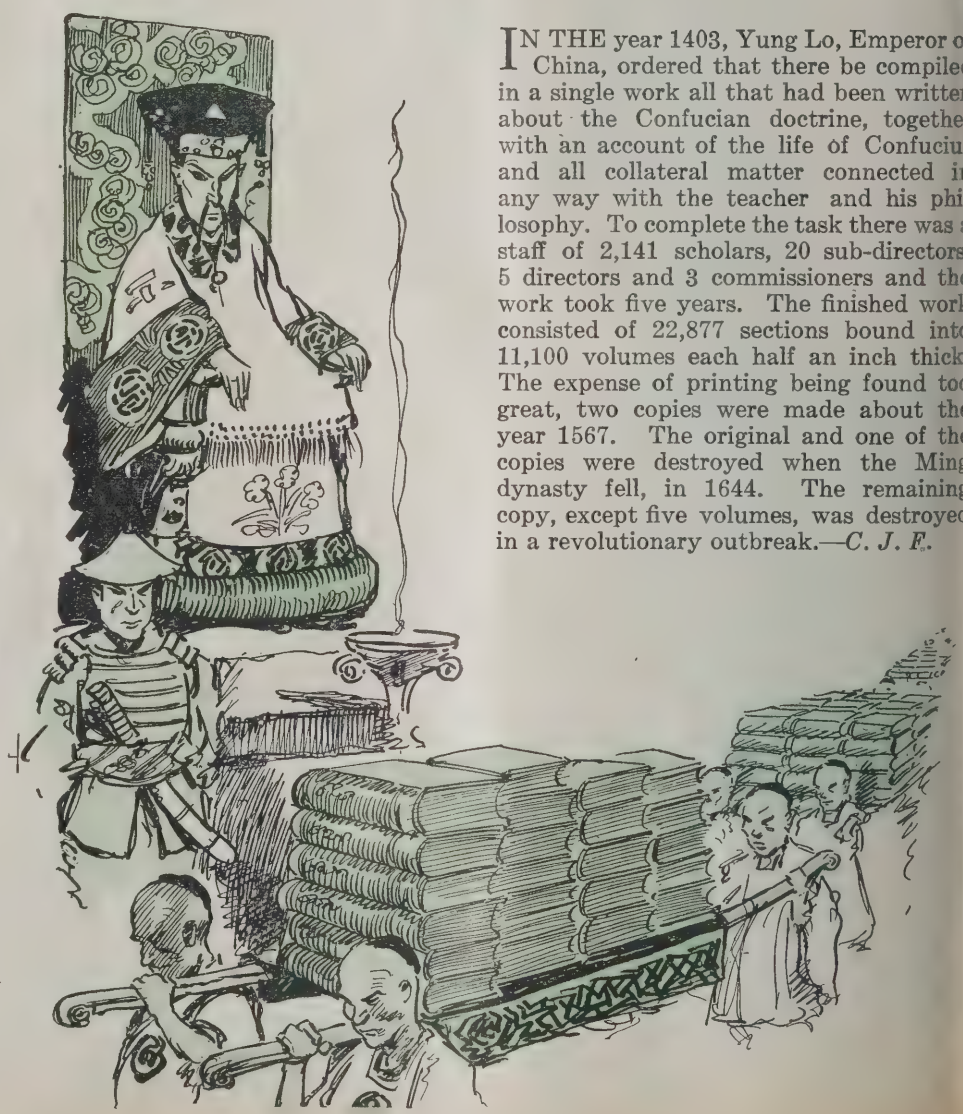
To walk correctly is an art. It is higher developed in the Oriental races than in the Western races. One has only to observe the smooth rhythmical glide of the Oriental as compared to the jerky gait of our own race fully to appreciate it.

Let us consider for a moment the right way to walk. The shoulders should be thrown back, military fashion. The head is held erect. The chest is expanded. Breathing should be regular and deep. The mouth is kept closed, except when talking. All breathing is done through the nostrils. The arms should swing by the sides, not like a windmill but just naturally to give balance and momentum to the body. The legs swing straight forward from the hips, not thrown outward in a circle. The knees bend sufficiently to clear the feet from the ground. The feet are held as near parallel as possible. Boots should not cramp the foot, especially the toes should be free, but should fit snugly to the arch. The heels should be flat and have a wide base to prevent the foot from wabbling and to increase its stability.

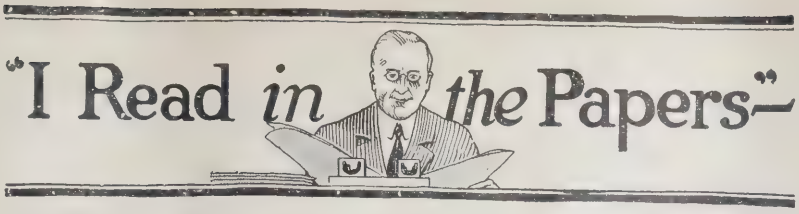
If one tires readily when walking and has no organic disease to account for it, it is certain that he is not walking correctly. True it is an art. We are all apprentices. With a little thought and practice we shall be able to prevent it becoming a lost art.

One is well repaid for his time spent walking. It gives a mental relaxation from the strain of modern life. It exercises every muscle in the body.

The Largest Book in the World



IN THE year 1403, Yung Lo, Emperor of China, ordered that there be compiled in a single work all that had been written about the Confucian doctrine, together with an account of the life of Confucius and all collateral matter connected in any way with the teacher and his philosophy. To complete the task there was a staff of 2,141 scholars, 20 sub-directors, 5 directors and 3 commissioners and the work took five years. The finished work consisted of 22,877 sections bound into 11,100 volumes each half an inch thick. The expense of printing being found too great, two copies were made about the year 1567. The original and one of the copies were destroyed when the Ming dynasty fell, in 1644. The remaining copy, except five volumes, was destroyed in a revolutionary outbreak.—*C. J. F.*



read in the papers ıat a qualified, sym-athetic observer has ıst returned to Que-ec City from a visit) the Labrador Coast. he inhabitants of that leak region depend pon summer fishing, e said, and would ave to leave as conditions were be-)ming increasingly difficult as time ent by. The fishing operations, al-ıough kept up day and night, were nsatisfactory. This would suggest ıat the famous welfare work that has een done in Labrador has perhaps ıerely served to keep people there ho should leave. These intrepid shermen would doubtless be quite ıtisfactory if transferred to the re-ıunerative fisheries of the British olumbia and Alaska Coast. The prefer acetylene. McGill and Toronto universities in Canada and Washington University of St. Louis and Chicago University have done notable research work in this important field.

I read in the papers that a bridge estimated at about 55,000 years old has been discovered near Dortmund in Germany. It is a perfectly preserved footbridge, and is supposed to have been used to enable Ice-Age man to cross a marshy river bed. If scientists are correct in their estimate of the age of this bridge we shall have to revise our judgment regarding the capacity of prehistoric man. The wood used is oak, and as the implements used at that time were made from the teeth of mammoths, the carpenters of the bridge must have had considerable perseverance and skill. Men marvel at the prodigious engineering feats accomplished in the building of the Pyramids, but the bridge at Dartmund is estimated to be ten times as old as the Pyramids.

I read in the papers that the latest fad among fashionable women in Paris is to have masks made of their faces. One well-known sculptor, who was a pupil of Rodin, has made no fewer than 16,000 of these masks. This idea has taken the place of photographs, and the results are considered far more artistic and permanent. This may be perfectly true, but it is well known that all portraits taken in a photographic studio are "retouched" before being submitted to the sitter. The retouching of a plaster mask is a very different thing. Of course the sculptor may smooth out wrinkles and soften contours with all the skill of a "beauty doctor" and more permanently.

orld has seen more heroic moves ıan this and if large numbers can be rced to move from one country to ıother because of the fortunes of war would seem wise to employ the re-ources of government to transfer ıfortunate people to better oppor-ıities. Welfare work has never solved ı economic problem and Labrador lk cannot live without profitable l-year employment of one kind or ıother.

read in the papers some interest-g news about recent fact-finding in the ld of anesthetics. Our old stand-bys, her and chloroform, have been eighed in the scientific balance and und not only wanting but dangerous hitherto unsuspected ways. Death metimes occurs a week or so after ıe use of chloroform because of tty changes it has caused in the liver. ther has been known to cause that rrible malady, acidosis, which comes hen phosphoric and lactic acids of the ody are discharged into the blood ream whose alkalinity is reduced too w for safety.

Ethylene, propylene and acetylene, ıe latter well known in welding and ıs lighting, are advocated as sub-itutes for ether and chloroform; ropylene is favored by many medical aders because oxygen, a strengthening gent, can be administered along with ıe anesthetic. The Germans seem to

Chanticleer in Bronze

FOR the first time in American history a national monument of granite and bronze is to be erected to a chicken. The approved design is a bronze male Rhode Island Red of great size on a large granite boulder. The monument will be placed in Adamsville, Rhode Island, a fitting tribute to a noble bird.

Seventy-one years ago a sailor, returning from a voyage to the Orient, presented a friend in Rhode Island with a Chittagong cockerel which he had picked up for a pet while on shore leave on the northwestern part of the Indo-China peninsula in what was once a part of Burma and is now in the province of Bengal, India. This bird was a giant size gamecock with brilliant red plumage and black feathers on its breast. It was placed with what had originally been Cochin Chinas, but which had lost some of their original characteristics through crossbreeding with other fowl. The Cochin Chinas came from the southeastern extremity while the Chittagong came from a point in the interior, to the north and west. It is not known who first brought the Cochin Chinas to Rhode Island, but it is an established fact that they came long before the Chittagong arrived.

William Tripp, the man who was presented with the Chittagong cockerel, and John Macomber, a friend, of Westport, Massachusetts, were both marketing eggs and trying to develop better egg layers which would also dress well for the table. They exchanged poultry from time to time. Mr. Macomber received a cockerel and a dozen pullets obtained from the crossbreeding of the Chittagong and Cochin Chinas, in exchange for some of his birds. The new strain was called "Tripp" or "Macomber" chickens and became very popular.

Dr. A. A. Brigham, then director of the Rhode Island agricultural experiment station, recognizing the worth and possibilities of the "Tripp hen," persuaded the owners to standardize the strain. It was then suggested that as they were a Rhode Island product, and were of a red plumage, they be called "Rhode Island Reds."

When first exhibited at the Providence poultry show in 1895 the newcomers carried first prize in every event entered. When the Rhode Island Reds began to be better known many imitations of the stock sprang up. However, the would-be Reds could not compare with the genuine article either in appearance or egg-laying ability.

So These Are the Chinese People?

(*Concluded from page 5*)

obliged to camp outside the town unless —if he happens to be a foreigner or an official—he can persuade the suspicious soldiers who guard the entrance that he has not come to rob the villagers.

Not only are the Chinese resourceful workmen; they are business men of the first rank. The thrift and business astuteness that is so characteristically Chinese is a part of the nation's tradition. Confucius and his greatest disciple, Mencius, taught, in no uncertain terms, that the highest good was that which brought material prosperity. The extent to which this teaching has been built into the life of the country has led to an emphasis upon materialism and a desire for wealth. Anyone who has had dealing with the Chinese will realize that, although scrupulously honest, the Chinese trader knows how to drive the best bargain and will not be content until he has succeeded.

The success of Chinese in economic matters is evident from one bit of China's history. Some centuries ago, in a province of Central China, a colony of Jews was founded. The Jews undertook to make their profits at the expense of the Chinese, but they were beaten at their own game and the colony, finally, was driven into bankruptcy and no longer exists.

Their Promissory Notes Were Two Feet Long

The business history of China is said to run back 2,200 years before Christ. In the Hsia and Shang dynasties—2205 to 1122 B. C.—barter and exchange took place at the ancient wells where the people gathered. Likewise, in front of the temples and shrines of worship, these early traders set up shop and bought and sold at great fairs. It was shortly after this period that Chinese history records trade carried on, with shells used as the medium of exchange. In 1103 B. C., the first mint was established and round coins—the "cash" of present-day China —were cast with a little hole in the center for stringing on a cord. Today, in any city of the interior, one can see coolies carrying over their shoulders enormous strings of this money, using it in much the same way, for much the same things and with much the same dickerings and verbal holocaust as their ancestors thirty centuries ago. Two hundred years before the time of Christ pieces of linen two feet long, having stamped upon them a bond or promise to pay a certain amount of money, were used as currency.

In a previous article I have referred to the remarkable labor organizations that developed with China's economic life. These "guilds," doubtless, provide the most effective basis for Chinese national unity. They are, in the first place, nation-wide. In the second place, they are securing, in many instances, an increasing number of intelligent leaders—men thoroughly awake to the new movements abroad in the world. In the third place—and even more fundamentally—the guild organizations are thoroughly democratic.

The present movement against foreign exploitation in China affects every class of Chinese merely because of the fact that the guilds are enlisted in it. Coolies on the foreign vessels, who know little or nothing of the real purposes of the agitation, go on strike in obedience to the command of those higher up, without question and few dare dispute the authority of the guild. In a guild meeting in Shanghai, not long since, there met—as members of the same organization—an ex-premier, a delegate to the Paris Peace Conference, a former Chinese student from Tibet, a brigadier general, a large number of merchants, a number of clerks, and the president of a labor union. Joined in the membership of this guild these individuals met as absolute equals—equals in a sense that is difficult for the West to understand.

Side by side with the guilds there have developed, in more recent times, a large number of chambers of commerce—unions of business men in which common policies are worked out and matters of common concern considered. There are said to be nearly 1,000 of these chambers of commerce throughout China. In all of the cities of the country they exert a very powerful influence. In the city of Chungking —1,200 miles up the Yangtsze River— many of the officials of the chamber of commerce received their education abroad in England and America. Much of the work of this chamber is of more than ordinary interest. One of its members, for instance, stands sponsor for a large orphanage. Mr. Wang, president of the chamber, is also president of the Friends Guild, which is organized for the young men of Chungking, with club house and program somewhat similar to that of a city Y. M. C. A. in the United States.

Have Watched the West Entering China

The guilds and the chambers of commerce provide the most significant support that any movement in China can win. It is because, to a very great extent, both of these organizations are now backing the anti-Western drive that that drive is proceeding so rapidly in such widely separated parts of the country.

For a century, now, the Chinese have watched Western powers enter China, take over the control of every one of the nation's great ports, establish their concessions in the best locations of the largest cities, patrol China's rivers with their gunboats and claim exemption, under extra-territorial privileges, from Chinese law. In addition, the customs collection, the collection of the salt tax—the most important tax in the country—and the postal service have all been under foreign domination. The accumulation of these encroachments—coupled with the fact that the terms of the Washington Conference have not, as yet, been carried through—combined to win the backing not only of the students but of these labor and commercial organizations as well.

Students Work for a Common Language

Another important factor is making for the unity of China in the present situation. Up to within a few years China has been widely disunited through the use of different languages in different sections of the country. Although mandarin was the official language of the government and spoken, doubtless, by a majority of the people, the remaining millions spoke dialects as different as French is different from English. In Fukien Province, alone it is said that there are 100 dialects.

More recently, however, the students have led a nation-wide movement to bring a common language to the people. The development of an alphabet and phonetic script to supplant the ancient system of character writing has made rapid progress under this student leadership. Scores of magazines are printed in the popular language all over the country. The students, themselves, have sought to carry the new language to the people with the result that vast numbers throughout the whole country, who were formerly ignorant of what was going on are now being instructed and, in the present situation, are learning of developments and of their significance for the nation.

With little question the anti-foreign movement in China will continue until important concessions are made to the demands of the Chinese. A conference of the Powers and China has been suggested, semi-officially, to consider all of the questions at issue. The problem can hardly be met in any other way, and certainly will not be met in conference unless, on all sides, a genuine spirit of conciliation develops. In the meantime, there is a very real obligation upon Americans not only to seek to understand the questions which this conference will consider, but to seek, further, for an understanding of the Chinese people themselves. The future of China may determine the rise or the fall of democratic principles in Asia. The people of the United States cannot escape the responsibility that rests upon them in their relationship with this great power that confronts America across the Pacific.

Famous Fighting Craft Modeled in Miniature Shown at Washington

SOME wiseacre has stated that a ship under full sail is one of the three most beautiful things in nature or in art. As his first choice of beauties he probably had in mind lovely woman, after whom sailing ships were generally named and whom they resembled in graceful lines and movements, and in wealth of draperies. Though he was perhaps thinking of a flower or a cathedral for his third choice, he might have picked out some exquisite ship model for last honors. As the fair child is mother, sometimes, to the fair lady, the model gives an inkling of the grace in form and movement of the ship to be.

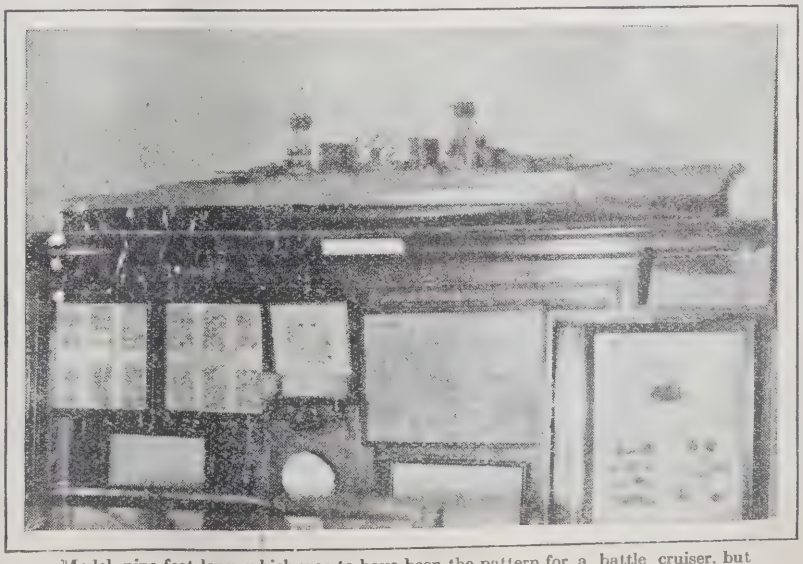
The Navy Department in its Washington offices has a fine collection of models of our up-to-date men-of-war of steam and steel. The Naval Academy's collection on the other hand contains a wide variety of ethnological and historic models. Here we can find a little of everything from Indian canoes and dugouts to "side wheelers" and latest superdreadnoughts. Among these are specimens of Eskimo kayaks, outriggers from Fiji, Ceylon, and the Marquesas, war canoes of the Haida and Tulalip Indians of the Northwest Coast, bark canoes and catamarans from Tierra del Fuego and the Amazon, an African dugout, a Spanish caïque, Chinese sampans and junks, and even a Singapore fast boat. It was from the fine hull lines of the last named that American ship designers got some of their ideas for the famous Baltimore clippers.

But the most interesting and ornate of the Naval Academy models, as of all ship models, belong to the era of sail. Among these is the *Ville de Paris*, a French ship of the line of that name. This model was presented nearly one hundred years ago by the French Government to the United States Navy. The *Ville de Paris* herself was the contribution of the citizens of Paris to Louis XV's fleet and served as flagship of Admiral de Grasse, who came to Washington's assistance at Yorktown. For his timely aid, General Washington in his letters to De Grasse generously declared, "The surrender of York (town), from which so much glory and advantage are derived to the allies, and the honor of which belongs to your Excellency, has greatly anticipated our most sanguine expectations"; and he added "navies have the casting vote in wars."

"A Topsail Breeze." Remarkable model which can actually sail, by Col. W. F. Spicer.

Little Ships in Middies' Museum

By HERMAN F. KRAFFT



Model, nine feet long, which was to have been the pattern for a battle cruiser, but which type was scrapped.

Collection of U. S. Naval Academy's Relics of War of Independence

After years of chipping and filing, prisoners of war sometimes produced models of favorite ships.

But the frigate *Constitution*, better known as *Old Ironsides*, about which center many of our earliest traditions of the sea, has always been and is today the ideal of our own ship modelers. The Peabody Museum in Salem has a contemporary model, presented in 1813 by Isaac Hull, her famous skipper in her duel with the *Guerriere* the year before. At Annapolis there is a large and accurately proportioned model of *Old Ironsides*, which was made by George W. Barnes for the Sons and Daughters of the American Revolution, by whom it was presented to the Naval Academy. Perhaps the most remarkable miniature of America's historic ship is the Boston Marine Museum's model made by Colonel Spicer. By various ingenious devices this tiny *Constitution* has actually sailed the seas. A photograph of this model, made during its Lilliputian maneuvers, is so realistic that it is little wonder that it has fooled old officers, who had in their youth sailed on the original, into the belief that they were looking at a picture of the real thing. Not only for the ship modeler but for all Americans, *Old Ironsides*, as she has many times since and before Holmes' well-known poem, again occupies the center of the stage today, when there is a movement on foot to let the school children of America restore her to her ancient glory.

The ship modeler's art is as ancient as Greek and Roman coins or even as Phoenician and Egyptian sculpture. The nations that have left us even crude images of ships were those that had commerce in goods and ideas with others—the sources of progress and civilization.

Real ship models owe their origin to a variety of reasons. Some of the earliest were the works of religious devotees, the church models, which were made by sailors to be presented to their home shrine with much ceremony as votive or thanksgiving offerings for safe returns from the fishing grounds or wars. Many such may be seen today in chapels and cathedrals along the coast of Europe from Brittany to Norway.

Again, models often were made by some early minister of marine to show his majesty what

the "kinges shippe" would be like, how she was to be rigged, how her decks were to be laid out and her guns to be mounted, and not least how the elaborate figurehead and counter on the completed vessel would look. To this class belong some of the finest ship models extant.

Besides religious and royal motives for the modeler's work, sailors with their natural love for scrimshaw made models of their favorite ships to while away time. This labor of love has given us many unique specimens that used to adorn the taverns along the water fronts of London and other great ports.

This model of the U. S. S. *Antietam* equals in size a small yacht, but it was not developed beyond this point.

Then, too, shipowners often had models of the argosies that brought them their wealth in their counting rooms or over their fireplaces. For a while merchants were also required to furnish models to the marine insurance companies.

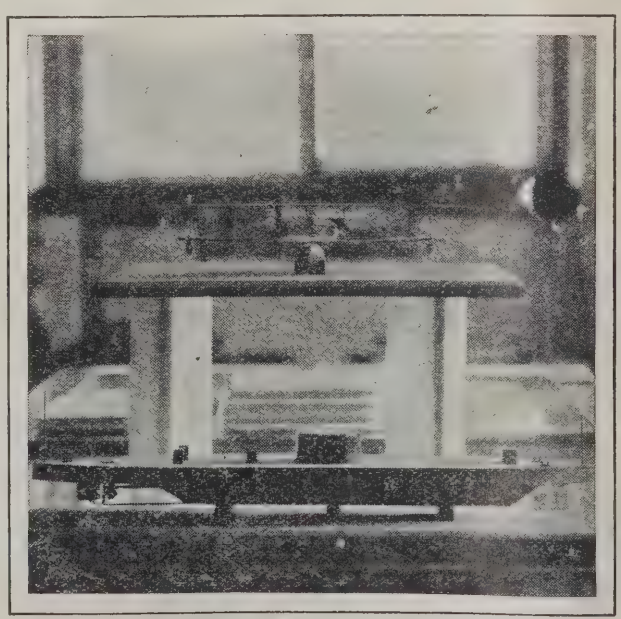
Even today the navies of the world have costly models made to visualize for their experts the forty-million-dollar steel warship, even as the architect prepares a miniature cathedral to show the world how the complete edifice will look.

Many of these priceless relics of earlier days, after the deaths of the owners and the eclipse of sail by steam, found their way to the garret, or perchance to the neighboring pond, a child's toy for a day. Latterly they have been hunted out, restored, and mounted in museums, where they speak to us of the glorious days of sail.

In ship models we can read the whole history of man on the sea. While the Navy possesses few centenarians in its collection, some of these perishable miniatures in European and even in our own museums go back to the fifteenth century. In them we can trace the evolution of the ship from the days of the galley and the one-masted, serpent-shaped, open viking boat, through the early medieval types with their half-dozen castles grafted on and their three masts, through the carack period of Columbus' time when the castles developed into permanent decks, through the epoch of the Dutch East Indiamen and the luggers that tell us of great cargo space and the origin of our American schooner, through the era of the huge ships of the line and clippers with their towering spread of spars and canvas that terminated in the "stun sails," "skyscrapers," and "moon rakers," down to the days of steam, and to oil-burning superdreadnoughts and Leviathans.

To illustrate the evolution of the warship in the United States, the Navy Department since the recent war has had a series of models constructed on scale. This series begins with John Paul Jones' flagship, the *Bon Homme Richard*, and ends with the battle cruiser and the *N. C. 4*, the first ship to do in the air what Columbus had done on the water.

In ship models we can realize then man's struggle to conquer the sea, but we can also see in them rare art objects and costly experiments. During the Tudor and Stuart periods the kings often called to their aid artists like Chrismas and Van Dyke to design the gorgeous figureheads and counters of their warships. The *Sovereign of the Seas*, England's "great ship" during the Dutch wars, has such wealth of elaborate carvings that it required years to make even a model of her. The *Seven Provinces*, flagship of "the



U. S. hydroplane and *The Monitor*. Two of a series of historic models showing development in naval construction.

greatest seaman of the seventeenth century," De Ruyter is a good representative of the ornateness of the man-of-war of this period. A modern copy in silver-plated copper from an original of De Ruyter's ship in the Netherlands museum was presented by the Holland-America Line to the U. S. S. *South Carolina* for her assistance in saving the passengers and crew of their steamer *Ryndam*, off Nantucket, May 26, 1915. This beautiful reminder of the brave but hopeless struggle of the Dutch against the Mistress of the Seas is now one of the Naval Academy collection. Some of the Continental museums have very costly specimens, for example, in the Musée de la Marine of the Louvre the French ship of the line Valmy is represented by a model made of ebony, ivory, and silver, which took six skilled artisans five years to make. In this case the model is more famous than the ship, for the Valmy was destined never to play a part in a real sea fight. While Europe has far more of genuine relics of the days of sail, the Naval Academy collection can boast of what is probably the largest ship model in the world, the *Antietam*. Named after the battle and regarded when her keel was laid as the last word in naval construction, owing to the revolutionary changes brought about by the ironclad, the *Antietam* was practically "scrapped" before she was completed and saw service only as an auxiliary vessel. But her fifty-foot model had already been completed in every detail so that the young midshipmen could actually learn the ropes in miniature. Likewise before other experiments were proved successful or the reverse ship models were called into play. In the history of submersibles from Fulton's time to the German U-boat many an undersea miniature had to be tried out to test the mathematician's calculations. In the Naval Academy collection there is a model of a David, the Confederate type of hand-propelled submarines which invariably suffocated their crews but sleep no Goliath.

In the shipmodeler's skill past and present, we can find some exquisite workmanship that borders on real art. With the products of his handicraft is bound up much of the history, the romance, the tragedy, and the achievement of man on the world's seven seas.

UNIV OF ILLINOIS
URBANA ILL

WHAT counts in a man or in a nation is not what the man or the nation can do, but what he or it actually does. Scholarship that consists in mere learning, but finds no expression in production, just as ability to shoot well at clay pigeons, may be of interest and value to him, but it ranks no higher unless it finds expression in achievement. From the standpoint of the nation, and from the broader standpoint of mankind, scholarship is of worth chiefly when it is productive, when the scholar not merely receives or acquires but gives.—*Theodore Roosevelt.*

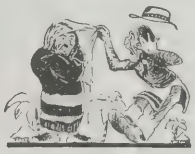
CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

Bookbinding originated in the incased clay tablets of 300 years B. C., and in the Eastern custom of "binding" inscribed palm leaves with threads of silk. Roman diptychs are among the oldest decorative bindings.



On the third day after marriage the San Blas Indian groom of Panama lifts the veil of his bride and sees her face for the first time.

The college man of today is reading three times as many books as did his father when he attended college 25 years ago, says Asa Don Dickinson, librarian of the University of Pennsylvania Library.

The sixth anniversary of the signing of the Versailles Peace Treaty was observed as a Day of General Mourning in Bavaria.

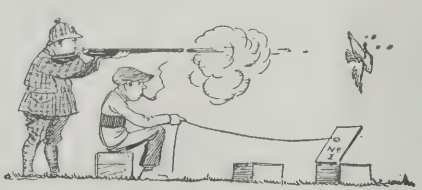
Bethlehem of Judea has a newspaper—*Sow-Ashab* (Voice of the People). It is printed at Jerusalem.

Among the 60,000 inhabitants of Tripoli there are more than 8,000 Jews.

The oldest ant and the oldest wasp known to the world have just been dug from oil shale beds in Colorado.

Damascus was famous in the Middle Ages for its silk and linen fabrics; hence the name "damask."

"Higher and higher buildings and ever greater concentration of business are not so much monuments of business enterprises as they are symptoms of economic waste."—*Harlan Bartholomew*, city plan engineer of St. Louis.



Sportsmen of England who originated trap shooting used live pigeons instead of the clay disc now in vogue.

When sand dunes are encountered in the Sahara Desert, travelers in automobiles are required to lay nets under their cars to secure traction. Frequently it takes thirty hours to go 1,500 feet.

Because he has a prejudice against taking their lives the beggar in the Orient carefully removes the vermin from his body and places them gently on the ground for others to acquire.

Twenty-two states have enacted certification laws for automobile titles, to prevent wrongful disposal of motor cars.

Ten per cent of all life insurance in force in California January 1, 1924, was allowed to lapse during the year, according to the *Underwriters' Report.*

A trick cave in the San Isabel National Forest in Colorado is so constituted that when you drop a straw hat into it a strong boomerang current of intermittent wind forces it from the ghostly cavern to the surface.

Malnourished children in Cleveland schools are gathered into special classes conducted by the nutrition clinics. They "graduate" when they attain the weight required for their age and height.

Dr. C. G. Bostrom, the state railways' eye specialist in Sweden, has found that between five and six per cent of all men are color blind.

The great stock ranches of the Panhandle district are being cut up into cotton farms. Stock land that sold from 50 cents to $2 an acre now brings from $20 to $40 as cotton land.

The railroads of Colombia, South America, are not standard gauge throughout, making it necessary to break bulk at each railhead.

Barbers are not responsible for the hats of their customers, in a decision handed down by a New York judge who held that "the barber is a craftsman laboring for wages, not a capitalist conducting a business of trade and trust."

In wet haying seasons, Norwegian farmers hang their hay up on fences to dry.

The only printed Bible in England four centuries ago was the Latin Vulgate, copies of which might be found chained fast in parish churches.

Guernsey is often called "England's Glass Island," because of the immense quantity of glass used there in the cultivation of the tomato.

The stones making up the royal palaces of Persia, built 2,600 years ago, were cemented together with pitch taken from the same oil seepages which centuries later led the modern oil companies to drill their first wells.

The Santa Barbara earthquake opened subterranean water sources and all streams in the quake zone show a marked increase in flow since the shake-up. If the increased flow continues it will more than pay for the losses suffered by the shock.

Eight to ten thousand earthquakes are recorded every year in various parts of the world.

South Africa has an Asiatic problem. Thousands of Indians are settling in South Africa, undermining the white race by working for nearly nothing and underselling their white competitors. Largely deprived of the franchise they still maintain power in their numbers which are increasing rapidly.

Vol. 25, No. 47

Change of Address

1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue:

Mr. Ford's Page this week takes the view that Wages are not exclusively the concern of the wage-earner, but that Business also has an interest in maintaining a high wage rate. (p. 9)

And, by the way, this is a subject that the commonality of people had better be thinking of. Any evil can be mitigated when we all begin to think about it. Most of the things we complain of are mere parasites on our public indifference. When a man talks about reducing wages, he is in a real sense an enemy of his country's safety.

Maybe you think the billy is the robber's favorite tool. Or the jimmy. Or the gun. Wrong on all three. The United States Post Office is! Robbery by mail is the modern method. Robbers allow the limited personnel of the post office to work at a few crimes, while they conduct the hundred crimes. You see if there are 5,000 robbers-by-mail, and 100 of them can keep the postoffice detective and prosecution force busy, that leaves the other 4,900 freedom to work. Most of the robbers-by-U. S. Mail are not Americans. (p. 7)

Possibly you have thrown up your hands at all the talk of crime and wondered "what the American people are coming to!" It is time we rebuked the cool assumption that the American people are becoming criminal. This increase of crime among us is not a *development*, it is an *invasion;* it is not the result of war, but of immigration. There is an editorial on this subject. (p. 10)

Wooden shoes, more romantic to behold than to wear, are out of style in the Dutch settlements of the U. S. where fifty years ago half a million people wore them. An interesting article about this cloggy kind of footgear. (p. 12)

Does a young man choose his occupation, or is he chosen by it? Mr. Benson thinks the former, but his own experience would seem to prove the latter. It is a pertinent subject to those facing the choice of a career. (p. 3)

The fertilizer trust has escaped all the trust-busting activities of recent years. Yet it collects nearer the source than any other trust, and its cost to the people almost equals that of government. (p. 6)

Another close-up study of Mr. Sapiro's methods in hog-tying the farmer, told by one who saw it done. (p. 14)

For fact's sake, read the article on page 20. Crime is not extending, but revolving. Not new criminals, but "repeaters" keep the courts busy. In New York, 66 per cent of crime is caused by men who have "repeated" as high as 50 times. (p. 20)

The delightful Master Pepys who wrote history on the spot, with the result that it has a different flavor than when cooked up by the historians. (p. 16)

P. T. Barnum was a Puritan. It took a professor of English literature to see in P. T. Barnum a foil for modern showmen. Barnum had qualities which are only now being appreciated. (p. 28)

Other articles of personality concern the Signers of 1776 (p. 8), Stevenson whom the Samoans and the world loved (p. 32). Barnum, Pepys, Stevenson, the two Adamses and John Hancock are a notable group to join together in one magazine number.

Then there is travel abroad—to Riga, the Pearl of the Baltic (p. 5), to the land of spices (p. 22) and an excursion into nature, that lively and profusely illustrated book (p. 2). A little side trip to St. Thomas, Canada, where they do things with flowers. (p. 18)

Nature Is a Book

In Its Pages Tragedy and Comedy Combine

By ROBERT SPARKS WALKER

ILLUSTRATED BY S. F. AARON

NATURE is a book that is just beginning to be intelligently studied. It is a volume that thus far has never been completed, yet it antedates everything else in literature. It is poetry, it is prose, it is wit, it is humor, it is drama, it is tragedy, it is song—in fact, it is everything that the word literature implies, and above all else it is *truth!*

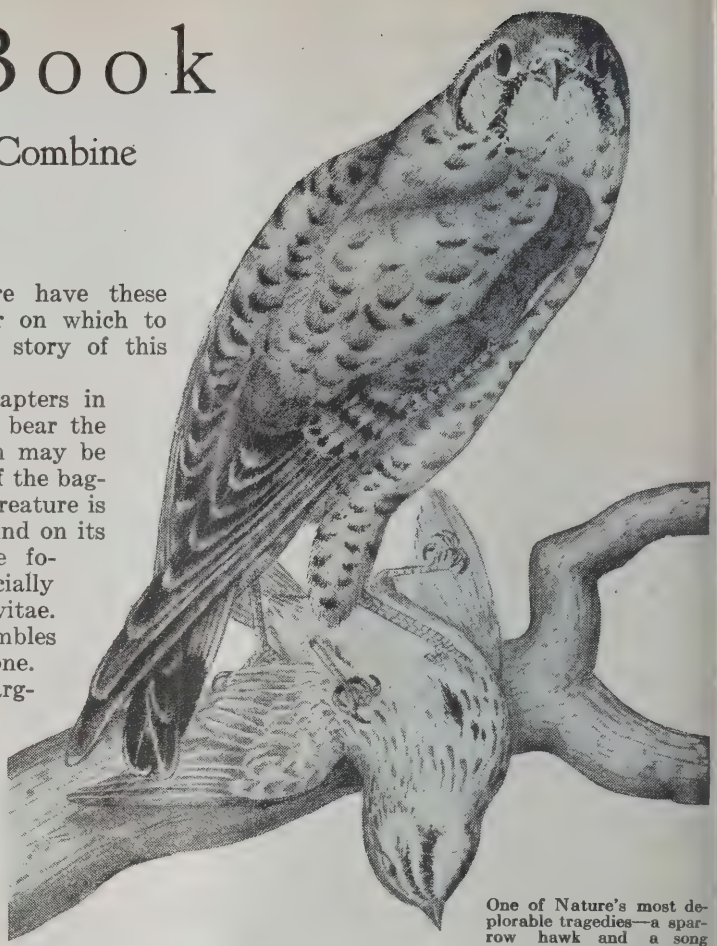
Did you ever notice that Nature often scribbles the same story on one, two or more pieces of paper? For example, in the months of May and June there may be observed in the Eastern United States a certain fungus gall which is produced by one of the pine rusts (*Peridermium cerebrum*). Nature writes this beautiful story on the Virginia scrub pine, the jack pine, the spruce pine, the short-leaved pine, and the old field pine. On these trees the reading appears in spheroid galls, and in the month of May, the golden yellow colors of the galls are marvelous illustrations. Their surfaces are convoluted like the human brain. The galls appear on twigs, branches and trunks of trees. When they set up on young pines, the trees usually die in early life, but when written on older trees the story is void of tragedy. The romance enters into the tale when the millions of tiny orange-yellow spores ride the wind-waves and settle on the leaves of the red, white, and black oaks, giving rise to the rust on these trees.

Shortly after Nature has continued her story on the oak, it is written in little pustules on the surface of the leaves. In about a month the writing on the oak leaves changes to red-brown horns or short fungus filaments. The climax of this charming story is fraught with tragedy, and the romance comes when the spores germinate like seed and bear very small sporidia that swing on the passing winds and return to the parental roof of the pine, setting up new infestations which in time make new galls. Now, should the oak trees be destroyed, that would mean the tragic extermination of this fungus, for it is essential that Nature have these two kinds of paper on which to write the complete story of this pine gall.

Protective larval cases and cocoons of the bagworm, on spruce.

Some of the chapters in Nature's book that bear the suggestion of fiction may be found in her story of the bagworm. When this creature is young it walks around on its head devouring the foliage of trees, especially of cedars and arborvitae. In this shape, it resembles a tiny ice cream cone. As it eats, it grows larger, and its body swings down and soon it looks about, apparently realizing the need of some sort of garment to protect its naked skin. If Nature did not do the thinking for the bagworm, and it could reason for itself, at this stage in its life, such reasoning might be thus: "Gee, how the robins and vireos and other birds are catching and eating my neighbors. I'll just spin for myself a pair of overalls, for no bird has yet been born who will deliberately swallow a tough garment, as tasteless as it is, in order to get a caterpillar for a morsel." So the bagworm begins to spin a garment around its bare body.

Soon thereafter it has finished a neat pair of overalls, which it fits on itself, holding them on by two hooks on the lower end of its body. This garment is usually tougher than the woolen clothes made by man. The front end of the trousers are open, where it exposes its head and feet that it may walk and eat with ease. Birds might drag its bare body out of the tough covering, but with a quick jerk it brings its head safely into the bag and pulls the flap over. As it grows, it might further reason: "Squirrels have strong forelegs, and with their sharp claws they can rip my trousers off. It's up to me to fool them and other animals." So the worm begins to slash off bits of small twigs and leaves from the tree on which it is feeding and these are glued over the outside of its bag. Finished, it is such a perfect camouflage that the worm eludes the keen eyes of the insect eaters. Fiction told in facts!



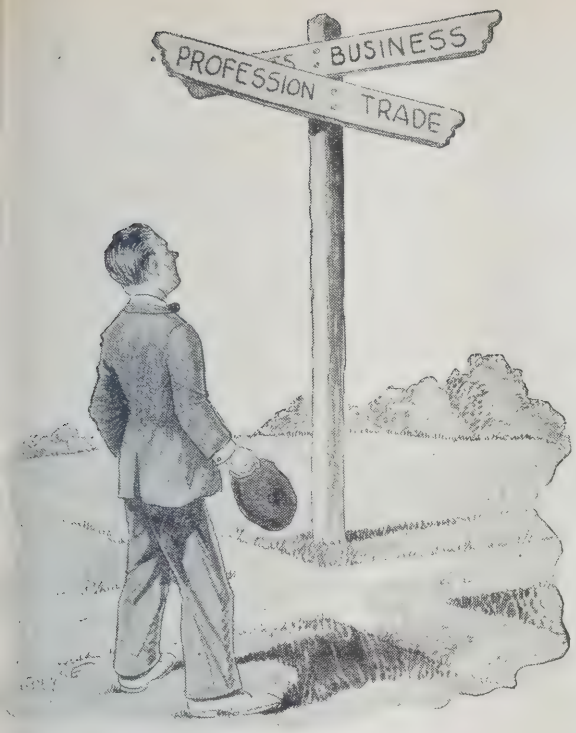
One of Nature's most deplorable tragedies—a sparrow hawk and a song sparrow. This falcon may be considered a useful bird because it destroys many field mice.

Where is the person who has not also read a story just as interesting that is written in tiny pebbles of the fresh water? In the clear springs the caddis worm has built of small stones a complete cocoon so perfectly that no stone mason of the human family can excel it in the art of making rubble walls!

Nature also writes a story that carries a flavor of fiction in the life of the chamelion whose colors so quickly simulate the background where it crawls that the harmony of colors saves its life from destruction.

The reader of Nature's book is compelled to dim his eyes and to muffle his eardrums if he wishes to avoid witnessing the many tragedies. The remarkable thing about it is the ability of ninety-nine out of every hundred persons unconsciously to muffle the eardrums and lightly dim their sight. A great deal of it is due to the majority of the tragedies occurring in the families of creatures too small to attract anything but passing notice, and not often this. Such a practice in regard to the tragic

(Continued on page 26)



"The choice that a young man makes that day settles about everything that is afterward to be settled for him."

The Greatest Moment in a Man's Life

By ALLAN L. BENSON

WHY did nature apparently intend that most men more than 40 years old should be undertakers?

The intention is plain enough. Look at their faces. Go wherever crowds are and study those about you. How many look happy? How many have faces that are utterly blank? One might think they wore masks. Perhaps they do; probably they don't. The real man usually goes into eclipse in his twenties and thereafter emerges only at long intervals and for brief moments.

Some day, when we have settled everything else, it may be worth while to consider why man is such a poor machine for the manufacture of happiness. In his nature and his environment he has the raw materials of happiness, just as the locomotive, in coal and water, has the raw materials of power. The locomotive wastes about 80 per cent of the power that is stored in the coal. We probably realize a smaller percentage of our opportunities than does the locomotive.

What is happiness? Happiness is the establishment of a proper relationship between an individual and his environment. What is a proper relationship? Could it be anything else than a relationship that satisfied a reasonable percentage of the great number of longings and desires that constitute each of us?

Small boys do not fail to satisfy everything of which they become conscious. That is why small boys are so happy. That is why "bad" small boys are the happiest of all. Huckleberry Finn will go down the ages because he was a "bad" boy. He did things. He did nothing bad, but he moved about and satisfied his nature.

That is exactly what men do not do. When they are in their late teens or early twenties, each of them fits himself into a nice straightjacket. Most of them do, at any rate. This jacket is called an occupation—a way of getting a living.

Worse than that, they do not exercise care in choosing the jacket. How much comfort would you expect if you bought your shoes the way most of us choose our occupations? Think of men rushing into a shoe store and grabbing whatever happened to be nearest and then wearing the shoes for life. You would not expect them to walk very well. You would not expect them to be without corns and bunions. Why then should you expect men to realize more than 20 per cent of the happiness they might have so long as they continue to choose occupations as maniacs might choose shoes?

Of course, we do very little choosing. Most of it is left to chance. A boy becomes old enough to work and looks around for a job. Unless he has a well-defined bent toward something, he reads the want ads in the daily papers and takes whatever he can get. Because his first blind gropings are so frightfully out of harmony with his nature, he quits a few jobs, is discharged from a few others and then settles down into one that is just good enough so he can stand it and just bad enough so that it leaves most of his nature unsatisfied. And that is his job for life.

Nor does the boy who is not pressed by poverty stand much better chance. He selects an occupation, and perhaps spends four or five years at highly specialized study, without having any clear idea of what it is for which he is preparing. An undergraduate at one of the greatest engineering schools in the United States recently told me that 60 per cent of the graduates of his school either never practice engineering at all or abandon it within a year or two after graduation. In the city in which the school is situated are two graduates, one of whom is in the ice business while the other sells coal. Almost everybody knows an engineer who isn't engineering, and there must be a great many men who are practicing engineering who should be doing something else. The same may be said of every other calling. Most of the square pegs seem to be in round holes.

How did they get that way? It is quite simple. Most of them had very little to say about the matter. They might have had something to say, but they did not realize the importance of what was happening when they permitted circumstances to drive them into occupations. Those who tried to guide their own steps were poor guides because they did not know the way. They chose occupations without knowing what they were choosing. When it was too late they found out.

Now I know of nothing in a boy's life that is of such overwhelming importance as the choosing of an occupation for life. Beside it, almost everything else becomes relatively unimportant. A man 50 years old can look back and see that everything that has happened to him in the last 30 years is due to the decision he made the day he reached the great crossroads of life and chose an occupation. The choice that a young man makes that day settles about everything that is afterward to be settled for him. After that he merely gets what logically comes to one who has chosen as he chose. Of course, there are a few glaring exceptions—but they are *exceptions*. For the great majority, life is fixed when the occupation is fixed. The occupation determines what longings shall be satisfied and what shall be starved, what tastes shall be developed and which shall be driven back upon themselves—it even determines what one's environment shall be and what kind of neighbors one shall have.

My fate was fixed the day I read the headlines that the telegraph editor of the Detroit *Free Press* put over the account of General Grant's death. Grant died on July 23, 1885. I was a little less than 14 years old. I had intended to be a lawyer. But along

Do we choose our work, or does it choose us? Mr. Benson thinks we choose; others think we are chosen. It seems that Mr. Benson himself did not, after all, choose, but was chosen. However, an article need not agree with us to be a good one, it need only be provocative of thought.

came the *Free Press* with column rules bottom side up to indicate heavy mourning. And those fateful headlines —I can see them now, though I have never seen them since, single column, right-hand side of the front page:

GRANT IS DEAD

The Conqueror of a Nation's Hearts at Rest

Sleeping Peacefully on the Banks of the Hudson

Those lines went through my mind like the roll of a pipe organ—and right on their heels came the thought: "I could write a head like that." So far as the law business was concerned, it thereafter had no existence for me. I went to school, taught school, and fussed around a bit, but in five years, I was in the atmosphere of printers' ink—in which I have been ever since.

But what a way to choose an occupation! It happened to turn out moderately well, but I think it was the wrong occupation at that. I think I should have been a lawyer as I intended to be before that gale from the press room blew me off my course.

Now what I am driving at is this: In the most important event of their lives, boys should not be left to grope their way; much less should they be forced by circumstances into places that they do not fit.

I believe that every school should include a course on occupations, to the end that boys may have definite and, so far as possible, illuminating information with regard to the chief trades and professions. As nearly as possible, boys should be enabled to understand just what it will mean to them if they choose this or that calling. There should be a textbook, each chapter of which should be written by a man who is practicing the trade or profession that he describes. An old lawyer should tell just what it means to establish a law business and practice law, stating facts just as they are, neither better nor worse, noting at their full strength the great satisfactions and the great discouragements. A physician should write a chapter about his profession and so on along the line through the various branches of engineering, including industrial pursuits. Let a factory superintendent tell just exactly what it means to start on a machine and work up to the top.

Wherever possible, local men should be invited to lecture before classes as a sort of supplementary course. Let the pupils ask questions. And, above all, stress each occupation in the terms of satisfactions obtained. What does the practitioner of a trade or profession get out of his work besides money? How interesting is it? How happy is he while engaged at it? What money it produces is relatively unimportant. Everybody must have some money, but nobody should work a minute at a thing from which he gets nothing but money. Every man spends the greater part of his life at work and if he gets no joy from his work he will have very little time to get it anywhere else. The men who are to be envied are those who take a keen pleasure in their work—who are so interested in it that they seem to forget everything else while they are at it. There are not many such, but that is because choosing an occupation is left, for the most part,

Send your mind off into other worlds. Dream!"

to ignorance and to chance.

Whenever you see a man in the right place, you see a happy man. Richard V. Lindabury, a New Jersey lawyer who was thrown from his horse the other day and killed, was, up to his death at the age of 74, infatuated with the practice of the law, always liking, as he said, "a good legal scrap." A few weeks ago I saw great beams of satisfaction radiating from the face of a Negro who manipulated a big steam road roller back and forth on a paving job that was being performed on my street. He was about 50 years old and of giant build. Instead of wearing dirty old clothes he wore a nice, clean summery suit (blouse and trousers) made of some light, striped material. His blouse was carefully buttoned. And no captain of a great ocean liner ever maneuvered his craft out into the stream with more dignity than this black man guided his ponderous roller over the ridges and crevices that it was his business to iron out. He respected his job because he liked it; and one could not help noticing that the white men who were shoveling crushed rock for him to smooth out respected him.

The best occupation for any man is the job that enables him to satisfy the greatest percentage of his inborn longings and desires. To put the same thought in another way, the best job for any man is the job that connects up, with the outside world, the greatest percentage of the longings that are within him. There are but two ingredients of happiness—what is in you and what is outside of you. The job is the link between the two.

I read the other day about a man who, asked what he would rather do than anything else in the world, replied: "Make my business the most efficient business in the world." Reminded that this was not an answer to the question, he added: "I know it isn't. What I would rather do than anything else in the world would be to ride an elephant—right on his neck the way I used to see fellows do in the circus when I was a boy."

There are a few wise men who contrive to ride on the elephant's neck in quite a different way. That is to say, not being wholly enamored of their jobs, they use the jobs as a means to an end and get their great satisfactions at something else. The thoughtful part of the whole world must have glowed at the story of the London hatter who played so large a part in the discovery of the cancer germ. For 40 years he had attended to his hat business until noon and devoted the remainder of the day to explorations with a microscope. He made no reputation as a hatter—though he made the business earn him a living—but what he doesn't know about the use of a microscope, few if any persons know. One might say that he should have devoted his life to microscopic investigation, but considering the fact that he has made such an enormous success of it as a side line, who shall say that he would have done more if he had not been a hatter each day until noon? Perhaps the hat business put him in such a state that he was very eager when he turned to his microscope; and the eager are the ones who do things in this world. They enjoy their work, because they fit it and it fits them.

I don't say that everything there is to do in this world is sufficient to yield great happiness to him who does it. There is a lot of very tedious, dull work that has to be done, though machinery will eventually do away with most if not all of it. But it is unfortunately true that there are in the world a great number of dull persons who are able to do nothing but this dull work. They are late children of the evolutionary urge who have not yet caught up with the procession, and until they catch up they will have to do what they can do. But I believe that the great majority of the human race is fit for more happiness than it is getting. Everywhere we see the race reaching out for more—not always getting it but reaching.

That is the meaning of the unprecedented rush for the colleges. It is a blind rush, for the most part, but its meaning cannot be doubted. The young of today believe that greater happiness lies that way. They are traveling upon instinct rather than upon judgment. Their instinct is right, but they need judgment to guide it—judgment and facts. They go to college to get—what? Something that will get them happiness. What is that something? They do not know. (Concluded on page 30)

Seeing Riga—Pearl of the Baltic

The New Capital of Latvia a Fascinating City of Strange Contrasts

By STANLEY HIGH

TO TRAVEL across Europe—beyond the borders of the larger nations—is like journeying over a crazy-quilt. In order to get rid of the odds and ends of territory left from the war the treaty makers of Versailles, with no particular design, patched together tiny states of all shapes and sizes. As American mileage goes, my recent journey through Europe was not so lengthy. But in European terms I traveled across thirteen different nations and suffered my baggage to be examined at least twice—often more—in every nation. Which meant—in plain terms—that my whole equipment was spread out for survey on thirty-three different occasions, to be examined by thirteen different kinds of customs' officers, in thirteen kinds of uniform, who spoke thirteen different languages and collected customs duty from me in thirteen different currencies.

In no part of Europe is this crazy-quilt arrangement so apparent as in those Baltic provinces that stretch out from East Prussia and include territory from the old empires of Russia, Germany, and Austro-Hungary. A trip from Chicago to Denver with two customs examinations at every state line and a different coinage, language and train in every state would be comparable. My journey from Berlin to Riga might have been worse but for the fact that the porter in my car was an exiled American—or so he called himself. Twenty-five years ago he had come to Chicago. Twenty years ago he returned to Germany for a visit; spent his savings and for the last two decades has been trying to get money enough to return to the shores of Lake Michigan. This friendly porter took my baggage and passport in charge, placated the Germans at the border and reduced the misery to a minimum.

Even from patch to patch of this European crazy-quilt, however, one can note very marked differences. More than language, currency and uniform, for instance, divided Lithuania from Germany. Ten minutes from the German border into Lithuania and the face of the world was changed. The country was undeveloped, like certain parts of Wyoming and Utah without, of course, the mountains or the sagebrush. Unlike the American West, however, conditions were primitive. The towns, in contrast to the spick-and-span villages of Germany, consisted of huts—thatched-roofed and gloomy—grouped in weary fashion in a clearing of the wood. The woods were grown up to underbrush; the fields unkempt and there was little evidence of the industry that was so apparent, on every hand, in Germany.

Above—One of Riga's narrow streets. At high noon our friends would appear in many costumes, selling wares of divers sorts.
Below—Riga's waterfront in winter.

A Lithuanian—with more than an average smattering of English—sat next to me in the compartment.

"Our country," he said, "it is in very bad condition. Three of every five Lithuanians are in the employ of the government."

I could easily believe him. The stations, even at the smallest towns, were thronged with soldiers—in uniforms old and new. Those who were not in the army appeared to be in the employ of the railroad—which is government-owned. A whole staff of employes united to take up our tickets. Everything, in fact, seemed to be done by groups. Thus, every small flock of goats had several attendants and I noticed one mixed herd of three cows, two goats and a horse that was watched over by four alert guardians.

But a few hours' journey brought us through Lithuania into Latvia. Latvia, Lithuania and Esthonia have been under Russian domination since the latter part of the eighteenth century. Of these three states only one—Lithuania—has a historical claim to independence. In Latvia and Esthonia the determination to establish self-government is based primarily upon the desire of the people of these provinces to throw off the yoke of foreign exploitation which for centuries had burdened them. Germans, Swedes, and Russians, all, in turn and repeatedly, overran the territory that now comprises these small nations. The peasants for many generations have been subjected to serious oppression. The population of the country, which is approximately 2,500,000, is almost wholly agricultural and in this agricultural community the coöperative movement is making rapid headway.

The old city of Riga—capital of the new state of Latvia and one of the loveliest cities in Europe—was one of Russia's chief industrial centers before the war. It was founded in the middle of the twelfth century by a company of adventuring merchants from Bremen. Fifty years later a community was established and as it prospered, during the succeeding centuries, kings and emperors, bishops and princes fought back and forth across the rich territory that it controlled.

Riga is a jumbled city and unusually fascinating. My hotel room was not all that could have been desired—done in a brilliant red paper with carpets, hangings and upholstery of similar hue. I had one feeble electric light at my disposal, which only served to make the decorations more weird. Then, too, when it came to sleeping I discovered that darkness so far to the north does not set in, nor the quiet of the night-time, until very late. It was nearly eleven at night when my train slowed down at Dvina, outside Riga, and

across the river the smokestacks and minarets of the city's sky line pointed into the dusk of early evening, and the lights of the river vessels had not yet been lighted.

It was at an outlandish hour, therefore, that I found myself—my coffee-and-rolls breakfast finished—wandering through the town. Riga's streets in the old city are alternately wide and narrow. They twist and wind like a knotted fishline and end nowhere in particular. The shops along them are, for the most part, attractive and modern. One may stand before a window and admire the products of American factories and then, in ten steps, round the corner into a Slavic market place.

German enterprise is largely responsible for the smokestacks that share the honors of the sky line with the minarets of Riga's churches. Before the war (one speaks always of "before the war," or "since the war" as of two different worlds) Riga was an industrial city. The vast hinterland

The old Russian cathedral in Riga which is now falling into disrepair because there are no funds to support it.

of all Russia was looked upon as the selling field for the products of Riga's factories. Now that is all "kaputt"—destroyed. Today there is no hinterland to buy from Riga. I talked with an engineer who, before the war, was in a rubber company that employed, in this city, 13,000 men. The capacity of the plant, in galoshes alone, was 80,000 daily. One day's manufacture of galoshes would supply the entire Latvian demand for a year. That factory, consequently, is closed.

Many such plants, however, were closed down before the revolution cut Latvia off from Russia. The site of one factory was pointed out to me, where the entire plant was shipped to Russia and made the basis for three factories there. Every machine in this factory—even the wire cabling—was shipped out of Latvia to strengthen the industry of Russia.

This stoppage of industry has made the task of Latvian rebuilding exceedingly difficult. At present the chief source of national income, (Concluded on page 27)

Fertilizers for Farmers

How Monopoly Controls Prices and Curtails Supplies

By OTTO WILSON

COFFEE and rubber monopolies (discussed in two previous articles) affect all of us, including the farmer. But the farmer has also a little group of necessities of his own, which he must bring from abroad, and each of which he can buy only from one small section of the globe. In each of these industries the output is more or less closely controlled by its small group of producers, and in each this monopoly feature has made the farmer pay higher prices than he would have paid had there been free competition.

Two of these are indispensable constituents of fertilizer, nitrates and potash. Both are to be found everywhere, but by some freak of Nature each has been piled up in great deposits in one general section, the nitrates in Chile and the potash in territory which before the war was all in German hands but which is now divided between Germany and France. In these deposits nitrates and potash can be mined so cheaply that no other natural deposits can compete with them.

The working of the monopoly and the tribute it has exacted from the American farmer were clearly shown by a pre-war incident. Certain potash interests in Germany contracted with American buyers to supply them with potash at lower rates than the potash syndicate was charging. But the syndicate, backed by the German Government, forbade the sales, and the contracts had to be canceled. Since the division of the deposits by the war the old air-tight control by a single syndicate no longer prevails. But evidently the monopoly feature is still to hold fast.

French and German Interests Are Combined

For the French and German interests, as reported by the newspapers, have formed a trade agreement, and to the farmer who loads the bags of fertilizer in his truck or wagon in the spring it will probably make no difference that the monopoly is handled by two sets of interests instead of one.

In the nitrate trade, while there is not such close control over prices as in some others, conditions are such that nitrates cost much more than they would if there were stiff competition. Presently we may build up such competition through our air-nitrate plants—although there will not, indeed, be much gain unless we can guard against a private monopoly at home that will charge all the traffic will bear. Then the mineral nitrates of Chile will quickly drop in price, for other large users of nitrates are developing their own air-nitrate industries, and the United States is the one big market left open.

The third of the trio of "farmer" monopolies is perhaps the tightest and most dangerous of them all—that which controls the sisal, or properly the henequen, fiber which goes into binder twine. This fiber supplies three fourths of the raw material for the twine that binds our yearly crops of grain. It comes entirely from Yucatan, the Mexican peninsula that juts out into the Caribbean Sea. If at the proper time of the year the henequen plantations should be destroyed, or anything else should prevent the export of the fiber, our grain farmers would be helpless. No other fiber could be obtained in large enough quantities to serve as a substitute. With much moonlight labor the farmer might be able to save a small fraction of his crop by the old hand-binding methods of his grandfather's day, but most of it would probably lie wasted in the fields. Many years ago such a calamity threatened. But a United States gunboat made an opportune appearance off the coast of Yucatan, and under its influence the blockade on exports melted away.

Without Fiber Farmers Would Be Helpless

There is always the possibility that other American necessities of life will be added to the foreign-monopoly list. For example, sugar.

"I do not say," said President Coolidge recently, "that such foreign combinations in restraint of trade exist in sugar at the present time, but the whole tendency of the development of foreign sugar production is in the direction of larger holdings. In the long run there lies in this, therefore, certain dangers to the consumer which can only be safeguarded by an assurance of competitive domestic supplies."

Wherever it can be applied, this solution of the difficulty, namely the fostering of a domestic supply to compete with the foreign monopoly, is probably the only one that holds promise of relief to American consumers.

(EDITORIAL NOTE—In connection with the above article it should be remembered that a way to nitrate independence was offered by Muscle Shoals, but this way has been closed apparently by the devious influences of the Fertilizer Trust in conjunction with the Power Trust, operating upon Congress.)

Using the Post Office to Rob

The People Lose a Billion Dollars in Mail Fraud Schemes Every Year

By AARON HARDY ULM

IT IS not extravagant to say that *a million gullible Americans* yearly lose their money and property in mail fraud schemes and that *a billion dollars annually are so lost.*"

The words of a sensationalist? Not at all. They are taken from an address made to the Investment Bankers' Association of America by Horace J. Donnelly, Sr., then assistant solicitor and now solicitor of the Post Office Department. For the last several years Mr. Donnelly has been the chief director of the Government's pursuit of mail fraud operators.

This pursuit has been going on for nearly a half-century. It is based on statutes which empower the officials to deny the use of the mails for the operation of fraudulent schemes and which provide for the criminal prosecution of persons who so operate such schemes through the mails.

In a Texas City Shady Oil Men Steal a Million

Yet it is probable that more fraudulent schemes are put over through the mails now than ever before. The harvest from them may be somewhat less than at the time when the foregoing estimate of a billion dollars a year was made, in 1923. For since that time there has been much apparent curbing of a species of mail-fraud operation that was then taking veritably millions a day from the public. This was the oil stock species, against which Government officials were then making an intensely concentrated campaign. Within a few months' time, fraud orders were issued against more than 100 persons and concerns engaged in selling stock in oil companies. Many were prosecuted criminally, several of the offenders now languish in prison.

Within less than two years, shady oil stock operators in one city in Texas took—in plain language, stole—more than $100,000,000 from the public. The extent of their operations may be illustrated by the fact that, within a month after the special campaign against them was started, postal receipts in that Texas city fell off 50 per cent.

But the operations were only curbed. Oil stock cases have developed regularly since then; several are pending now. The authorities say, however, that the special campaign succeeded in reducing that species of operation to only a negligible proportion of its former volume.

It is the only elaborate campaign of the kind made by the Government since it undertook, many years ago, to keep the mails free of outright thieving. One reason for this is that the regular flow of mail-fraud work coming in due course to those who look after this phase of Government activity is ordinarily equal to or beyond the facilities for handling it. There may be other reasons, but, if so, one of them patently is not lack of scrupulous attention to duty on the part of the officials having to do with this work. The corps of Post Office inspectors, which does the hard work in the premises, is noted for efficiency and energy. The attorneys who handle the cases for the Government become so aroused by the flood of mendacity which pours upon them that they develop a zeal beyond that usually going with official work.

Still the ranks of the mail-fraud operators expand and undoubtedly the volume of their garnerings, though at times checked temporarily, grows. When, a dozen years ago, the Post Office Department estimated the garnerings at $100,000,000 a year, the figures seemed unbelievable. The present estimate of a billion or more is considered modest—and arouses no special interest, except perhaps that of enthusiasm among those who share the spoils of the most insidious thievery common in present-day American life.

Men engaged in this kind of thievery have oeprated for years and have acquired millions—often becoming "leading citizens"—without being, or before they are, disturbed. Only recently a group was indicted in an eastern city on account of operations that had, during a period of ten years or more, yielded several million dollars to the promoters. Many when checked by a fraud order merely shift bases of operation, make changes in names and (though not always) in type of operation, and keep going. Some have continued operations after being sent to—and even from—prison.

Only a small proportion, however, ever land in prison. Despite the special campaigns that had been waged against them during the preceding two or three years, only 152 of the probable 10,000 or more were serving sentences in the two biggest Federal penitentiaries on June 30, last, for robbing persons via the mails.

Only a Small Proportion Land in Prison

A large number of those convicted are let off with fines that usually amount to an insignificant percentage of their garnerings. One of the biggest mail-fraud operators prosecuted in the last ten years—a man who literally got millions from the public—was let off on a fine of $1,000 each on two of numerous counts in an indictment to which he pleaded guilty. *The preparation of the case cost the Government many times the amount of the fine imposed.*

His operations at the time were stopped, however, by a fraud order, which apparently is the most that need be feared by the run of operators. And for reasons that shall be given, the fraud order need arouse no great fear among these schemers.

Fraud orders are issued in only a small proportion of cases. The operator, if at all clever, always can make a sizeable clean-up before, in the ordinary course, the mails will be closed to him.

Long Distance "Astrology" May Be Legal

While the courts usually uphold the Post Office Department, judicial construction of the law is sometimes surprisingly legalistic. Many years ago the Supreme Court laid down the ruling that what is generally held to be a *fallacy* is not presumptively a *fraud.* The case involved the selling of a "magnetic cure" to be administered at long distance for disease. The authorities don't dare hold, for example, that "astrology" is not a science or is incapable of being employed in accurately exploring the future. If in selling a long-distance treatment for disease, or "astrological" readings of the future, you do all that you promise, the authorities will hesitate in closing the mails to you.

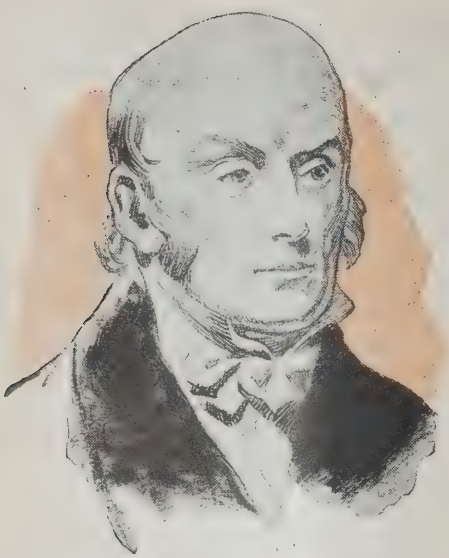
The fraud must not only be a patent one but, also, it must be proved that it is intentional—which is not always easy to do in law even though there be no doubt in common sense.

Hence the cases that are made under the fraud-order statute usually are as clear as purse-snatching. But in many of these, convictions cannot be, or, rather, are not, procured under criminal statutes.

Investigations are made by Post Office inspectors, of whom there are about six hundred. They have manifold duties to perform. Only when special campaigns are made, as in the oil stock cases, are they detailed singly or in groups for the investigation of mail frauds. Only one, an expert in medical fraud cases, gives most of his time to that part of the work, in which only a few become, like him, specialists. When an inspector was asked recently for a report on a case in his district, he replied:

"I have on my hands for investigation not less than 86 mail-fraud cases."

All of them, like the bulk of those in which proceedings are begun, had arisen by reason of (*Concluded on page 27*)



John Adams

The Signers of 177

John Hancock, of Massachusetts, and the Adams Brothe

By CARL SCHURZ LOWDEN

(Copyright, 1925, by Carl Schurz Lowden)

MASSACHUSETTS in the North and Virginia in the South were the strongest backers of the independence movement. They vied with each other for this honor, but they remained friendly rivals. Patrick Henry, Richard Henry Lee and Thomas Jefferson were Virginia's big guns. Massachusetts had a remarkable triumvirate consisting of John Hancock, John and Samuel Adams.

There was Samuel Adams who had continued his anti-royal activities even to the point of making himself liable to be sent to England for trial on the charge of treason. Governor Gage of Massachusetts had Colonel Fenton go to the patriot's home and make certain promises to be fulfilled when Adams ceased his opposition to the authorities. When the purpose of the visit was revealed, the American pledged the go-between on his word of honor to deliver verbatim the reply he was on the point of giving. Then Adams said:

"I trust I have long since made my peace with the king of kings. No personal consideration shall induce me to abandon the righteous cause of my country. Tell Governor Gage it is the advice of Samuel Adams to him no longer to insult the feelings of an exasperated people."

When Colonel Fenton conveyed this message Gage was so angered that he issued a proclamation of pardon to all offenders except Adams and Hancock.

"In his majesty's name," he announced, "I do hereby offer and promise his most gracious pardon to all persons who shall forthwith lay down their arms and return to the duties of peaceable subjects, excepting only from the benefit of such pardon Samuel Adams and John Hancock whose offenses are too flagitious in nature to admit of any other consideration but that of condign punishment."

The London newspapers apparently expected that the heads of Adams and Hancock would soon be placed on exhibition in that city.

British troops left Boston shortly before midnight of April 18, 1775, with instructions to proceed to Lexington and capture the rebel pair, then go on to Concord and destroy the military stores at that place.

They reckoned not of Paul Revere who was alertly watching for a signal. When the lanterns flashed from the steeple of the Old North Church, he galloped away to spread the warning that the British were coming. He stopped at the Lexington house in which Samuel and John Adams were sleeping.

"Don't make so much noise," the man on guard cried out to the silversmith.

"Noise," the rider replied, "you'll have noise enough before long. The 'regulars' are coming."

The pair escaped. It is often unwise to speculate or say what might have been; but if these two leaders had been captured at that time, the blow might have been sufficient to cause the Revolution to fail.

The British could not handle Samuel Adams. They had attempted to silence him with preferment, a form of bribery; but he proved to be an exceedingly deaf individual. The king wrote pointedly to Hutchinson, then the governor of the colony. Why had Samuel Adams not been "fixed"? Hutchinson became vexed.

"Such," he answered, "is the obstinacy and inflexible disposition of the man that he can never be conciliated by any office or gift whatsoever."

Hutchinson knew him, and his great tenacity. After the Boston Massacre when the residents of the city and the people of Massachusetts were demanding the removal of the troops, Hutchinson and Colonel Dalrymple, the commander, consulted together and the announced that one of the two regiments would be taken away. Samu Adams, who was present during th conference, soon convinced them of th desirability of doing the thing t brown rather than by halves.

"If the governor, or Colon Dalrymple, or both together," h argued, "have the authority to remov one regiment, they have the authorit to remove two. Nothing short of th total evacuation of the town by a the regular troops will satisfy th public mind, or preserve the peace o the province."

Two regiments were ordered ou of Boston. That left the city wit none, a consummation which most o the residents had long devoutly wished

The nation is indebted to Samue Adams for his work in fathering th first Congress. It was his idea, h suggested it to the Massachusett assembly, and this colony then sug gested it to the others. As the Congres resulted in the union and confedera tion of the thirteen colonies, Samue Adams certainly deserved the often heard sobriquet of "Father of th Revolution."

MR. FORD'S PAGE

IN A country where practically everyone earns his living by working, and the majority of workers are wage-earners, a proposal to reduce wages could just as well be described as a proposal to reduce the number of customers; it could just as well be described as a proposal to reduce business. For that is what it amounts to.

But there is a type of business man who will never see this except as a form of words. To him business is not a science but a foray. To him labor is not a social partnership composed of human beings in all stages of life's romance and experiences, it is a nuisance, a drain to be decreased at all costs. He is in business to make money for himself alone; he is not in business to make utility for the user of his commodity; he is not in business to make money for the employes who have houses to build and sweethearts to wed and children to rear and educate. None of these aspects of life, as they run through and vitalize business, have any meaning for him.

When pressure comes his first thought is not to go over the ship and stop the leaks, overcome obstacles by managerial resource, tap new centers of strength. No, his first thought is to reduce wages! What he should take out of his own energy and genius for leadership, he takes out of his men's pay envelope instead.

When this kind of business man is numerous enough, he simply destroys wholesale the purchasing power of the community. An unemployed man is an out-of-work customer. He can't buy. An underpaid man is a customer reduced in purchasing power. He can't buy. What a strange business philosophy that would meet the emergencies of business by creating more emergencies. Business depression is caused by weakened purchasing power. Purchasing power is weakened by uncertainty or insufficiency of income. The cure of business depression is through purchasing power, and the source of purchasing power is wages.

This country could not last any time on the purchasing power of those whose income is independent of what they receive from their work. This country is maintained by work. The evidence of work is wages. The effect of wages is the continuity of work. Reduce wages and you reduce work because you reduce the demand upon which work depends.

No sooner does one contend for a steady wage and a just wage than theorists arise and demand the mathematical formula of a just wage. They want to know how it is arrived at. They want to know how it can be described in terms of political economy. The question is not going to be evaded here, but it is going to be postponed in order that it may not be used to derail the present pertinent statement to young business men.

One may question whether it is worth while to argue this point with a business man. If he needs to be argued with about it, he should not be in business. And if he should not be in business, the natural law of business will eliminate him soon enough.

But this fact requires present emphasis, namely, that *wages is more of a question for Business than it is for Labor.* It is more important to Business than it is to Labor. Low wages will break Business far more quickly than it will Labor. For Labor can support life under conditions that will not mean the slightest support for Business as a whole. If any business man thinks that the successful solution of the wage problem consists in getting wages as low as possible, he should ponder the fact that Business could not possibly pay the lowest possible wage. When things got that low, Business would be unable to pay anything.

There is, after all, a world of wisdom in the parable of the goose that laid the golden egg.

Just now, for no apparent reason, there is a restless movement toward suggesting, at least, a general wage reduction. Whence this stupidity arises is hard to guess. For it *is* stupidity. It is not even greed. It is not even a desire to oppress. It is more stupid than these. Everywhere through the business world it should be asserted that stupidity will not be permitted to start a retrograde movement in this country.

Reduce profits; reduce prices; reduce dividends; reduce costs—reduce anything rather than wages. However, if wages are not reduced, neither will any of the other products of business require to be reduced. The pay envelope does as it is done by—when increased, it increases business. When reduced, it reduces business.

WAGES is not exclusively the concern of the wage-earner; wages is also the concern of Business. It is to the best interest of Business as well as of Labor that wages be kept high. For in a country where everyone works and every worker is a wage-earner, the basis of business is purchasing power, and the basis of purchasing power is wages. An unemployed man is an out-of-work customer. An underpaid man is a poor customer. Business beats itself when it beats down wages. And a mere "living wage" is never sufficient to support a lively business.

EDITORIALS

Are Americans Criminal?

NEWSPAPER readers are now aware that Crime has joined in the headlines of crimes. Side by side with horror stands horrified philosophy asking why crime should be so rife. And a committee has been organized in New York to study the matter.

There are two facts which any committee can find if it wants facts and that few newspapers will care to print because they cannot handle them. First, that crime is not an aftermath of war; second, that crime, in this country, comes mostly from two racial groups which it is not polite to mention.

The outrageous assumption that the American stock is degenerating is made in every penny newspaper. Even the New York Committee will probably begin its labors by deploring that we, the people of the United States, are going to the devil. As a matter of fact and observation, we are not *producing* crime, we are being *invaded by it.* And the crime that we behold is not a lapse, it is the normal level of life in lands and classes from which our criminals come. Our own people are as dependable and straight as they ever were; there has come in among us a type of humanity which has crime in its nature.

Dr. Mayo, the famous surgeon, hit the nail on the head in his reported statement during a recent visit to London. Asked to explain the "wave of crime" in the United States, he said, "The dark-skinned people are killing each other—and the more the better." He let it be clearly understood that the "crime wave" was not "American," but racial and transatlantic.

Our crime statistics have no reference whatever to the war, but to our immigration statistics. Before the war was thought of and immigration was free, the crime indicator began to mount. The registers of our courts are sufficient indication that the American has not gone wild, that the solider peoples who merged in the founding of this nation do not figure in the "crime wave." Nothing has happened to *the American people.* They have not turned highwaymen and murderers, nor even bootleggers. These criminal classes are recruited from aliens who brought their criminal proclivities with them.

Nothing more damnable has been attempted in this country than the deliberate insinuation that this crime increase is American.

New York State furnishes a precedent in truth-finding. The governor there is asking $100,000,000 for more jails and more insane asylums. The politicians won't inquire who fill the jails, but the doctors—always a more courageous breed—have inquired who fill the asylums. Is American New York going insane? No. The insane are the aliens, shipped over here and "inspected" at the rate of eight a minute, to fill our public institutions and become charges on taxpaying Americans. The doctors of New York have made that fact clear.

Of course, America has been the dumping ground of the world. The pitiful stories we read of intending immigrants crowded and stranded in distant ports, because refused admission to the United States, must be read with another fact in mind, namely, that those people cannot even return to the country of their birth *because they are not wanted.* They leave their native land for a port to embark to America. They are rejected. Their native land refuses to have them back—feels well rid of them. That is what America has been getting these last twenty years. Certain European governments have periodically cleansed their countries of crime and insanity by sending the criminal and insane to the United States!

It is to be hoped that committees and newspapers will sufficiently respect the facts to permit a few of them to appear. If crime in America is to be investigated, let it be thoroughly done, and by Americans.

Love, Honor and Obey

BISHOP Irving P. Johnson is strong for "obey" in the marriage ceremony. He bases his position on the sound foundation fact that every institution must have a head, and that the home is no exception. The Bishop is not likely to have great success with his teaching because the whole atmosphere of "obedience" has changed for this generation. There has been so devastating an experience with authority minus wisdom, with power minus justice, that the inoffensive "obey" of the marriage vow has quite innocently and ludicrously become the point of attack. People who bow to every other obedience, some of it quite justifying repudiation, assert their sense of independence when approaching that highest form of cooperation, the obedience given to honor and love. "To love, honor and obey"—in such a trinity "obey" may be excised a thousand times; it trails on just the same—provided the love and honor stay.

However, there needs no addition to the verbal reaction which the Bishop's attitude will cause. Every home has a head, whether the man or the woman. Few married souls are of equal age, and if they are, they lack equality in the insights and endurances that are so necessary to a beautiful life. Fronting the world the head of the house is the man, recognized so everywhere. But in the home the head of the house is, by common agreement, the woman. In an age when people were more conscious of order and authority than now, "obey" had its place. In this day the sense of order is in the veins of all good folk, who obey "love and honor" and render their obedience freely and joyfully to these, whether the ceremonial says so or not. For far deeper than the prayerbook is the power of "love and honor" to bring obedience in their train.

Rights and Duties of States

LITTLE given to self-praise, THE DEARBORN INDEPENDENT is nevertheless proud to think that it was instrumental in reviving throughout the country the sense of the Rights of the States to Home Rule in matters not delegated by the Constitution to the Federal Government. The wild rush toward bureaucracy, centralization, prussianization of the whole country, a rush encouraged by those who can more easily control politicians than they can the people, has been stopped. Efforts will still be made to take away the Rights of the States, but the people are awake and that course will not prove so easy in the future.

However, that is not all. Rights *may* be taken away from the States and *are* taken away when States refuse the Duties which Rights imply. No State, in the name of its Rights, can throw itself as a barrier across the path of the nation's progress. When it does, its right to do so is removed. Recent discussion has retained to the State its rights over its schools and to the families of States their rights in their own children. This has been done by showing what is proposed and would be possible under the so-called Child Labor amendment to the Constitution and under the proposed Federal Department of Education. Those who want to control all children under 18 from a Washington Bureau, those who want to put all the district schools under a Bureau at Washington, based their strongest argument on the neglect practiced by the States—neglect in protecting tender children from barbarous labor conditions, neglect in fostering an adequate educational system in backward districts.

Insofar as these charges were true (and to a minor extent in a few neglected places the first was true; to a minor extent but in more places the second was true) it called attention to the neglect of State Duties. The conclusion drawn was wrong, of course. Because a State neglects a matter is no reason why it should be immediately dissociated from all rights and duties in that matter by having the Federal Government appropriate it. Home Rule with less efficiency is more valuable to this nation than Federal Rule with more efficiency. That statement would be true even if Federal Rule were more efficient than Home Rule, which *it is not.* When a State neglects its duties, the procedure is to wake it to its responsibility and through education and urgence bring its people to a vigorous handling of their own affairs.

If there are states which permit little children to go to work, or youth or women to toil under hurtful conditions; if there are States which neglect or forget the district school, they may expect constant assault on their Rights to control the conditions under which their children live, and their Rights to control their own educational system. The Right of the State to Home Rule depends on the State's fulfillment of its duty to rule at home in accordance with the best interests of all its people—especially the multitude of plain people.

Are Men Growing Smaller?

THERE must be something wrong when big men have to form themselves into a Union for the purpose of getting a square deal in the amenities of life. By "big men" we mean those men whose physical latitude and longitude are above the average, not the men whose names are linked with "big business" or great achievement.

What are they kicking about? Simply this: Hotel beds are too small, chairs are too short in the legs, and doorways and other openings are so constructed that they are apt to knock their heads on the transom.

There is a popular delusion that a six-foot man can sleep comfortably in a six-foot bed. The fact is that, geometrically speaking, he has to convert himself into the diagonal of an oblong area before he can sleep at all. Otherwise his feet would be projecting several inches beyond the foot of the bed.

Does this persistent catering to the wants of smaller men suggest that the race is physically deteriorating? Probably not, although some think that it is. The fact that tall men are becoming vocal in clubs and unions may indicate just the opposite, that the physical proportions of the race are increasing. Certainly the conditions of life today make for larger physique.

Lined up for the photographer after school in Domberg.

The Passing of Wooden Shoes

Once Worn by the Thousand, They May Be Soon Classed as Antiques

By DIRK P. De YOUNG

I HEAR that wooden shoes are going out of style—at least in the United States. About twenty years ago there were more wooden shoes worn in Chicago, Grand Rapids, and Kalamazoo, than in the city of Amsterdam, Holland. I wore them myself when I was a boy. My father wore them. My mother, no she never did—she is a born Yankee—but many other women in the United States wore them at that time, while an uncle of mine, now the president of a large bank and the principal owner of a very prosperous manufacturing business—who can afford golden slippers at present—formerly courted his wife in his wooden shoes. In Michigan, Iowa, Illinois, and Nebraska, where thousands of Dutch settled in the period from 1850 to 1900, wooden shoes were as much of a staple as pork and corn. During that era as many as a million pairs a year were imported from Holland for their use.

In Nebraska, where I lived, the country schoolhouse which I attended was called the "Wooden Shoe School." As Whittier said, it still stands by the roadside, "a ragged beggar sunning" where we as children—some of us in wooden shoes—"went creeping slow to school, while storming out to playing." That is a very old school in the southeastern part of Lancaster County, of which Lincoln is the county seat. That section is all of Dutch descent, even today, although the language is no longer spoken much among them. There is a neighborhood legend about one of the pioneer schoolmasters of that country school, which will bear repeating, although I do not guarantee its truth.

The teacher, himself a Dutchman, wore wooden shoes. It was the custom when such footwear was in style for the wearer to leave them outside on the porch, stepping into the building in his stocking feet. But this gentleman, so the legend goes, was a very studious, absent-minded man of learning. Thus it happened that he did just the opposite occasionally—put on his shoes when he entered the schoolhouse and walked home in his stocking feet.

This is rather personal, and somewhat beside the story. Perhaps the editor will blue-pencil it and perhaps he will not. I know that he prefers to have the teller of a story keep himself in the background. But when I grew up, shortly after I finished college, I was appointed to the American Consular Service, with a billet at Amsterdam, Holland. I always suspected that my early connection with the "Wooden Shoe School," and the fact that I was then wearing the baggy trousers of the "peg-top" era influenced the State Department in selecting me for that particular post.

A contented Hollander, who has worn wooden shoes since infancy.

But I did not wear wooden shoes when I later attended the Queen's Ball at the Royal Palace at Amsterdam. Neither did my wife—nor the Queen herself—nor any of the other guests. Wooden shoes are not numerous in Amsterdam—even there they are passing out of style. They are seldom seen in the larger cities of the Netherlands except on the feet of boatmen on the canals. In the country, and in the small villages of the lowlands, however, they are still worn quite as much as formerly. Aside from those manufactured in the country itself, 2,300,000 pairs were imported for local consumption in 1924, while the exports are now negligible. Thus only in the rural districts of Holland, where the people have not changed their styles in much of anything since the time of William the Silent, wooden shoes remain in vogue.

Some years ago there was some sentiment in favor of producing wooden shoes by machinery, but it has never been tried in Holland to a very great extent. In 1910, however, German capital started about a dozen plants, thoroughly equipped with up-to-date woodworking machinery, which were installed in different favorable sections

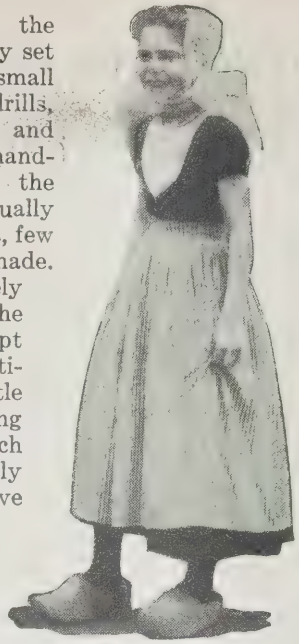
of the Netherlands. But they failed absolutely and closed down a few months after they began operations.

The machines were unable to finish the shoes up to requirements and as a certain amount of work had to be done by hand anyway, it was found cheaper to do it all in the old way. At present, with a few exceptions, the local product is handmade. Some of these handworking factories employ many men and carry stocks of as high as 200,000 pairs in reserve.

In the ready-made articles there is keen competition, principally between Belgian and Dutch manufacturers. As a consequence, wooden shoes sometimes glut the market, and prices go down, causing heavy losses in the industry. The number of pairs actually consumed annually in Holland, like the sands on the seashore, cannot be computed. They imported, as before mentioned, more than two million pairs last year. They manufactured many times that number locally themselves. From six to eight weeks is the life of such a shoe when constantly worn.

Naturally, wood is the raw material from which wooden shoes are made. Willow wood was formerly the principal kind, unless the wearer is exceptionally muscular and wants a pair hewn out of oak, with a weight of about five pounds and a long harpoon toe. But owing to the scarcity of willow timber in recent years, poplar is now being used more and more in its stead. Some Russian and Scandinavian woods are also used, while much of the lumber for the industry comes down the Rhine from the forests of Germany.

The lumber is purchased in the log, in the longest possible lengths, and entirely sawed at the factories. A very ordinary set of tools, in the shape of small saws, round chisels, drills, draw and hook knives, and similar equipment for handworking them, comprise the kit. These tools are usually made by local blacksmiths, few of them being factory made. After the shoes are entirely hewn out they are set in the sun or wind to dry—except in some instances where artificial heat is used. Little care is taken in packing them for shipment, as such shoes are neither easily broken nor soiled. I have seen them both in Holland and in the United States, strung up on exhibition just outside the stores, like dried apples on a string.



A smiling Dutch maiden.

There are both high and low wooden shoes. The low styles are mostly for women and children, as well as for what might be called the white-collared rural gentry. The high ones are worn by laborers and farmers. The low shoe has a latchet and is usually more stylish, at the same time being much more comfortable on the foot. Most people who wear wooden shoes have a real smartly decorated pair for Sunday wear.

Wooden shoes are seldom repaired, resoling being impossible, while polishing of any sort is exceptional. Occasionally a real fancy pair of Sunday shoes, with much carving and other scenery worked thereon, are varnished to keep them shiny and bright, but on the whole the only touching up they get is from a scrub brush and a douche of lye water.

Some of the wooden shoes imported in the United States came as souvenirs—brought hither by tourists from Boston and other Yankee sections, who do not know that they are on sale in almost every Dutch community of this country—in small quantities—even yet. Others came—and still come in reduced amounts—for the Hollanders living in the Dakotas, Minnesota, Nebraska, Illinois, Kansas, Iowa, and farther west. In that great region, even as recently as fifteen years ago, it was estimated that there were 500,000 persons who wore wooden shoes—and the imports at that time seem to tally with it. But now wooden shoes have all but passed out of fashion in the United States. In Pella, Iowa, where my own forbears originally settled in the year 1850, and where my grandmother at the ripe old age of 94 still lives—and she wore wooden shoes when she was a girl, too—they are all of that generation of Dutchmen. When my great-grandfather landed there, about eighty years ago, he not only brought along with him an immense supply of wooden shoes for the family, but also brought along stones—so they tell me—all the way from Holland to hold down the sauerkraut in the huge pickling urns, also a part of the then Dutch immigrant's household utensils. Those stones, brought along from Holland to the Hawkeye State where were already so many "niggerheads," are still joked about, and attracted much more attention on his arrival in the then wilds of the Wooly West than his assorted baggage of wooden shoes.

It is good form in the best rural circles of Holland—and was in the United States, too, when wooden shoes were the prevailing mode—for the guest to call in his wooden shoes, slip them off at his host's doorstep, and walk into the parlor in his stocking feet. Sometimes house-slippers are carried along instead, exchanging the "houten klompen," as the wooden footwear are called in the Dutch language, as he enters his neighbor's home. Where wooden shoes are worn, the people go to church and to school in them, leaving them outside the buildings in orderly rows, according to sizes and shapes. This is in fact a necessity—imagine what a noise all those wooden shoes would make on so many pairs of feet in a public building!

But all the same wooden shoes are passing, like the peg-top trousers.

Something fine and large in a Dutch shoe store.

When Sapiro Did Not Cooperate

He Refused Plan of American Cotton Association He Had Formerly Indorsed

By HARVIE JORDAN

THE American Cotton Association was organized at New Orleans, Louisiana, in May, 1919, six months after the World War and during a period of the highest inflated values for American farm products, including cotton, ever known in the history of the Nation. For nine years the cotton growers and their allied business interests had been without the guiding supervision of a broad and comprehensive interstate association, the Southern Cotton Association having accomplished its main purpose and retired from activities in 1910.

The American Cotton Association, like its predecessor, embraced within its membership cotton growers, merchants, bankers, manufacturers, and other professional and business interests allied directly or indirectly with the cotton-growing industry. Its membership is, therefore, cosmopolitan and free from domination and control of any distinctive class or class prejudice.

All Interested in Cotton Were Eligible

The constitution of the association provides that "*all individuals who are interested directly or indirectly in the prosperity of the cotton producing industry and the cotton producing sections shall be eligible to membership in this Association.*"

J. S. Wannamaker, St. Matthews, South Carolina, at that time one of the largest individual cotton planters east of the Mississippi River, a successful banker and supply merchant, was chosen president of the association, which position he has continued to hold by the unanimous vote of the directors in their annual meetings. The board of directors as constituted, each cotton state being represented on basis of production, was organized with forty members, chosen from leading representatives of growers, bankers, and merchants. The president and the entire board of directors, executive and finance committees, serve the association without salary or other emolument, personally paying their own expenses attending the conventions and conferences, rarely any member ever having presented a bill for traveling cost or hotel expense. Their motive has been the highest patriotic desire to render service to the cotton-growing industry. The president was voted a salary by the board of directors, effective January 1, 1924, at $10,000 per annum. The monthly pay roll of the association, with its full corps of employes, rarely exceeded $1,000 a month for several years after organization, economy of expenditures for salaries being a cardinal principle of the work. The association received its state charter as an eleemosynary institution, without capital stock or dividend-earning organization, on August 22, 1919, and established its original headquarters at Atlanta, Georgia.

The Association Receives Its State Charter

To the ultimate and successful carrying out of certain broad and and plain economic principles relating to the practical departments of the cotton-growing industry, the association, its officials and widespread membership were fully committed through the inauguration of a South-wide educational and constructive campaign.

Fifteen cotton states enlisted under the banners of the American Cotton Association and took active part through their respective representative leaders in creating and perfecting the interstate organization.

The by-laws of the association were so drawn as to provide for the first unit of representation to begin in the township or militia district and from there reach up through the various cotton counties to the State Subdivision and finally to the National Association. This gave a distinctive republican type of government patterned after the Constitution of the United States. Practically all of the 800 cotton-growing counties were represented in the organization with a direct and affiliated membership reaching several hundred thousand.

Some of the Ground Which Was Covered

Leading officials and representative delegates of the association attended the second World Cotton Conference held in this country, in New Orleans, October, 1919, and took an active part in the five days' proceedings of the Conference. Thirteen countries were represented, delegates attending from practically every country in the world where American cotton is manufactured. A World Cotton Congress was organized at that Conference and the American Cotton Association was enrolled in the membership.

With all of the cotton states and counties fully organized and equipped for the great educational and constructive reforms which had been undertaken, the first annual convention of the association was called to meet in the city auditorium at Montgomery, Alabama, April 13-16, 1920. More than one thousand representative delegates from fifteen states were registered and enrolled upon attendance at the conference.

To give an idea of the broad field of work undertaken by the association, a list of the general committees, composed of from twenty to thirty selected men on each committee, and who attended the conference, is hereby given as follows: *Banking and legislation; warehousing and operation; cooperative marketing; tare and statistics; finance, organization and membership; seed improvement and diversification; cost of production; high density gin compression; cotton acreage and price recommendation; patents, improvements, inventions and processes; education* and a number of special committees on affiliated subjects.

Among the leading subjects for discussion before the convention were: *Diversification, cooperative marketing, economic reform in baling and handling cotton, warehousing, cotton statistics.*

Cooperative Cotton Marketing Became an Issue

The leading theme which commanded the most urgent and thoughtful consideration of the board of directors and the delegates attending the convention was the matter of beginning field activities, issuing propaganda and developing on a South-wide scale the organization of Coöperative Cotton Marketing associations. It was felt that the greatest opportunities for economic reform in the cotton-growing industry would be found in the advocacy and adoption of better baling methods; a more economic system of distribution, developing closer trade relations with the spinners and control of production, could be had through the effective organization of the growers into sound and efficient State Coöperative Cotton Marketing associations.

The American Cotton Association thus became the pioneer and leader in the first comprehensive South-wide movement ever practically presented for extended organization of the growers to market their crop by combined coöperative effort. That the association would take this advanced step in its constructive, educational work had been broadcast over the country in its preconvention publicity regarding subjects of vital importance to the growers that would come on for discussion and action during the Montgomery Conference, April 13-16, 1920.

President Heard That Sapiro Would Attend

It was due to this extended broadcast publicity that the president of the association received unsolicited advices from the Pacific Coast that

Aaron Sapiro would attend the convention and seek an opportunity to address the delegates on Coöperative Cotton Marketing. Mr. Sapiro had not previously expressed or implied by person or communication any interest whatever in the American Cotton Association until the question of coöperative marketing became a subject of special activity in the councils and literature of the organization.

Receives Half-hour to Address the Meeting

The official program of the Montgomery Conference provided for several addresses by prominent speakers of national reputation, on the leading subjects of coöperative marketing, warehousing and economic reform in baling, but no place on the program had been officially assigned to Mr. Sapiro. He reached Montgomery from his far western home, three thousand miles from the Cotton Belt, and at once sought and obtained conference with President Wannamaker and insisted that he not only be heard before the convention but that ample time for an extended address be granted him. Every moment of the nine sessions of the three-day convention was filled with the subjects for discussion and the invited speakers were present. After repeated conferences it was finally agreed that Mr. Sapiro should be allotted thirty minutes. He exceeded his time by more than an hour.

In this connection it should be emphasized that before Mr. Sapiro delivered his address he found opportunity, by appearing before the general committee on marketing, talking with executive officials and fully investigating the plans of the association on the subject, to become fully posted on the methods the association would pursue.

Mr. Sapiro Indorses Plans of Association

These plans were made known to Mr. Sapiro soon after he reached Montgomery on April 13, 1920. In the stenographic record of his lengthy address he repeatedly indorsed and approved the plans as advocated for adoption by the American Cotton Association for organizing State Coöperative Cotton Marketing associations, and especially did he emphasize the use of the American Cotton Association as the publicity driving power behind the building of the new system of coöperative marketing and the use of *Cotton News* as the circulating medium for the entire membership when the coöperatives had been properly organized according to the plans proposed. Notwithstanding the fact that every executive official, every delegate and every invited speaker who attended the Montgomery convention paid their own traveling expenses and hotel bills, Mr. Sapiro made out and presented an expense bill covering his journey from San Francisco to Montgomery and return and violently insisted upon its payment by the American Cotton Association, although he came there largely on his own invitation and forced a lengthy period for his address on an already officially filled program.

The American Cotton Association appointed a special committee of thirty outstanding men at the Montgomery Conference to begin at once to draft plans for a comprehensive system of coöperative cotton marketing associations. Among the members of this committee was Carl Williams, of Oklahoma City, Oklahoma. The committee perfected its work and submitted its report to a largely attended called meeting of the American Cotton Association held at Montgomery, Alabama, September 2-3, 1920. The report was unanimously adopted, ordered published in pamphlet form and thousands of copies were mailed out over the cotton belt, preparatory to the active campaign work for organization to be started by the association in 1921.

Mr. Sapiro Came to Oklahoma

In November, 1920, shortly after the publicity campaign of the American Cotton Association had been under way to stimulate the growers and prepare them for organizing coöperative marketing associations, Mr. Sapiro left the Pacific slope, came to Oklahoma City, where he was joined by Carl Williams, and the Sapiro plan for organizing coöperative cotton marketing associations was prepared and actively begun in Oklahoma. Sapiro and Williams formulated their plans without conference with officials of the American Cotton Association, but by beginning the active work of organization first, pushed their plans forward and in two years thereafter had all the leading cotton states federated into the Sapiro Cotton Growers Exchange, with Williams as president and Sapiro as leading counsel and advisor.

Thousands of farmers believed when joining the Sapiro organizations that they were founded upon the plans laid out by the American Cotton Association and that it was an active part of the Sapiro chain of coöperatives. This misapprehension on the part of numerous grower members of the Sapiro organizations has resulted in considerable unfavorable attacks on the association because of dissatisfaction at times by members with the operations of the coöperatives.

In February, 1922, after the organization of the American Cotton Growers Exchange by Sapiro as the overhead directing organization of the State Coöperatives, officials of the American Cotton Association appeared before the trustees and executive officials of the American Cotton Growers Exchange, at Atlanta, Georgia, and presented a proposition to bring about mutual coöperation along the lines laid down at the Montgomery convention in April, 1920, and which Mr. Sapiro and Mr. Williams both so fully endorsed at that time. But the suggestions were refused and, consequently, there has been no coöperation between the American Cotton Association and the Sapiro chain of coöperative cotton marketing associations as now dominated and controlled by the American Cotton Growers Exchange.

Never Have Controlled Ten Per Cent

The Sapiro coöperatives have never in any year controlled 10 per cent of the cotton production, nor have the organizations marketed cotton direct to consuming mills to any extent. The organizations have made no apparent effort to ascertain the cost of cotton production by their membership or to seek effectively to secure prices that would net their membership cost plus a reasonable profit above cost. To the outsider, the Sapiro system has only succeeded so far in creating additional cotton-selling agencies, multiplying more middlemen, with the advantage over other cotton merchants, in that the contracts of the membership require delivery of all the cotton produced in five-year periods.

The American Cotton Association has the distinction of being the only agency that has ever undertaken to ascertain the average cost of production each year in advance of harvesting the crop, and recommending a minimum bulk-line price that would pay to the growers cost plus a reasonable profit.

The first minimum price recommended to the growers as right and proper for their staple was in September, 1919. The price recommended was received for the crop. Each year since then, except in the drastic deflation of the autumn and winter of 1920, the minimum price recommended by the association has been reached and paid to thousands of growers who took advantage of the market quotations as they prevailed from time to time. Without definite knowledge of the cost of production and determined effort to secure a price that will represent a reasonable profit, the interest of the growers will never be subserved under any system of marketing spot cotton.

And Now It Is the Boll Weevil

The educational and constructive work of the American Cotton Association has been largely directed since the beginning of 1923, to the operation of a South-wide Boll Weevil Control Campaign, the intensive culture of cotton, soil improvement, rotation of crops and planting abundant food and feed crops so as to make each cotton farm self-sustaining. The association has operated under its supervision nearly 3,000 ocular cotton demonstration farms for boll weevil control in the eleven cotton states, furnishing free to the farmer operators of demonstrations, the necessary poisons and machinery for applying same.

Master Samuel Pepys—His Diary

Things Not in History Are Sometimes the Most Historical

(Second of Series)

By CHARLES J. FINGER

ILLUSTRATED BY W. O. FITZGERALD

"When from being a common clerk he climbed into fashionable circles and he set down the shortcomings of those about him."

YOU must have been struck by the fact that Pepys seems to stand as an observer placed a little higher than those about him. Somehow he seems more modern than his contemporaries, certainly more dignified, simple and businesslike. He appears as a strong and originally powerful mind not easily submerged into the froth and ripple of life, but with some buoyant spirit, exquisite and fine, all his own. Not that he was a saint by any means, for his actions were, at times, petty, even sordid and mean. But he realizes his shortcomings and steps out more brisk, following a livelier inspiration. To my thinking, all this was because he had touched hands with wise old spirits and so was determined to nourish a fine life of his own.

When from being a common clerk, as he styled himself, he climbed into fashionable circles, he was no sycophant to hide or disguise what he saw, and he set down the shortcomings of those hedged about with pomp and circumstance just as he set down the shortcomings of his man Tom who annoyed him by whistling as he walked the streets, or by going about with his coat hung over his arm. Thus, he sees the king at table and exclaims in wonderment at "my lord Barkshire waiting on table and serving the king drink, in that dirty pickle as I never saw man in my life," a picture that well matches another given by Father Trixier who, having seen the same king supping with Louis XIV and the two queens at Compiègne, wrote that "every time Marie-Therese spoke to the English king he lifted his hat to her, and by the end of the meal his hat was most terrible dirty."

But a reader wonders at the dirty pickle of my lord Barkshire, for if we have made definite progress anywhere it is in the direction of personal cleanliness. Consider. Pepys is very explicit as to his gettings up and his goings to bed, his clothes, the physic he took, how he had his house boy comb his head, how he cleaned his face with pumice stone, how the housemaid washed his feet, but there is a reticence when it comes to bathing. Indeed, from a passage or two we gather much that affords food for serious speculation on this score, as, for example, this passage: "My wife is going with her woman to bathe herself after her long being within doors, so that she now pretends to a resolution for being hereafter very clean. How long it will hold I can guess." Clearly, comment is needless.

Himself a man thrifty and orderly, not for a moment given to habits of idleness, Pepys is astounded at the mingled pride and neglect and luxury and beggary of the court. "Mr. Evelyn," he writes, "tells me of several of the menial servants of the Court

"Women painted red on the cheeks, which makes me sick."

lacking bread that have not received a farthing wages since the king's coming in." In another place he tells of a visit to Lady Peterborough, one of the court ladies, and makes this entry: "The woman is a very wise woman, and is very plain in telling me how her plate and jewells are at pawn for money, and how they are forced to live beyond their estate, and do get nothing by his being a courtier." That poverty touched the department in which Pepys worked, in time, and he tells how things at the office were in sorry case, those there "having little to do but to bemoan under the want of money; and indeed, little is or can be done, we not having received one penny for service in many weeks, and none in view." Of the English ambassador in Spain he writes: "I was . . . discoursing about the ill state of my lord Sandwich, that he can neither get to be called home nor money got to maintain him there; which will ruin his family." Foreign envoys were in no better condition judging by an entry telling of the Russian representatives who "have none of them clothes which are their own but taken from the king's wardrobe and which they dare not bring back dirty or spotted, but clean, or are in danger of being beaten." As for the king's own wardrobe, note this: "I was witness of a horrible rateing which Mr. Ashburnham, as one of the Grooms of the King's Bed Chamber, did give him (Mr. Townshend) for want of linen for the King's Person; which he swore was not to be endured, and that the King would not endure it . . . the King having this day no handkerchers, and but three bands to his neck, he swore. Mr. Townshend pleaded want of money and the owing of the linen draper five thousand pounds; and that he hath of late got many rich things made—beds and sheets and saddles, without money, and that he could go no further . . . When he was gone, Townshend told me that it is the grooms taking away the King's linen at the quarter end as their fee, which makes this great want; for, whether the King can get it or not, they will run away at the quarter's end with what he hath had, let the king get more as he can. . ." And this: ". . . there is not an officer in the house almost but curses him for letting them starve, and there is not a farthing of money to be raised for the buying them bread."

His eyes opened to the disorder about the royal premises, Pepys soon discovered the feet of clay under the front of brass and became filled with

dark suspicion. His loyalty and respect sagged under the strain. So down went his reflections in this manner: "Having heard the King and the Duke talk, and seeing and observing their habits of intercourse, God forgive me, though I admire them with all my duty possible, yet the more a man considers and observes them, the less he finds of difference between them and other men." Obviously, standing on his pedestal of self-respect, the man overtopped his lord. His royal master was deficient in hero stuff and on close scrutiny the halo vanished. The man saw straight and set down what he saw. Describing a meeting at a royal hunt where drink was spilled freely, Pepys tells of the company "all a-crying for joy, being all maudlin and kissing one another, the King the Duke of York, the Duke of York the King; and in such a maudlin pickle as never people were." Then come entries recording many strange things that throw strong light on fashionable society of the day: a woman who poured a pint and a half of wine into a "pye" and drank it all at a draught; the goings and comings of Nell Gwynne, women painted red "on the cheeks which makes me sick"; the doings of other mistresses of the king; quarrels concerning illegitimate offspring of the king, wild doings at court balls where dancers smeared one another's faces with soot and tallow; the affairs of the Lord Mayor, "a talking, bragging and buffle-headed fellow"; the king being at Lady Castlemaine's lodgings "a-dancing with fiddlers all night almost and all the world coming to take notice of it": or, "how loose the court is, nobody looking after business, but every man his lust and gain, and how the king is become besotted with Mrs. Stewart that he gets into corners with her half an hour together kissing her to be observation of the world."

Very naturally with such a central luminary, there was imitation among the satellites, and the foremost of the court ladies played strange pranks, going about as common orange vendors for adventure sake much as Rochester and Sedley became amateur innkeepers so that they might debauch the wives of farmers. Writes Pepys: "What mad freaks the Mayds of Honour at Court have; Mrs. Jennings one of the Duchesses Mayds the other day dressed herself like an orange wench and went up and down crying oranges; soon falling down, or by some accident, her fine shoes were discerned and she put to a great deal of shame; that such as these tricks being ordinary, and worse among them, thereby few will venture upon them for wives."

"One of the Duchesses Mayds the other day dressed herself like an orange wench and went up and down crying oranges."

Literally, not figuratively, Pepys goes from high to low, from king to butcher, baker and candlestick maker and always presenting pictures with photographic accuracy. In evidence of that accuracy and meticulous care I point to the scene with the shepherd, and his boy, sunburnt and graceful, in rough clothes, reading the Bible "which he did with the forced tone with which children usually do read, that was mighty pretty and I did give him something." Or, again, where he records a visit to the butcher and quotes the tradesman's remark thus: "Look how fat it is, the lean only appears here and there a speck, like beauty spots." The man is like Robert Burns with his eye for the small things—a mouse, a daisy upturned. So it is plain that we can accept without question the testimony of one who sets things down with such particularity, extraordinary though that testimony may be. And strange tales of brutality, of wild sport, of ruffianism he gives. We learn of street fights that are really battles with flags and pistols and swords, between the followers of the French and the Spanish ambassadors, in which men are killed; of duels to the death on the slightest provocation; of riots between rival guilds or trade companies; of prisoners on trial flinging stones at the judge and the judge using the incident as occasion for a *bon mot;* of people hiding their money in back yards for safe-keeping; of an actor falling into such ecstacy in his dance that he broke his leg while on the stage; of a child torn to pieces by stray dogs in the town of Walthamstow; of prize fights where men fought with naked sharp swords; of crowded entertainments at bear gardens with the sport "very good." The account of that last is of strange interest.

"To the bear-garden, where now the yard was full of people and most of them seamen, striving by force to get in, that I was afraid to be seen among them, but got into the ale-house, and so by a back way was put into the bull house, where I stood a good while all alone among the bulls, and was afraid I was among the bears, too; but by and by the door opened. I got into the common pit and there with my cloak about my face, I stood and saw the prize fought, till one of them, a shoemaker, was so cut in both his wrists that he could not fight any longer, and then they broke off; his enemy was a butcher. The sport was very good, and various humours to be seen among the rabble that was there."

But though Pepys went to that half-ashamed, there was no such shame, no covering his face with his cloak at the more fashionable entertainment of a public execution. He records his attendance at one or two, but more particularly at the execution of a Colonel Turner, found guilty of robbery. "To get a place to see Turner hanged . . . and seeing people flock in the city, I enquired, and found that Turner was not yet hanged. So I went among them to Leadenhall Street . . . near where the robbery was done; and to St. Mary Axe where he lived. And there I got for a shilling to stand upon the wheel of a cart, in great pain, above an hour before the execution was done, he delaying the time by long discourses and prayers, one after another, in hopes of a reprieve; but none came, and at last he was flung off the ladder in his cloak. A comely looked man he was, and kept his countenance to the end; I was sorry to see him. It was believed that there were at least twelve to fourteen thousand people in the street."

Reading that, it is a little difficult to imagine anything refined and noble in a man who would stand for an hour on a cart wheel to see a wholly unlovely and dramatic affair, one of thousands bawling and sweating and blocking a narrow street.

"And there I got for a shilling to stand upon the wheel of a cart above an hour before the execution was done."

A corner of the St. Thomas Horticultural Society's trial gardens where thousands of gladioli are tested yearly.

Making Better Citizens With Flowers

By L. B. BIRDSALL

THE picturesque little city of St. Thomas, in the province of Ontario, Canada, has gained international distinction from two sources. One is the St. Thomas Horticultural Society, the largest organization of the kind on the North American Continent; the other is Dr. Frank E. Bennett, the president of the society. The two are synonymous.

Speak to an Ontarian about the society and ten to one he will say: "Oh, yes, that's Dr. Bennett's organization!" or refer to Dr. Bennett and you'll receive the response: "Sure, I know him! He's the head of the St. Thomas Horticultural Society." The affinity between the organization and the organizer has existed for fifteen years and together they have gained for St. Thomas the title of "The Flower City of Canada."

Dr. Bennett is as well known in Canada's banner province as its premier and in the United States he is perhaps better known—and all through his horticultural activities. He is a tireless worker and a supreme optimist, often described as "a man who thinks, talks, dreams, and acts florally." A dentist by profession, for years he has sacrificed that profession, that he might devote his time and energy to civic beautification and the advancement of horticulture in all its branches. Almost single-handed he has developed the St. Thomas society from a few dozen amateur gardeners to an organization of over three thousand active members with an annual revenue of nearly $25,000.

In appreciation of this flower-idealist's efforts, the executives of the American Gladiolus Society made him their president. He was the first Canadian to fill that office. The largest gladiolus hybridizer in California recently named one of his latest and finest creations "Dr. Bennett," while the Dominion Department of Agriculture has recognized his ability and worth by designating the society's extensive gardens in St. Thomas as official trial grounds. There thousands of varieties of gladioli, irises, and other flowers are grown each year, and in August and September those grounds are the mecca for floriculturists from miles around.

It is in his native city that Dr. Bennett has achieved the most remarkable results. St. Thomas is a railroad center, the Canadian divisional point of three big American roads. The average railroad city is not usually a thing of beauty and a joy forever and St. Thomas, ten years ago, was in every sense of the word an average railroad city. The environments of the yards were largely ugly waste spaces, the repositories of rubbish. Today those unsightly places have entirely disappeared.

A wide expanse in front of one depot on the main business street that was a sand-lot for years and years is a lovely little public park with cinder walks meandering through the shrubbery. Paralleling the railroad tracks that dissect the city, north and south and east and west, are miles of velvet lawn, dotted with orderly flower beds and shaded by tall maples. Where the buildings adjoining the tracks are disorderly, high ornamental fences have been erected, flanked by thousands of flowering shrubs. One thoroughfare that bore the title "Railway Street," had the name changed to "Princess Avenue." It is now one of the show streets of the city.

Dr. Bennett received his inspiration to engage in this line of civic endeavor at a convention in Rochester, NewYork, many years ago. Stretched across the convention hall was a huge banner, flaunting the words of the late Elbert Hubbard: *Do Nothing, Say Nothing, Be Nothing.*

"My resolve to devote more of my energies to public service," said Dr. Bennett, "found expression in horticulture. I have always loved flowers. When I am among them I have better and nobler thoughts. I saw in them the immeasurable medium through which I could brighten lives. If flowers had an elevating effect on me, if they dispelled pessimism and made me see how beautiful the old world really is, would they not have the same effect on others? I asked, for in the final analysis, human natures are very much alike.

"My deductions proved correct. Horticulture is a common meeting ground through which men get to know each other better. It creates enthusiasm, an appreciation of the beautiful and a civic pride, and in doing that, it can't help but make better citizens."

Circle—Dr. Frank E. Bennett. Below—Showing the method of treatment of tracks on a divided traffic street.

The Transformed County Fair

Progressive Movement Sweeping Away "Shady" Attractions

By GEORGE M. GAHAGAN

PLACED in a position where fair men bring their troubles, talk shop in season and out of season, urge reforms and uphold the old order, glow over new institutions and decry the changing, and canvass every phase of making agricultural shows into greater successes, the writer at the editorial desk of a fair publication must see some things that impress and cause enthusiasm. It would be no tribute to the man with the blue pencil to say that he did see; he would be blind, indeed, if he did not. Yet, speaking with a fair degree of expereience from the standpoint of a handler of such a clearing house of fair manager's ideas, the writer believes that the position brings one into somewhat of a judical frame of mind. One handles the evidence, weighs it, takes the opposite side, considers the argument, and then, with his figurative scales balanced, tries to reach a decision—and usually succeeds.

Of course, there is no decision handed down from the bench in many instances, for in the court room, which consists of the pages of his journal devoted to the advocacy of certain ideas by managers the world over, the case is most often left to the great jury of the public for the decision, without charge from the judicial chair. And who, with the history of all great movements before him, will say that the public does not generally, at least, reach a verdict fair to the majority?

All of which is preliminary to the convincing feeling that in general the fairs, state, district and county, are moving forward; that out of the warring opinions of the managers; the conflicting interests of the legitimate concessionaire and the crooked and salacious concessionaire; the progressive ideas of the modern-minded exponent and the stuck-in-the-rut man who believes that because things have been they are right and prudent—that out of all these things, threshed out to a great degree through the press devoted to fairs and attachments of fairs, there is a steady movement for the betterment and advancement of these institutions so linked with agriculture.

The world does move assuredly—and so does the higher state of the farmer come year by year with a forceful reaction from the old ways that is evidence of the rising intelligence of his sphere. And the world's movement is not of that forced nature which was conceived by the Celtic sewer digger, who was interrogated one day by a kindly old gentleman of philosophical nature. The gray-haired one had been informed that Pat was well informed, despite the lack of an education, and he tramped across the street, smiled benignly upon the perspiring one in the trench, and waited for him to look up.

"It's hot down there in that trench, isn't it?" remarked the gentleman.

"It is, sor," returned Pat, wiping the sweat from his brow with the back of his hand.

"And the sun—it's a wonderful thing, too, but isn't it a hard thing to work against? Let's see, who was it that commanded the sun to stand still?"

Above—"The Lure That Was" — but now is the minor attraction — even where it remains.

Right—The happy winner of the blue in the baby beef contest at his home home town fair.

Pat reached back for his pick. "Oi don't *know* who it wuz, but Oi'd make a giss that it wuz some murdherin' divil av a contrachtor who wanted t' git a big day's wurruk out av his min."

Analyzing the present situation of the county fairs, one is struck with the readiness to adopt praiseworthy ideas which appear to dominate the managers. If one cares to bring into concert the relation of the upward-looking managers to the material success which is manifest on numberless grounds about the country, one can readily establish convincing evidence that the determination to run a clean fair, a fair with progressive ideas, with an ideal in view, is fruitful of money at the gate, the grandstand and the other sources, whence comes the sustenance from year to year.

Among the fair men of the country there is general agreement that Ohio is near the top—if not the real leader—in county fairs, and the situation in the Buckeye State to one who has noted the growth and development of the modern idea is strongly favorable to the movement which must be termed here—for want of something more dependable for suggestion—the progressive movement.

In this movement—and perhaps it is unnecessary to specify it—the principle of fair-and-square dealing is foremost. In short, the claim is for a clean fair, and the management makes good on the claim. The men of these fairs believe that because crooked games were permitted in the old days, and because salacious exhibitions drew throngs in other years, these are not legitimate claims for the patronage of the present—and the future, also.

For years there has been a decided movement away from the farms. The city with its bright lights, glamour and gayety has been the goal. The turn from the humble highways and byways of the productive regions has been strangely contradictory of a movement urged by our best scientific men to greater advantages for health. But youth is headstrong and easily lured. Many succeed in the city—many do not. It is idle to say that every boy or girl born on a farm should stay on a farm through life, and such a theory is not compatible with the proposition to present the dignity of the farm, the possibilities, the rising opportunities, the approach of urban advantages to the farmer's door. There are great buildings in many cities teaching various trades to the young; why should not the farming communities teach better farming, the beauties and charms of farming—teach it more thoroughly than agricultural colleges can teach it with their inability to reach many of the growing generation in the country?

How About the Human Derelict

Psychiatrists as Social Engineers Do Some Strenuous Salvage Work

By HOWARD W. BOWMAN

MENTION was made in a previous article of the manner employed by psychiatrists in delving into the minds of men and, by the use of certain defined tests, ascertaining the mental ages of individuals. To date the largest socio-psychiatric delinquency study to be made of any group was conducted in the psychopathic clinic of the Municipal Criminal Courts of Detroit, and for that reason a survey of this work in Detroit may be safely taken to be representative of similar work in other like clinics in America.

Detroit has at the head of its psychopathic clinic Dr. Arnold L. Jacoby, who is recognized as an authority. His assistant is Dr. Jessie M. Ostrander who, like himself, is the author of a number of articles on psychological work in connection with crime. The office force includes three social workers, who gather statistics and histories concerning the subjects, and a physician who makes the customary physical examinations.

Cases referred to the clinic are studied and examined first by the physician, then by a psychologist and a social worker. A complete record is made of the subject's past performances from all available sources, his responses to the various standardized psychometric tests, the results of his physical, neurological and psychiatric examinations. These facts are then considered at a staff conference in which the case is discussed, diagnosed and a recommendation outlined. A report of the result of the examination is then submitted to the referring authority.

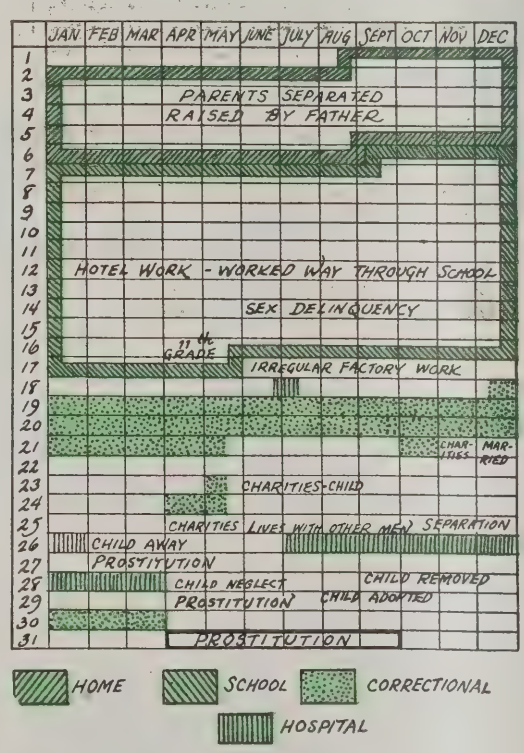
The clinic adheres strictly to the medico-social viewpoint, although there can be little question that should a judge act along the lines recommended by the clinic the legal phase of the offender's case would be affected. In the clinic the crime for which the individual is arrested is regarded as a symptom of that individual's make-up, and the object of the study then is to determine what underlying disorder or defect of the personality exists which may have contributed to the production of the individual symptoms for which he was arrested.

All human behavior, including criminal behavior, is regarded by the psychologists as having a cause either in the personality of the offender or in his social environment. Therefore, Detroit's clinic concerns itself with attempting to find the cause. Having found the cause, the next consideration is the determination of what is the best thing to do to prevent a recurrence of that symptom or other anti-social symptoms.

With this viewpoint, Dr. Jacoby points out, little or no consideration is given to questions of legal responsibility in the clinic's work. The question of whether or not a particular offender was legally responsible for his criminal act is held to be no help toward the understanding of his case.

Likewise, questions of differentiation between sanity and insanity are regarded as of very secondary importance. The clinic considers the offender before it as a problem demanding solution and it does not believe that the arbitrary declaration of sanity or insanity, responsibility or irresponsibility, helps in any way toward its solution.

The reports upon cases which are submitted by the clinic to the courts contain a short statement, usually no more than a paragraph, setting forth the deviations from the average which the individual has shown, either in his nervous and mental make-up or in his so-called adaptation to society. The second paragraph then contains a short statement as to what is deemed the best thing to be done for the individual.



This chart is that of a thirty-one-year-old girl, a common prostitute, who showed, upon examination, a normal degree of intelligence but a very serious emotional disorder which had been much accentuated by her early environment. She was not to be classed as insane and thus treated in an insane hospital, but she was much in need of mental hygiene and treatment under the closest sort of custody and supervision. While this woman is not insane, in that she is suffering from acquired mental disease, she is utterly incompetent to compete satisfactorily with the rest of society industrially and hence she cannot make a living for herself in legitimate ways. Much of this history of her life might have been avoided had she been adequately treated during her school period.

"The crime itself is seldom an accurate index of the amount of treatment or confinement which the individual needs to insure the safety of the community," says Dr. Jacoby. "A case to illustrate this point was that of an embezzler who stole $1,800. His friends and family made good the money he had stolen and the case was dropped. He returned to society with the same industrial inadequacies which had been responsible for his first offense. A few months later he was again arrested, this time for the theft of $4,000 from another employer.

"The average cost of a study is about $25. The average cost of a single felony trial is said to be about $500. It can be readily seen that the prevention of a single felony trial brought about by a thorough study of the individual, and the administration of proper treatment, as a result of that study, would pay for several examinations."

We find in a perusal of cases in the psychopathic clinic and in discussions with the psychiatrists that it is apparent *the criminal problem is not kept alive by the occasional offender, but by the repeated offender.* The question, therefore, arises: Is the established machinery of our law a failure and is the psychopathic clinic a correction? Let us see.

In connection with the discussion of "repeaters," or recidivists, as they are termed by the psychiatrists, perhaps no better idea can be obtained of just what part they play in our social scheme than to refer to a survey made of the Detroit clinic somewhat recently by Dr. Jacoby, Dr. Theophile Raphael, Dr. Ward W. Harryman and Mary M. Raphael, A. B., assisted by Mrs. W. W. Harryman and Dr. and Mrs. M. A. Gore.

Detroit's criminal courts, with seven judges having jurisdiction over all adult criminal offenders, hold trials of all manner of felonies and misdemeanors, ranging from mere traffic violations to the major crimes. The 1,918 cases examined were selected for study-analysis because they were considered sufficiently complete and were bona fide court cases; that is, cases not referred for special examination from other agencies than the court.

There were among these cases 1,509 males and 479 females, this

roup representing three times in umber the group previously studied y Professor Bernard Glueck at Sing ing Prison, and twice the number re- orted from the Boston Municipal 'ourt by Professor V. V. Anderson. 'ollowing is the table of recidivism ccording to mental status as prepared y this committee:

'ondition	*Per cent Recidivist*
nferior	49.7
'eeble minded	41.3
)ementia praecox	14.1
Maniac depressive insanity	40.0
'aranoid state undifferentiated	0.0
Alcoholic psychosis	45.4
Alcoholic deterioration	63.2
Neuraxial syphilis*	61.7
enile or cerebral arterio- sclerotic psychosis	40.7
Epileptic psychosis	62.5
'sychopathic personality	31.3
'sychoneurosis	20.5
'sychosis with drug addiction	56.5
Undiagnosed	27.3

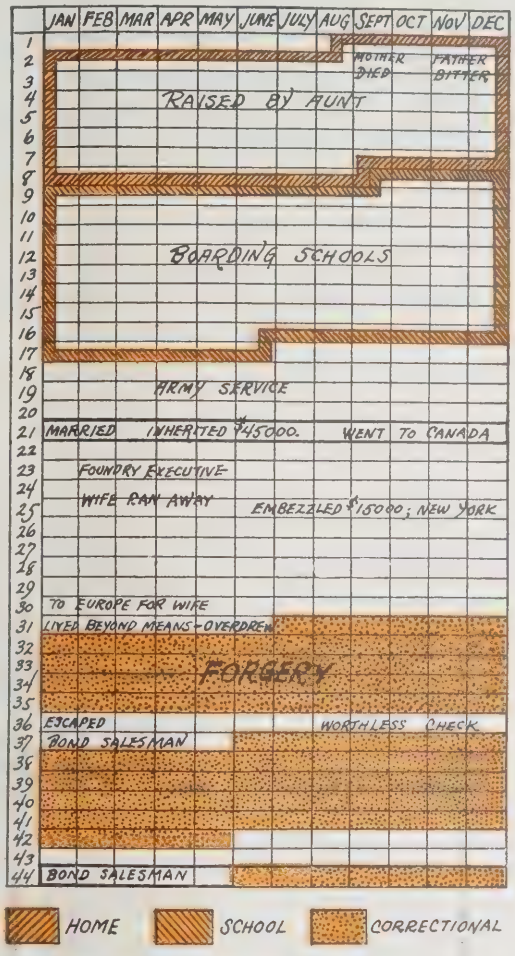
The New York State Commis- ion on Prisons recently invited the National Committee for Mental Hygiene to conduct a survey of the ounty jails and penitentiaries in he Empire State. This work was onducted by twenty-one psy- hiatrists, assisted by a staff of sychologists and psychiatric social vorkers who examined 1,288 pris- oners.

The survey included an in- pection of each jail and peniten- iary studied, a physical, neuro- ogical and psychiatric examination f each prisoner, a psychometric xamination of selected prisoners, nd a study of the records in each ase. As a result it was found that *'66 per cent were recidivists*—the rrests numbering from two to more han fifty; 23 per cent were normal —defined as those who were at east of average intelligence as de- ermined by individual tests, who were ree from nervous or mental disease, nd whose 'personality' showed no utstanding pathologic traits; 77 per ent were psychopathological individ- uals of well-recognized types; 64 per ent of those arrested only once were nentally abnormal; 90 per cent of hose arrested four or more times were nentally abnormal; and 37 per cent vere under thirty years of age.

"Insofar as the prisoners in this tudy are concerned," says the report, n part, "and it is believed they are epresentative of county-jail popula- ions generally, the problem of de- inquency is a problem of recidivism, nd recidivism is a problem of psy- hopathology. It is clear that in the nain one is not dealing with a group f 'normal' individuals, but with a roup least likely to profit either by nodes of punishment or by well- ntentioned but largely misapplied efforts at 'reformation' . . .

"Severe punishment, probation, the ndeterminate sentence (as now pro- vided), parole, occupational training, all assume that the average prisoner is a 'normal' individual who may profit either by punishment or by the op- portunity given him to 'reform.' An examination of the prisoner does not warrant such an assumption . . . The crux of the situation is ignored and recidivism is the result."

*Not including tabes without psychosis.



This chart illustrates a man's life. The years of his life are given in the vertical, left-hand column, while the months of the year are indicated across the top. He was studied on the occasion of his arrest in his forty-fourth year for obtaining money under false pretenses. He showed himself to be of rather superior intelligence, but quite lacking in his appreciation of social values. No effort was made to understand why he committed crime and to correct the difficulty in his personality with the result that one notices, as he grows older, that his imprisonments come closer together, and he is less able to keep from crime. This criminal career might have been prevented by psychiatric study and treatment along mental hygiene lines very much earlier in his life.

The recommendations made by this committee are as follows:

"1. That steps be taken looking to the abandonment of county jails as places of punishment.

"2. That there be created: (a) Well planned and adequately financed diagnostic clearing-house facilities where sentenced jail prisoners may be sent for a period of observation and study . . . . (b) Institutions adequately equipped for vocational training. (c) Industrial farms, or institutions for vocational training, sufficiently diverse in plan and method to meet the diversified needs of those to be trained . . . A system that assumes that all prisoners are alike, presumably 'normal,' and that all will profit if given 'opportunity,' fails before it begins.

"3. That provision be made for truly indeterminate sentences. It is hardly intelligent for a judge, who knows nothing of a prisoner (the chances being more than three to one that he is feeble-minded, psychoneurotic, with mental disease, or a pathological personality) except that he is guilty of a certain offense, to prognosticate that by an incarceration for three months or six months the prisoner will have been sufficiently punished to have learned his 'lesson,' that society will not tolerate such conduct, or that in some miraculous way in the process of sitting idly about for a similar period he will have sufficiently reformed as to wish to live a socially accepted life . . .

"4. That disposition of prisoners be based upon the needs of the prisoners as revealed by adequate observation and examination . . .

"5. The time for the parole of a prisoner cannot be determined mechanically by calendar and clock . . .

"A prisoner should be paroled only when the problem he presents —whether it be the comparatively simple one of occupational training for a 'normal' individual or the more complicated problem of mental disease or defect, or pathological personality—has been sufficiently, well met to warrant the belief that he will be able to adjust himself suitably in the community.

"The one exception to this rule that should be made is provision for the parole of certain carefully selected prisoners to psychiatric out-patient clinics for treatment. In such instances the length of parole should not be automatically determined, but should continue until such time as, in view of those who have had charge of the treatment, the prisoner is able to resume his life in the community.

"6. A prisoner when placed upon parole and even at the expiration of his parole is a convalescent . . . Even after the most painstaking and successful treatment his health is not robust. He still requires treatment, not so much medical as social. Suitable employment should be found for him and skilled and understanding supervision on the part of a psychiatric social worker should be maintained for the first few months of his return to the community."

And to this Dr. Jacoby adds that if at this time a psychopathic analysis were to be made of the prisoners at Jackson Prison, one of the municipal penal institutions of Michigan, and the recommendations of psychiatrists making such an analysis were to be followed, at least 500 prisoners who have yet their sentences to serve out would be released, and that 500 of those about to complete their terms would be held for an "indefinite duration." The system works both ways.

The Romance of Spices

Stories of the Sweet-Scented Riches of Cathay

By THEODORE MAISCH

LONG before the first stray wisps of history were cut into stone a long caravan of camels, "with their silly necks a-bobbin' like a basketfull of snakes," plodded eastward. They passed through cities now long buried and forgotten. They left bleaching bones on the burning desert sands.

They penetrated the gloom of thick jungle. Ever eastward they toiled. They fought through the craggy mountain passes of Afghanistan, they bathed in the waters of the Indus and struggling on met the slant-eyed dwellers of Cathay. All for a few pounds of cloves, cinnamon, pepper and other Eastern wares.

Such is the antiquity of our modern spices.

They came to us down a royal road indeed—royal because bloody, bloody because royal. Spices, reckoned today at a few cents a pound, in ancient times were worth more than their weight in purest gold. Lives were lost, kingdoms made and overthrown, the New World discovered, in the struggle for the precious stuff. But the secrets of their sources were guarded by Orientals for thousands of years. In the fifteenth century, Portuguese efforts to locate these sources furnish an example of crafty secret-service work that rivals in thrills the masterpieces of mystery fiction.

The earliest caravan starting points of which we have any record were Balsun, on the Persian Gulf, and Mocha, on the Red Sea. In those times, and clear up to the thirteenth century, all trade routes to the Orient were overland. And they were infested with thieving tribes who either levied great toll or pillaged all who passed. Caravans were heavily guarded; expeditions of war they really were. Despite all precautions many vanished for all time in the mysterious East. Those that did return brought weird tales of strange peoples and of opulent Eastern cities. But the spices that came through represented so high a cost in lives and equipment that on the royal board alone could they be found.

Manifestly, the control of those routes was worth fighting for. The toll collected was enormous. Just as modern wars are waged for supremacy so did those ancient city kingdoms and tribes war among themselves for power. Power is wealth. Wealth is trade.

Probably the earliest authentic records of spices are those Old Testament references to tithes of cumin and anise. Joseph's jealous brothers sold him to a loaded caravan returning from those distant places, a sale which greatly influenced the subsequent history of Egypt.

With the shifting of the early kingdoms the trade centers also changed. Babylon was the first of record, followed by Tyre, Sidon, Alexandria, Syracuse, Carthage, and finally Rome. But the fame of spices traveled far beyond Rome. The semi-barbaric Visigoths must have had a taste. They prized them so highly that Alaric, the Goth, when he conquered Rome in 408 B. C., during the reign of Honorius, did not neglect to include, among other indemnity, a tribute of 3,000 pounds of pepper from the fallen city. Probably the Romans considered it a terrible ransom. Presently, about 350 years later, we find this fragment from the time of Augustus Caesar, " . . . . unto the East, under the rising sun, to fetch rough pep-

r and pale cumin seed for Roman
res."

After a time the trade center shifted
Constantinople where it remained
til "like an exhalation from the deep"
nice was born.

The later crusaders, centuries after,
t into this port and used it for an
barkation point. The converging of
many armies of different nations gave
a prominence which was used to
at advantage in the development of
commerce. When she gained com-
te control of the Mediterranean by
defeat of the Genoese fleet in June,
80, she entered into the greatest pe-
d of her history.

Fortunately some of the early mer-
ntile and warehouse records have
en preserved and they show a heavy
ffic in pepper, cinnamon, nutmeg,
ice, cloves, and ginger. It is esti-
ated that the annual Venetian trade
those days totaled, in spices alone,
0,000,000, a remarkable sum for those
ys. It must be remembered, too,
at Venice was only a city of small
ea.

But the merchant princes of the city
l not obtain the spices from their
urces. After the thirteenth-century
oorish merchants brought the Far
stern products by water to the Ara-
an and Red seas to the port of Suez.
aravans then carried the goods to the
le, whence they were taken by boat
wn the Nile to Alexandria. It was
obably from this point that the Vene-
n galleys picked up their cargoes of Eastern spices.

It Was the Golden Day for Venice

To support and carry on so heavy a marine trade 300 great galleys were erated by the Venetians; in ad-ion, 45 war galleys patrolled the seas, rnishing a protection sorely needed ainst the swarms of pirate draft, who re not always Moslem rovers. The war galleys were manned by a total 11,000 seamen, the 300 merchant lleys required 8,000, and 3,000 small aft (10 to 20 tons) required 17,000. he shipyards employed 16,000 men, hich brings the total maritime popula-n at that time to more than 50,000 en. There were also numerous arch-s and oarsmen. It was indeed the lden day of Venice. The Venetian g was a familiar sight anywhere on e Mediterranean, and on the west ast of Europe clear to Bruges and ndon. As banker and money-lender ylock could not have found a busier ace, for on the Rialto, the center of e commercial life of the city, gathered e merchants of Lombardy, Navarre, uscany, Bavaria, Hungary, Florence, atalonia, Germany, Brabant, England, d Flanders.

The trading was highly organized. nd foreign merchants were made to el that it was a privilege for them to ade with the citizens of Venice. The ate placed them under strict super-sion so that neither the state nor the cal merchants should be cheated.

The spices and other wares intended for Germany were transported over the snow-clad Alps by heavily guarded pack-trains. Those intended for Western Europe and England were sent yearly by fleets of galleys. On the way the galleys touched at Pola, Corfu, Alicante, Almeria, Cadiz and Lisbon. The terminus of the journey was Bruges where merchants of the Hanseatic League and of the Fuggers took charge of the further distribution. A few of the galleys went on to London and Southampton.

A Bale of Cloves Was Worth Five Dollars

There, in England, the trade was becoming organized. In the beginning of the fourteenth century King Edward granted certain privileges to the merchants. The document bore the title "Charta Mercatoria," and it mentions particularly "spices, gross spices or groceries as well as minor spices." The "Fraternity of Pepperers" at that time changed their name to the "Guild of Grocers," and promptly added six cloves to their coat of arms. At that time a grocer was a merchant adventurer. He carried on international trade, fitted out ships and sold spices in large lots only. The "Pepperers" were the little corner-store merchants who sold to the family trade in small parcels.

But prices were still out of all reason. A bale of cloves (500 pounds) at that time was worth 2 ducats (about $5) in the Moluccas, where they were grown. It was worth 14 ducats by the time it reached Malacca, and 500 ducats in Calicut, and by the time it reached London it was worth nearly 2,000 ducats! To this high cost of spices can be assigned largely the reason for the obsession which had taken hold of all maritime nations at that time to find a direct route to the Oriental source of these precious wares. This motive, entirely selfish, was responsible for the discovery of the New World which Columbus thought was one of the Spice Islands. After him came Da Gama, Magellan, the Cabots, Vespucci, Sir Humphrey Gilbert, Drake and others. But it was Vasco de Gama who first reached the land of spices.

When Marco Polo Sailed Strange Seas

A map and a voluminous treatise more than a hundred years old was directly responsible for this sudden interest. More than a hundred years before this time a navigator, Marco Polo, sailed strange seas. Childishly crude charts and maps, and freakish distortions of facts of his wanderings, were compiled into this voluminous work. This lay quietly in Venice; probably the Venetians didn't take it seriously for no one took the trouble to disturb it and the dust lay thick upon it. Early in the fifteenth century Prince John, a son of King John of Portugal, returning from a visit to Venice gave a copy of this work to his brother, Prince Henry.

The immediate effect of this gift was the establishment of a port on Cape St. Vincent, the southernmost point of Western Europe, where Prince Henry surrounded himself with navigators, cartographers and mathematicians. Portugal had entered the competition for the control of the spice trade. Centuries of bloodshed and unspeakable atrocities were to ensue. Beginning in the year 1418 he sent out an expedition each year for forty years. Besides gaining the approbation of Pope Martin V, discovering the Cape Verde Islands, the Azores, the Canary Islands, and charting more than 1,000 miles of African coast line, he won the monopoly of the grains of paradise, or Melegueta pepper.

About this time King John of Portugal also took a hand. But he was a crafty monarch. Secretly he sent an emissary to the Orient to bring back full information concerning the point of origin of the spices and to determine the best possible sea route. The messenger failed through a lack of knowledge of the Arabic language, which was the language spoken by the Moorish merchants. Two other gentlemen adventurers, Pedro Covilham and Alfonso de Payva, were then sent on the same errand, but in addition they were also to locate and visit the land of Prester John, a fabulous Christian monarch who was believed to have established a powerful empire beyond the fringes of the desert. Amazing tales were told of his wealth.

Where Pepper and Ginger Were Growing

The adventurers, or secret-service agents as they would be termed today, took ship to Alexandria, thence followed the Nile to Cairo. A caravan took them to the Red Sea. Here they met some Moorish traders who had just returned from India. They accompanied the traders to Aden where Payva left them to continue on to Abyssinia. Covilham, still disguised as a Moorish merchant, escaped detection at the hands of the Moors and finally reached Calicut, on the Malabar coast of India, thus winning the distinction of being the first Portuguese to have sailed those seas. With exultation he saw pepper and ginger growing. And he further obtained important information concerning cinnamon and cloves. At great personal risk, for as a spy detection would have resulted in summary execution, he had successfully carried out his work. An equally arduous task was awaiting him on his return to Egypt. There he learned that Payva, his companion, had been murdered while enroute to Abyssinia. He dispatched a messenger to his master, the king, with letters fully recounting his adventures and the information he had obtained, and then continued on to Abyssinia to complete the work of his murdered companion. He reached that country but was destined never to return to his native land for he made himself so useful to the native king that he was constrained to remain. He rose to honor, meanwhile serving his former master by periodically sending com-

Nature Is a Book

(*Continued from page 2*)

tales that lie in the background of every page of Nature's book enables one to see and appreciate the beauty. I am not sure but that such a practice in studying our fellow man would also bring as pleasant results!

One Sunday while in a wooded country, I observed a beautiful white bird flying through the air. Its long, expanded wings made it look as if it had a spread of wings more than six feet. How the savage nature sprang up within me, and how I yearned to have that bird, dead or alive! But in a moment its swift flight had been lost to view. A few more minutes and the sound of a gunshot reached my ears. Thirty minutes later an old woodsman was seen approaching along a woodland path, carrying the same white heron which had only a few minutes before passed over! What a sweet poem was instantly tragedy!

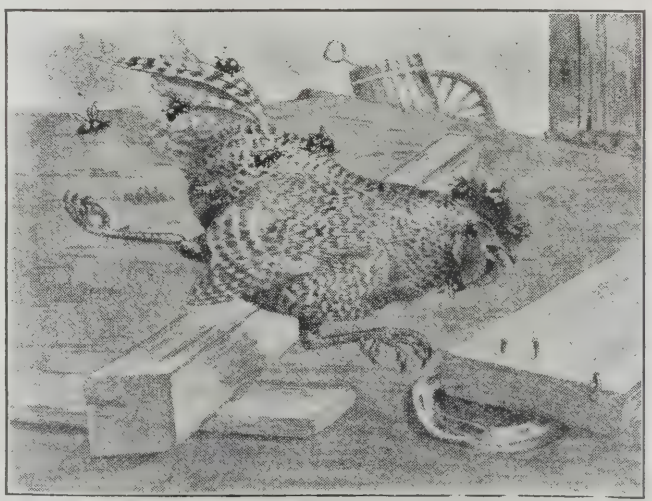
Many chapters in Nature's book teem with humor, and the humorous veins may often be read in her selections of both prose and poetry. When members of the human family think of humor in Nature they almost invariably think of apes and monkeys, but humor is written across other pages.

I was spending the summer in the country with my uncle. In his corncrib near the small door lay a half-gallon tin can. A queen bumblebee had chosen this can for raising her young. A slight disturbance of the can was answered by humming threats that left the impression that the can contained thousands of bees! My aunt had a hundred or more grown and half-grown chickens; also a large Plymouth Rock rooster, the captain of the flock. These fowls frequented the space around the front crib door to receive their allotment of shelled corn. While the fowls were busily engaged in picking corn on the ground, the can containing the bumblebees was upset. The enraged bees emerged and swore vengeance on the fowls. As they soared round and round, every now and then an angry bee encircled the head of a chicken, with a threat to alight on its red comb. This wholesale soaring and buzzing puzzled the chickens completely; it was beyond their comprehension. Nature seemed to refuse to do their thinking for them in this instance.

At frequent intervals the fowls' attention was drawn from the corn on the ground, and as a bumblebee encircled the head of one of them, the chicken made an attempt to keep its eye on the whirling culprit, moving its head round and round and pecking violently at the infuriated insect. The fowl's failure to hit the target had a tendency further to irritate the bee, whereupon it lit astride the chicken's red comb and began to sting. At this stage of the performance, the chicken would duck its head and then with the claws of first one foot and then the other, make vigorous but vain attempts to rid its head of the pain-producing insect. Failing in this, in a half-squatting posture, the fowl made a mad race for an old building under which it sought safety. Picture to yourself a hundred such spectacles as this one, and you may form a partial conception of the depth of the comedy!

To reach the old building under which the chickens and hens sought refuge, they had to pass the spot where I stood, or was hiding. As each one went by, traveling at the most rapid fowl pace I have ever witnessed, I observed from one to three bumblebees riding on her comb, and two bumblebees seated on the tips of the tail feathers, holding on with a tight grip, bobbing up and down like the float on a fishing line in a swift stream.

One by one the bumblebees drove every fowl away, except the large rooster. He had pecked a thousand times and had missed his target equally as many times. With his head he had drawn circles in the air for so long a time that surely he must have felt as void of equilibrium as a drunken man. Circles would have danced before a human being for weeks, had he gone through the same performance



One of Nature's comedies. Bumblebees giving chanticleer the worst of it.

This old veteran had been the head of the flock for many months, had protected them, and the flock had confidence in his courage. How could he afford to allow himself the humiliation of being defeated by such a small creature as a bumblebee? Whether he had any thoughts like these, I do not know, but he put up a good fight long after all the rest of the flock had deserted the ground. Finally he gave up and took to his feet, moving as swiftly as any member of his family which had preceded him. As he passed by me, I observed three bumblebees crouched on his comb; one was swinging to a wattle loosely, jostling about as if it were about to lose its hold; two bumblebees were riding on his back where decent folk should ride; and three were holding on with main and might to his tail feathers! He, too, sought safety under the old building, but just what each one did on reaching the spot I do not know. It was an hour before they emerged!

At the zoo in Atlanta, Georgia, in Grant Park, one Sunday, I spent an hour watching the human-like behavior of certain monkeys and apes. If these animals could speak, they would doubtless change the name of Sunday to Peanut Day. They were kept quite busy receiving the gifts of roasted peanuts, and arms were stretching through the bars constantly, begging for more. I had been talking to a respectable looking ape when a woman quietly approached, holding some peanuts in one hand. Placing his body tightly against the cage, this ape reached out for the tempting bit of food. As he was in the act of removing it from her hand, she quickly withdrew the left hand which contained the peanuts, and threw the right hand in its place. Around her wrist was twined a good-sized snake whose tongue was splitting the air. When the ape saw the serpent so near his paw, he fell back into the cage turning a complete somersault backward! The poor creature nervously arighted his body, ran up a small dead tree in its cage and then ran out on to the end of the highest branch. From his distant position he stretched his body, and wrenched his

neck painfully in an effort to get a glimpse of the woman's hand which she was concealing behind her. The frightened ape never came down as long as the woman remained in sight. The instinctive fear of snakes, even with apes and monkeys, adds a humorous page to this book of Nature.

It would doubtless have been just as easy for Nature to have made green apples palatable, but her plans for the success of her species would have been threatened with extinction. If green apples were as tasty and appetizing as ripe ones, how many of such fruits would reach maturity? A fruit grower tells me that he has found one apple which is sufficiently appetizing while green to make it tempting to be devoured. The flickers and some other birds discover the fruit is tasty which leaves him few apples of that variety for maturing. Nature could not guarantee the perpetuation of her species of fruits if she did not act cautiously. But when the boy is tempted to eat green apples, Nature gives him such a severe lesson in "stomach ache" that as he rolls and tumbles and groans, when he utters, "Never again," Nature wins her objective—a promise never to molest her fruit until she has matured both seeds and pulp!

The birds watch for the coloring up of small fruits, especially cherries and grapes and berries. Some of the birds, however, do not seem to be able to tell when white grapes are ripe. One of my friends grows white grapes, and he is a great lover of birds. He specializes in white grapes because he declares that his bird friends sit by for weeks patiently waiting for his white grapes to ripen, and in the meanwhile he harvests his crop!

The poetry of Nature! How many styles of composition, how sweet the rhythm, how accurate are her measures! There are poetic expressions all about us. In the heavens, in the atmosphere, in the sunshine, in the breeze, in the brook, in the song of birds, in the movements of the insects, in the tree tops, in the meadows, in the blossoming flowers, and sometimes we read a sweet couplet scattered here and there throughout her prose writings.

If it were possible for a man to live a thousand years, though he were a genius enough to remember everything he reads in Nature's book, at the conclusion of his reading, he would still find her interesting pages leading him on with just as fresh and crisp stories as those he had passed over. We can no more hope to complete this book than we can hope to memorize the contents of any large volume written by man. There are no more reasons for a nature lover trying to see and identify every bird, every plant, every tree, every insect, every leaf, every stone, every star or every animal than there is for him to make an effort to read every book and pamphlet that has been produced since the invention of the printing press!

Using the Post Office to Rob

(*Concluded from page 7*)

complaints from the outside, from persons who had been "stung."

There are scores of frauds in which no complaints ever are made by victims. Among these is the probably worst class, that of the fake medical cases. Nobody ever complains on the score of being defrauded by the most sinister of all mail swindlers, those who prey on the sick and ignorant and poor. These cases have to be developed independently of the dupes, who sometimes stand by those who defraud them with an ardor equal to that displayed by religious fanatics.

Recently, a fraud order closed the mails to a quack who had made a fortune by selling, through the mails only, a preparation of alcohol, olive oil, flavoring extracts and water as a certain cure for every known disease. When he was tried in the courts, a crowd of his dupes made such a fervid display of protest and defense that the jury acquitted him!

There has been some curbing of such operations but millions still are made out of them—and thousands of persons who trust to the "cures" thus distributed go to untimely graves from which, but for these deceptions, they might be saved.

Outside agencies, like the medical associations, have given aid, chiefly in the form of exposures, in curbing medical frauds. Other agencies, such as the National Vigilance Committee of the Associated Advertising Clubs and the Better Business Bureaus now maintained by local advertising clubs in most of the big cities, also have given aid in developing many kinds of cases.

It is patent, however, that the field is not covered. In fact, it is so insufficiently covered that one may wonder if what is done really helps in the long run. For it probably causes many persons to believe that the mails are reasonably well protected from imposters who frequently make use of the public impression to that effect.

When the special campaign against the oil stock operators was on, a bold performer sold a lot of stock in a fake oil concern by emblazoning his literature with statements like the following:

"Present-day investors are protected by close supervision of all offerings by Federal investigators and by the enactment of a super-strict blue-sky law.

"With the closing of the mails to the fraud artists, the way is opened for the legitimate operator who would never attempt to compete with the flamboyant misrepresentations of the professional 'skin game' exponents."

Officials who have followed frauds for years declare that *the run of persons who fill the coffers of swindlers by mail are confirmed "suckers" who are made easier marks by being stung.*

> "Operator after operator in worthless stocks," says one, "has told me that mere lists of names, no matter how carefully selected, are worthless in their game. What they pay big money for are *the names and addresses of persons who already have been swindled.* One list of that kind I happen to know sold for $10,000."

It was for operations with such lists that a famous man was recently convicted and given a long term in prison. He pretended to "merge" into one big combine the companies in which the dupes had bought worthless stock. He offered new stock in exchange for the old on condition that the dupes send in more money. The big "killings" in fake oil stocks were made through "merger" operations of that sort, in which only those who already had been defrauded were solicited.

The "sucker list," say investigators, is the Aladdin's lamp of most big swindling operations via the mails.

But advertising, either directly by mail or through newspapers and other publications, is no doubt the controlling factor.

In a following article I shall show the assistance rendered by advertising skill to defrauders of the people.

Riga—Pearl of the Baltic

(*Concluded from page 6*)

doubtless, is from shipments of wood. These shipments go, for the most part, to England, where the wood is used for paper pulp and in construction work. But the woods of Latvia are being devastated by this commercial exploitation. It is said, in Riga, that ten years will see the end of such extensive shipments, unless some methods of conservation are introduced.

From an economic point of view, however, one wonders how successfully Latvia or the other Baltic States will be able to establish prosperity without some sort of working commercial alliance with Russia. At present, in fact, no such prospect is on the horizon. Nothing could be further than that from the expressed intentions of the politicians of Latvia. But, in private, one hears it frequently said that the future is certain to see some sort of an Entente of Baltic States with Russia, for commercial if for no other purposes.

No fact is more apparent in Riga—as in most places in Europe—than that the problems of building a well established state depend, almost wholly, on the matter of international coöperation and good will. Lithuania and Latvia and Esthonia—if they can bury their respective hatchets—can set up the machinery for economic coöperation that will solve their major difficulties.

Barnum, the Showman

Puritan New Englanders Who Succeeded

P. T. BARNUM.

By LEWIS WORTHINGTON SMITH

MR. H. L. MENCKEN'S greater predecessor in the art of consistent and self-conscious humbugging was the Connecticut Puritan, Phineas Taylor Barnum. One important difference between them must not be overlooked. Mr. Mencken enjoys the critical jokes that he plays upon his youngling victims because he likes to bite. Barnum enjoyed his jokes because he had a lively pleasure in a good-natured laugh.

It is probably well within the truth to say that, up to his day, Barnum was the greatest entertainer that the world had so far seen. No one could have been less a man of the sour face than Barnum, and yet he was a typical Yankee, a typical Puritan. He was brought up in the religious fashion of his New England. He liked to go to church and Bible school. He studied the Scriptures diligently and made himself well informed with regard to them. They were a matter of interest to him, as almost everything that came to his notice was a matter of interest. Although less soberly, he was like his greater Yankee predecessor, Benjamin Franklin, in that matter.

Barnum's life began with a joke played upon him by his maternal grandfather. At his grandson's birth, Phineas Taylor gave the boy's mother in trust for his namesake five acres of land, "Ivy Island." The boy dreamed of this as the basis for the fortune that attained to manhood. He was not given an opportunity of seeing the bit of land until he had passed from boyhood into youth. Then he learned that the five acres made a piece of worthless waste land in a bog. He learned also that he had been the victim of the family fondness for practical joking.

Barnum's face is an interesting study. There are ripples waiting about the mouth, but the lips are not in the least loose or flabby. They are such lips as can give a decided yes or no under twinkling eyes. They have the Puritan determination, the Puritan steadiness of will. It is easy to believe that Barnum was not a man to surrender to the first chance wind of adversity. He was a man to smile on occasion as if nothing mattered, and at the same time to set his foot solidly on the forward track because the goal was still a thing to warm the passion of his desires. He lost his fortune more than once, but he lost neither his geniality and good temper nor his tenacity. He recovered from his losses always with astonishing rapidity.

Barnum entered definitely upon his career as a showman with the purchase of the American Museum in New York in 1841. He was then 31 years old and had already gone through a variety of experiences, including sixty days in jail for libel. This imprisonment was a triumph of a sort, because he was the object of general sympathy such that his jail room was carpeted and papered for him and he was taken home at the end of it in a coach with an accompaniment of speeches and a brass band.

Whether this feeling for him among his fellow citizens was rooted in their conviction that he was not the sinner that the court had pronounced him or in the humanitarian tendencies characteristic of the Puritan cannot be told. Beyond their reasoning judgments, however, something in the man gave fervor to the occasion. He was earnest and he was not one to strike his colors. At the same time he was not a man to make a long face when he saw some one else hauling them down. They might go up again. It was a natural expectation with men of his race and kind that they would again be flying at the top of the pole.

There is nothing in existence now like Barnum's American Museum. It was a museum first, and the eagerness of t New England c sire to kn something about everything to be se on the planet found there its mo affluent manifestation. It was also lecture hall, and the desire to lea what could be communicated by wo of mouth was there given a degree satisfaction. Then again it was theater, and those who wished to amused without being offended could sure of getting the worth of their mone

In a fine way Barnum's bringi Jennie Lind to America was probab his most important achievement. presented her, not at the Museum, b at Castle Garden, September 11, 185 The receipts for the first concert f only a little below eighteen thousa dollars. The first ticket sold broug two hundred and twenty-five dolla Barnum promptly offered her bett terms than her contract called for, a her American tour went throug triumphantly beyond all expectation

Jennie Lind succeeded because s was a great singer, at once a remarkab voice and a no less remarkable perso ality, but she succeeded also becau Barnum was an experienced and gift advertiser. Advertising was not science in those days. Man had n been studied in the laboratory as body of psychological reactions. directly sympathetic understanding human nature was needful in any o who wished to persuade the public buy his wares. That was one of Ba num's great endowments. Connecti in his day, intellectually aristocrat under the eaves of Yale University, no doubt it was, was politically one the most democratic spots on the glob

Barnum's American Museum (from a contemporary photograph).

Ward, the Humorist

Making Laughter an International Emotion

The Puritan faith lived in the assertion of the individual and in the minimizing of his subjection to a formula. Interest in individual men and women, their characteristics and their motives and impulses, flowered out of this soil of the mind as naturally as violets out of a sheltered hollow where the water trickles earliest in the spring.

The maxims of successful conduct by which a man determines his progress toward a goal are important items in any process of personal evaluation. Barnum's evocation of fortune out of difficulties grounded itself in some affirmations and bits of advice that are simple platitudes and that yet are far from universal motives and incentives. A few of them illustrate clearly enough the natural activity and force of the man.

The foundation of success in life is good health.

Whatever you do, do it with your might.

Use the best tools.

Read the newspapers.

Preserve your integrity.

The last three of these admonitions represent happily three several aspects of the Puritan temper. The man who insists upon using the best tools is so far one of the aristocrats of those who do things. Insistence upon the value of the newspapers is a mark of that breadth and catholicity of spirit that only the socially unadvised have failed to see in the Puritan. The man who preserves his integrity maintains himself—his own individuality, his own gifts and powers—in the face of whatever may be alien to it in the world. Nothing could be more unequivocally Puritan. Nothing could more mark the finely patrician temper in a world of plebeian compromises.

JENNIE LIND.

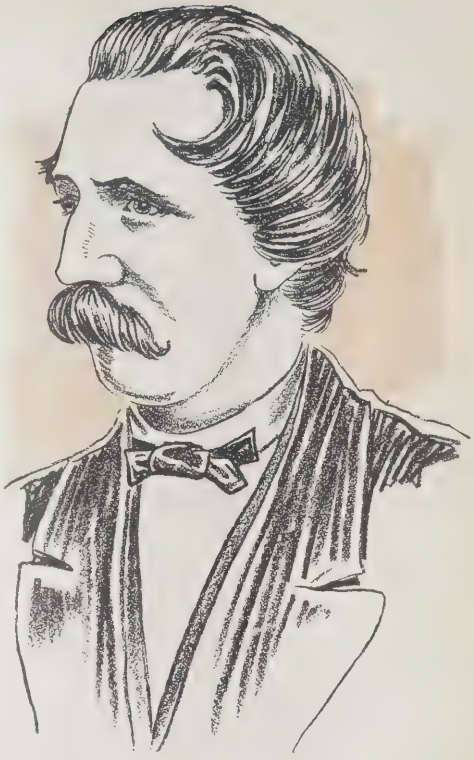
It was from Puritan New England that our first full-throated literary laugh was heard about the world. Of the three humorists whom we may properly consider as most notably the predecessors of Mark Twain, "Josh Billings" (Henry Wheeler Shaw) was born in Massachusetts, "Petroleum V. Nasby" (David Ross Locke) was born in New York State, and "Artemus Ward" (Charles Farrar Browne) was born in Maine. Of these only Artemus Ward achieved an international reputation. He joked with words as Barnum joked with anything that came to hand. His name itself was a sort of joke, being the signature to letters that he wrote for the Cleveland *Plain Dealer*.

Barnum could have found his collection of wax figures, his snakes, and his lone tiger poor stuff for exhibition purposes, but his assumed price of admission was only fifteen cents. That small tax appears continually in his accounts of his show business. He held to it strenuously, and in his fictitious visit to Salt Lake City he reports himself as having somewhat violently opposed the efforts of some Mormon women to secure free entrance on the strength of a "revelation" accorded them to that effect. With relation to the prophet's eighty wives he had asked Brigham Young, "How do you like it as far as you hev got?" Young had replied, "Middlin'," but Ward found the blandishments of the women who wanted to see his show without paying for it not so satisfying. "I girded up my Lions and fled the Seen," is his report of his escape.

Browne's humor was at once rather broad and rather obvious. It was not coarse in a gross way, but it certainly was not affected by any refinements of subtlety. It had its source of exaggeration, extravagance, and overstatement. Its kinship with the more polished humor of Charles Dudley Warner and Oliver Wendell Holmes is somewhat remote. None the less it is essentially and characteristically American. It has the abandon that in some ways marks our American temper. Owen Wister's *Virginian*, telling the frog story to a crowd of completely fascinated disbelievers, plays upon the same American delight in the incongruous preservation of the sober face. Browne is reported to have said absurd things in his lectures, unrelated bits of nonsense, without so much as the betraying shadow of a smile.

Browne died of tuberculosis before he had quite filled out his thirty-third year. Other men, of course, have made some place for themselves in the world at that age, but it takes gifts of no mean order to gain the attention of the world, to establish a reputation, and to win the respect of some of its more thoughtful minds at that age.

He was in his twenty-sixth year at



ARTEMUS WARD.

work on the *Plain Dealer* when his salary was advanced from twelve dollars to fifteen dollars a week. The following year he went to New York to edit *Vanity Fair*, but that periodical failed. His income from his writing was so small that he was almost driven to the lecture platform. He got together a random body of comicalities, gave the lecture the title, *The Babes in the Woods*, placarded New York with announcements that

ARTEMUS WARD
will
Speak a Piece,

and on a stormy night in December, 1861, faced a small audience, that did not pay expenses, with his drollery. Despite this inauspicious beginning, he went on with his work on the platform, gaining more and more hearers. His most successful lecture was *Among the Mormons*. The tickets were themselves part of the antic humor of the occasion. They read:

ADMIT THE BEARER
AND ONE WIFE
Yours truly,
A. Ward.

Only a little more than five years after his first lecture appearance Browne was dead, and yet in that time he had made an enduring place among American humorists. It was indeed not a great place. Mark Twain overshadows him immeasurably. Perhaps we laugh with him and then forget him as we forget Twain, but he had made them laugh in London, as he had made them laugh in New York. No other American humorist had succeeded so far before. Moreover distinguished men in England had given him their friendship, and men of taste and literary discrimination in America, such men as

William Dean Howells, had come to appreciate him and love him.

The persistence of the humorist's outlook in him, as well as his native courage, appears in something that is told of his last hours. T. W. Robertson, the dramatist, author of *Caste, Home, School,* and other well-known plays of the mid-Victorian period, was with him. Browne had gone to Southampton, hoping to make the voyage home to America. His strength had failed. Robertson, in attendance upon him, tried to persuade him to take some medicine in a glass of water.

"My dear Tom," said Browne, "I can't take that dreadful stuff."

"Come, come," Robertson urged him; "do take it for my sake. You know I would do anything for you."

"Would you?" Browne asked.

"I would, indeed," Robertson assured him.

"Then you take it," said Browne.

This equability of temper seems to have marked the man's whole life. He had the Puritan control of his emotions. That gift in him enabled him to maintain a solemn countenance in the presence of the violent laughter of those whom he was entertaining. He was not a clown unconscious of the occasion for amusement in what he said. When he was writing it out he was sometimes fairly hilarious himself, pounding on the desk before which he sat and otherwise exhibiting his enjoyment of his own fun. He was thoroughly human in fact.

The genial laugh is our American manner. Humor of that sort is the great solvent. It is easier to laugh shams out of existence than to strike them down with the sword. That was the advantage that Cervantes had over the knight of his creation, Don Quixote. Moreover, the man who laughs, whether Cervantes or Barnum or Artemus Ward, is safer from the explosive effects of egotism than either Don Quixote or the more modern crusading knights who are splintering their lances in the face of the calm ridicule of the world.

How "Dazzy" Vance Was Named

Arthur (Dazzy) Vance, Brooklyn pitcher, who is the most valuable player in the National League, or was last year, is a product of the sand plains of Nebraska, where they breed good, rugged men and women. The nickname "Dazzy" is a corruption of "Daisy," and it came about in this way. When Vance was a boy he used to visit at the home of an old friend plainsman near Hastings, Nebraska. This friend had all kinds of cowboy paraphernalia—guns, chaps, lariats, saddles and spurs. Vance would express his pleasure at the various articles by saying, "Ain't that a dazzy?" He meant "daisy." It was a common word with him and as he used it at school the boys began to call him Dazzy, and the name has clung to him through all his remarkable career.

The Greatest Moment in a Man's Life

(Concluded from page 4)

The fact that almost a burning question among college presidents has come to be "Why do so many college graduates fail?" indicates how blindly the young are groping. What do they mean by "failing"? Does any man who really tries ever fail? It would seem as if the college and, along with it, all of society had failed, instead of the young man. More light should have been thrown upon his path. He should have been given better information with regard to the exact nature of the business he set out to master.

Oh, that wonderful hatter in London! There is hope for the world so long as even one man can do what he did. But until we develop enough intelligence to flood the crossroads of youth with a great light, one cannot help feeling sincerely sorry for the young as they flounder about in the dark at the crucial moment of their lives. They don't know what they want to do because they have never lived before and have no knowledge of what the world holds. They don't know what is inside of them that, if they are ever to be happy, must be brought into touch with the world. Older men could help them, if only they would think to do so.

Get in the closest possible touch with the life about you. Send your mind off into other worlds. Dream. Become more and more of a self-starter. Don't be dependent upon others for your happiness. Make your own and shed a little, if you can. As Emerson said, "Keep your friendships in repair." Friends are the most important things in the world, the most to be desired—and the hardest to get if they are worth while. Reach out in every direction for things to feed that tireless bit of gray up in your loft that can stand anything better than dullness. Avoid dull persons. Try not to have others keep away from you on that account. Get what money you need to live decently and forget the rest. Only your mind counts. Satisfy its legitimate longings and you are happy. The only way to satisfy it is to feed it. It likes more things than there are on the menu of an ocean liner and no elephant has an appetite that can compare with it. It is all you have and all you need with which to be happy, but you have got to give it what it wants.

Since each of us is the composite of all of his ancestors, one of your ancestors may now and then call for something you ought not to have, but the other ancestors, if you will listen to them, will set you right. Your mind can go wherever thought can go—and that is everywhere. Make the most of what you have upstairs and you need not worry about the rest of the world. Do work that you like to do, but don't stop with your work.

Why It Is Called the Monroe Doctrine

THE Monroe Doctrine is so call because it was first officially set o about a century ago by Preside Monroe. The term has been popular used for a variety of principles intend to explain or to define the policy of t United States toward Latin-Americ countries. America, besides includi the United States and the Domini of Canada, comprises a number nations of Latin origin—Mexico, t Argentine, the United States of Bra and other Central and South Americ countries, most of which had original been settled by Spain. In 1823 mo of these countries had broken aw and were founding their own gover ments, even as the United States h done.

Spain, however, disliked to lo her colonies. About this time the was an attempt made by sever European powers to effect a reconque of the New World. A combination Central European powers, common called the Holy Alliance, after crushi several attempts at liberal gover ment in Europe, turned its attention Spain and to the Spanish colonie A French army, with the mandate the Holy Alliance, in 1823, overra Spain and restored the royal despot power. The Bourbon monarch aske for the application to these revolte colonies of America. Metternich, t grand master of the Alliance, thoug well of the idea and it was discussed the Congress of Verona of 1822. Ame ica, even at this early date, had bee practicing the "Policy of Isolation, which was early laid down by Was ington, Hamilton, Jefferson, Adam and other statesmen. Its purport w that the United States had no share i European political combinations, w not a party to European wars an would pursue the policy of developin itself as an American state. From thi policy it was an easy transition to th complementary doctrine that Europea powers should keep hands off America affairs. George Channing, Foreig Minister of Great Britain, now steppe into the field and suggested to ou Minister in London, Richard Rush that the United States join in Englan in a declaration against intervention Monroe was inclined to accept thi proposal but after long Cabinet dis cussions John Quincy Adams, the Secretary of State, convinced Monro that it would be better to make a independent declaration. This prin ciple was therefore laid down b Monroe, that while the States had n interest in European politics, they would not allow any interference b other countries in the affairs of Ameri can countries.

The Signers of 1776

(*Concluded from page 8*)

To this patriot is also attributed the lea of the non-importation plan which e persuaded almost all of the merchants the colony to adopt. Thereby the tamp Act was effectually opposed.

The idea of forming committees of orrespondence to prepare for the evolution was probably born in the rain of Samuel Adams. Virginia aims it for her son, Richard Henry ee; and Massachusetts claims the onor for Adams. It may have been multaneous; anyhow, there is glory nough for all. Boston was the first wn to adopt the plan after Adams ad suggested it; and a few days later irginia became the first colony to adopt it.

Samuel Adams and the Taxes of England

When representatives were sent to England to protest against the unjust stem of taxation, the hand of amuel Adams directed their course; e was the man who wrote their inructions.

Is it surprising, therefore, that amuel Adams seemed in British eyes ntirely too obnoxious to have the rivilege of pardon extended to him?

He early perceived that the colonies ust fight for their rights, or possess one. He looked forward longingly to he test. Then came the Lexington irmish preceded by the narrow escape Hancock and himself. He felt hat the die had been cast, that he turning point had arrived at last.

"This is a fine day," he told a friend.

"Yes," answered the man, thinking hat Adams meant the weather, "very leasant."

"I mean," he patiently explained, this day is a glorious day for America."

In a letter penned in April, 1776, e expressed himself as perfectly tisfied of the necessity of a public, efinite declaration to break the tie nding the colonies to Great Britain. e wondered what good reason could e offered against such action.

"Will it widen the breach?" Adams uizzed. "This would be a strange uestion after we have raised armies nd fought battles with the British oops, set up an American navy, imrovised other vessels to capture ships, esignated them the enemies of the nited Colonies and torn into shivers heir acts of trade."

The prospect of victory had been onsiderably dimmed in 1777 when ongress got scared and resolved to eet next at Lancaster, Pennsylvania. hortly afterward Adams and a group the members informally discussed he outlook. He was characteristically heerful, but the others were downearted.

"Gentlemen," he commented, "your pirits appear to be heavily oppressed y our public calamities. I hope you o not despair of our final success."

"The chance is desperate."

"If this be our language," Adams swung out roundly, "it is so indeed. If we wear long faces, they will become fashionable. The people take their tone from ours. If we despair, can it be expected that they will continue their efforts in what we conceive to be a hopeless cause? Let us banish such feelings and show a spirit that will keep alive the confidence of the people rather than damp their courage. Better tidings will soon arrive. Our cause is just and righteous. We shall never be abandoned by Heaven while we show ourselves worthy of its aid and protection."

Samuel Adams earned the name of "Father of the Revolution." John Adams was the "Colossus of Congress," a title apparently invented by Jefferson who said:

"He was our Colossus on the floor. Not graceful, not elegant, not always fluent in his public addresses, he yet came out with a power both of thought and expression that moved us from our seats."

Jefferson, generous in his praise, gave credit where credit was due. He had written the Declaration for Congress, but John Adams had read it to Congress and then had done much more.

"John Adams," the future third President said, "was the pillar of its support on the floor of Congress, its ablest advocate and defender against the multifarious assaults it encountered."

These two men were candidates for the presidency to succeed George Washington. Adams won by a very narrow margin, so narrow that he often dubbed himself, "President of three votes." Four years later Adams tried for a second term, and Jefferson was again his opponent. The supporters of Jefferson were violent, but he assuredly did not hesitate to rebuke them.

"Gentlemen," he protested, "you do not know that man. There is not upon this earth a more perfectly honest man than John Adams. Concealment is no part of his character, of that he is utterly incapable. It is not his nature to meditate anything that he would not willingly publish to the world. I know him well, and I repeat that a man more perfectly honest never issued from the hands of the Creator."

A Friendship Which Lasted Till Death

Jefferson was the winner on this occasion. Unfortunately Adams failed to be a good loser; for many years he remained bitter toward his political rival. As time went on the people characterized him more and more as "noble old John Adams." Finally he had the pleasure of seeing his son in the White House. He and Jefferson resumed their friendship; they wrote letters to each other as long as they lived. And when death came, it came to both on the same day, the fourth of July, 1826, precisely fifty years, or half a century, after their beloved Declaration of Independence had been adopted by Congress sitting in Philadelphia.

John Adams achieved one distinction that no other man in our history has held: he was the only President to have a son serving later in the same capacity. John Adams and John Quincy Adams constituted the presidential exemplification of "like father, like son."

Could Not Bribe John Hancock

For eleven years John Hancock had been the wealthiest man in Massachusetts.

Until the time of the Boston Massacre there was much doubt as to John Hancock's attitude. He had a truly magnificent equipage; especially upon public occasions and at other times, too, he rode with six beautiful bay horses and servants in elegant livery. His clothing was sumptuously embroidered in gold, silver and lace. He liked dancing, music, card parties, social dinners and luxurious festivities.

Efforts were made to bribe Hancock, but he repulsed these overtures just as firmly as Samuel Adams had. Offered a commission in the army of the enemy if he would declare his allegiance to the king, he spurned the suggestion in strong language.

"I would rather be a private against tyranny," he protested, "than a field marshal for the king."

On the night before the Battle of Bunker Hill the American commander, General Joseph Warren, a physician by occupation, and Elbridge Gerry were restless bedfellows. They had been intimate friends for many years and both were high-minded patriots.

"Doctor," Gerry called after Warren as he went off to his troops and to his death (as it happened), "give them plenty of ball."

Warren shouted back that he would. And he did. But he lost his own life in the bloody battle.

General Washington is said to have depended on no one with more confidence for the promotion of his plans than he did upon Elbridge Gerry. And the army fondly called him "the soldier's friend" because he was ever looking after the welfare of the men.

Robert Treat Paine, a fellow signer of the Declaration with Gerry, also died in 1814; but he had attained the ripe age of eighty-three. He was a staunch admirer of General Washington for whom he served ably during the entire Revolution as chief cannon-buyer. He was also one of the principal agents in supplying the American troops with powder and ball. Like Gerry, he proved himself a true friend to the soldiers.

Robert Louis Stevenson, the Man Samoans Loved

Robert Louis Stevenson as a poet.

THE United States has a rich and beautiful territory in the islands of Tutuila and Manua in the Samoan group, 4,200 miles southwest of San Francisco. The other two islands in the group, Sava and Upolu, until the World War in 1914, were in the possession of Germany.

It was in the Island of Upolu that Robert Louis Stevenson lived for the last and the happiest years of his life, for in the calm climate and the tropical sunshine he found comfort, and in the lives of the natives and in their activities he found unending interest. The Island of Upolu is one of the most beautiful in the world. It is rich and fertile, and the trees and farms are luxuriant in their greenness. The natives are Polynesians of the highest type, simple, brave, kindly people of surprising intelligence.

Robert Louis Stevenson as the hero of Southern Sea fancy.

The population of the Samoan group numbers around 39,000 persons. Although the natives live simply, almost primitively, they are clean, honorable and generous to a remarkable degree.

It was among these natives that the great Scottish poet and novelist lived for so many years. The older men of Upolu still remember him and speak of him with love and reverence. During the years that Stevenson lived in Samoa he acquired a great influence with the natives, took an active interest in all their affairs, and attended their councils where he sat in state, one of their great men.

Stevenson chose as the site for his house one of the most beautiful spots on the islands. At the foot of Mount Vaea, it overlooked a scene of tropical splendor, and here he lived in contentment for many years. It was to the door of the house which stood on this site before he built his new home, that the natives, in love for him, built a road. It was in this house that Stevenson wrote many of his later novels.

The love of Robert Louis Stevenson for his wife, Mrs. Osbourne, is one of the most perfect love stories in literary history. In 1879 Stevenson met his wife for the first time. For a number of years he did not see her, but he wrote to her and their affection grew. Then he learned that she was ill in California. He was then in Edinburgh, Scotland, his home.

He came to America, making the trip in spite of the hardship of the voyage and the fact that his health was then at its worst. He married Mrs. Osbourne and took her back to Scotland with him, and during all the hard years that followed she traveled with him, seeking a place where he could find rest and health. When they found Samoa she was as delighted as he. Here they lived in perfect accord until he died in December, 1894. When he died he was carried to the grave by sixty of the natives who loved him so well. To lay him at rest on the spot he had chosen on the top of the mountain, the natives cleared a pathway, being times compelled to pull themsel and the casket up by means of ro so steep was the ascent.

On the simple tombstone is car his own beautiful *Requiem:*

Under the wide and starry sky,
Dig the grave and let me lie.
Glad did I live and gladly die,
And I laid me down with a will

This be the verse you grave for
"Here he lies, where he longed to
Home is the sailor, home from sea
And the hunter home from the hi

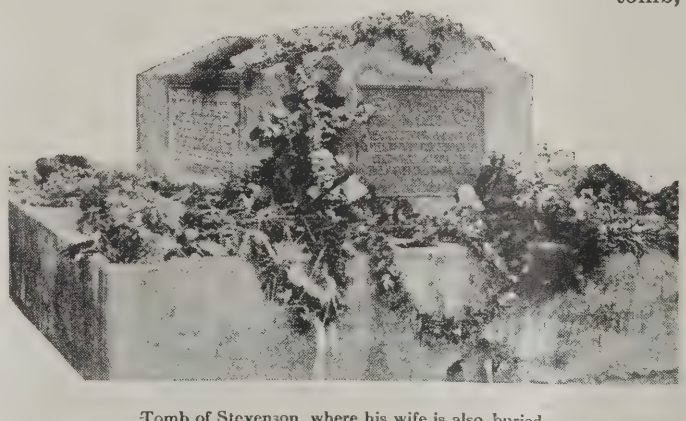
There is now a path, well worn the feet of many pilgrims, which we its zigzag way up the mountain si making the climb as easy as possi Here and there along the road are re ing benches, the gifts of lovers Stevenson's works, and usually bear the names of the donors.

Various hands have attended d ing the passing years the tomb and little plot of ground. At no time h it been neglected, not even when ci war raged beneath it and shells fr great warships in the harbor tore t hillsides, and one plowed its w through the Stevenson home belo Samoans, Germans, British, and N Zealanders have seen to it that Stevenson lover could visit the pla and charge that it was ill-kept.

When Mrs. Stevenson died 1914 she was buried in the sar tomb, and the last verse of the poe her husband wrote to her graven on the monument:

"Teacher, tender comrad
wife,
A fellow-farer true throug
life,
Heart-whole and soul fre
The August Father ga
to me."

And there they rest that lone mountain ove looking the salt sea murmu ing its requiems among th coral reefs. United though fa from the land of their birt



Tomb of Stevenson, where his wife is also buried.

Stevenson's Land of Enchantment

The famous novelist sought health and happiness on beautiful Upolu, one of the Samoan Islands in the South Seas.

A GROUP of natives, servants and guests appear in the above picture, surrounding Robert Louis Stevenson and his family, at a party in honor of the author's birthday. He was called "Tusitala," which means "Teller of Tales."

THE Island of Upolu is wild and luxuriant in its greenness. In the oval above, some native women are shown at a waterfall.

HOUSE that Stevenson designed, and in which he produced his later works, appears above. He experienced difficulty in getting through the island's tangled undergrowth, hence the natives built from the sea to his door "the Road of the Loving Heart."

THE Native Square on market day, at the right. Stevenson was often part of such a picture. The United States has a rich territory in two of the four islands in the Samoan group.

CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

"Anglo-Saxophone" is a word coined abroad to describe the speech of Americans who know but one language and who raise their voices to foreign waiters as if noise would increase their intelligibility.

In George Washington's time ice cream was a novelty but the average United States citizen now eats two and one-half gallons a year.

The manuscript of Scott's *Antiquary* sold recently for $10,000. It brought $200 when sold 93 years ago.

A grave in Arlington Cemetery bears a plain white wooden marker, on which in black letters is this inscription:

Lot 3121
Wm. J. Bryan
Col.
U. S. Vols.

Chauncey M. Depew was a member of the New York Legislature when the Civil War began.

An ancient Persian ambassador to France every morning before the day's business saluted a turf of earth dug from his native soil to remind him of the loyalty due his country in all the transactions of the day.

The poet Byron had a clubfoot which caused him untold embarrassment. Talleyrand was also clubfooted.

Photography has been substituted for typewriting in the office of the *Register* of Chicago, where a great saving is anticipated.

Though the barber shop private shaving mug is almost gone, many old-time shops still have many old individual cups that are no longer in use, some of them belonging to estates and unclaimed by their owners.

To the query of one church paper as to whether there is a shortage in ministers, another irreverently replies: "Yes; decidedly; but not in preachers."

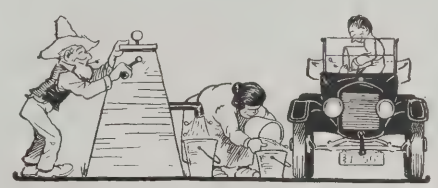
It is surmised that the epistolary xxxxx's, for "kisses," originated in the ancient custom of placing crosses (x's) on the dead, as a salute from friends.

Native Maori women of New Zealand salute their friends in the street by rubbing noses.

The Statue of Liberty in New York Harbor reached America, as the gift of France, on June 17, 1885. Frederic Auguste Bartholdi was the sculptor.

Although there are three million more persons in the cities than in the country, there are two million more children under ten years of age in the country than in the cities.

Tom Moore, the Irish poet, was a grocer's son, short of stature and of insignificant appearance.



Residents of Fredericktown, Missouri, are pumping gasoline from their wells instead of water. This combustible fluid is pure enough to be used in automobiles just as it comes from the earth, after straining out the sediment.

A government censor is present in every newspaper office in Italy. Some issues have to be "made up" five or six times before they are approved. The result of this suppression is a secret press opposed to Mussolini.

A statue to Lafayette in New York bears the inscription, "As soon as I heard of America's independence, my heart was enlisted."

Germany is the most heavily taxed nation, 26 per cent of the national income going into the public treasury. Next is Great Britain with 22 per cent and Japan with 21.8 per cent. France turns in 17.8 per cent of her revenue. The United States is taxed 10.5 per cent of its national income.

The movie rights for one of Mark Twain's least important stories recently sold for $25,000, for a six-year agreement.

Though the goose that laid the golden eggs may long since be dead, the American hen produces more wealth in a single year than all the gold and silver miners in the world.

In the villages just out of Monte Carlo, the women and girls carry large and beautifully shaped copper jugs to the village pump for their water supply.

The principal and 13 teachers at Moody's Northfield Seminary have resigned, but it is denied that the action of the trustees in lifting the ban against dances at the school had anything to do with it.

Napoleon said, "Men are hogs that feed on gold"—a statement whose truth would be increased if it began with "some."

Under the metric system a mile a minute or 60 miles an hour becomes 1.609 kilometers a minute or 96.54 kilometers an hour. Same speed but more figures and longer words.

A man may legally spank his wife under certain circumstances, in Georgia, according to a ruling made by the superior court of that state.

The municipal authorities of Berlin took over the American expression "to park," and this has caused many attacks to be directed against them for introducing further foreign expressions into the German language.

The old city of Athens is to be torn down and archeologists will excavate twenty-five feet beneath the surface in search of centuries of deposits. Forty American colleges plan to assist in the expectation that the work will yield more important disclosures concerning classical civilization, history and art than resulted from the excavations at Pompeii.

Change of Address

1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue:

Mr. Ford's Page this week asserts that there is no theory" or "standard" of wages, that both are in the making.

Reminiscent of Thoreau and Emerson is this little tale of a trip on one of the country's storied streams. Concord River has a secure place in our literature and history. "The Cruise of the *Nina* on the Concord River," by Florence Taft Eaton, gives us some delightful impressions of an old New England locality. (p. 2)

When taxes become extortionate and confiscatory, loyal men speak out. Our various government units take half a billion a year, that they have no moral right to collect. Royal S. Copeland, United States Senator from New York, speaks his mind on this matter. (p. 3)

New York as a "pagan" city has long been a common theme. But that a great many of its Christian churches have had to be put on the same list as that through which missions to the heathen are financed is not so commonly known. New York is now a Mission proposition for Protestant churches. Most of them are supported by the contributions of persons who do not attend them. (p. 5)

The Boxer indemnity, which was generously returned for educational purposes, is being repeated in the case of Persia. The restitution made for the death of Major Imbrie is to be returned for the education of Persians. The story is vividly told. (p. 6)

Kansas voices its own opinion through its own press. It is not part of a foreign press syndicate. It is time we were thinking about New York "boiler plate" journalism which robs various sections of the country of their own power of expression. (p. 7)

In the church of St. Clement Danes in Old London is Dr. Samuel Johnson's pew. It is now a memorial to the great lexicographer. Just why this was done makes an interesting tale. (p. 8)

Lorado Taft, the American sculptor, shows in his work a mystic vision. An illustration of the American quality of this mysticism is shown on the cover of this issue. Mr. Taft's opinions on the future of American art are full of interest. (p. 12)

Taking the census of bears, mountain lions, wolves and other denizens of the Western wilds is a rather unusual job. (p. 15)

Delightful Master Samuel Pepys in the dual role of connoisseur and book lover. (p. 16)

A market for brains exists, just as for wheat and cotton. The cotton men, however, think they are paying too much for the kind of brains that is sold by Aaron Sapiro. And the returns they have been receiving for cotton seem altogether disproportionate. (p. 18)

A nation's history baked into pottery and other articles of clay, illustrated on jugs and mugs and dinner plates, is sometimes illuminative of facts that print cannot present. Many American scenes and scenes in American history are to be found on the old Staffordshire ware of our grandfathers. (p. 20)

The frequency with which criminals are paroled or pardoned, and the considerable sums of money that are forthcoming to cover lawyers' services to crooks, are aspects of the crime situation deserving attention. Where does this money come from? This question is answered in a comprehensive article. (p. 25)

"All the world loves a lover," and many love to see pictures of lovers. Catherine B. Ely writes about this. (p. 32)

"Old North Bridge."

Cruise of the "Nina on the Concor

By FLORENCE TAFT EATON

HIT IS a lovely summer morning and we are starting on an all-day trip on the Concord River—loveliest of streams! "We" are father, mother, and six children—from little Tom, aged three, to big Harold, of the mature age of fourteen. A tiny black dog, who makes up in valor what he lacks in size, completes our party. The *Nina* is a staunch, round-bottomed rowboat of the "family" type, holding us all easily, and including, each trip, a small guest chosen by a different child. Material here, all told, for a merry day!

We are going down river today and Davis Hill is our destination. How could Concordians exist without their river! Canoe parties and picnics in summer, paddling at twilight and in the moonlight—who can tell how many romances are here brought to a happy ending! In winter, skating, ice boating, skate-sailing, and hockey throng the river—now expanded into a broad lake covering the meadows—with merry parties of children, young people—and their elders!

Paddling under our first bridge—Concord is a town of many bridges—we round the corner on which stands the gray, vine-covered former home of Frank B. Sanborn, one of the very last of Concord's famous circle of authors and philosophers. Here, until the end of his life, could he be seen, a picturesque and interesting figure, tall, somewhat bent, with flowing hair and tie of cheerful hue, working in his little garden patches among his corn and peas, or doing his best to wrest his marshland from the river. With his mass of erudition, his phenomenal memory, his connection with the abolitionists and his spectacular shelter of John Brown and consequent arrest, he is one of the interesting features of his time. As we rounded the point we saw a beautiful pale yellow iris, stretching delicately from a pile of ashes and debris on the river bank. It was unlike any I had seen, in garden or marsh. Was it a tribute of Nature to a unique and intellectual personality?

Our next bridge is the Nashawtuc—the flattest arch in the state, with Nashawtuc Hill on the left, a beautiful green slope with a rounded top, from which can be seen a wonderful view—Wachusett and the New Hampshire hills on the west, the "Cliffs" rising abruptly from Fairhaven Bay, Nobscott and other green hills toward the south, toward the east the village, its main street stretching along the river, and the gilded dome of the old "First Church" shining among the trees; and toward the north the river, winding like a blue ribbon through the meadows, and a glimpse of the "Minute Man" and the old "Battle Ground."

Looking downstream.

Paddling under another bridge the North Branch unites with the Sudbury, on whose placid bosom we have been gliding, forming the Concord. Musketaquid or Grass-Grown River was its old name. A beautiful high point of land called Egg Rock because, as George Bartlett remarks, it was once "laid there," covered with fine trees and carpeted with soft green grass, juts out between two stones. This has been a picnic ground from time immemorial, and I suppose more picnic parties have gathered here than in any one spot in the country! I remember a meeting of the old Saturday Club, one of the oldest and most noted of the m clubs of the town, and of which Er son, Alcott, Louisa M. Alcott, Sanborn and many other celebri were at one time honored memb at Egg Rock, many years ago. contents of the lunch baskets w first enjoyed, but Concord picnics w then nothing if not literary, and, a our supper, each member had to c tribute an original poem, a bit of s timent, or—must I confess it?—a g joke, for the entertainment of the co pany. The young bride whom passing years have changed into white-haired matron could comp the lunchbasket end fairly competer but I well remember her trembl dread of her part of the liter program!

On the face of one of the ro where the two streams meet the following beautiful inscr tion:

"On the hill Nashawtuc, at meeting of the waters,
And along their banks,
Lived the Indian owners Musketaquid
Before the White Men came."

A little farther up the No Branch is "Gibraltar," a la rock near the boat landing Edward W. Emerson, son of t poet, whose hospitable home on Lowell road, a short distar back from the river. Few cele rities, from home or abro visit Concord without payi their respects to this worthy a gifted descendant of the poet and charming wife. As we paddle dow stream we pass under the "Red Bridg —fondly so called, although not for many a long year—and a few mo strokes bring us to (Continued on page

Toward Nashawtuc Bridge.

Federal Taxes Should Be Cut Half a Billion a Year

By ROYAL S. COPELAND
United States Senator from New York

Royal Copeland, United States Senator from New York.

OUR national, state, and municipal governments are all great offenders against the people. They are collecting ney in the form of taxes that they ve no moral right to collect, and ending money that they have no ht to spend. Most of the states d cities are also borrowing money at they have no moral right to borrow. No private business could keep out bankruptcy if it were run as our rious governments are conducted. ockholders and bondholders would use to put up money to continue ch waste and such extravagance. the people of the United States only lized it, they have, in this matter, eto power as great as have the stockders of a corporation. They can ve billions of dollars that are now ng wasted each year and lower es if they will but make a determed drive at the polls to do so. But accomplish this task, the people will ve to be alert all the time—when y are voting for national officers, en they are voting for state officers, d when they are voting for municipal vants. Because not all of the money wasted in Washington, great as the ste in the national capital is. The tes and the cities also are terrific enders.

The people are awakening to the iousness of our situation. I hear ir complaints wherever I go. An cle of mine celebrated the one ndredth anniversary of his birth, other day. I was one of 120 relaes who helped him do it. Most them were Republicans. But mocrats and Republicans both eed that the most important ject in America today is exsive taxation. Every one of m felt that our various governnts were taking from him ney to which they had no moral e.

They were right, of course. rely because a government has legal power to tax, it does not ow that it has a right to impose essive taxation. *And all taxa is excessive,* and therefore hout justification, *that goes bed the bare cost of government* en honestly and economically ninistered.

I have nothing to do with te and municipal governments, so far as I have power in the tional Government, I am going ve as hard as I can for economical ernment and lower taxation.

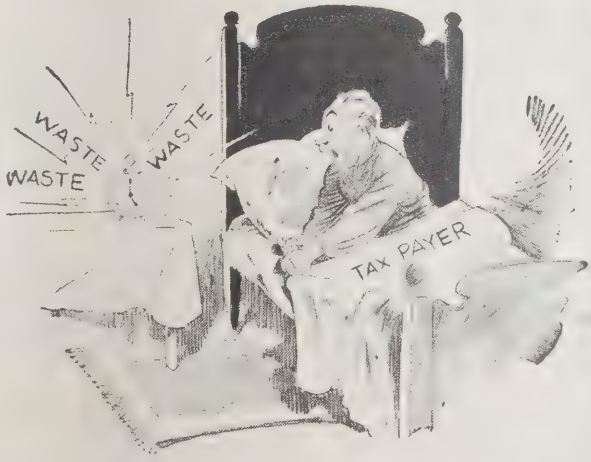
I believe Congress should go about it, as speedily as possible after the beginning of the next session, to cut off $500,000,000 a year from the taxation that the people are now bearing.

I believe the surtax should be cut from 40 to 10 per cent, that the automobile and other nuisance taxes should be wholly done away with, and that both the inheritance and gift taxes should be repealed. I would also exempt from taxation those whose annual incomes are less than $5,000.

I would reduce the surtax upon large incomes because business must have a chance if it is to keep in business. It cannot function well if the Federal Government is to take almost half of its profits and the other governments some more. Moreover, men taxed so heavily seek legal ways to avoid some of the tax and these measures do not help the public. For instance, money invested in tax-exempt bonds does not provide employment for workingmen. I believe a surtax of 10 per cent is enough to put upon any business or any man.

The nuisance taxes should be done away with because they *are* nuisances. We do not need the money they produce and those who produce it do need it.

The inheritance and gift taxes are the worst of the lot. What possible basis is there in ethics for the collection of a tax upon inheritances and gifts? The collection of such taxes reminds me of nothing so much as the holding up of passengers on a train by highwaymen. The government simply



The people are awakening to the seriousness of our situation."

wants the money and takes it.

Does it take it because the man who has just died owed the government some money? That cannot be, because if such had been the case the government, presumably, would not have waited for the man to die to recover what he owed to the National Treasury. How could the man have owed the government anything, anyway? He had paid his Federal income tax, which represented not only all that the government should have collected from him but more. So long as he lived, the government did not pretend that it had a title to a single cent that he possessed.

What is there about death that gives even the United States Government the right to claim title to wealth that it did not pretend to own so long as its accumulator lived? The moment he stops breathing, the National Government claims to own 40 per cent of it and if he has property and offices in 45 of the other states, they claim 20 per cent more of it.

Of course, the death of nobody gives the national and state governments the moral and ethical right to claim anything he possessed to which they had no right so long as he lived. Death is merely seized upon as an excuse for raiding estates and collecting more money to waste. Breathing or crossing the street might as well be the excuse for taxation.

No excuse is needed for taxation that is necessary. Any excuse is good enough. But when the governments, national and state, do not need extraordinary sums of money, such holdups are unjustified. Nor should any estate at any time be subjected to such a tax that the payment of it might take the estate from its owners. It has been publicly asserted that this is exactly what occurred to the estate of the late John Wanamaker. It is said that the taxes upon this estate have taken it all—or will take it all unless the heirs win suits that are now in court. I have also heard it asserted in the United States Senate that other

estates have been wrecked by the various inheritance taxes imposed upon them.

I would also repeal the tax upon gifts. This tax was imposed to prevent men from seeking to avoid the inheritance tax. The same reasoning applies in this matter that I applied to the inheritance tax. Either a man owns certain property or he does not. Either the government owns an interest in this property or it does not. If the man owns the property and the government has no interest in it, why has not the man a right to sell it or give it away without paying tribute to the government? Of course he has such a right. In collecting such taxes the government simply puts itself in the position of saying: "I have the power to rob you and I am going to do it."

"Merely because a government has the legal power to tax, it does not follow that it has the right to impose excessive taxation."

There is no question of the government's power. But neither is there any question of the right of the people to order their national and state governments to cut out the super-tax business.

Some persons, of course, justify the raiding of estates on the ground that too much money should not be permitted to accumulate in anyone's hands. I do not know whether this reasoning is sound or not. I do not look at the matter quite that way. I do not see that the mere fact of ownership amounts to so much. I am more concerned as to *what the man does with what he owns*. If he does badly, from the point of view of the public welfare, I would not wait until he died to apply corrective measures. I would apply them while he was still living and in the midst of his anti-social acts. I would hedge him about with laws that would give him no choice but to go straight. And so long as a man goes straight—so long as he uses his wealth in a manner that is helpful to society—I do not see that it makes any difference how much property he owns. But no matter how much anyone owns or may own, the people always have it in their power to lay down the conditions under which he may use his wealth. If they do not know how to use this power, that is something for them to study. But it is certainly wrong to hold up a good man who wants to give away some of his property and it is stupid merely to tax a bad man who wants to do the same thing. Of course there is no sense in the gift tax law because it was enacted merely to give effect to another unjust law—the taxation of inheritances. In this world it usually follows that one wrong act compels resort to another act equally wrong.

I am further opposed to breaking up fortunes, merely because they are large, for the reason that my experience in Washington and my observations throughout the world have led me to believe that such action instead of doing good would do harm. In other words, I believe that those who have accumulated great fortunes are more capable of handling them in such a manner that the public will derive some benefit therefrom than are any set of public officials in the country. If an extra billion were to be dumped into the Treasury at Washington, what would happen? It would be wasted. But if a billion were added to industry it would provide work and wages for a good many persons. Some rich men keep reinvesting their profits in business, thus creating employment for others. Perhaps there is nothing better that one person can do for another than to provide him with the means of earning a comfortable living for himself and those who are dependent upon him. But of course there are other ways of using money in such a manner as to benefit others. I came upon such an instance in Warsaw, where I was ta to as fine a laboratory as I ever sa my life outside of Rockefeller Insti in New York. I asked who provi the money for such a splendid inst tion in such an out-of-the-way p and I was told that Rockefeller did

"Not all the money is wasted in Washington—the states and the cities also are terrific offenders."

As long as rich men use their mo as our rich men do, I would rat they would keep it than to break their fortunes and let our politici take hold. They are no more to trusted with great riches than m are to be trusted in a box of cheese.

I am, therefore, in favor of reduc Federal taxation at the next session Congress at least to the extent $500,000,000 a year. Secretary Mel is obsessed with the idea of pay off our national debt as soon as possi but I think he is wrong in this. Dur the last five years we have reduc the national debt to the extent five billions, leaving a balance about twenty-one billions.

I believe this is paying the d too rapidly. I am in favor of leavi part of the burden for future gene tions to bear. We can reduce Fede taxation $500,000,000 a year and s reduce the national debt to the exte of $300,000,000 a year, which wou discharge the debt in about 60 yea This is what I think we should do. will be enough for the present generati

This generation has already pa extremely heavily for the war and w have to keep on paying until it di We paid about $40,000,000,000 wh the war was in progress. We ha paid $5,000,000,000 since it ende We have $21,000,000,000 yet to pa If we were to pay $300,000,000 a ye on the principal that would amount, 20 years, to $6,000,000,000 mo Twenty years will cov the remainder of t productive period of tho who were 25 years o when the European w began. The present ge eration should not taxed to death to cle off a debt that it was n wholly responsible for i curring.

We who are still aliv have some rights. Bus ness men who are sti alive have some right I do not feel that busine men have been give either a fair or an i telligent deal by thos who made existing ta laws. Politicians had to much to say in makin them. They taxed busi ness too heavily becaus they believed such taxa tion would make them popular. Poli ticians always have their eyes on th largest groups of voters. It mean nothing to them to tax big incomes a high as 60 per cent. Only a few hav such incomes and they have but on vote each. Ninety-

Mission Mite Boxes for Pagan New York

By WILLIAM L. STIDGER

NEW YORK the Wealthy—New York the Powerful—the Babylon of the Western world—is on a par with China and frica so far as Protestant churches re concerned.

Protestant churches in New York re for the most part supported by issionary collections taken up in her parts of the country.

Not only has the number of those urches startlingly decreased, but ose that remain are less and less le to maintain themselves.

New York is now on the Mission ap of the great Protestant denomina-ons—along with India, Zululand and urkey.

This does not mean that New York non-Christian. Its large Catholic ligious census of more than 2,000,000 d its 423 Catholic churches would revent that.

Nor does it mean that New York non-religious. Its large Jewish re-gious preference of nearly 1,900,000 ith their 1,127 synagogues (1918) ould prevent that.

It means that its 1,941,847 Protes-nt population (figures of 1920) are ot sufficiently interested in religion support the diminished number of rotestant churches that remain in at city.

Presbyterians, Baptists, and Metho-sts have all sent out S O S calls for lp. They have dipped deeply into eir World Mission funds to support ew York churches that are slowly ying.

People in other states who think ey are giving money to convert the eathen probably do not know that e mission field, which part of their oney goes to cultivate, lies much nearer ome—that New York, the mecca of merica's finance, literature, art and shion has become the graveyard of rotestant churches.

Out of 40 Presbyterian churches, 1 are being supported by missionary nds.

Out of 26 Methodist churches, 21 re being supported and maintained by missionary funds.

Out of 21 Baptist churches, 12 are being supported by missionary funds.

Taking the larger area of New York City, Methodist figures show the large number of 51 churches being supported by missionary funds.

And all this in face of the fact that there are 36 fewer Protestant churches in Manhattan than there were 25 years ago.

And more than half of the churches still surviving have a budget of about $4,000 a year.

Almost overnight New York City, or Manhattan, to be exact, has become the world's great Mission Field.

A folder published by the Baptist Church Extension Society of Manhattan has in big black letters the title: "GREATER NEW YORK THE WORLD'S STRATEGIC MISSION FIELD."

This folder starts off with a statement by Walter Laidlaw, a noted statistician.

"New York City in Colonial days was Teutonic in race and Protestant in religion. Today it is Latin, Slavic and Semitic in race and dominantly Catholic and Jewish in religion. . . . .

"In thirty years Protestantism's potential population has fallen from nearly one-half to slightly more than one-third the city's population; the Roman Catholic population has shown a reduced percentage at every census period; while the increase of the Jewish population has been larger than the Protestant decline."

Mr. Laidlaw said: "Within ten years Manhattan will be a Jewish city, due to increased birth rate alone, even if we do not have any additional immigration of Jews."

Statistics already show this remarkable situation; that nearly half the population of New York City (45.3 per cent) is of Southern European origin; while 87.32 per cent of the city's total increase between 1910 and 1920 is of Southeastern European origin.

To put it in an even more simple fashion, here is the statement so familiar and true as to have become almost trite:

New York is the world's largest *Jewish City.*

New York is the world's largest *Negro City.*

New York is the world's largest *Italian City.*

New York is the world's largest *Irish City.*

On Manhattan Island the number of Protestant churches and missions, English speaking and white, which are receiving help from money that the churches of America outside of New York send in to that Mission Field are:

Presbyterian 21.
Methodist 21.
Baptist 12.

Those *not* receiving help are in the minority in these three great denominations as the following statement shows:

Presbyterian 19.
Methodist 5.
Baptist 9.

Take the Methodists, easily reckoned the most virile, at least the largest of the Protestant denominations, yet the figures show that of all the Methodist churches on Manhattan Island only five are independent of Missionary money raised by the rest of the denomination.

Charles Stelzie says that within thirty years, below 30th street, 46 churches have sold out their holdings while the population has increased 300,000.

Another statement is made by Dr. Christian Reisner:

"There are 36 less Protestant churches on Manhattan Island than there were 25 years ago. Not a single outstanding new church has been created in Greater New York in 15 years, while 56 per cent of the present Protestant churches in existence work on an annual budget of $4,000."

"Do you mean to say that fifty-six per cent of the (Concluded on page 27)

Another Indemnity—This Time Persi

Major Imbrie's Murder—Once More a Foreign Nation Must Satisfy American Hono

By CAMERON WILKIE

WALLACE SMITH MURRAY boarded the *Sphinx* at Beyrout. The news spread quickly that he was the American who negotiated the settlement of the now famous Imbrie murder case; that he was on his way to Washington to report to the State Department; that he and his young wife had raced for three days and nights from Teheran across the desert to catch this French liner in which we are cruising around the Mediterranean.

In several fascinating conversations with this young representative of the New School of American Diplomacy, a quiet-voiced, careful, well-trained chap, I heard one of the most stirring stories of modern diplomatic relations, which it would not be proper for me to quote. The State Department has its wise rules in these matters, and Mr. Murray has not as yet made his official report to Washington. However, here is the story that American archives will hold for the use of future historians.

The People Resent Being Photographed

Due to the resignation of Rabbi Joseph F. Kornfeldt, of Columbus, Ohio, who was the Minister to Persia, by appointment of President Harding, and who now lives in Toledo, Mr. Murray has been the *charge d'affaires* in Persia since September 1, 1924.

Robert W. Imbrie, American Consul in Persia, was murdered a year ago on July 18 by fanatical Persians because he attempted to take a photograph of a miraculous fountain in Teheran.

Imbrie was a Scot, a graduate of Yale, and, while a rough and ready, adventuring sort of fellow, according to his fellow members of the Diplomatic Service, he was in nowise a fool; and he did not in any manner thrust himself into this dangerous situation, as most American newspapers have stated. He had been the American Consul at Angora, the Turkish capital, and came to Teheran from that turbulent city of the new Turkish Government.

Imbrie had been out and out in his fight against the new influx of Bolshevists into Turkey. He had been in Russia when the Bolshevist movement broke out there and had rendered great aid in saving bonds and property of Americans. In Angora he had come into contact with Bolshevism as a full-fledged power. It is hard to resist the conclusion that his antagonism to Bolshevism had something to do with his tragic end.

The fountain in Teheran, where Imbrie was murdered, had been the scene of a recent miracle. A Protestant sect of the Mohammedans called Bahais—which incidentally has many adherents in Chicago, Illinois—had believed that this fountain was sacred because of this miracle.

The miracle was this: a man had cursed the orthodox Mohammedan religion and the Prophet himself and his eyes had dropped out at this very fountain! This was widely believed among the Bahais and the place was regarded as holy. People came by thousands and brought their sick and afflicted to be cured by its waters.

Major Imbrie drove up with a friend to take a picture of this fountain for use in the *National Geographic Magazine*, whose Near East correspondent he had been for some time. He had with him an American prisoner named Seymour. Seymour had been sentenced to serve eighteen months for murderous assault on a fellow American oil driller in the Persian oil fields. Imbrie had taken pity on him and was taking him out for a ride in his carriage. They were not close friends. Neither of them realized the danger into which they suddenly ran.

Major Imbrie stepped from the carriage, which he had hired, and focused his camera on the fountain. The fanatics protested against his taking the picture on the grounds that there were Mohammedan women present, not on the grounds of religion. Even veiled women are not to be photographed in Persia. The evidence in the trial proves that Major Imbrie did not take the picture but the crowd thought he did because they heard the click of his camera as he shut it, without having exposed the film.

The crowd started toward him and he and Seymour jumped into their carriage and drove rapidly away to avoid a clash. Then some agitators in the crowd started to shout: "He has poisoned the waters of the fountain and has caused the death of many Mohammedans."

Attacked by the Mob in Jail Yard

This stirred the mob of fanatical Mohammedans to fury and they started to run after the fleeing men. However, the mob was on foot and the carriage managed to reach the police station nearest at hand where the Cossacks were stationed. Major Imbrie had difficulty in making the policemen understand who he was, and, during this time the crowd caught up with him just as he was writing on a card his name and the fact that he was the American Consul. The crowd dragged him out of his carriage and beat him severely. Seymour, in the meantime, escaped into the wall the police station.

By this time the cry was spread through the crowd that Imbrie committed murder. As the mob swept through the streets between the miraculous fountain and the po station it had been joined by sh keepers and bystanders until it n bered about five thousand, none whom knew what it was all about few of whom were in the original gr that had started after the victims the fountain.

By the time the soldiers got Imb into the jail yard these five thous infuriated men had gathered about gates, and, upon being harangued leaders they broke into the yard again assaulted the two America Some of the policemen took part the assault; one of them was la executed for doing so. The po station was at least a mile from fountain where the trouble began. policemen, paralyzed by the size a the fury of the mob, were helple For twenty minutes Major Imb fought alone.

Murdered While on the Operating Table

nally, however, C sacks rescued bo Americans and them to a hospi and sent for a surgeon. At this ti neither man was seriously wounded.

The mob followed their victims the hospital, and while the two Ame cans were on the operating tables ha ing their wounds dressed, a Moha medan named Seyed Hossein, a dire descendant of the great Prophet, ag 24, got up on a box in front of t hospital and addressed the alrea demented mob, urging them to bre into the hospital and kill these Ame cans.

Infuriated further by this appeal t mob broke into the hospital and a tacked both men as they lay helple on the operating tables having the wounds dressed. One young Moha medan boy about seventeen years o tore the flagstones up from the floor the operating room and beat in t face of Major Imbrie. Both this bo and Seyed Hossein, who harangued th crowd in front of the hospital, wer executed for their part in this crim Seymour owes his life alone to the fa that the mob saw him stretched ou on the table and thought he was a ready dead.

They sent for Mrs. Imbrie and sh arrived just as her husband died, a hal hour later. He had more than 18 wounds on his body.

The government of Persia declare martial law within two hours an that martial law (Concluded on page 31

Kansas Generates Its Own Opinion

In Freedom From Foreign Influences the Press Finds the Secret of Service

By FRANK M. CHASE

I AM always glad when I can put Kansas in the title of an article. People generally seem to take an extra interest in what the Sunflower State is saying and doing. The mere mention of its name starts a pricking of ears nearly anywhere.

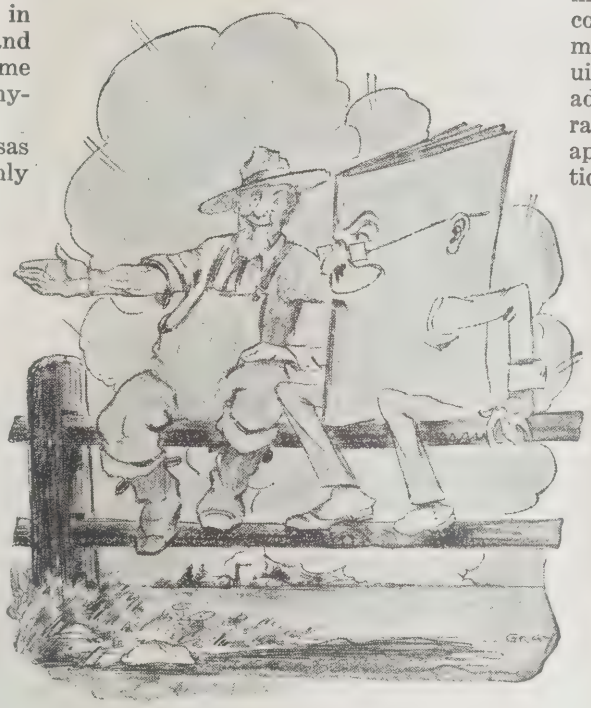
For this state of affairs the Kansas press is largely responsible. Not only do the newspapers of Kansas broadcast its name and fame, but they are the chief agency in the formation of a public opinion that is eagerly read by the rest of the nation.

In the manner in which this opinion is developed lies much of the explanation for its wide appeal. Kansas newspaper opinion is handmade, homemade, and from the "grass roots." It is formed and spread by small papers, each answerable to its own community and not subservient to a capitalistic management half the width of the continent away.

"It has always been true of the Kansas press that it has kept in close touch with its patrons and given preference to the local drift of things," said Captain Henry King, for many years the distinguished editor of the St. Louis *Globe-Democrat*. "This is probably the main secret of its strength and its utility, and there is to be derived from it an important lesson in journalism. The tendency of too many newspapers is toward the remote and universal instead of that which directly concerns the average reader. It is all very well to tell what is going on in different parts of the world, and to expatiate profoundly about events and issues that have the enchantment of distance, but it is better to make a faithful report of proximate occurrences and to editorialize on themes that have to do with the practical life of a given community. The paper that devotes most of its space to its own town and state has the true idea of its mission and its limitations."

These words are as true today as when they were spoken in the course of a commencement-day address at the University of Kansas nearly twenty years ago. The Kansas press is essentially a local press. The newspapers of the state are numerous and small. With a population of approximately 1,800,000, Kansas has a total of 648 newspapers and periodicals, or one paper for each 2,600 inhabitants.

The Kansas editor is close to his readers. He forms his opinions out of his own reading and contacts, and is held to account for them by the man whom he meets on the street the next day. What he writes is the man-to-man expression of one trying sincerely to serve his neighbors and fellow beings.



The Kansas press always keeps in close touch with its patrons.

Kansas is practically free of chain newspapers, or syndicates, as they are sometimes called. In but one instance—Arthur Capper's Kansas City *Kansan*—is a Kansas daily under absentee control, and this was started at the request of the residents and business interests of the city. As W. Y. Morgan, one of the state's prominent editors, said in a letter to the writer while this article was in preparation, "Kansas papers are developed individually and each of them stands on its own legs and talks or howls as it pleases."

The chain newspaper, in fact, finds little favor among Kansas editors. It does not fit in with their notion of an untrammeled press.

> *"I think one man should run one newspaper and no more,"* said William Allen White, the famous editor of the almost equally famed Emporia *Gazette*. *"A chain of newspapers must be very much like a chain of wives. Unless a man gives his whole heart, he doesn't give anything to his wife or his newspaper."*

With his usual incisiveness, Mr. White struck to the core of the chain newspaper question. A worthy newspaper is an exacting mistress. Material resources alone do not build it. In addition, there must be vision, purpose, initiative and loyalty, service and adaptation to the community. Even more than adaptation, a deep-rooted confidence and interest in the community is essential. And these requisites do not flourish to the best advantage under chain control. The rarity with which chain newspapers approach even a semblance of distinction is evidence of the blighting effect of the syndicate system.

From the reader's point of view, in fact, it is difficult to see that the chain newspaper has any well-defined advantage over the papers individually owned. Its advantages are mainly commercial. Through the reduction of overhead and standardization of policies and methods many savings are undoubtedly possible. This standardization, however, is not confined to the counting room. It is all too evident in the editorial columns of most of the chain papers.

> *"The chief fault of chain newspapers,"* writes Ralph E. Stout, managing editor of the Kansas City *Star*, *"is a certain machine-made, canned aspect which seems to me to be common to all of them.* They lack the individuality which is an attractive feature to most newspapers printed by an individual in his own town. I doubt if they can ever fully fill the field or rise to the full opportunities that each newspaper has."

"Chain newspapers are a fine thing for the man who owns them," said Henry J. Allen, owner of the Wichita *Beacon* and former governor of Kansas, who took a few minutes between talks to journalism classes at the state university to give me his views on the subject. "In America today they are very prosperous. By means of their large organizations and standardized procedure they are enabled to save a great deal of overhead expense as compared with the individually owned papers.

"But for the reader and the community in which it circulates the chain newspaper is not so good. In most instances it is simply a merchandising proposition, and real publishing is more than merchandising. In its relation to the community, indeed, the chain newspaper is not unlike the chain store. The chain paper may give good news service, just as the chain store may sell good goods. But both lack the pulsing, human relationship of the business that has

Dr. Johnson's Pew in Old London

In the Old Church of St. Clement Danes His Memorial May Be Read

By HUGH A. GRANT

IT WAS Bernard Shaw who remarked, many years ago, that in no other country than England and in no other city than London would two buildings like St. Mary-le-Strand and St. Clement Danes be allowed to stand, as they have done for two hundred years and more, right in the middle of the busiest street in the city. It is safe to say, however, that no matter how serious the congestion of traffic in the Strand becomes these two beautiful examples of Sir Christopher Wren's architecture will never be removed.

St. Clement Danes is especially dear to English people and to many millions throughout the world, because, here, over one hundred and fifty years ago, was wont to come, Sunday after Sunday, and often on a weekday, too, "that much enduring man," as Carlyle calls him, Dr. Samuel Johnson.

In the north gallery of this church there is a pew which is more revered and respected than the "squire's pew" was wont to be in many a country church, in days gone by. Nearly a century and a half has passed since the death of Dr. Johnson, yet, in the soft light and amidst the high back pews of St. Clement Danes, one has no difficulty in recalling his presence. A plain plate of brass fixed to the back of the pew reminds all and sundry that here the great essayist and lexicographer used to kneel in worship. "Westminster Abbey," as one writer puts it, "can show his grave, and St. Paul's his monument; but here is preserved the memory of the sacred place where the rugged but sensitive man used, for many a long year, to ask for strength and grace."

It has been remarked that Boswell shows us Johnson in his chambers, in the clubs and in the streets but his own confessions enable us to understand him at church.

The remark is true enough. Listening to him on a Saturday night, maybe, at the "Mitre" or the "Turk's Head," we might wonder at his rude and even fierce replies, his unreasoning prejudices, his domineering and despotic intellect. We might find it difficult to see in him a man of deep religious feeling, but when the bells of St. Clement's echoed through the little courts and narrow alleys around about Inner Temple Lane the Temple porter would regularly open the gates to let out the scholastic large-wigged "Mr." Johnson on his way to church.

Dr. Johnson's pew in St. Clement Danes.

On by the posts of Fleet street, touching each as he goes, rolls, rather than walks, Mr. Johnson the dictionary-maker. He seems more solemn than usual, and the sound of the church bells deepens his pensiveness into an abiding melancholy. It is a strange transformation. He, who was the center of everything the night before, enters the church as though anxious to avoid notice, and moves heavily up the old staircase to his accustomed seat in the gallery by the pillar. He has told us how he strove to solve the great problem "how to purify and fortify my soul, and hold real communion with the highest." That pew in the north gallery of St. Clement Danes is the actual scene of the great struggle. Here he sat after his good resolution "to go to church every Sunday and read the scriptures," and here he came in the last year of his life, at the age of seventy-five, to return thanks to God for his recovery from an illness which had laid him low a hundred-and-twenty-and-nine days.

And so, in the year 1851, some inhabitants of the parish of St. Clement Danes, whose grandfathers, maybe, had known the great writer in the flesh, put up this simple memorial to his former presence as a worshiper in their parish church. The inscription runs:

> "In this pew and beside this pillar, for many years attended divine service the celebrated Dr. Samuel Johnson, the philosopher, the poet, the great lexicographer, the profound moralist, and chief writer of his time. Born 1709, died 1784. In the remembrance and honour of noble faculties, nobly employed, some inhabitants of the parish of St. Clement Danes have placed this slight memorial, A. D. 1851."

And so it is to this day, the pew and the pillar, the light and the silence, much as it was years ago.

MR. FORD'S PAGE

CLEAR vision confirms the view that to maintain wages at a high level is as important to Business as to Labor. Even more important, since Labor can outlive Business in a contest with adversity. The volume and value of exchange rests upon purchasing power, and purchasing power upon the adequacy of the pay envelope. That must always be true in a nation of workers who are slaves neither to aristocracy nor low-level communism.

This magazine is constantly receiving letters asking what is meant by a "just wage" or an "adequate wage," the desire evidently being for some statement of *a theory of wages.* It is a false theory that at present there is any standard of wages, or can be. The whole matter is still in the making, and the new theory must be based on a new practice.

The old theory, which still persists in business, is that the rate of wages depends on the bargaining power of the worker as against the monopoly power of the employer. Business is a pitched battle with wages the terms of armistice. Under that theory both sides lost. Under that theory labor unions rose and organized war began, with boycott and lockout as the weapons. Nothing more is needed than these results to prove the theory false. Yet it is clung to by old-line Management and old-line Labor with equal tenacity. They both are wrong.

THERE is at present no theory of wages because the old theory has been destroyed by progress and justice, and the new one is still in the making. The true theory of the wage rate must be found as the tensile strength of materials is found, by tests. Wages, regarded as an armistice between capital and labor, can yield no basic principle. But when regarded as one of the principal products of a business —as the dividends of production—there is hope of finding what they ought to be. "All that the traffic will bear" has never yet been applied to wages.

The acceptance of a theory like that, as if it were a natural law, has hindered our progress in discovering the true basis of human relations. It needs to be driven home to men's minds that such a theory represents nothing but the accommodation of their logic to their errors. They give sanction to selfishness and glorify greed by writing them learnedly into a book and calling them "political economy." The *theory of wages* in the past has been merely a description of the predatory spirit that actuated money-making at the period in which the theory was formed.

References to a "living wage," or the "American standard" are attempts to establish a new theory. But even a "living wage" may be very low. A business may be so useless to the public, or so badly managed, as not to be able to pay even a "living wage." To make that the standard is to court experiments in low-level living.

The "living wage" in America happens to be fairly high. The reason is found in the energy and intelligence of Labor, and the ability of management in Business. The two have coöperated toward useful production which in turn has been rewarded by wide purchase and use.

In a very important sense, then, there is no standard wage except that set by the energy, ability and character of all who are engaged in the business, managers and men. The political economists and social theorists have no basis on which to erect a theory of a standard wage. The basic fact is that the standard wage is what management and industry can make it. Upon managers more than upon political economists rests the responsibility of furnishing data for the new theory of wages.

A business that does not include a steady and profitable wage scale among the good things it produces is not a very productive business. A business where the dividends are out of all proportion to the wages is perilously lopsided. Yet a business which should divide every last surplus dollar into wages would be in danger of extinction.

There are three factors in the situation: the manager, the employe, the business. The business as a going concern must always be considered. There stands Industry like the University, like the Church, an institution valuable in itself. It provides the worker with an outlet for his activity, the public with commodities and utilities. Thus the Industrial institution itself commands consideration in all questions of profits and wages. Its stability, its protection against emergencies—*its own wages,* so to speak, is a charge upon the income. To injure such a medium by wrong wages, wrong prices or wrong profits is to commit a social crime.

When management understands that wages are water on the business wheel, and are to be regarded as profits rather than costs (that is, they are desirable to increase rather than decrease), then we shall begin to see what wage possibilities are. Until we try it, we do not know. Until we know, we can formulate no theory or standard. Until then we must work on to create the best conditions we can —not the best conditions for one class only, but for all. A true theory can be erected only on the best attainable common social benefit.

A Good Mixer

THESE money-grubbing Americans! There are times when the American traveler abroad feels that he must hang his head in shame. Surely, judging by what he hears, his must be a nation of hard-faced overlords wringing the last cent from an oppressed lower order which toils ceaselessly, slave-like. He is not conscious of having spent his life gouging his fellow men; and he does not recall that the face of the Western world is covered by crawling creatures, enslaved by capitalism.

After a while he shakes himself free from this superimposed view of things, and looks back upon America with his own spectacles and not through the jaundiced lenses of the European. He remembers lines of motor cars parked before a construction job, where even eight-dollar-a-day hodcarriers may have rolled up to work in their motor cars.

Then he may open the *Times Trade Supplement,* in London, perhaps, and discover a column of figures telling him a graphic story of Britain's life.

In England the bicycle industry makes more than 10 per cent on the money invested; while the motor industry, despite prices that would stagger the folks at home, returns a bare 2½ per cent. The workingman who can afford to own a good bike considers himself fortunate.

The most profitable trade for the Briton is *tobacco,* with a return of 17½ per cent; and second is *brewing,* at 11 per cent. Sheffield steel and Welsh coal have been synonymous with Britain's world trade supremacy for years; yet coal, iron and steel are returning her investors savings bank rates only today.

The most profitable major industry is that of textile manufacturing, which shows an earning capacity of 10 per cent, but this is a low wage calling and the general level of the population is not lifted radically by its prosperity.

Having digested these facts and recalled to mind some of the glimpses he has had of the lives of peoples of Europe, the Yankee traveler is ready to do a little George Cohan flag-waving by now.

"This hated American dollar is, after all, democratic, a good mixer—circulates around," he says. "We grub for it, hey? Well, why not? But it isn't the dollar we want: it's bathtubs, and healthy children, and better houses education, fun, motor cars—and even trips to Europe."

Tolerance and Intolerance

CHARLES E. HUGHES has studied to combine impressiveness with unsatisfactoriness. He has the habit of assuming an attitude of great breadth as the basis of a rather narrow special pleading. In his able address before the American Bar Association he took occasion to read a lecture on tolerance, or, to be more accurate, a lecture against what he called "the spirit of intolerance." He had a magnificent occasion and a time to speak when his words could have commanded national attention, a theme that offered opportunity for a new Monroe Doctrine of the mind. But he threw it away from sheer inability to understand what is proceeding in this country.

The danger in which this nation stands is not tolerance or intolerance, but indifference. The thing that passes for tolerance in this country today is a spineless and unmoral mushiness that doesn't care. The thing that passes for intolerance is in many instances the first reactions of an awakening consciousness toward certain powerful trends now operative in the nation. What we call intolerance has this advantage over indifference, that it represents mental activity, however incomplete, while indifference represents deadness. You can deal with intolerance on the basis of the facts, because its mind has been stabbed awake, but on what ground can you deal with indifference until disaster overtakes it?

We need intolerance in this country, an intolerance of subversive racial propaganda, an intolerance of group activity at the expense of society, an intolerance of special interests of all kinds, be they financial, political, ecclesiastical, racial or what not. And we need an intolerance of all intolerance that does not advance to a better understanding of what arouses its fear or favor. For there is an intolerance of favor as well as an intolerance of attack, and usually one begets the other. Indeed it may be taken as a rule, when you find one intolerance, look for the other.

On the other hand we need a broad tolerance that sees in all these constructively intolerable things an era of growth which may be overpassed. We need a tolerance of all the various *isms* and *ists* striving to attain ex-

pression. But tolerance without an alert understanding and appraisal of what is going on is not tolerance at all. It is mental laziness and indifference.

This was the message to whose great height the mind of Charles Evans Hughes failed to reach. He took one side of the matter. A more accurate and statesmanly view is that taken by Professor Abbott, of Harvard, an excerpt from whose excellent and arousing book, *The New Barbarians*, is printed as a motto on the back cover of this issue.

So Now It's Prosperity!

IT IS marvelous the results we get when what we call the national mind makes itself vocal in the newspapers. The great game nowadays is to produce opinions at a second's notice on subjects proposed by the reporter—be it crime, religion, business, government or art. It is crime just now. Mysteriously down the line the word has run—discuss crime. Of course, crimes and criminals have been discussed all along, but now it is crime. And the cause of crime—it is to discover that that newspapermen now comb the town's talkers for opinions.

Most unique of all the causes of crime thus far reported (and it is to be hoped that all are being properly numbered and classified for later exhibition) is that of prosperity. We are too prosperous, say many, therefore we are criminal. Just what that means is not at once clear. Is it that the robber is so prosperous that he goes out to play highwayman? Or is it that we citizens are too prosperous and that we therefore tempt the poor highwayman? Would reducing the robber's prosperity cool his tendency to steal, or would reducing our prosperity reduce the temptation? It is an important matter and should be made clear. Poor thieves might become honest, and poor citizens might win security of person. That would be a case of Blessed be Poverty!

We trust that this explanation of crime will not be taken too seriously by those gentlemen who are already nervously considering suggesting a reduction of wages. It would be rather difficult to prove that high wages turn the working class into the criminal class. It would be rather embarrassing if a reduction of the prosperity of the wage-earners would also result in a reduction of the prosperity of the wage-payers, for it might indicate that prosperity had a criminal effect on employers also.

Someone with a mind to do it could prove that crime decreases as prosperity increases, that it is not prosperity but criminality that demands attention. The crime of the country is committed by a comparatively small class, easily described and controlled. If all the criminals were congregated in one spot we should be surprised at their small numbers. But they are very energetic, systematic and organized. Equal energy, system and interest on the par of the crime-combating agencies of society would speadily curb the excess.

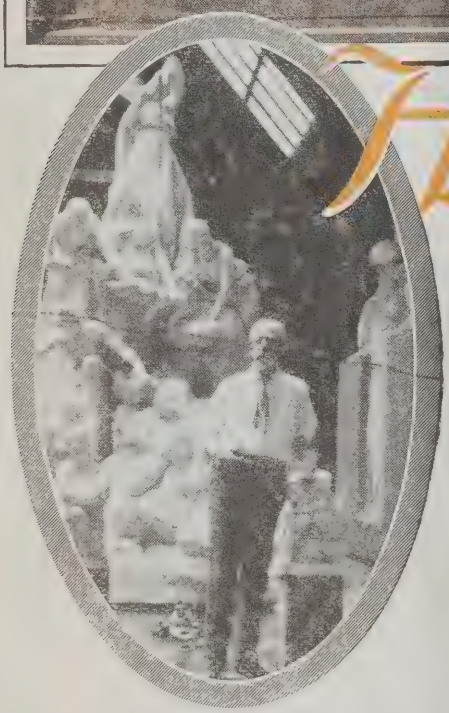
The Liberal Obsession

THE good old Liberal name, like some decent old neighborhoods, has suffered much. The wrong kind of people have adopted it. Liberalism and looseness have come to have too much in common, as labels. The true liberals of other days were Americans of the progressive type who did not conceive themselves to be the enemies of Americans of the conservative type, but who fulfilled their destiny in casting about to build a road for further advance while the conservatives maintained the right of way that had already been won. They were one army, one people, with one ultimate object, but with different though complementary services. Cavalry and infantry, so to speak.

The so-called liberals of today, however, are mostly servants of alien propaganda. The point that they do not know they are agents and that they shriek at you when you say they are does not alter the fact. They may be forgiven for ignorance of their being dupes, but they surely are blamable in not knowing that their stock-in-trade is of alien origin. The attempt to fasten the irregularities of one racial strain on the regularities of another has never been successful, but has been most harmful to those who have made it.

Our sham Liberals have allowed themselves to be made tools for the prostitution of a grand old term. The things they stand for are not to be named in the same day with true Liberalism. The "liberals" themselves (even those who can speak English) are so far outside true Liberalism that they have never known its fundamental principles. They stand outside the path of progress and they have no conception which way this high race of men is moving.

Yet so noble was the Liberalism which this country nurtured that even now the name has power, and this power is being used to silence those who wonder at the false propaganda put forth in its name. "What! would you contend against Liberalism!" The way to meet that challenge is to deny to these dupes the name of Liberal. It doesn't belong to them. Those most entitled to the term have least to do with those who claim it.



Lorado Taft's "Fountain of Time" in Washington Park, Chicago, and (in oval) the sculptor in his studio.

He Carves Mysticism Into Stone

Lorado Taft, Apostle of the Modern Renaissance

By J. V. NASH

IT WAS during the luncheon hour that I dropped into the studio of Lorado Taft—a group of low, rambling buildings built round a remodeled stable on the southern side of Chicago's Midway, with its World's Fair associations, and within the shadow of the majestic Gothic towers of the university.

In a little room to the left of the main entrance hall, serving as a refectory, the master sat at table surrounded by his assistants and students in a delightful atmosphere of informality and familiar companionship. It seemed for all the world like the household of one of the great artistic craftsmen of the Italian Renaissance in the days of Benvenuto Cellini transplanted into twentieth century America.

Just outside the door of the refectory stood a snowy plaster model of one of the greatest of Lorado Taft's sculptures, "The Fountain of the Great Lakes," facing a sunken pool, on the edge of which the studio pussy lay dreamily regarding the goldfish slowly gliding to and fro in the shallow water.

Lorado Taft is a man of simple and democratic manners, with a winning smile and a Lincoln-like friendliness which immediately puts the visitor at his ease. He is of slender build, rather tall, and despite his graying hair the youthfulness of his personality and bearing would never suggest his age as being round sixty-five.

While laughingly deprecating the inroads upon his time by the constant stream of interviewers, sight-seers, and general visitors to the studio, he expressed himself as very happy to discuss with me his work and his views on art for the benefit of THE DEARBORN INDEPENDENT readers.

And so, after he had posed for a couple of photographs beside the goldfish pool, we sat together for some little time on a bench by the wall while he told me about some of the things that are nearest to his heart.

But first for a bit of background. During a period of many years Lorado Taft has been one of the most vital forces in the cultural life of America. He is a native product of the Middle West, for, though of New England ancestry, he was born at Elmwood, Illinois, April 29, 1860, and was graduated from the University of Illinois in 1879, at the early age of nineteen. For several years, beginning in 1880, he studied art at the famous École des Beaux Arts in Paris. In 1886 he became an instructor in art at the Chicago Art Institute; he has been a lecturer on art at the University of Chicago since its establishment in 1892, and he is also a nonresident member of the faculty of his Alma Mater, the state university.

He is the author of two important books, *The History of American Sculpture* (1903), and *Recent Tendencies in Sculpture* (1921), besides numerous special articles on subjects connected with art. He is a fluent and popular lecturer, and is much in demand on the public platform. One lecture alone —"Processes of Sculpture"—out of his varied list has already attained a record of more than a thousand deliveries.

During the war period, Lorado Taft spent several months in uniform, giving popular lectures to the men of the A. E. F. in France.

Asked how he happened to become an artist, Mr. Taft replied: "I chose art for my life work because as a small boy I had a little facility in drawing and I took pleasure in hearing my mother talk about it to the neighbors and listening to their praise. At the beginning we are all little prigs and frankly selfish, but that is the way art begins; it comes from the pleasure of

oing things and having hem appreciated. When was sent away to school, nd met a thousand other ttle 'smarties,' I found wasn't so wonderful. n Paris I was protected y my ignorance.

"Then I returned to merica, and in January, 886, I established my tudio in Chicago. I ound, however, that no- ody wanted me or my rt. They felt they had o particular need of culpture there."

Appreciation came lowly, but Lorado Taft vent quietly about his vork, constantly improving his tech- nique.

Then in 1893 there was held n Chicago the great World's Colum- bian Exposition, popularly known as the World's Fair. It was here that his first vork of national importance was xecuted.

He undertook the decoration of the reat Horticultural Building. His two nagnificent groups, "The Sleep of the Flowers," and "The Awakening of the Flowers," on either side of the main ntrance, won instant recognition and ed to many other commissions for oteworthy sculptures. Lorado Taft oon sprang into prominence as one of he leading American sculptors, and is fame has been quietly but surely rowing ever since.

When I inquired of Mr. Taft his iews on the place of art in our ational life, he said:

"There is nothing that merica needs so much today s art. It is the thing that has een left out of our inheritance. here is no civilized country in he world that is so lacking in hose traditions as America. I eel that art is the only thing hat really explains life. It is hat accretion of beauty, de- eloped and handed on from one eneration to another. Take hat away, and there is nothing hat explains the life about us— t is all mystery. That is my reed."

"Just what, Mr. Taft, does rt seek to express?" I con- inued.

"Art," he answered promptly, 'should express one's highest deals, the things that mean nost to the individual. It is n expression of emotion and spiration."

"Art, then," I suggested, 'is closely allied to religion?"

"Why, yes," he rejoined, "I hink the joy of living is part f religion, and that is inherent n art."

"What are your principal nterests just now?" was the ext question.

Lorado Taft is a modern sculptor who has incorporated the ideals of the Old Masters with the artistic vision of today.

Among his works of more than nation-wide fame are the colossal "Fountain of Time," on the Midway Plaisance, Chicago, and the great figure of "Black Hawk," which embodies in a powerful manner the Indian personality.

On the cover of this issue of THE DEARBORN INDEPENDENT is a picture of this majestic statue, in which the Indian is represented "Unflinchingly, erect, with the pathos of the past in his face, the tragedy of the future in his eyes, but with the dauntless courage of a man in his figure and in his whole attitude."

"I am greatly interested," said Mr. Taft, "in community work, in the beautifying of our cities, and particularly in bringing art before our school children in a practical way." He went on to explain some detail of his work in connection with the public schools, by means of which the rising generation is being given a first-hand acquaintance with and appreciation of sculpture.

"Then, too," he resumed, "I am exceedingly interested, here in Chicago, in the establishment of a new museum of architecture and sculpture in the building formerly occupied by the Field Museum. We have already been promised the use of the east wing for that purpose, and I trust that the plan will go through successfully."

My next question was this: "Do you think that America has achieved a distinctively national art of its own?" He reflected a moment and then replied:

"Most art that we have has been an imitation of the arts of the past. Our art has not been developed from our own experience and emotions. As a people we haven't sufficient acquaintance with these other arts to do them real justice. We are the heirs of the ages. Our art, however, is largely a jumble of motifs borrowed from the past and without special significance."

Some of the most significant of Mr. Taft's later works include the following: "The Solitude of the Soul," at the Art Institute of Chicago; "The Blind," an ideal group inspired by Maeterlinck's drama of the same name; the sculpture of the Columbus Memorial Fountain at Washington, D. C.; "The Fountain of the Great Lakes," Grant Park, Chicago; the Washington Monument at Seattle, Washington; "Black Hawk," and Ogle County Soldiers' Memorial, at Oregon, Illinois; the Thatcher Memorial Fountain at Denver, Colorado; and, most interesting perhaps of all, the colossal "Fountain of Time" group on the Midway Plaisance, Chicago.

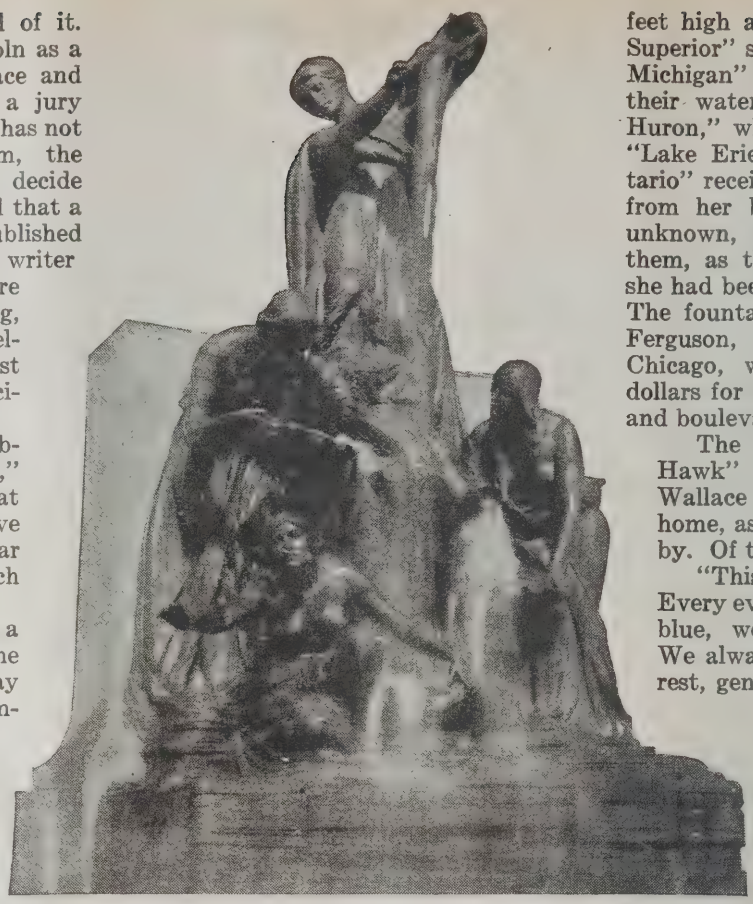
Mr. Taft is also working on a statue of Lincoln, and while in his studio I

"The Blind," by Lorado Taft, a nobly sculptured group full of subtle meaning.

was privileged to see a model of it. The conception is that of Lincoln as a young lawyer, with uplifted face and outstretched arms, addressing a jury in the court room. As the work has not yet assumed permanent form, the sculptor saying that he might decide on certain changes, he preferred that a photograph should not be published at this time. To the eye of the writer the whole bearing of the figure seemed beautiful and inspiring, without the suggestion of melancholy which lingers about most other statues of the Great Emancipator.

Of recent Taft creations, probably "The Fountain of Time," "The Fountain of the Great Lakes," and "Black Hawk" have appealed most to the popular imagination. A word as to each of these masterpieces:

"The Fountain of Time" is a part of a comprehensive scheme for the decoration of the Midway in Chicago. Mr. Taft's plan comprises a great canal which will run through the existing depressions in this broad boulevard, the canal to be spanned by three bridges of monumental design, dedicated to the three great ideals of the race, and to be called, respectively, "The Bridge of the Sciences," "The Bridge of the Arts," and "The Bridge of Religions." Along the roadways upon either side of the canal will stand statues of the world's greatest idealists, ranged at half-block intervals and treated as architectural notes, connecting the bridges with the fountains and uniting the various features of the decorative scheme. At the eastern end of the Midway will rise a sculptural group to be known as "The Fountain of Creation," while at the western end there now stands completed and dedicated "The Fountain of Time."



"Ferguson Fountain of the Great Lakes," by Lorado Taft.

"The Fountain of Time" shows the human procession passing in review before the great, immovable figure of Time, represented by a rugged, mysterious shape, apparently reviewing a throng of hastening figures combined in a series of waves.

"The Fountain of the Great Lakes" stands in Grant Park, just south of the Art Institute. The figures are ten feet high and cast in bronze. "La[ke] Superior" stands on high, with "La[ke] Michigan" at the side, both pour[ing] their water into the basin of "La[ke] Huron," who passes the waters on [to] "Lake Erie," from whom "Lake [On]tario" receives them. "As they esca[pe] from her basin and hasten into [the] unknown, she reaches wistfully af[ter] them, as though questioning whet[her] she had been neglectful of her charg[e]." The fountain is a memorial to B. [F.] Ferguson, a public-spirited citizen [of] Chicago, who bequeathed a milli[on] dollars for beautifying the city's par[ks] and boulevards.

The great figure of "Bla[ck] Hawk" stands on land owned [by] Wallace Heckman, whose summ[er] home, as well as Mr. Taft's, is nea[r] by. Of this work, the sculptor say[s]:

"This is the way it happene[d]. Every evening as the shadows turne[d] blue, we walked over this blu[ff]. We always stopped at this point [to] rest, generally taking an attitude [at] once restful and reve[al]ent. As we stood ther[e] we involuntarily folde[d] our arms, and it can[e] over me that generation[s] before had done so. An[d] so the figure grew ou[t] of the attitude, as w[e] stood and looked o[n] these beautiful scenes. I did not stud[y] any one type or race of Indians. It [is] a composite of the Foxes, the Sacs, th[e] Sioux, and the Mohawks, and, in short [it] it represents the Indian personality. [We] have left off the usual Indian trappings[,] the feathers and buckskin and othe[r] conventional signs. There is even [a] hint of the old Roman in the face, whic[h] was necessary to make it suggest a spiri[t] unconquered while still the conquere[d] race. To be suggestive rather tha[n] direct is what I aim at—to do that i[s] the great joy of the sculptor."

In his dedicatory address, Edgar A. Bancroft said of the statue:

"There the sculptor has placed im[-] perishably the Indian—not sullen, no[t] resentful, not despondent, not sur[-] rendering; but simple, unflinching[,] erect, with the pathos of the past in hi[s] face, the tragedy of the future in hi[s] eyes, but with the dauntless courage o[f] a man in his figure and in his whol[e] attitude."

The statue is a solid mass of con[-] crete weighing many tons.

Mr. Taft always has a number o[f] students working under his supervisio[n] in the studio, but he tells me that it i[s] all by informal instruction and persona[l] arrangement. During his career as [a] sculptor, he has discovered and devel[-] oped much latent artistic talent, a nota[-] ble example of which was the young French miner whom he came across a[t] the World's Fair and who later rose to fame in artistic circles.

Mr. Taft enjoys a charming do[-] mestic life with his wife and daughters. Incidentally, he is a brother-in-law of Hamlin Garland, the great writer.

Cider Time on the Farm

DO YOU recall in the old days, along about the middle of September and from then on into October the cider pressing period? Grandad would come in some night from the orchard and remark that tomorrow we'd take the first apples to press. Next day he would hook the team to the wagon and putting on the big box would hie to the orchard. There was plenty to do then. The old wagon box would be filled to overflowing with delicious apples, fully ripened on the tree. No windfalls in that bunch. The apples would then be stored in some shady, cool room, there to acquire more saccharine matter while losing a considerable quantity of watery juice.

Along about the latter part of November, when the mornings were frosty and clear, the apples were taken to the old tumble-down cider mill, worked by waterpower at the stream that ran through the little village. Here the juice was pressed from the fruit and run into barrels. For a week we were permitted to drink it. Then when vinous fermentation commenced the barrels were taboo—at least for the children. Vinegar was the ultimate result.

If grandad lived in the present he would be able to store the cider for future use, secure in the knowledge that it would be as fresh in the following spring as the day it came from the crushing rollers of the old mill.

A process has been developed for concentrating sweet cider which consists essentially of freezing the fresh apple juice, grinding the frozen product, and then, by means of a centrifugal process, separating the essential solids from the frozen water, in much the same manner that cream is separated from milk. Five gallons of cider can be reduced by this process to one gallon of sirupy cider concentrate.

A Census of Bears and Lions

How the Inhabitants of the Pacific Wilds Were Classed and Enumerated

By HARRY H. DUNN

ONE of the most unusual attempts at enumerating the inhabitants of any section of country has just been completed on the Pacific Coast of the United States in the taking of a census of the larger wild animals and birds of California by a department of the state government. It is not to be apprehended from the title of this story that every grizzly bear, mountain lion, deer or antelope was hunted down by the census-taker and made to tell the number in its family, their ages, and so on; nevertheless, the results of the work done amount to about the same as they would have had this method been followed.

DR. H. C. BRYANT

The director of this census was the California Fish and Game Commission, and the active census-takers were Dr. H. C. Bryant, professor in the zoölogical department of the University of California, and chief of the educational department of the fish and game commission, and George Neale, executive secretary of the commission. Possibly they did not interview every bear, mountain lion, antelope and deer, but they have what they regard as an accurate enumeration of the wild animals and larger birds, so accurate that it contains less than one per cent of error.

The census has required more than a year in the taking, in which Mr. Neale, who has hunted and fished over every county in the state, retraced his steps through most of them. Dr. Bryant sent out blank reports to be filled out by hunters, trappers, fishermen and ranch-owners in the mountain ranges; while Jay Bruce, the professional mountain lion hunter employed by the state, made an exhaustive survey of the mountain lion population, and, incidentally, of the deer herds, on which the lions feed almost exclusively, except in the vicinity of the cattle ranches, where they kill a few calves and now and then a sheep or hog.

Bruce's report is one of the most interesting natural history documents since Gilbert White, of Selbourne, penned his celebrated notebooks. He found that there are about 600 mountain lions in California; that they are increasing at the rate of about 100 a year; that each mountain lion kills an average of one deer a week, or 50 deer a year, for a total of some 30,000 deer are destroyed by this agency alone every year.

Bruce also learned that there are approximately 100,000 deer in California alone, exclusive of the blacktails, whose habitat is rather limited to the lava beds of Modoc County in Northern California, and which are being reduced in numbers by the inroads of mountain lions, men, and an occasional killing of a fawn by an eagle. Hunters killed more than 12,000 deer in California in 1923, but the increase considerably exceeded the total destruction of 42,000 by hunters and mountain lions. Bruce himself trails down and kills 30 to 40 mountain lions a year, but admits that he is unable to keep up with the increase.

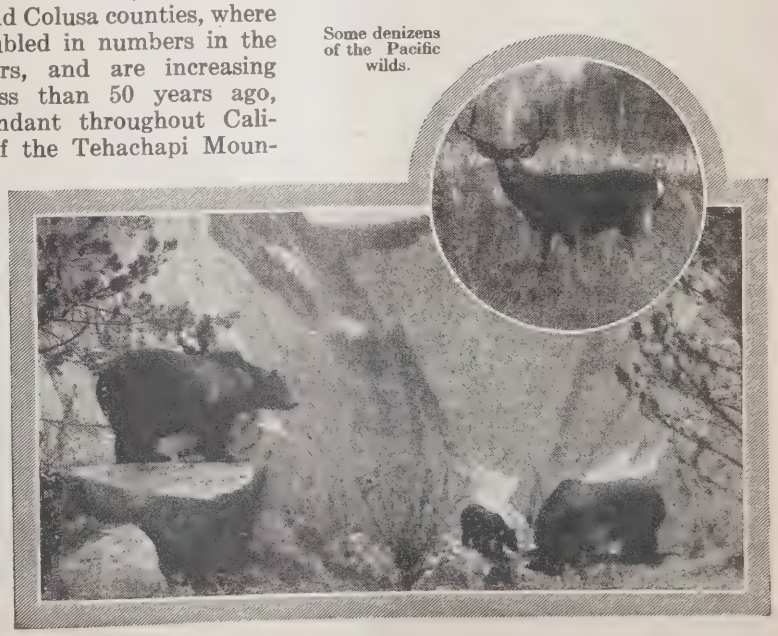
Reports from Wyoming, Montana, and Eastern Washington and Oregon, where there still are grizzlies, indicate that they are increasing there. Their extinction, however, is only a matter of time, since the grizzly is a very different animal from the black bear, being possessed of a homicidal complex which impels to attempt to wreck every man with whom he comes in contact.

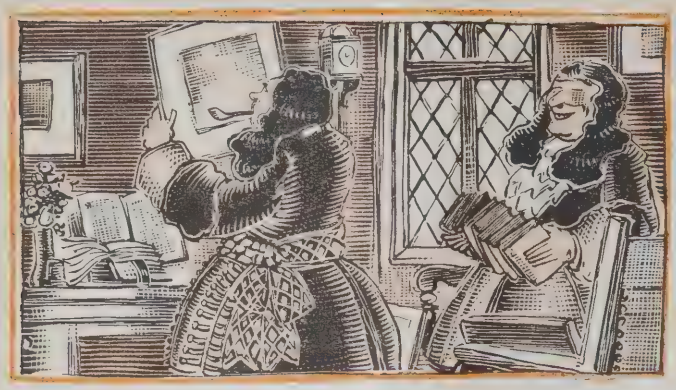
It was not generally known until this first animal census revealed the fact, that there are two kinds of elk still living in wild freedom in Northern California. They are the Valley elk and the Roosevelt elk, and they roam at will over more than 30,000 acres in Lake, Glenn and Colusa counties, where they have doubled in numbers in the past five years, and are increasing annually. Less than 50 years ago, elk were abundant throughout California north of the Tehachapi Mountains, which divide the state a little bit south of the center.

This unique census also showed that the bounty placed on the killing of coyotes—small wolves common to all the western states—had resulted in so reducing their numbers that the rabbits, on which the coyotes prey at all seasons of the year, had become serious pests in some of the fruit-growing sections. The State Supreme Court declared this paying of bounties to be unconstitutional, and some of the counties began paying it themselves. Now, however, the bounty has been removed in most of the counties, due to the fact that the skins of the coyotes are becoming valuable as furs, and hunters are pursuing them for this reason. The result is that the coyotes have returned to their balance of power over the rabbits, and the fruit-growers are again protected. This is an interesting demonstration of the economic balance sheet presented by Nature to man whenever he interferes with her animal life.

The mysterious California condor, the largest bird native to North America, and larger than the celebrated condor of the Andes, was believed to be extinct until the recent animal and bird census was completed, when it was shown that there are still a number of pairs making their homes in caves in inaccessible cliffs in the higher mountains of the coast ranges. These huge birds lay but one egg a year, so that their rate of increase is slow, but they are now strongly protected by state law and by the patrols of the state fish and game commission, as well as by forest rangers, so that the prospects are they will one day regain the numbers they had when the Gringo came to the Pacific Coast. Though large, powerful and capable of sustained flight at great altitudes, the condor is harmless and should be saved from the fate which overtook the great auk, the passenger pigeon and the Labrador duck.

Some denizens of the Pacific wilds.





"And I kept him with me all day hanging things and setting up my books."

Pepys, Connoisseur and Student

Concerning Sundry Speculations in Books and Divers Matters of Entertainment

By CHARLES J. FINGER

ILLUSTRATED BY W. O. FITZGERALD

THE Pepys who believed in the value of things beautiful and rare; books, pictures, music—the Pepys with great interest in things of the mind—Pepys the scholar, quiet, attractive, genial—that Pepys can be best imagined by those who have seen the collection kept at Magdalene College, Cambridge University, the diarist's library. For in it the man's personality is expressed in many ways, and, with proper spirit, the library is much as Pepys left it. There are, in all, some three thousand books, contained in eleven carved mahogany bookcases. That it was a vision of beauty and delight to its owner cannot be doubted, and there was certainly joyfulness and ardor about the man when he made the entry at the time he housed his volumes in their new home. The comfort of it all enraptured him; he was always stirred by the picturesque. Nor was he ashamed to talk frankly and unaffectedly about his feelings. So:

"Up and dispatched several businesses at home in the morning, and then comes Sympson to set up my other new presses for my books, and so he and I fell into the furnishing of my new closet, and taking out the things out of my old, and I kept him with me all day, and he dined with me and so all the afternoon till it was quite dark hanging things, that is my maps and pictures and draughts, and setting up my books, and as much as we could do, to my most extraordinary satisfaction; so I think it will be as noble a closet as any man hath, and light enough,—though indeed it would be better to have a little more light."

On the whole, the library is more the collection of a lover of the curious than of the tools of a student, as might be expected. The man could never resist the appeal of the quaint. As an example of his curious habits there is the case of Butler's *Hudibras*, a doggerel poem of ten thousand or so verses ridiculing the Presbyterians and Independents, a piece of frank burlesque meaning less to us of today because dealing with party feeling and ephemeral things. Still, it had a success in its day in spite of its affectations. Pepys tells of a conversation he had with a Mr. Battersby, then "falling into discourse of a book of drollery in use called Hudebras," decides that he "must needs to find it out, and met with it at the temple; cost me two shillings and six-pence. But when I came to read it, it is so silly an abuse of the Presbyter Knight going to

"There bought an idle, rogueish French book."

the wars that I am ashamed of it; and by and by meeting at Mr. Townsend's at dinner, I sold it to him for eighteen pence." So he was rid of what he considered a bad bargain. But before long he hears it praised, for the king was reported to have been very fond of it, and at once Pepys is ashamed that he should have been ashamed so "bought Hudebras again . . . I am resolved once more to read him."

Similar springs of action moved him in the case of Hobbe's *Leviathan* (1651), a harmless enough book according to our notions, having for its argument that the theory of a divine right of kings and priests should be destroyed, and supporting the idea that power lodged in rulers by the people could not be taken away by the people, that the end of all power was the commonweal. It was a book o speculative philosophy, and a dull on at that, but it made a stir. Nevile i his *Dialogue* and Herrington in hi idealist romance, *Oceana*, the first sup porting a monarchy, the second a democracy, leaped into the ring con tending that all secure government was based on property, and presently the bishops took a hand. Thus the book had that fictitious value resulting from dispute and Pepys grew keen to possess it. "To my booksellers," he says, "for Hobb's Leviathan which is now mightily called for; and what was heretofore sold for eight shillings I now give twenty-four shillings for, at the second hand, and is sold for thirty shillings, it being a book the Bishops will not let be printed again." Another side light on his bookish loves is revealed in this entry: "To the Strand to my booksellers and there bought an idle, rogueish French book, which I have bought in plain binding avoiding the buying of it better bound, because I resolve as soon as I have read it, to burn it, that it may not stand in the list of books, nor among them, to disgrace them if it should be found." Rochester's poems too he possessed, but the licentious imagination of the roysterer so worried Pepys that he expressed his shame at keeping it in his collection, yet could not bring himself to part with it, so salved his uneasy conscience by having it lettered *Rochester's Life*. And, sometimes, it

"To my chamber and there to ticket a good part of my books."

would seem that he enriched his library much in the manner in which the court grooms furnished their wardrobes. If not, what is to be made of this: "To St. Paul's Churchyard and there bespoke Rushworth's collections, and also Scobell's Acts of the Long Parliament, which I will make the king pay for."

But Pepys was also a reader. Of that there is indisputable evidence both in the library and in the diaries. Sometimes, when his eyes began to fail, his wife read to him, and in return for the service he taught her what he knew of astronomy and mathematics. Before that weakness grew upon him, most of his reading seems to have been done in the morning, his rising hour being sometimes as early as two. "Up very early to read the Seaman's Grammar and Dictionary, which do please me very well," he writes, and there are many similar entries. Still, for the most part, he seems to have been one of those for whom the delight came in buying a book, carrying it home with a kind of growing affection, feeling a thrill when he placed in on the shelf, then dipping into it occasionally and at random when he fell to arranging his shelves. So we find entries relating to purchases of odd things and rare—"To my booksellers and there took home a book on Microscopy," or "Bought at a shop Cardinall Mazarin's Will, in French," but learn nothing further. Once indeed he went to his booksellers, "kissed the booksellers wife" but that ended the transaction. At other times he bought largely but makes no mention of his purchases, thus: "Paid my bookseller six pounds for books I had from him this day."

He was an eager purchaser as well as reader of anything connected with antiquarianism and old ballads. In the library are prints and drawings, portraits of well-known men, maps, topographical data, and his method of guarding these treasures is revealed by the entry: "To day, my brave vellum covers to keep pictures in, come in, which pleases me much." There are also many broadsides bound

Sometimes, when his eyes began to fail, his wife read to him.

in five folio volumes, on the cover of the first of them written, in his own hand, this note: "My collection of ballads, begun by Mr. Seldon, improv'd by the addition of many pieces older thereto in time; the whole continued to the year 1700, when the form till then peculiar thereto, vizt, of the black letter, with pictures, seems (for cheapness sake) wholly laid aside, for that of the white letters, without pictures." Like William Morris he seems to have been heavy-hearted at the passing of a rich heritage of beauty.

In his collection are news-letters, Scottish ballads, many sea-tracts, the pocketbooks of Sir Francis Drake and of King James, old novels, "loose plays," books on shorthand, naval matters, geography, hydography and data concerning the furnishing of the Spanish Armada. Of rare books he had a copy of the first book printed in England, *The Game and Playe of the Chesse* (1474), of which only ten copies are in existence—of *The Booke of the Ordre of Chyvalries or Knighthode* (1483-85), one of four known copies—*The Historie of Reynart the Foxe* (1489), the only known copy. He had also copies of the first and second editions of Chaucer's *Canterbury Tales*. Each volume had its book plate neatly inserted, and he had three kinds of them. Two have the Pepys portrait, the other carries his monogram and two ship anchors. The patient care of the man is shown by his careful catalog work, by the numbering and the listing, the arranging and rearranging. He was never satisfied, always trying to do the thing a little better, a little more orderly, a little more precisely. "To my chamber," he says, "and there to ticket a good part of my books in order to the numbering of them for my easy finding them to read as I have occasion." And he had a curious way of arranging his volumes, placing them according to size from small to large, sometimes raising the little books to a level with their neighbors by placing carefully cut blocks of wood, gilded, at their bases. For economy's sake the books were arranged in two rows on each shelf, the smaller ones to the front.

Fine working qualities had Samuel Pepys, taking him all in all—a man with the sense of adventure, looking for unaffected intercourse with his fellows, full of an ardent generosity of life, no pompous nonsense about him, sometimes petty and foolish and whimsical, but at his best sharp-edged, clean-cut, brave in his individuality and self-respect.

South Sea Islanders as Sailors

By WILLIAM LEE CALNON

ABOUT the easiest victim in the world when it comes to seasickness is the average South Sea Islander when he travels on a steamship. In a small boat he is able to go hundreds of miles over the open seas, without the slightest inclination to *mal de mer*. White sailors who never get seasick on shipboard sometimes succumb when caught in high seas while out in small boats.

The South Sea Islander depends on the pau-pau, the bonita boat and the "pulling boat" of large size.

For service in bays, lagoons and close inshore in good weather the Islander uses his pau-pau, a very narrow and swift canoe of the dugout type with outrigger attached. Even the outrigger does not always keep him from tipping over, but a simple twist

Samoan canoe with outrigger.

rights his boat again and he clambers back in.

The bonita boat is used for fishing trips well out at sea. This boat is a cross between a canoe and a small rowboat, is quite light and is propelled with paddles. The usual sized bonita boat will hold three or four passengers. It is always gaily painted.

For inter-island trips and others including many passengers, the big pulling boats are used. These are wide enough for two rowers to sit side by side and sometimes are made long enough to carry sixty to eighty persons. Every village has one or more pulling boats, so that all inhabitants can leave when occasion demands. Races between boats representing various villages or islands form one of the most popular South Sea Island sports.

"Brains and Talent" at Sapiro Prices

What Were They Worth to Cooperative Cotton Marketing Annually?

By JOHN MARSHALL

THE movement to bring about coöperation among the cotton farmers in the production, handling and marketing of their great staple, that is to say, the American Cotton Association, was organized independently of Aaron Sapiro and without assistance from, or reference to, anything he had done in the matter of organizing the farmers of the country.

In 1920 this Association, after much preliminary educational work, held a largely attended meeting, composed of representatives from its various state organizations, in Montgomery, Alabama. While many men, prominent in one way or another in agricultural endeavors, were selected to speak on the prearranged program of this convention, Aaron Sapiro was not among them. In fact he was scarcely known to the leaders of the organized cotton movement in the South.

However, Sapiro was not the man to allow a good cause to suffer for lack of an introduction, even if it had to be a personally conducted one. It came to pass, therefore, that very soon Sapiro was busy seeking to impress the president of the American Cotton Association with an understanding of his (Sapiro's) fame and accomplishments as an organizer of farmers in California. He let it be known he would like to be present at the Montgomery Convention, and be accorded a place on the program. Notwithstanding the fact that these overtures aroused no enthusiasm and received scant response, Sapiro was in Montgomery bright and early, still insisting that he be heard. With characteristic racial enterprise and taste, he bearded, so to speak, the president of the American Cotton Association at his breakfast table, on the convention morn, with reiterations of his demand that he be allowed to speak. Through some means, farmers, who were attending the meeting, were stirred up to unite their voices with his, running to the office of the president of the Association with requests that Sapiro be allotted time on the program.

Agreed That Sapiro Should Have Thirty Minutes

It was finally agreed that Sapiro should have thirty minutes in which to exploit himself and his views.

The time he actually consumed was nearer two hours.

There is available a stenographic report of his address on this occasion. It affords interesting reading to one familiar with the cotton industry, in that it demonstrates the fact that Sapiro may have known something about what Merritt and others did in organizing the raisin industry, but that he was amazingly ignorant of the details of cotton production and its needs. The speech is notable, also, as a comparison, between what Sapiro said should be done in coöperative cotton marketing, and what organizations, subsequently fathered by him, did, and are now actually doing.

To have heard the address, since he was introduced as having "come all the way across the continent from California" where he was said to have "made a great success in the organization of Coöperative Marketing associations," one, ill-advised, would have thought Sapiro had organized the raisin industry (an impression easily conveyed); and that consequently he was the logical organizer of the cotton, or any other branch of agriculture.

Anyone who underestimates the keenness and subtlety of Sapiro's mind makes a serious mistake. Quick to catch on, he caught on at Montgomery with the celerity of an accomplished mental prestidigitarian. He was seeking leadership, and he meant to be satisfied with nothing less. Men who had devoted years of intelligent study to the cotton farmer's problems—men who were keenly interested in a prosperous Southern agriculture did not figure, save as stepping-stones, in the Sapiro movement; or, as they became stumblingblocks in his pathway.

Paying Tribute to Genius of Wannamaker

The American Cotton Association went into this Montgomery gathering with definite, constructive, well-digested ideas. The Association had long been rendering intelligent and profitable aid to the cotton planters; and at a minimum cost. Its plans for the future looked to the *permanent improvement of a great industry.* For instance, diversification of crops; making the farm self-sustaining; the improvement and enlarging of warehousing facilities; the broadening of the market for raw cotton; the solution of the cotton farmer's transportation problems; the standardizing of grades; gin compression; and better marketing.

Sapiro was quick to catch on to all this and stated in his address: "Now, I just want to say a word of compliment for your American Cotton Association. You men have done a much vaster thing than you think you have done. You have made the South think of cotton from a National standpoint. . . . . I pay the highest tribute to the genius of Mr. Wannamaker for what, I think, is the biggest work done in the South. . . . . But now you have work to do. You have got to back up Mr. Wannamaker. You have got to do with cotton what he has indicated should be done with cotton."

Thus one beholds Sapiro giving Wannamaker credit and indorsing his ideas, and the ideas of those who were working with him—either because they were sound or because of the paucity of his (Sapiro's) own—and declaring all these suggested improvements and reforms should be accomplished.

Some Professions Versus Performances

But facts show that since Sapiro became the guiding genius of the American Cotton Growers Exchange and the legal guide, philosopher and friend of all the State Coöperative Cotton Marketing associations upon which it is superimposed, the parallel between his protestations and his performances is tragic as well as deadly. For there are the professions of faith of the Montgomery address that may be checked up and off in detail against the record of things done and undone by the various existing coöperative cotton marketing organizations, which Sapiro was instrumental in bringing into existence; and of which he served as the legal adviser.

A few specific instances will graphically illustrate.

Sapiro at Montgomery: "You understand what I mean. It cannot be formed successfully unless you have forty per cent of the cotton behind you."

Again: "You provide that the whole thing is conditional, that it does not go unless forty per cent or thirty-three per cent, or whatever you figure is the right minimum of all the cotton production of the United States, sign up these contracts; in short, you would make the whole thing conditional upon getting real control of the national marketing unit. If you sign up thirty-three and a third per cent of the cotton of the country you have it." (Applause).

Of course there was "applause"! —that was exactly what the American Cotton Association believed and was working for.

If words mean anything at all the quoted statements mean that Sapiro believed that coöperative cotton marketing associations must control a minimum of thirty-three and a third per cent (possibly forty) of the cotton, or they could render no effective aid to the farmers.

But the records will show that *Sapiro subsequently did organize Cooperative Cotton Marketing associations that have never controlled more than ten or twelve per cent of the cotton of the*

South. He organized them at an extravagant cost; they are being conducted in an expensive fashion—controlling, as mere sales agencies, during the season of 1924-25, some 924,000 bales out of a crop of 13,600,000 bales. That is a percentage of about eight, rather than thirty-three. It is an amount of cotton that can be mishandled to the everlasting detriment of individual cotton farmers, but it is certainly not one with which the price of cotton may be dictated.

Directors Given Power to Speculate

In that Montgomery address Mr. Sapiro vented much virtuous indignation upon the heads of gamblers and speculators. It was both right and politic to do so. Subsequently in the constitution and by-laws of coöperative cotton marketing associations it was stated that one of the major purposes of their organizations was to decrease speculation in cotton. That also is a worthy and pious purpose. All these are worthy sentiments and would be more conducive to edification were it not common report that certain Sapiro coöperative cotton marketing organizations have, themselves, sold cotton on call, and delivered the cotton without fixing the price. And the offense was certainly not minimized by the fact that this pathetically absurd form of speculation was engaged in with cotton held in a species of trust.

It is scarcely to be credited that the charters of the Sapiro coöperative marketing associations vest their boards of directors with the power to speculate on the market with any part of the cotton confided to their care by their membership. In default of such a power being vested in them, it would be interesting to learn whether boards of directors have not vitiated their charters by such acts.

As a matter of fact, this very question is in a fair way to be brought to an issue through the medium of a suit entered by the South Carolina Coöperative Cotton Marketing Association against a well-known firm of Jewish merchants for the recovery of a very large sum of money. This is a suit for the recovery of damages, on various allegations; and it is highly probable that this matter of selling cotton on call and delivering it without fixing the price will come in for a great deal of investigation and discussion. Efforts have been made to stop this suit. If carried to its legitimate conclusion the suit would open up an endless vista of investigations. It only remains to be seen what pressure those who disapprove the suit can bring for its abandonment.

A Remarkably Significant Circumstance

A remarkably significant circumstance in connection with the suit took place in New York. An official of the South Carolina organization had gone into one of the greatest banking institutions in the country to talk about financing the cotton crop of 1925. The subject of the suit was almost immediately introduced. Disapprobation of it was expressed. Just how the bank learned of the suit is not known. It may be that its information was consequent upon the fact that only a few days previously leading officials of the Cotton Growers Exchange had been in New York, on their way to Europe. But in any event it is difficult to understand why the suit itself should have been a matter of such vivid interest to these particular bankers, who, generally speaking, had nothing whatever to do with it.

So long as the movement to promote coöperation in the marketing of cotton was in the hands of the American Cotton Association it was conducted at a minimum of expense. Since it has been taken over by Aaron Sapiro, and those who accept him as their leader and legal advisor, it has become a most remarkably expensive affair. Just how expensive probably no one knows. The mere organization of the existing Sapiro group in South Carolina is reported to have cost between sixty and seventy thousand dollars. Ten or more organizations having been formed, and South Carolina being one of the smallest of the cotton states, an idea may be had of the initial expense.

The American Cotton Growers Exchange is now operating at an annual expense of $350,000. With the state organizations, this would foot up something like two and one-half million annually for the salaried, office and departmental expenses of mere sales agencies engaged in the marketing of considerably less than one million bales out of a total crop of 13,600,000. It is left to the imagination how much it would cost to handle, after the Sapiro fashion, 40 instead of 8 per cent of the crop.

"Brains and Talent" Which Were for Sale

To do justice to the agricultural Moses, who went to Montgomery to lead the Gentiles of the cotton patches of the South, out of the wilderness of agrarian difficulties into the land of milk and honey, it should be said that he told his hearers in that memorable address that they should buy for themselves the best "brains and talent" that were to be had. He said their business was to produce the cotton, and leave all else to the purchaseable "brains and talent."

Whether the "brains and talent" so far employed, by and with the consent of Mr. Sapiro, is the best to be had may be a matter of opinion, but there is no question about their having been employed in wholesale numbers and at very fashionable prices. There is, for instance, C. B. Howard, general sales manager of the American Cotton Growers Exchange. Mr. Howard had been connected, not altogether successfully, with one or more commission houses in Atlanta. He was out of a job and was seeking one in Savannah when called back to participate in the organization of Georgia coöperatively. It is a matter of mere passing moment that while yet in the commission business he had declined to join with the American Cotton Association in its aspirations. At that time Mr. Howard wrote to the Association to say that he was not in sympathy with its coöperative plans as they would be contrary to his existing business interests. But, subsequently, as a matter of employment, Mr. Howard did consent to aid in organizing Georgia as a coöperative cotton marketing unit; and almost immediately thereafter he became the general sales manager of the American Cotton Growers Exchange at a salary of $50,000. There was, subsequently, some effort made to get the Howard "brains and talent" at a cheaper price; but the records for 1924-25 will show that, with salary, assistants, and traveling expenses, and all, Mr. Howard is still costing the Exchange between $40,000 and $50,000 per annum. His contract for the future seems to call for $18,000 for the first 750,000 bales handled jointly by the state and overhead concerns; two cents per bale extra on the next 250,000 bales; and one cent per bale additional on anything over a million bales. There is also an item of about $11,000 allowed him for assistants.

Some Good Prices Were Realized

Then there is Dr. B. W. Kilgore. Dr. Kilgore's "brains and talent" had been employed in an educational way in North Carolina. He was made head of the Extension Service in that state, at a salary commensurate with his abilities. In the meantime Carl Williams, of Oklahoma, originally foregathering with Mr. Sapiro in the formation of Coöperative Cotton Marketing associations, had been made president of the American Cotton Exchange, and subsequently, rather unexpectedly to himself, had been made "president emeritus," whatever that may mean, of the Cotton Growers Exchange, Dr. Kilgore being elected to succeed him.

What Happened Regarding Dr. B. W. Kilgore

During this period the question of electing an honest-to-goodness "dirt" farmer as a member of the Federal Reserve Board came up. Dr. Kilgore was considered as an available candidate for the place; and it is even reported that friends of Kilgore sought Mr. Sapiro's influence as a stepping-stone to that important position. The same report has it that Sapiro said he was willing to do anything in his power for the Doctor, but that he had something better in mind for him. However, Dr. Kilgore did not become the "dirt" farmer member of the Federal Reserve Board, but he did

American History in Earthenware

Old Staffordshire Dishes as Records

City Hotel, New York.

Much of the early history of the Republic is printed and pictured upon this unique chinaware, a use that is reminiscent of the baked clay tablet records of ancient Babylon.

Harvard College, Boston.

By M. L. FENTON

IF THOU hast two loaves of bread, sell one and buy hyacinths, for bread nourisheth the body, but hyacinths delight the soul." Americans in increasing number are recognizing the wisdom of heeding that friendly counsel of Seneca, and are spending more time and thought than was formerly the custom of the country upon securing beautiful and interesting articles with which to surround themselves; objects to delight and nourish the soul.

One of the manifestations of the interest is to be found in the widespread impulse to discard the ugly, badly made furniture and utensils of the past forty years, and to substitute for them the simple, well-made objects that had been in use during the years when we were still the colonies of Great Britain and up to about 1830, before, that is, the arrival in our midst of the childish craze for ornament and the indifference to good workmanship which constitute "Victorianism" and the "golden oak" era.

The desire for early American things arises, of course, from more sources than that from which the love of beautiful possessions springs, it comes, in part, from an affection for our forbears for the history of our country, and from a desire to have visible contact in our homes with what was most worthy in our past national life. It involves a respect for ourselves and for that from which we sprang.

The objects which we have learned to prize and to go "antique-ing" for are of many sorts, from mahogany highboys to Currier and Ives prints. One of the most essentially valuable and interesting of these more than "fifty-seven varieties" is Staffordshire ware, particularly the plates. They are among the most difficult of Americana to secure, but it still remains true of them as of other things, "if ye seek, ye shall find." The search for them is to be recommended because they have esthetic charm, due to their strong, deep blue color and to the general excellence of their design. They have, also, great historic value.

Upon them are depicted, in its entirety, the America of the years during which they were made; public buildings, inventions, heroes, landscapes, private houses, sections of cities; nothing was overlooked. There are more than two hundred and fifty subjects. One can make a complete sight-seeing tour of this land as it was at that time by means of a full collection of Staffordshire ware. And it so happens that one can do it by means of no other pictorial representations, for the plates antedate cameras and all comprehensive use of illustration. They furnish indeed the only visible record of much that was interesting, and has since disappeared, in early America.

"Mendenhall Ferry, on the Schuylkill River."

Staffordshire ware emanated from a cluster of towns in that midland English county; Burslem, Cobridge, Hanley, Stoke-upon-Trent, Tunstall, where the direct and collateral descendents of the early potters are still found making tableware, and whose modern aspect has been made pleasantly familiar to most novel readers through *Clayhanger* and *"The Old Wives' Tale.*

Most of the plates which we term "Staffordshire" were made during the years between 1812 and 1828, although the making of them had been begun earlier, in 1780, by Stevenson and Dale at Cobridge. They are distinguished by their remarkably satisfying blue color, by a decorative border, which varies with each manufacturer, and, chiefly, by the "view" of an American scene in the center of the plate. They were made of common clay, in a fairly rough and ready manner, and were sold in America at prices as low as fourpence, and no higher than a shilling. That price included the cost of transporting them from the center of England across the ocean, and thence inland to the dealers in tableware in the various cities.

The potters having determined to make the decoration a matter of views of America set about securing good and representative ones, which they did from (Continued on page 28)

The Cruise of the "Nina"

We met a party off for a day's sport on Concord River.

(*Continued from page 2*)

the famous "Old North Bridge," celebrated in history and song, the Old Manse, and the Battle Ground, visited each year by thousands of reverent—and otherwise!—tourists from all over the world. Here was also the scene of the village tragedy which, it is said, Hawthorne immortalized in his *Blythedale Romance*. A young girl, weary of life, sought for release in the quiet stream. Her hat and shawl were found by Hawthorne and Curtis under a tree; and, later, at midnight, her body, with peaceful face upturned to the stars.

Under still another bridge, and we are off through the meadows. Minot Pratt, the noted botanist and lover of nature, tilled the old Pratt Farm, and many are the shy and delicate plants he has naturalized in the woods and fields. As we paddle along we find many rare river plants and flowers which "keep his gentle memory green." Here is the yellow iris, and the curious water-chestnut (*Trapa natans*) with its hard, black spiked seeds, from which one enterprising young lady devised a head for hatpins, to be sold as Concord souvenirs! Emerson finds

"Violets and bilberry bells,
Maple sap, and daffodels,
Grass with green flag, half-mast high;
Succory to match the sky,
Columbine with horn of honey,
Scented fern and agrimony;
Clover, catchfly, adder's tongue,
And brier roses—dwelt among."

Farther down we paddle close to the shore to see at closer range the showy and beautiful rose-colored flowers of the river-mallow or hibiscus, loved by Thoreau, and frequently mentioned in his *Week on the Concord and Merrimac Rivers*. With what a tender and seeing eye does he note its beauties—all invisible and unnoticed by the ordinary frequenter of the woods and meadows, and, with his magic pencil, makes them ours! Other rare flowers which he notes on the same journey are the rose-colored polygonum, the arrowhead (*Chelone glabra*), the arethusa, which Hawthorne calls "one of the delicatest, gracefullest, and sweetest of the whole race of flowers," and the lovely purple geradia. The brilliant cardinal flower (*Lobelia cardinalis*) flaunts its glowing beauty in a few lonely spots, and, like all rare things, is therefore the more admired.

Our camp for the day is a charming spot in a beautiful grove on a hillside, just above the river, with the "Great Meadows" stretching beyond us. Here we lounge and read, pick flowers and berries for dessert, and feast our eyes on the blue river and green fields. How good our chowder tastes, made in a kettle over an improvised oven in the chink of a wall! Surely no blackberries were ever so good as those we find on the top of the hill, sun-ripened and deliciously flavored! A furry little wood animal—genus unknown—is discovered and brought to bay by our valiant Peter, to the great excitement of the children. Diversions are unnumbered, and our enjoyment is in like proportion; we are never ready to start for home! All too soon the long summer day is over and we are on the river again, paddling upstream. Twilight is falling and the moon is rising. As we glide along we pass a lone fisherman tending his lines. As we watch his bites, so few and far between, we are humorously reminded of the olden times, when the river was so full of shad and salmon that an old ordinance stated that "no apprentice should be compelled to eat salmon more than five days in the week!"

Startled by our paddles, a solitary bittern rises from the rushes and soars away, his long legs stretched behind him. A canoe, its load suggestive of a couplet from George Bartlett's *Floating Hearts*—

"The boat is as full as a boat should be,
With nobody in it but you and me!"

comes drifting downstream, its occupants forgetful of time and tide. A strain of merry song floats down to us, and presently we come upon a picnic party, whose gay voices make the silence vocal. Home is reached, and that day's cruise of the *Nina* over!

As the "Wayside," "Old Manse," and lonely "Ridge" on Lexington road speak of Hawthorne, the square, dignified white house, shaded by tall, dark pines, of Emerson, so do Walden Pond and the Concord River speak especially of Thoreau. Hawthorne and Thoreau are known to my generation by their books, the tributes of their friends, and by the loving traditions of the village. Emerson was a familiar figure in the village streets when I first came to Concord. He had a lofty, dignified presence, but a kindly smile always accompanied his courteous greeting. He would stop to give a nod to a baby in its carriage, he delighted in a real conversation with his friends, and he was always the courteous and delightful host. He was beloved by the townspeople, and after his hold of this world had loosened and the gigantic intellect began to cloud, they affectionately sought to protect and help the revered seer who was also the kindly friend who still enjoyed his daily pilgrimage to the "Milldam"—the old name still retained for the business part of our little village. His relations with the townspeople and his farmer neighbors were close and intimate; and many are the anecdotes which have attained the best sort of immortality—that of tradition. His learned philosophy and sometime mystical erudition was regarded with kindly tolerance by some of his former neighbors—rich in their own peculiar practical lore. "I suppose," says the inimitable "Sam" Staples, one of the latter, "that Mr. Emerson *thinks* he knows a good many things that I don't! but I *know* that I know a darn sight of things he doesn't!"

As to Henry Thoreau, he is Walden and the Concord River, and Walden and the Concord River are Thoreau's own. The river is connected with a thousand associations of Emerson, Hawthorne, Thoreau, and many others of undying fame, who loved it and lived near it; but especially is it connected with Thoreau, that unique, lonely, stoical hermit, who is more and more interesting to thoughtful readers as time passes; that Thoreau, child of Nature, who was only an average student at Harvard College, but who took a *summa cum laude* degree in the

"By the ancient hemlocks, grim and gray."

teachings of "running brooks," stones, woods and wild creatures; who stopped making pencils when he had produced one to suit him; taught school and was a boy with his boys, leading in sports and tramps—the fastest runner, the best swimmer, the quickest berry-gatherer of them all. At home all influences were unconventional but lofty; his surroundings and daily living were of the simplest; to use the picturesque phrase of Bazalgette, his French and most admiring biographer, the "family table was no banquet, for they had *neglected to be rich!*" Could any words better express the comparative unimportance of riches in the family code? This may be the more easily understood when we hear that if a pupil—for he was school-teacher at this time, and the family housed and boarded out-of-town boys—found it hard to pay his tuition or board, he was "kept" and taught without charge. "Time enough to talk about money later!"

He began early to be associated with the meadows, woods, and especially the river of his dearly loved Concord. "Why travel," he says, "when you can find everything at home?" His most intimate friends were the birds, plants, and wild creatures, and he esteemed the time spent watching them as nothing if it brought him into more exact knowledge of their habits and habitat. A hunt for arrowheads on Clamshell Bluff was a thrilling adventure; a paddle on the Assabet for fish might produce fish but—of much more avail—it brought him the delight of meditation, acute observation and annotation.

Sailing Into the Lone Haunts of Nature

A carefully kept journal, brought up to date every evening, clarified and preserved—fortunately for his later audience—his thoughts and experiences.

In a boat of his and his brother's construction, Henry and John took numberless trips on the same river on which the *Nina* later happily cruised. Every bird, wild flower and fern, water plant and lily-dotted inlet has been minutely noted by his gifted pen. The solitary bittern which we start up and excitedly watch as he takes his arrow-like flight over the river and meadows, is doubtless a descendant of one he has carefully chronicled. He has made a poem of the fairy dance of the blue dragonflies who dart over the lilies, and the muskrat who leaves a thread-like trail down the river. The turtles who sun themselves on the rocks and clumsily splash into the water as we pass, the elaborate nest of the Mother Bream among the weeds, and the pickerel who splashes a glittering cascade of spray as he jumps out of water for a minnow—all speak of Thoreau; he has lovingly watched and noted every one, times without number.

In his *Week on the Concord and Merrimac Rivers*, Thoreau lets us into his secrets. He unveils the spirit of stream and meadow, tells us a thousand attributes of flower, insect, and bird, opens our eyes to unimagined beauties of Nature; nothing too minute to escape his loving inspection; nothing too unimportant to be carefully observed and noted. "The sight of a marsh-hawk in Concord meadows is worth more to me than the entry of the Allies into Paris," he writes; and he notes the flight, habits, and peculiarities of that same marsh-hawk with the most loving accuracy. As for his knowledge of the Concord and neighboring fauna, it was minute, affectionate, and perfect.

Thoreau and Others Who Were Ramblers

His disposition, personality, and attributes were so unique as to make him an impressive figure even in those times, when the "Giants" made Concord famous. "I should not like to exchange any of my life for money," he writes; and he condescended to earn or use only enough of it to supply his simple wants. He chose to take extended tramps into the surrounding country and especially through Maine, easily walking his thirty miles a day, because he considered that he could do this more quickly and easily than he could earn the money to pay fares. He "collects dry wood for the fires as the weather grows cool, and feasts when he gets hungry—not till then!" He builds with his own hands the smallest and simplest of huts in Walden woods, where he can study, meditate, observe, and write. He makes most of his scanty furniture, "thanking God that he can sit and stand without the aid of a furniture warehouse!" He provides three chairs—"one for solitude, two for friendship, and three for society!" He plants his beans for his main sustenance and renounces all the privileges, and also the claims, of community life and the ordinary obligations of society and politics.

"Few lives contain so many renunciations," it has been said. He was a Harvard graduate, but the fields, woods, and meadows were his Alma Mater. "Education," he says, "often makes a straight ditch out of a free, meandering brook."

A double, triple personality is that of Thoreau. He is the friend of Alcott, whom he helps with pickaxe and spade while he is locating at Hillside, communing meantime of lofty philosophy and intricate problems; of Hawthorne—although they were never closely akin; of William Ellery Channing, Henry's crony in his rambles and tramps, and whom he compliments—if we can speak of compliments in connection with that rugged, straightforward personality—as "the only one who doesn't throw a blot on my afternoon landscape!" and of Emerson, the seer and prophet. He is the good son, brother, and housemate, who helps build the house, who plants the garden, digs the potatoes, and takes part in the innumerable diversions indulged in by the lively Thoreau family.

Also the Crony of the Odd-Job Man

He is also the crony of the odd-job man, the farmhands, the fishermen and loafers, and delights to have a "dish of talk" with them and enjoy their humble but picturesque philosophy—and they adore him! Still another side is shown to the social aristocrats and the ceremonious of the village, with whom he stiffens and freezes at once and who judge him as "queer," "conceited"—in present-day parlance, a "freak."

But it is in his solitary hut in his adored Walden woods, or paddling alone or with the beloved John or a congenial companion that he is the true Thoreau, of whom the river speaks to us, and to all who glide over its placid surface with the love of Nature in their hearts.

How the Indians Made Sugar

THOMAS CONANT, a writer of four decades ago, discovered how the Jesuit Fathers learned the art of sugar-making from the Indians. There was the annual tapping of the sugar-maple, although the Indians did not have iron kettles for boiling the sap. How did they manage to boil down the juice without a kettle?

They tapped the trees with their tomahawks and inserted a spile to conduct the juice from the tree to a vessel underneath. This spile was simply a piece of dry wood, grooved on its upper side. The process was indeed crude, yet they produced a considerable quantity of sugar.

Their buckets consisted of a roll of birch bark, sewed at the ends with deer sinews or roots. No doubt the sap caught in such vessels was as sweet as that gathered in our own bright tin pails. The sap was carried from the trees to the boiling place, where there was a large caldron made of sheets of birch bark. Beside this caldron a fire was built, in which was placed a lot of stones. As soon as these stones were heated to a red heat, they were dropped into the birchen caldron. As the stones were cooled they were taken out and hot ones were put in. By repeating this process, slow as it was, the sap finally boiled. The boiling was continued until the sap was boiled down and sugar was the result.

Thus sugar was made without the aid of a kettle. Mr. Conant seemed to foresee doubt in some minds, and assures us that his forefathers who came to his province in Canada handed down in family tradition the story of the Indian method of making sugar. Indeed they were eyewitnesses themselves. When settlers came, the Indians learned a better way, and traded their furs for iron kettles and began making sugar much as it is made today.

Kansas Generates Its Own Opinion

(*Concluded from page 7*)

made its own way in its own community. They are not an integral part of the community's life.

"I would rather see ten papers owned by ten honest, sincere publishers than the same number under a single control, despite all the superior resources in men and money that the group management might place behind them. All the gods of the local owner and editor surround him—his family, his home, his friends, his business, his burying ground. To these he feels his allegiance and devotes his energies. The editor of the chain paper, on the other hand, surrounded by forces emanating from a distant office and holding his position under it, has a divided interest, and his views are likely to come from the same office along with his salary check. Because of these conditions the public opinion of states shot through with chain newspapers is never so genuinely representative as where the newspapers are individually owned and edited."

The ingrained personal nature of the Kansas press is perhaps no better exemplified than by its unusual custom in crediting clipped material. To the Kansas editor the editorial in the Iola *Register* is not simply the *Register* speaking but its editor, Charley Scott. Hence such credit lines as "Herb Cavaness of the Chanute *Tribune*," "Rolla Clymer in the El Dorado *Times*," and "George W. Marble of the Fort Scott *Tribune-Monitor*" appear throughout the state. As a result many Kansas editors are widely known and enjoy a prestige which they would not otherwise have.

"Probably the first reason why Kansas has no chain papers," said Mr. Marble, one of the most frequently quoted of the state's editors, "is because there are so few cities in Kansas that constitute a field large enough to attract them. I have a notion, however, that it might be difficult for a chain or syndicate paper to get far in Kansas owing to the peculiar aversion the average Kansan has to even a suggestion that he is being exploited, either politically, industrially, or with respect to his reading. My observation is that the average Kansan has a notion he is important enough in the general scheme of things to be allowed to form his own judgments and act on his own initiative. That's why a politically controlled paper or one whose ownership smacks of political interest or design cannot get anywhere in this state.

"I have had opportunity to observe pretty widely, and I am sure there is no state in which the press is so generally courageous on political issues and so universally independent of political or party traditions. This no more reflects the trend of the editorial mind than it does the state of the public mind in Kansas. I cannot imagine the people of any city in Kansas tolerating a chain newspaper whose editorial policies came down from New York or Philadelphia or Kansas City; nor whose profits were regularly reduced to New York drafts and mailed out of town. Much less would a Kansas constituency tolerate suggestion from some outside source of power as what she should believe in politics or how she should vote."

Mr. Marble, who recently completed a term as president of the National Editorial Association, has been around a good deal and his statements relative to the impertinence of syndicates in Kansas are not the boasting of a provincial. On the other hand they reflect a freedom of thought, on the part of the people as well as that of the press, which is one of the distinguishing marks of the state.

Is there not, indeed, a lesson in the Kansas press?

People seem to take an extra interest in what the Sunflower State is doing and saying.

A very efficient machine for the owner.

In the large centers today the great dailies, through consolidations and the spread of chain newspapers, are coming more and more under the control of a few rich men. Hearst, Munsey, Scripps, Curtis—these names are the identification tags of great chains of newspaper properties, some of which dominate the journalistic field of entire cities.

Is this a sound state of affairs? Are such organizations conducive to the best development of a free and healthful public opinion? Do they permit of enough individual expression that the mass of people they serve are adequately represented?

It is significant that Kansas, with its highly representative and distinctive press, has felt the influence of neither chain newspapers nor wholesale consolidations. True, a number of the state's papers have disappeared as a natural consequence of rising publishing costs, but the professional dealer in newspapers has been pleasantly absent. There has been in Kansas no such killing of papers as New York has witnessed the last decade, nor such consolidations as have reduced the newspapers of Chicago nearly one-half within a generation.

It has often been observed that democracy works successfully in the rural regions. This is not, as Jefferson thought, due to the possession of any naturally superior political wisdom by rural people, but to their better opportunity to know the facts concerning their local government. The people of Kansas, through their 600-odd newspapers, locally owned, free of foreign influences and dedicated to their respective communities, have a means of determining the facts upon which wise government is based and of expressing their opinion that the people of New York and Chicago have not. This is the lesson of the Kansas press to journalism and to the nation.

Outside control of newspapers and external influences in shaping their policy have played too great a part in influencing public opinion. A home press, actuated by regional aspirations, is the voice of the people. Too frequently it is the voice of alien purpose springing from a self-centered source.

"I Read in the Papers"

I read in the papers that a minister hereabout has been charged with heresy. It would almost pay ambitious ministers to induce someone to charge them with heresy. Otherwise they may never be heard of. In this instance the charge grows out of a perfectly harmless sermon on Darwin. Perfectly harmless. Nothing whatever to distinguish it from thousands of other sermons delivered twice every Sunday. But it surprised some people. It surprised them to hear that the pastor believed in evolution. They had not known it before. They had listened to him for years and had not guessed it. The surprise was a shock and ended in charges being preferred. It doesn't make any difference to me what any minister believes, but it is rather important that there should be anywhere in the church a tacit deception of the people. It need not make any more difference to a man's Christianity whether he is an evolutionist than whether he is a Democrat, but since multitudes in the church think it does, true Christianity would seem to require considerable outspokenness on these subjects.

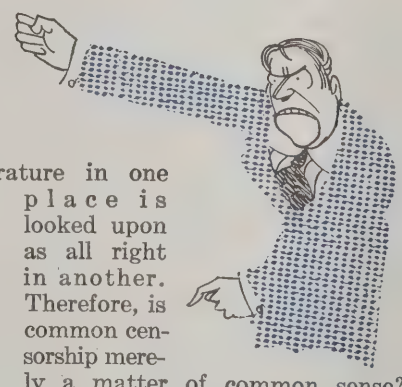
I am convinced that this general condition exists of the pew not suspecting what the pulpit believes. It is notorious in the denomination to which belongs the minister above referred to, that a declaration by the ministry of their beliefs would shake if not destroy the church. There has been just that much concealment about it. The conventional old evangelical terms are used with new and modern and unorthodox meanings—pulpit weasel words; the old tone of piety and the old formalism are retained; and with it goes what I usually feel to be a mock pious concern not to "hurt old and unlearned believers' faith." I always think it is more to prevent a row in the church and a possible change in the pastorate. I wish there were more frankness and less concern with "the faith of the ignorant." A Catholic priest whom I know met that attitude on the part of a young buck who was tarred with a specious modern "liberalism" which he was carefully keeping from his old Irish mother because, as he said, "he did not want to shake her faith." "Try it and see if you can," said my priest friend. There's something in that. Faith is not shaken. Illusion may be, but not faith. The whole heresy business, which led to this comment, has nothing to do with faith, nothing to do with knowledge. It roots in ignorance, universal ignorance, which frankness and honesty would make tolerable and even honorable. For I believe that a certain ignorance is one of God's mercies to us.

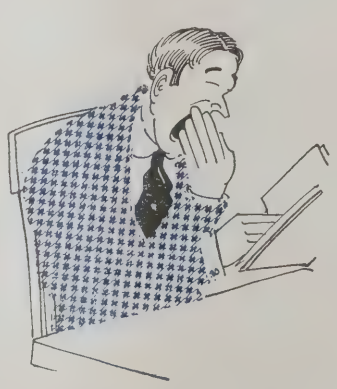
I read in the papers that the Los Angeles Chamber of Commerce, the chief agency in the upbuilding of that marvelous community, has demanded that the three railroads operating so-called limited trains from Chicago at an average speed of only thirty-three miles an hour shorten the schedule half a day and arrive in the morning instead of afternoon. These trains under a so-called time agreement between the carriers that abolishes real exertion in the service of the public now leave Chicago after dinner and arrive, sixty-eight hours later, in Los Angeles after lunch on the third day. The amazing increase of travel from the Midwest to Florida has doubtless made the Los Angeles chamber awaken to the need of faster trains even though the railroad managements are lazy and indifferent. Limited trains at a speed of 33 miles an hour suggest Russia or Spain rather than America.

I read in the papers that a distinguished French advocate who attended the convention of the American Bar Association at Detroit says that there is no post-war increase of crime in France. He did not attempt to give reasons, he merely stated the fact. He even said there was a decrease of some forms of crime. The reasons, however, can be supplied. First, crime is not a necessary phenomenon of years following the war. To say "Crime is the outcome of the war" is one of those sayings which, given currency, run on and on and settle the question for the unthinking. Professional pacifists welcomed it, and those classes which supply most of our criminals welcomed it more. The press spread it and the pulpit preached it, with no reason to do so except that someone started it in motion. If crime is a necessary post-war development, why did not France experience it? The second reason is that France is one people. A national unit with the elements of character does not go to pieces on a sudden. Germany experienced a post-war crime increase but it did not indicate the degeneration of the German people, for after the war Germany became the dumping ground for the same classes which are providing most of the criminal actions in the United States. France, on the other hand, kept her borders fairly clear and has come through clean. To say that in America our own people are suffering moral breakdown as a natural aftermath of war is a slander upon the American character. What has happened is that we have been invaded by hordes of those who are criminals in whatever part of the world they live. If the various commissions appointed to investigate crime push their work to the end, and do it fearlessly, they will be able to make some interesting disclosures to the American people.

The International Jew treats of the Jewish Question in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: Twenty-five cents each; complete set, one dollar. THE DEARBORN PUBLISHING CO.—Dearborn, Mich.

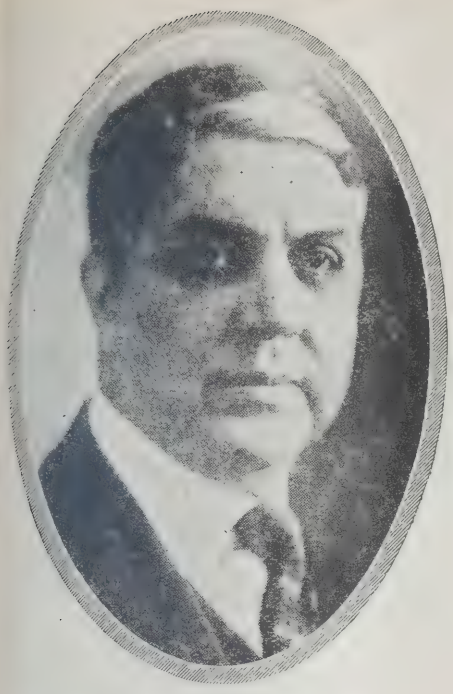
WAS there ever a censor that satisfied everybody? Censorship is to a large extent governed by local sentiment and psychology. What is considered undesirable in art or literature in one place is looked upon as all right in another. Therefore, is common censorship merely a matter of common sense? Thomas L. Masson discusses this question in next week's issue of THE DEARBORN INDEPENDENT. He throws much light on the methods by which some books are passed as "good" while others are condemned as "wicked."





Underworld Will Pay $100,000 to Free a Man

By NORMAN BEASLEY



Ex-Governor Harry L. Davis, of Ohio.

GEORGE "JIGGS" LOSTEINER is a "lifer" in the state penitentiary of Ohio.

In an interview, given while he was governor, Harry L. Davis referred to Losteiner in this fashion:

"He is, undoubtedly, one of the worst criminals in the history of Ohio. His career of lawlessness, prior to his life sentence, extended over twenty years and included almost every serious crime on the statute books, including a $25,000 bank robbery, in which one official was killed; a $23,000 pay roll robbery, in which two policemen were wounded, and a $60,000 bank robbery which resulted in his last arrest. Outside of a reformatory sentence, and some fines, he was never punished until 1916 when he was given a penitentiary sentence.

"Upon his release, he committed two murders and four robberies in which more than $200,000 was stolen. Yet, when he was tried for murder, though he was found guilty in the first degree, the jury recommended mercy and thus saved him from the electric chair."

Losteiner has served less than five years of his "life sentence." The average "life imprisonment" term in the State of Ohio is something less than eight years. However, before becoming too critical of Ohio, bear in mind that the average "life imprisonment" sentence in the United States also hits in the immediate neighborhood of that same average—eight years!

Police officials in several cities in Ohio tell me that there isn't any question in their minds but that the "underworld" has the purpose, the methods and the people to raise $100,000 inside of a period of ten days, any time, if they have reason to believe that they have a chance at bringing about the liberation of Losteiner, or any other prisoner in whom they are especially interested.

In Ohio, alone, an average of eight criminals are released daily on pardon, or parole, from the state's penal institutions. In the course of a year the number of criminals thus let out in the United States runs into tens of thousands.

This, of itself, would not necessarily be an abuse of the pardon and parole systems. Its very existence, of course, contemplates the release, from time to time, of deserving prisoners where it is felt that they are no longer a menace to society, and are entitled to another chance. Besides, without a parole system, the penal institutions of the country would be clogged, to overflowing, with inmates.

But, if the power of money and other influences allows confirmed criminals to go free then the parole and pardon systems fail of their purpose.

Not infrequently there are individuals who, justly or not, have the reputation in the "underworld" of being able to "grease" paroles. As a result such persons get the bulk of this business. Those hired in parole cases can be roughly divided into three classes:

1. Those who accept cases, usually at interesting fees, pretending fictitious influence—political or otherwise—but really propose to do nothing, hoping, only, that in the ordinary course of events, the man may be paroled. When such an event occurs these persons pocket the additional fee that is measured with "success."

2. Those who accept cases with accompanying financial rewards and undertake a systematic and carefully conceived campaign to obtain freedom for certain prisoners, without openly appearing; they secure others, frequently men of responsibility and impeccable characters and motives, to go before the pardon board.

3. Those who take parole cases, for a fee, and seek to gain their ends largely through sources of official influence and pressure.

After naming these three customary methods it is but fair to say that practically all the money that goes into efforts to secure pardons, or paroles, is used up in attorneys' fees, traveling expenses and other kindred items which are legitimate in themselves.

The financial power of the "underworld" is felt from the moment a criminal, who is a member of of a gang, is arrested. Police officials and state executives that have been interviewed refute the thought that there is such a thing as "organized crime." There are "organized gangs" and the fight against society is largely a matter of "gang protection" with any connection between gangs being largely casual and indirect.

However, the gang usually is bound

Enforcement procedure in cases of violation of conditional pardon.

to rally to the defense of any member when he is apprehended by the police. Usually they provide the necessary funds to employ counsel. The raising of this money means more crime. I have been told that the raising of any fund by a prisoner's criminal associates is usually a case of blackmail. The knowledge by the "underworld" of crimes can be used as a club to force tribute from those who committed them.

The workings of the "system" are simple enough. An important arrest is made by the police. The prisoner is identified as a bank burglar and he is taken into custody. A date for his trial is set.

Watch the "system" go to work—

When the case is called, what type of lawyer is on hand to defend the prisoner?

Does the court have to assign a lawyer, as in the cases of indigent prisoners, where the state, itself, bears the expense of providing legal defense?

Is it a lawyer receiving a small fee and without an earned reputation?

Gangsters Are Defended by Best Lawyers

The answer to these three questions is—"No!"

Invariably you will find "gangsters" defended by some of the best legal talent obtainable.

From the time of the arrest, money is provided by the "gang." The trial results in a conviction. What happens? Appeals are taken—and it costs money, under such circumstances, to carry the case to a higher court, or to secure a retrial. But, again, the prisoner is convicted. He is sent to prison. It may be life, or it may be ten or twenty years. But there is never a let-up in the fight for freedom. Every conceivable effort to free the prisoner is made. And, if the word goes out that there is a chance for release, money is no object.

In the State of Ohio a certain criminal—a member of a desperate gang—was awaiting electrocution in the death house. In the final days word was sent to his confederates that there was a possibility of preventing the execution. A sum said to have been $100,000 was raised in an effort to save the man from the death chair. The efforts proved unavailing.

"I am positive," declared former Governor Davis, "that the men intrusted with running the business of this, or any other state, are honest. I am well aware of the fact that there have been one or two bad 'messes' in which high officials of other states have been implicated, but, remember, there are forty-eight states and there have been hundreds and hundreds of public officials. The 'slips' of the very minute minority rather prove the rule. In addition, pardon boards are not implicated. I have had some experience with pardon boards in this state, as well as in other states, and the men who comprise them, I sincerely believe, are inherently honest."

In other words, the money element ends where influence starts—and influence starts somewhere near the top.

In order to work up a case for his client the lawyer is compelled, first of all, to see to it that the case will have a strong appeal for the pardon board or parole authorities. Considerable time is likely to be spent weaving this end of the political rope which is to be thrown over the prison walls. The campaign is carefully mapped out and persons are interested who are presumed to have control of certain voting strength. The governor is, of course, elected by popular vote and it is logical for the lawyer to think in terms of political influence. In fact, it is expedient that he so do. Parole boards are, in turn, appointed by the governor.

Arrangements are made to have the prisoner appear in his most favorable light and word sifts through to him that friends are working on the outside. The prisoner obeys every rule and mandate of the warden and the guards. He becomes a model prisoner. The warden, getting reports from his subordinates, reads where "convict 40,018" has turned over a new leaf—in prison.

"Industrious, obedient to rules, making something of himself . . ." everything that goes toward the making of a fine report on "convict 40,018" is in the warden's hands. The warden, when called on, makes his statements accordingly. He cannot do otherwise. The warden's report becomes a paragraph in the prospective pardon, or parole. The chaplain makes similar observations.

The prisoner's life history is combed. It is found, perchance, that, in youth, he was hit on the head by a baseball. He is mentally deficient, decides the lawyer, and begins his trial of circumstantial evidence accordingly. It is shown that "as a boy, the prisoner never had a chance to go straight! . . ." all the heart throbs that can be put into a report are embodied in it. By the time the proposed parole, or pardon, is ready for submission it has been carefully edited and then turned over to the influential persons for action.

Improving His Chances of Escaping

Generally, this carefully worked-out plan succeeds. If it fails there usually follows an effort to have the prisoner transferred to some other section of the prison—other than the one he has been in—or to some other prison.

The reason for this is to improve the prisoner's chances for a pardon—under new surroundings—or, *to improve his chances of escape!*

"Is one prisoner on an equal footing with another when it comes to granting pardons?" I asked Mr. Davis.

"You know there is a difference," he snapped. "The prisoner without influence, or money, stands a good chance of serving his full term unless the warden, for some reason, interests himself in the case. I recall one case that may help to illustrate my point.

"For many years it has been the custom in most states to pardon a criminal in honor of some big holiday. While I was governor, a request for a holiday pardon for a certain criminal was laid before me. A delegation presented the request for the man's release.

"I had the man's record brought to me and found it a bit out of order. I urged the delegation to select a more deserving prisoner but to no avail. It was pointed out that the man of their choice had come from a wealthy family, that he had a wife and daughter and that these relatives had made arrangements to start the convict in business in a distant state.

"I argued the wisdom of letting a man of this type go free but they were insistent.

" 'We have never before been denied our choice,' they said. 'We have made it and we propose to stand by it. Custom has given us the right to pick our own man. We want the release of the man we have selected.'

" 'Will you assume personal responsibility for the future conduct of this man?' I inquired.

" 'Surely,' they said, and signed an agreement to that effect.

"An amusing follow-up resulted. I was criticized by the newspapers for granting this pardon and the head of the committee that had waited on me denied, in the public prints, all responsibility for the freed man.

Pardons Should Be Free From Politics

"My conclusion, based on my experience with the crime problem, is that the pardoning and paroling of prisoners should be as far removed from rapidly changing political authority as possible.

"As respects pardons in capital cases, as well as in all others, the greatest power in all creation is the power over life and death and freedom. In most of the states, this direct power is delegated into the discretion of one man—the governor.

"It is my contention that no single human being should have vested in him such an unqualified and sweeping power; for, virtually, it becomes an individual responsibility. And that is an unthinkable condition.

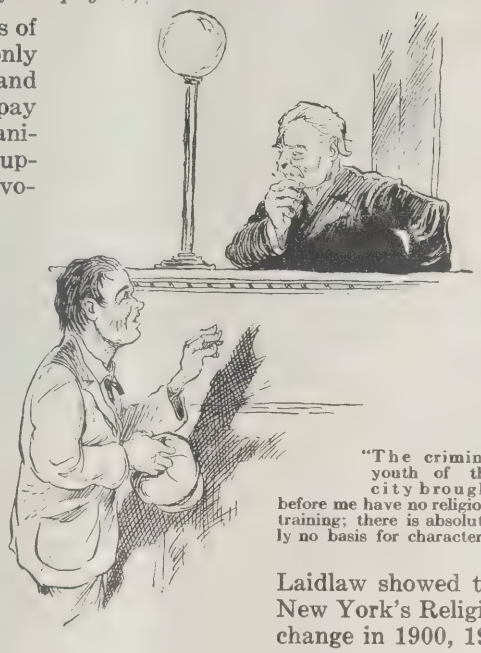
"I am a strong believer that the chief executive's unchecked authority to grant freedom to prisoners should be taken away. Unwise and indiscriminate use of the pardon—or, for that matter, parole—power is one of the really serious elements contributing to crime conditions.

"If the criminal is made to realize that this one avenue of evasion, or, at least, possible evasion, of the consequences of his crime is closed to him, it is bound to act as a deterrent influence.

(Concluded on page 31)

Mission Mite Boxes

(Concluded from page 5)



"The criminal youth of this city brought before me have no religious training; there is absolutely no basis for character."

Protestant churches of New York City only have four thousand dollars a year to pay their preachers, janitors, heat, light, upkeep, and benevolences?"

"I mean exactly that very thing! New York is a Mission Field and the sooner the church world realizes that fact the better they will understand the problem here and what becomes of a lot of their money given for Missions.

"If that statement startles you," continued Dr. Reisner (and no man in Manhattan knows the city better than he) "let me call your mind to the fact that from 114th street to 260th street, a distance of seven miles, between Harlem and Hudson rivers, with a population of 400,000, there are only four churches, Jewish, Catholic, or Protestant, which seat as many as a thousand people.

"Go into the real residence section, in the Washington Heights region, where more than 200 apartment houses have been erected within a year and a half, and where is located the largest high school in the world, and where the Columbia University Medical Center will be located—this residence section has only one completed church! The rest are only chapels or roofed-over foundations, with basements. There is one section that has 50,000 persons without even a Sunday school of any denomination.

"There are one million young people in this city who are growing up with no more religious education than if they were reared in the jungles of Africa; 800,000 never see a Bible. Chief Magistrate McAdoo says, 'The criminal youth of this city brought before me have no religious training; there is absolutely no basis for character.' "

In the course of my investigations for this article I visited every denominational headquarters in New York City, including the headquarters of the Methodists, Presbyterians, Baptists, Protestant Episcopals; the four denominations really doing outstanding work in New York. The Congregational church has only one or two institutions in Manhattan, due to an ancient church agreement.

When I talked with Dr. Walter Laidlaw, who is recognized in church circles, and quoted by men of every denomination as an authority, he said:

"New York City is the greatest Mission Field in the world, equally for Catholics, Jewish and Protestants. The fact that these three groups are about equal in number is *unparalleled in all the history of the world.*"

He further added: "It is more difficult to make progress here even than it is in India, or China."

Then Dr. Laidlaw showed the following table of New York's Religious Composition and change in 1900, 1910, and 1920:

	1900	1910	1920
Greek Orthodox -		56,764	91,459
Jewish - - -	597,674	1,252,135	1,643,012
Protestant - -	1,629,240	1,785,366	1,941,847
Roman Catholic -	1,210,288	1,672,618	1,943,730
Totals - - -	3,437,202	4,766,883	5,620,048

Dr. Millard L. Robinson, of the New York Methodist Society, clearly recognizes New York City as a Mission Field:

"When a local church can no longer maintain itself our society accepts the title of that property, assumes its financial obligations, and carries on its work."

"How do you carry on that work?"

"With the aid of Missionary money," he replied, simply, and as a matter of long established fact.

"Just how many churches of that type do you now support?" he was asked.

"In this territory we have 51 churches, including 4 colored, 4 German, 3 Swedish, 1 Chinese, 1 Japanese, 1 Korean, and 1 Italian. The rest of them are so-called American churches but all of which are made up of members born in foreign lands or whose parents were."

In a book entitled *The Case for New York*, issued by the New York City Society and the Board of Home Missions of the Methodist church, the opening paragraph says:

"The educational work of the great Centenary Campaign of the Methodist Episcopal church, revealed to the membership of the Church at large, throughout the country, that New York City had become *America's Greatest Missionary Field.* (Italics are the author's.) This was a disappointing surprise to many people who had always thought of New York City as an embodiment of wealth and prosperity and achievement. People could scarcely believe the facts presented so complete had been the change in the religious situation in Old New York.

"Enough money has been pledged and paid in so that we are now bringing to completion wonderful new, modern buildings for this work, costing about $350,000."

"Do you mean that $350,000 of Centenary Missionary money has been poured into New York City?" I asked the secretary.

"More than that," he replied.

"Actually how many self-supporting churches have you in Manhattan and the Bronx?"

"There are only four self-supporting Methodist churches in Manhattan and the Bronx," was his reply.

Then he added: "I mean by that, the larger churches. They are Madison Avenue, St. Paul's, Grace, and Washington Heights. There are a few small churches in the country districts which get along in a meager way. But thirty-eight churches are receiving help either from Missionary money or endowments."

The Northern Baptists put out a pamphlet in which they tell of their needs in New York City. This is a pure appeal for Missionary money:

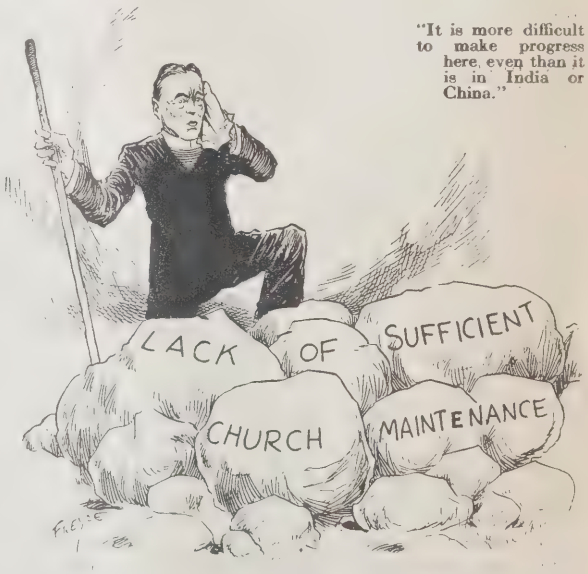
"We need $100,000 for Church Extension in the New York City Area."

"We need $150,000 to Build a Christian Center for Chinese and Negroes."

"We need $150,000 for renovation of downtown churches in New York."

"We need $50,000 for equipment of two foreign language works."

"We need $116,500 to pay off mortgages on Baptist properties."



"It is more difficult to make progress here, even than it is in India or China."

Church leaders frankly and openly admit the situation. New York has been drawing on the denominations at large—upon Kansas farmers, and California fruit-growers, and Chicago workingmen, and the nation and churches out in what New Yorkers call "The Provinces"—for help.

American History in Earthenware

Detroit from the river.

(*Continued from page 20*)

three sources: from some volumes of the *Beauties of America* which were popular in England at the time, from the sketchbooks of English gentlemen who had crossed the seas to look upon those beauties for themselves, and from the sketches of their own artists whom they sent over to supplement the subjects that had been procurable in England. We know the name of one of these men, W. C. Wall, Esquire, from Dublin, who came to New York in 1818 to make sketches for the Stevenson pottery at Cobridge. When a housewife bought a Staffordshire plate she had an accurate picture, and she had, moreover, scenes from every part of the country, Dan to Beersheba, from which to make her selection. The sketches were engraved upon copper and then transferred to the clay by means of wet impressions made on tissue paper with prepared colors mixed with oil. So that, in effect, the plates are copper engravings upon clay, the work, by hand, of artist artisans.

The ware was sold in America in huge quantities. Every house required dishes, there were no potteries in America, this ware was cheap, was reasonably strong and unbreakable, it looked well on shelves and upon white tablecloths, as it still does, and it satisfied man's desire to look upon portrayals of his own and Nature's handiwork, it was interesting to eat off "Fairmount Water Works on the Schuylkill," "Marine Hospital, Louisville, Kentucky," or "Mt. Vernon, the seat of the late Gen. George Washington."

At the great bicentennial in 1820 of the landing of the Pilgrims, while Daniel Webster spoke fervently and oratorically of that landing the guests could look down upon their plates and behold the scene depicted there, Samoset and Squanto on a rock ready to be cordial to the Pilgrims climbing out of a little boat, the *Mayflower*, riding at anchor in the distance.

The principal makers of Staffordshire were Enoch Wood, of Burslem, a friend of John Wesley, whose bust he made in 1781; Joseph Stubbs, of Burslem; Andrew Stevenson, of Cobridge; R. Stevenson and Williams, of Cobridge, whose plates are of artistic excellence; Joseph Clews, a very successful potter of Cobridge who tried to start a pottery in America at Troy, Perry, County, Indiana, in 1836; the Ridgeways, father and sons, at Hanley, and Joseph Heath at Tunstall. The latter is best known as the maker of tableware which depicts the "Residence of Richard Jordan."

Richard Jordan had been a famous Quaker preacher who resided at Newton, Gloucester County, New Jersey. Upon his death in 1826 a number of his friends ordered the tableware made in his memory. It was bought in large quantities throughout New Jersey and Eastern Pennsylvania where he had been revered. The scene portrayed is a charming and peaceful one, the house, the barn, a quiet lane, and Richard Jordan himself in the foreground. William Mason, a Philadelphia drawing teacher, made the sketch. It is a plate well worth finding.

The border, a characteristic feature of all Staffordshire, served, in a manner, as a trade-mark for the individual potters, so that one knows the potter by his borders. Those which one comes most readily to recognize are the sea shell and mosses border of Enoch Wood, the rose leaf medallions arranged in trim fashion by the Ridgeways, James Clews' fantastic one in which he tried to do honor to everything in heaven above and the earth below, flowers, stars, fruits, patriotic emblems and the very names of the fifteen states which comprised the Union; the Stubbs border is distinguished by its eagles at regular intervals, and that of R. Stevenson and Williams by its arrangement of oak leaves and acorns.

The district of England in which the pottery was made was then much as Arnold Bennett describes it still to be: "a region of pitheads, chimneys, and kilns, tier above tier, dim in their own smoke." The manufacturers were, as portraits of them clearly indicate, industrious, upright men, whose main interest in life was their work, which they did well. All the Staffordshire plates are worth looking at, worth possessing. One particularly diverting and instructive one is that of Boston Common by Stubbs. It has the border in which eagles are interspersed with flowers, and within it has a well-composed picture of the heart of the Boston of 1812. The Common is in the foreground, trees and cows and winding paths upon it, in the clear distance are Beacon Mall and Park Street, leading to the state house. To the right and left of the state house are accurate drawings of the houses which stood there; on the right those of Joseph Coolidge, Thomas Amory, Governor Gore; on the left, immediately beside the state house, is John Hancock's mansion, next it is that of Dr. John Joy, rising behind Dr. Joy's house is that of Thomas Perkins, and at the very edge of the plate is the house of the first mayor of Boston, the father of Wendell Phillips. They are all handsome,

Lafayette at Castle Garden.

speaking clearly of pleasant and cultivated ways of living. Their owners possessed extensive libraries, sent their sons to Harvard College, of which there are fine Staffordshire plates, observed the amenities and patronized the abundant lecture courses for which even then Boston was renowned.

New York Hotel Where Victories Were Celebrated

The mixture of the primitive with the sophisticated that is evident and delightful in the plate of Boston Common is equally so in that of the City Hotel of New York, at the time the most important and finest hostelry in America. There the victories of the War of 1812 were celebrated, Lafayette made it his headquarters when he was the guest of the nation in 1824, there Dickens was given a festive dinner while Washington Irving acted as toastmaster. It was built in 1792, a skyscraper of five stories and seventy-eight rooms, visible from New Jersey and Brooklyn. There it is, depicted on the plate, in front of its splendor a cord of wood ready to be sawed into usable pieces and right there on Broadway, convenient for all, the pump.

Then urban places still retained some of the charm of the rural. The uncrowded, marvelously safe street is almost more acutely indicative of the distance in time between that New York and the present one than are the pump and the cord of firewood. Trinity Church, whose spire is seen in the distance, is all that is today left of the scene. The plate was made by R. Stevenson and Williams of Cobridge, and bears their border of oak leaves and acorns. The plate was made at the time of Lafayette's visit to America and the almost simultaneous completion of the Erie Canal, accordingly, for generous measure and to tempt the housewife, there are in the upper border the portraits of Washington and Lafayette, and, in the lower, a picture of the Erie Canal bridge at Little Falls.

When Lafayette Landed at Castle Garden

The completion of the Erie Canal was the signal for the issue of plates depicting it as extensive as the appearance of spring hats at Easter, and no housewife, apparently, felt quite *comme il faut* without one. There was some justification for this. The Erie Canal was as great a feat of engineering skill and daring as had been the medieval cathedrals and the aqueducts of Rome. Moreover its erection was of enormous significance to the country. In effect the United States had been not one nation but two until the canal afforded the connecting transportation facility between the east and the west. The Alleghenys had made transportation from one to the other impossibly difficult, with the result that Philadelphia was the commercial center of the East and the West congregated its cities and villages along the waterways connected with the Ohio and Mississippi and used those rivers as a means to reach New Orleans which the West used for importing and exporting.

Alone, under the leadership of De Witt Clinton, New York State financed the building of the canal and she derived her reward, for it made New York City the commercial center of the entire country, East and West. The Rochester plate of the canal by Enoch Wood shows the stone aqueduct which had been built to carry the canal over the Genesee River. The plate deserves to be particularly prized for it was made by the man who is often regarded as the father of British pottery, it commemorates the building of the canal that made the United States an economic unit, and it presents the picture of a fine aqueduct which has been destroyed and should have been preserved as a monument to the heroes of a great and peaceful project.

The most dramatic of the plates is "The Landing of Lafayette at Castle Garden" made by James Clews at Cobridge. Guns boom from the battery, horsemen are galloping about in great self-importance, flags are flying, the harbor is as full of craft as it can hold —on a plate. It is no doubt a true representation of the stir and bustle that existed in New York on the day when the *Cadmus*, a sailing vessel of which also there are plates, after a fifteen-day voyage appeared in the harbor with Lafayette, who had arrived to be the honored guest of the nation, on board.

When Detroit First Became American

Comparable to it in stir is the plate of Detroit, the city which had flown three flags, the French, the English, the American, and had only recently, by the victory at Put-in-Bay, been made definitively American. The whole town seems to be on the plate, some of the houses are still within the stockade that had withstood an eleven-month siege by Pontiac. The river is as uncomfortably full of varied craft as the Detroit streets now are of motor cars.

"Prosperity" Was Brought to Staffordshire

One of the quietest plates is the Stubbs, one, with its border of vegetables and flowers, of "Mendenhall Ferry on the Schuylkill River." Here are portrayed the inn, the rope ferry and two sedate residences on the hill among the trees. Already we have country life in America and the Philadelphia flavor.

Quite certainly a few hours with Staffordshire plates gives one such a generous feast of early American life and history as nothing else in existence can. And that is singular when one considers that these plates were made by Englishmen in England very shortly after two decisive defeats of their country by Americans. At first it seems somewhat ignoble that men should portray their country's enemies as heroes, should make money out of their country's losses. But upon deliberation and upon looking at portraits of the potters themselves, Wood, Clews, Stevenson, one is moved to conclude that they may have been showing high good sense.

What quarrel had these diligent Staffordshire potters with George Washington and Commodore Perry, and what good had rulers with imperialistic tendencies ever done them? The better and incontrovertible fact upon which they acted was that whatever kind of tableware the Americans would buy brought prosperity to the Staffordshire towns. No harm was done to anyone. And we have a volume of history depicted upon plates.

Federal Taxes Should Be Cut Half a Billion a Year

(*Concluded from page 4*)

seven per cent of the population pay no income tax at all.

That is to say, they pay no income taxes directly. As a matter of fact the 97 per cent who pay no direct income taxes furnish almost all of the money with which the other 3 per cent pay all of the income taxes that are paid. I think the people are beginning to understand this. That is why they are so interested in the subject of taxation.

The truth of the matter is that every business man includes his taxes, of all sorts, in his cost of doing business and does his best to pass the whole thing along to the people in the form of higher prices for the things they buy. If this were all that happened not so much harm would be done as wages would necessarily have to go up to cover the increased cost of living. But this is not all that happens. The money that is raised by taxation, in excess of the cost of honest government economically administered, is wasted.

When waste is carried too far it ruins him who practices it. Waste is always harmful to the extent that it is permitted to go on. If it be kept this side of ruin it nevertheless hurts. Waste in governmental expenditures does much to make the struggle for existence as hard as it is. Three per cent of the population furnish most of the money that our National Government wastes, but the burden is spread over the other 97 per cent. Something is added to the price of everything they buy to provide the money that is wasted in Washington.

I shall do all I can to reduce taxation at least half a billion a year and keep Federal expenditures within our income.

Fort Washington

OLD Fort Washington, lying between Fort Washington and Pinehurst avenues at One Hundred Eighty-third street, New York City, is soon to be demolished and the ground occupied by modern apartment houses. This old fort is a relic of Revolutionary times and was occupied first by the American and later by the British armies. Farmers living in this vicinity during the past century gathered several wagonloads of cannon, cannon balls, and other metal that belonged to the original camp, and sold them to a Spuyten Duyvil foundryman. Amateur archeologists have found many relics of Revolutionary times while "excavating" near the surface. A monument commemorating the fort stands on the line of its eastern ramparts. Here a small plot of ground has been set aside, so that the buildings about to rise will not disturb it.

The British and Hessian huts were built near the Fort, and in one camp near Two Hundredth street remains of more than fifty such huts have been found. The officers' quarters were inside the fort and they were of better material. The old fireplace with its equipment and bricks was found, together with pieces of fine china, spikes, hinges, barrels, buttons, and old coins of British mintage. The bricks were of Colonial pattern. The old fireplace has been taken up and rebuilt on the lawn of Washington's headquarters where it may now be seen.

A Nautical Mile

A NAUTICAL mile is called a knot. Originally a knot was an actual knot on a ship's "log-line." The log line was a long line attached to a log which was thrown over the ship's bow. The log remained practically stationary and the time required for the vessel to pass by the log from bow to stern determined the rate the ship was going. This practice was known as "heaving the log." Upon this log line, at intervals of 1/120 of a geographical mile, were tied knots.

The distance between any two knots was the distance the ship would move if traveling at the rate of one sea mile per hour, during, say, half a minute. One man counted the knots in the rapidly passing line while another stood turning a sandglass, somewhat similar to an hourglass, measuring the time. When the sandglass was emptied the log line was stopped and the knots counted. Thus was the ship's speed determined. If fifteen knots had run out, the ship had been doing fifteen sea miles per hour, or, as a seaman would express it, she was "doing fifteen knots." The rate at which a vessel sails, or can sail, is usually given in knots per hour, the admiralty knot or measured mile being 6,080 feet.

"Brains and Talent" at Sapiro Prices

(*Concluded from page 19*)

later on give up his position with the Extension Service; and later still became one of the most important officials of the American Cotton Growers Exchange—a place where Sapiro evidently preferred him than on the Reserve Board.

Consider also the case of C. O. Moser. Mr. Moser's "brains and talent" had originally been employed in a county demonstration way in Texas, at a not excessive salary. Quite recently he was made general manager of the American Cotton Growers Exchange at a salary of $18,000. But the coöperative five-year contracts running out shortly in Texas, he has been returned to that state to assist in retaining the old membership of its organization in line.

It is enough to say that the salary lists of the Sapiro coöperative organizations fairly bristle with the names of gentlemen of "brains and talent," but of comparatively little authority in the cotton world, at salaries whose total strangely contrasts with the benefit of it all to the cotton farmer.

Mr. Sapiro himself should not be omitted from the list of "brains and talent" which, admittedly, cost money. It would seem that he originally got, as retainer fees, $20,000 from the Exchange, and $1,200 annually from *each* of the state associations. These were retainer fees only. For each specific piece of work he did he rendered a bill. For legal services in the railroad rate case now in the courts, for instance, there is allotted $15,000. When he drew the contracts under which his coöperative associations were to borrow money from the War Finance Corporation his bill to each state association is reported to have been $1,800. So that it is difficult to say with any degree of certainty just what the "brains and talent" of Mr. Sapiro are estimated to be worth to coöperative cotton marketing annually.

What the fees, for drawing the contracts with the War Finance Corporation, were paid for, is even more a matter for speculation. Under these contracts Eugene Meyer, Jr., then head of the corporation, which was formed to assist the agricultural interest financially, agreed to lend the Southern Coöperative Marketing associations money at six per cent, *provided they enter into an iron-bound contract with the corporation to market one-eighth of all the cotton in their possession each month.* That such a contract was uneconomic and contrary to the very purposes contemplated by coöperation itself would seem to be apparent to a schoolboy.

Charging Cotton Men More Than the Banks

It subsequently developed also that while Mr. Meyer lent money to the cooperative organizations at six per cent, he lent it at five per cent to the banks that were doing business with the cotton farmers.

The banks could and did borrow money from the Federal Reserve Bank at four and four and a half per cent.

When these facts became accidentally public there was considerable stir about the matter. There was even some semblance of an investigation. Mr. Meyer was asked to explain—he was especially asked to explain why he charged the coöperative organizations one per cent more than he charged the banks, when cotton was the basis of the collateral in both instances. *He said he did it at the request of the co-operative organizations themselves;* and because he did not wish to interfere with the business of the banks. These explanations that were likely to prove highly unconvincing to *the agriculturalists for whose aid and comfort the War Finance Corporation was specifically set up.*

Some Little Things in Need of Explanation

It would not be unreasonable to ask just why Mr. Sapiro drew a contract by which the organizations, for which he was so largely responsible, and for which he was retained as legal adviser—organizations whose special mission was supposed to be the conservation of the financial interests of the cotton farmers—should be required to pay one per cent more than a bank next door.

That he should, in addition to this, have drawn a contract by which one-eighth of all the cotton in the co-operative warehouses came on the market each month as "distress" cotton, would seem to be beyond belief, were it not a matter of record.

"Brains and talent" are, of course, as Mr. Sapiro said at Montgomery, very valuable assets in any industry. But much depends upon the question of whose interest they are employed in. And Mr. Sapiro would have to be even more ignorant of the cotton industry than at times he has appeared to be, to convince one that he thought such a contract, as that he drew between Mr. Meyer and the coöperative associations he had organized for the ostensible purpose of getting a higher price for cotton, was a good one for the farmers who had confided their cotton to his organizations for handling.

And if it is true, as Mr. Meyer said, that the one per cent higher rate was charged with *the consent*, if not actually at the *request*, of the Sapiro Coöperative Cotton Marketing associations, upon what grounds do these gentlemen, selected for the specific purpose of safeguarding the interests of their membership, defend themselves against the charge of either not knowing how to perform their duties wisely, or else of not caring how they are performed?

Another Indemnity—This Time Persia

(*Concluded from page 6*)

was still in force at the time Mr. Murray left, a year later. A military tribunal was at once set to investigate this crime and punish the guilty parties. The government of Persia realized the seriousness of the situation. Nothing like it had occurred in a hundred years and the Persians were humiliated beyond measure, particularly as the victim happened to be an American. For more than a hundred years the Persians have liked America and Americans more than any other nation on earth.

American missionaries had been in Persia for nearly a century. Morgan Shuster, an American, had rehabilitated their finances; their greatest international friend had been America. They have a sort of a mystic reverence for America and Americans.

The government put the country under military régime, and put this trial into a military court because they wanted speedy results. The State Department of the United States acted in a dignified and admirable manner. There were no unjust demands. There was no suggestion of undue threat. There was a demand for redress, speedy trial, punishment of the murderers, and a fair indemnity.

Imbrie was assaulted at eleven a. m., was dead at two p. m., and the nation was under military law by sunset.

The trials lasted from July to October. Hundreds were tried. Thirty-four were condemned to prison sentences, and three were executed. One of the condemned was a major in the army, and from this major down to privates no mercy was shown.

The Persian Government considered the soldier who confessed to having assaulted Major Imbrie as the worst of the culprits, due to the fact that, as a soldier, he should have protected him. The soldier gave as his defense the fact that he had been swept away with religious fury. He was the first to be executed, and Mr. Murray saw him shot at sunrise a month before the others.

When Seyed Was Shot at Sunrise

In the case of the direct descendant of Mohammed, Seyed Hossein, the tribunal asked for clemency. It is an extremely difficult thing in a Mohammedan nation to have a Mohammedan executed for the murder of a Christian, due to the belief of a Mohammedan that to kill a Christian is an act of grace, and merits reward instead of death. Indeed a Mohammedan who kills a Christian is expected to receive special favors in heaven when he dies.

The request of the tribunal for clemency in this case presented a serious diplomatic situation. Mr. Murray handled it skillfully, like a diplomat who has right on his side and the United States Government back of him. The Persian Government was finally informed that the State Department at Washington had instructed Murray to leave Persia if clemency was granted to this Mohammedan who had incited the mob outside the hospital walls. It was a tense moment, but the Persian Government defied Mohammedan traditions, and ordered the Seyed shot, along with the seventeen-year-old boy who had beaten Major Imbrie's face in while he lay helpless on the operating table.

Mr. Murray, according to his orders from the State Department, with his staff went to a prison outside the walls of Teheran, on the morning of November 2, 1924, and saw the Mohammedan, Seyed, and the boy shot by a firing squad, afterward inspecting the bodies to see that full justice had been done and that no substitutions had been made. The execution of this Mohammedan is a rare case in diplomatic history.

U. S. Government Demands an Indemnity

In addition to the execution of the murderers, and the imprisonment of 34 others the United States Government demanded an indemnity of $60,000 for Mrs. Imbrie, the widow of the murdered consul. This was promptly paid.

The second demand of our State Department was that Persia should pay all of the expenses of the trial, and those of shipping the body to America. In addition to this the Persian Government was to give the body the proper salutes and honor due the remains. Our government sent a warship, the *Trenton*, to carry the remains home, accompanied by Mrs. Imbrie. This cost $110,000. Persia paid it immediately. Then came a stroke of genius in American diplomacy.

At the suggestion of Mr. Murray, the *charge d'affaires*, this money covering the expense of transporting Imbrie's remains to America, has been set aside by our government to educate Persian boys. It constitutes a trust fund to be administered in the United States. The $110,000 has been paid over to Mr. Murray and this autumn the first of the Persian students will come to American schools.

Our State Department made no unjust or autocratic demands in this case, but it made quick decisions, and by the final allotment of the indemnity for an education fund we have demonstrated to Persia, as our use of the Boxer Indemnity demonstrated to China, that peace and enlightenment mean more to us than any show of power. The moral influence of these two acts of international kindness are two of the great chapters in American diplomacy—chapters that will be remembered as an integral part of American history.

Underworld Will Pay

(*Concluded from page 26*)

"I believe that the vesting of the pardoning power, and indirectly the paroling power, in the State Supreme Court, would serve justice and the interests of society to much better advantage.

"1. There are many reasons for my belief. The terms of office of supreme judges are for a longer period than that of the governor.

"2. They are removed more remotely from the effects of political influence.

"3. As trained judges they are better qualified to weigh the merits of each case, and besides, in many instances, they have passed on the legal aspects of the case.

"4. Even the paroling power of the supreme judges—granting they had it—should be curtailed so as to prevent the pardoning of any life prisoner prior to his having served twenty years.

"5. The sole authority that should remain vested in the governor, connected with the pardoning power, is the right to grant reprieves and not more than two of these to be granted at any one time.

"I would make it compulsory in connection with the granting of pardons by the Supreme Court, that its vote be unanimous for a pardon. By this method I would eliminate the item of influence because the circle of influence is the vicious circle that starts and ends in the granting of unwarranted pardons.

"As for paroles, I would have a board established of two members appointed by the judges of the Supreme Court for terms of six or eight years, with salaries commensurate to the responsibilities of their duties—such members, however, being removable at any time by unanimous vote of the supreme judges upon charges and a trial before that court.

"In that way, we could come nearer to removing the parole system from the detrimental influences that have long been its curse, and establish it on a basis where the obscure prisoner would have a chance to gain his freedom if he deserves it. But, the real reason for such a system would be to protect the public against the release of out-and-out crooks—gangsters whose gang will commit crime and compel crime to raise funds with which to get their members out of prison and back into the gang.

Some Suggestions for Pardons and Paroles

"And, chief of all, I would have a law preventing the granting of any parole, or pardon, to any but first offenders. In the case of life prisoners I would require, as I have said, that they serve twenty years before being eligible for parole; in the case of second or third offenders I would require that they serve at least three-quarters of their terms before they could be considered for pardon, or parole."

The Lady Playing the Theorbo, by Gerald Ter Borch.

Lovers as Painted by Famous Artists

By CATHERINE BEACH ELY

The Meeting on the Lake, by Arthur G. von Rambeau.

THE wooing of maidens and the dreams of lovers strike a major chord in life, and also in art, which is life's reflector. On the canvases of famous painters of every nationality lovers sigh, rejoice, long for one another, pledge their fealty with eyes and song, with impassioned words and eloquent silences. The New York Metropolitan Museum shows us sweethearts as the painter sees them—American, Dutch, Italian, French and Austrian lovers of high social rank, and in rustic setting, in moments of happy anticipation, and as congenial pairs, whispering tender vows.

The Trousseau, an American painting by Charles W. Hawthorne, portrays a girl who meditates upon her coming marriage with an expression of awe at the great step she is about to take into an unknown future. Behind her stands her mother absorbed in measuring a delicately tinted garment against her daughter's shoulder; at the table sits a neighbor sewing upon gleaming satin. The scene is conceived in the rather austere mood of a New England country village. Color and composition reflect the attractive reserve expressed by the faces and postures of the women.

This painting has the insight into character and mood which is the acknowledged attribute of Hawthorne, one of our leading modern American painters of *genre*. Although he has traveled and lived much in foreign countries, his paintings give us real American types, like this demure little native-stock maiden dreaming of her lover amid the shimmer of her trousseau.

We have another American type in *Celia's Arbor*, by Lilian Westcott Hale. The artist does not tell us by an explicit title that Celia awaits her lover, but we may assume from the festiveness of her toilet and the coquettish poise of her head that such is the case. However, Celia, as a self-reliant American young women, would not weep if her lover were ten minutes late, and, if he did not come at all, she could find other sources of entertainment.

The picture has the spirit of the happy unclouded moments which stir the heart of youth just as the spring breeze touches the light foliage of the trees in the background of the scene. It is painted with the atmospheric charm and facility of composition which characterize the work of one of America's leading women artists.

The scene changes to Holland in *The Lady Playing the Theorbo*, by Gerard Ter Borch, a love-painting presented in the faithful detail of seventeenth century Dutch art. The artist was thinking fully as much about the pattern on the tablecloth as he was about the lady's sentimental smile or her admirer's tender absorption in her and her music. No doubt she is singing for him a little Dutch love song punctuated by her adoring eyes, while her happy lover sits on the table in an attitude of passive beatitude.

The artist gallantly turns the highlight on the fair one, while her lover sits in shadow. How Ter Borch did enjoy painting the gleaming light on her satin robe and white throat and on her plump fingers tripping over the lute-strings! A wholesome young couple, this—just the pair to make a contented home.

Two centuries later than Ter Borch, Josef Israels, another great painter of Dutch life, chose the frame of poverty for his scenes. In *The Bashful Suitor* the young peasant couple is portrayed against a background of flat Dutch country with peaceful cattle resting and stunted trees brushed by a gentle sea breeze. They walk without looking at each other, their childlike faces touched by timid joy and an almost religious absorption in the great event of being together.

In *The Rendezvous*, A. Simonetti wields an Italian painter's brush with facile charm. The little picture is impregnated with the bright atmosphere of Italy. The young woman in her charming *froufrou* of silk, lace, feathers and flowers expects her lover at the trysting place in the niche of a sunny wall near a marble fountain. Her pretty face expresses wistful awaiting about to break into a joyous welcome of the beloved.

The Trousseau, by Charles W. Hawthorne.

The Intended, by Etienne P. Berne-Bellecour, is staged with the strictest French decorum. The fiancé in military costume holds his lady's skein with soldierly rigor, while she, at the other end of the lovers' bench, looks demurely down at her ball of worsted. Those were the days when to be popular with young men a girl must be shy. The couple is dutifully chaperoned by father and mother. Father looks as if he might be roguishly listening in on the young pair and mother seems to be telling him to read his book.

It is a happy family scene, as French as can be, painted in a charming grove with properly arranged trees and the inevitable marble pillar. The ladies are beribboned and bemuslined, the men bewigged and in knee breeches. The coloring of the painting has pleasing refinement, the composition opens up avenues of light in the foliage.

Bellecour painted this decorous betrothed French pair at a period when simple romance and graceful art-technique had not yet been invaded by the white light of scientific realism which was to destroy for the time being so many delicate *nuances* in life and art.

Arthur G. von Rambeau's *Meeting on the Lake*, with its obvious sentiment of the nineteenth century Teuton school, ends our brief ramble among love-paintings by nationalities. This picture is full of old-fashioned romance presented with Austrian fervor. The blond lady, whose voluminous pink gown and black lace mantilla are in striking contrast to the boyish outing costume of the modern girl, has evidently been taking her daily dozen as the rower of a little boat on the lake; so also has the swain wearing the jaunty Tyrolean hat.

The two boats with their mutually enamored occupants are drawn up side by side in a shady cove under the willows, while the lover clasps the lady's hand and seeks to look into her downcast eyes. The calm lake holds the shadows of the mountains in its clear depths, and the calm face of the lady is shadowed by a coy timidity.

We leave our pictorial lovers to the joyous preoccupations of youthful romance. Into the stern realities they have brought a few bright strains upon a theme as old as life itself.

Lovers in Famous Paintings

"The Intended" by Etienne Berne-Bellecour.

"... Bright strains upon a theme as old and as perennial as life itself."

THERE is another characteristic . . . . of this peculiar land. It is what is called toleration. It is the product at once of America's temper and her complex population. It has its finer side—its disinclination to persecute, its sympathy with manifold elements and opinions. It has its worse side—its carelessness and indifference to abuses. It has its worst side—the appeal to endure attacks upon the fundamental principles of American life and institutions under guise of "liberal" and "broad-minded" sentiments. Despite the assertions to the contrary, Americans tolerate many things which seem to many other people intolerable. Partly from good-nature . . . . partly, no doubt, from the fear of arousing the animosity of minorities bent on their own interests and ascendancy, Americans suffer certain evils which a more homogeneous people would resent and destroy—as they have done and are doing.—

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue:

Mr. Ford's Page this week discusses the phrase "in ıe long run." (p. 9)

This is a serious paper doing a serious work. But ·ious articles are not heavy, dull ones. They're the ıly interesting ones. They freshen and exercise the ind. A number of such articles appear in this issue. 'e don't hesitate to say to anyone—learned or un- arned—that his mind measurements will be stretched ıd his brain cells pleasurably exercised, his knowl- lge increased and his ideas of public affairs enlarged and alanced by reading *all* of the articles noted here.

A member of the Washington bar disperses the fog hich hangs around the Constitutional amendment elating to religion. That document says that *Congress* ıall not establish or prohibit the free exercise of religion. ongress, but not the States. It is left to the States to rotect or regulate religious liberty. (p. 3)

And Max Bentley's story ıkes us down to Texas, where ıey sell the golden fleece, ot according to Aaron Sa- iro's method, either! (p. 21)

When we seek justice we on't have to hire a judge or a ıry or a bailiff, but we do ave to hire a lawyer. And ıe quality of justice meted ut will depend somewhat on ıe quality of the lawyer. ıd that quality harks back o price again. Therefore, What price justice?" (p. 8)

I am not exactly sure hose attention to direct to Number One Logs" on p. 4—the plain citizen, who has nly indignation to use, or ıe forestry officials who can o something about it. Any- ay this is one of the few ımber articles I have seen hat really bite in.

We Americans rightly feel hat we are a straight, decent eople. But in South America 'e are regarded as crooked nd indecent. There's a eason. Things are being one in our national name that we would never allow in our personal names. Un-American, alien, international bankers use our name as a mask. If you want to know *why* we are distrusted in some countries, read the story which begins on page 7.

Of course the Indians have no appeal except to our consciences. And it is right that we be pricked in our consciences by such showings as are made on page 20. We liberated the Negro and still oppress the Red Man.

And then there are our dependent Samoans. The difference between the British and the United States Samoan brings shame to us. A British Samoan can come as a freeman to the United States. A United States Samoan is arrested if he leaves his island. Who is responsible for this stupid policy? (p. 13)

Censors will never be a satisfactory substitute for sense. The situation that calls for censors calls for something more drastic than censorship can supply. It is easy to go off half cocked on this subject. Tom Masson has some ideas that will bear threshing over. (p. 12)

Altogether in contrast with the above subjects, because altogether pleasant, is Mary Harrod Northend's article on The Wayside Inn at Sudbury. The writer is an antiquary of renown and the subject is "an ancient hostelry as any in the land may be," a combination which insures a delightful view of the old tavern. (p. 31)

This article takes us to the water, to Portland Harbor, where we see "The Gentle Art of Trawling." (p. 2)

And this story takes us afield with the katydid. Do you notice the excellent drawings by which Mr. Aaron illustrates his work? (p. 5)

Everyone should have his work for the world—the plus sign he writes after the work he does for a living—and Judge Henry Neil has his. It concerns those most important individuals on the planet—the children. (p. 24)

An island fisherman.

The Gentle Art of Trawling

By MAY B. WHITING

A TRAWLING trip is no place for a novice. All the island fishermen of Maine will tell you that. They will speak vaguely of the early start long before the break of day, of the tedious "laying by" or waiting, of the blazing sun, of the heavy swell, of the long hours of hauling in that mysterious region "way offshore" where they go. They will tell of the chilling fogs that roll in, of the sudden squalls, and of the necessity of finishing the day's work and getting the catch to market, no matter how great the discomfort.

Many an afternoon I have stood by the fish house door and watched the work of baiting. I have seen the frozen shad or herring taken from the barrels, sprinkled with salt, and cut into pieces an inch square. The trawls are 500 fathoms long with a hook hung every six feet, making 500 hooks to a line. As the trawl is baited it is coiled in a barrel with the baited hooks laid neatly in rows on one side when it is finished. Usually three or four men use the same fish house, and as they work they exchange stories of the wonderful catches they have seen or of who is the fastest baiter ever known in Casco Bay. I have often heard of an unfamed Houdini of the islands, who, by coiling his line first and arranging the hooks, could do the trick in sixteen minutes. Ordinarily it takes nearly an hour to bait a trawl, and each little boat carries at least four.

Many a time, at three o'clock in the morning, I have been awakened by hearing the punts scrape down over the rocks, followed by the rhythmic sweep of oars. Soon a swaying lantern appears in the harbor, and you hear the throb of the engine and know that the little boat with its solitary occupant has headed out for that alluring fishing ground "way offshore." I have seen, late in the afternoon, the boats return. I have heard the questions shouted across the water, "How did you stock this trip? Who's high liner now?" and wished that I might have seen, with my own eyes, the events of that long, long day.

In midsummer the forts in Portland Harbor sent out warning that there was to be target practice for a week and that the fishermen must keep out of range of the guns. There was some grumbling and a few of the rash ones went out just the same, only to return well humbled, for it is no light thing to be alone in a motor boat with shot splashing about your bow. But the ill wind of the fishermen blew me good luck, for my neighbor decided to set his trawls "inshore" whence it would be possible to come back to the cove and so break up the day, and I was invited to go along. That night as I looked at the stars I thought, "Tomorrow I shall know how you look, not arrayed for all the world, as now, but shining for just a few lone fishermen in the pale hour before break of day."

At half-past three I was stirring, and at four, when the punts began to scrape down the beach, I was on the bank, the chill wind of morning whispering discouragement in my ears. But once in the boat, with the cheerful "chunk, chunk" of the engine and the water rippling from the bow, there was all the thrill of a new adventure. The Great Dipper looked down queerly from an unwonted angle, and there was that uncanny stillness that just precedes the dawn. Ahead of our prow the point of Jewel Island rose dimly in the starlight. My neighbor felt the witching hour and began to tell some of the fisherman tales that never lose their fascination. The character of the region, half-legendary now, is "Old Man Chase." A generation ago he flourished alone on Jewel, a pirate and a horribly cruel man. All among the islands there are stories of skeletons found beneath his barn, of boats lured on the rocks by fires at night for their spoils, of strangers who visited the islands never to return, and of how, at night, his voice howls in the tempest.

By the time we reach the inshore fishing ground the stars have paled and dawn has risen. The fisherman sights a mark from the point of Jewel Island and the light on Half Way Rock, mid-distance (Concluded on page 23)

Entering the harbor.

This Is a Christian Nation, Not Atheistic

Says the Supreme Court of the United States

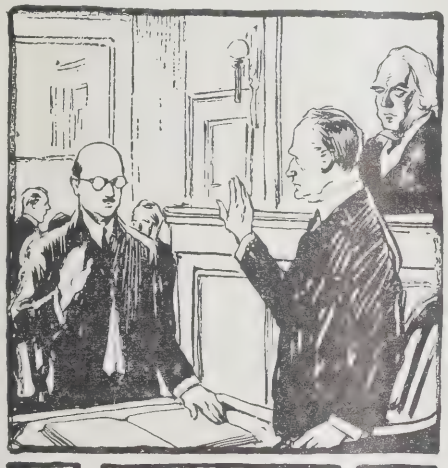
By IREDELL MEARES

ILLUSTRATED BY W. W. CLARKE

THE opinion is held by many persons that the Constitution of the United States protects citizens in their religious beliefs. The reverse is true. The Federal Constitution provides by its First Amendment that "Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof," but it does not prohibit the states to which, in the enjoyment of religious freedom, the people must look for protection.

The Supreme Court of the United States in a series of decisions has held that "the First Amendment, like others proposed and adopted at the same time, was not intended to limit the power of state governments in respect to their own citizens, but to operate on the National Government alone. . . . The power for that purpose was originally placed there and has never been surrendered to the United States. . . . . They left the authority of the states just where they found it and added nothing to the existing powers of the United States. . . . . The Constitution makes no provision for protecting citizens in their respective states in their religious liberties; that is left to the state constitutions and laws. Nor is there any inhibition imposed by the United States Constitution on the States."

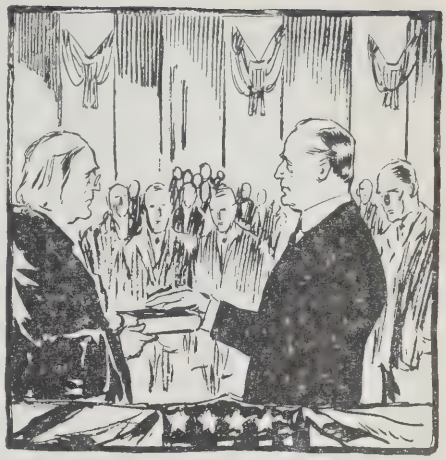
Permoli vs. First Municipality, 3 Howard, 609, United States vs. Cruikshank, 92 U. S. 552, and Turner vs. Williams, 194 U. S. 292, from which the above quotations are made, are some fifteen cases in which the Supreme Court of the United States has held that religious liberty is to be protected by the states, not the National Government, although Congress is prohibited from making laws "respecting an establishment of religion or prohibiting the free exercise thereof." Congress can make no law, therefore, establishing a religion or abridging the free exercise thereof, while the states might do either, if not in conflict with their constitutions. If Congress were to enact such a law, it would be in violation of the First Amendment to the Constitution of the United States.



The Oath

Leon H. Wittner, who is a clerk in the United States Treasury Department at Washington, where he has been employed for several years, has recently achieved publicity by bringing a suit in the Supreme Court for the District of Columbia vs. the Treasurer of the United States, and others, to restrain them from paying the salaries of Dr. Frank W. Ballou, the superintendent of public schools, and Professor W. P. Hay, head of the department of biology and chemistry, because of a clause in the appropriation bill passed by Congress, which prohibits the use of funds appropriated for schools in the payment of salaries to teachers, who teach disrespect of the Bible, and alleging that Dr. Ballou and Professor Hay teach and permit to be taught certain scientific studies, like the theory of evolution, which are in contradiction to the plan of creation, as contained in the Bible, and, therefore, in disrespect of that sacred book.

Mr. Wittner in a public interview, which appeared in the Washington *Post* of July 23, 1925, said he was "not an agnostic," but "I am an atheist. I do not believe in God or the Bible. Religion, in my opinion, is detrimental because it makes people dependent on worship and deprives them of their independence."



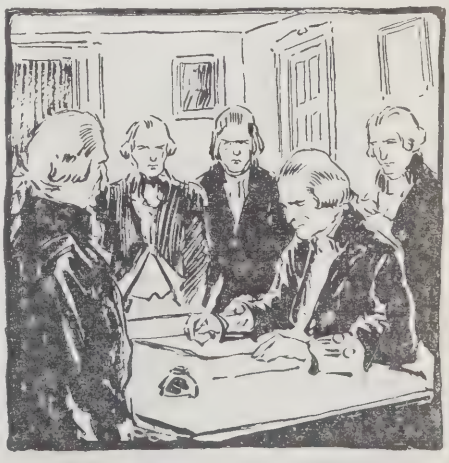
Presidential Inauguration

Why a man maintaining these views should be concerned about any teaching of disrespect of the Bible would be a mental puzzle useless to unravel in the absence of any personal interpretation of his motive. The question of motive, of course, will not be considered by the courts in deciding questions involved in the suit.

It developed, however, in an investigation by the public officials that Mr. Wittner each time he had received clerical appointments had struck from the required oath of office, which he signed, the words, "So help me God."

The fact may have been purposely or inadvertently overlooked, when the oath was signed and filed, and Mr. Wittner admitted into the government service. His attitude stated in public interview is that, "being a true atheist, I could not sign an oath containing 'So help me God.' It would demand that I lie." So, when taking and subscribing the customary oath, which all government employes are required to take, he strikes out the solemn appeal, but accepts his support from a religious nation, although repudiating the faith of its people in God.

The Will



Declaration of Independence

That this is a religious nation, so founded and so designed, is a matter of fact, and Mr. Wittner will probably find himself mistaken in saying "I do not believe any court would hold the oath constitutional for it virtually means that government workers must accept a definite religion—Christianity."

Compact with Columbus

This definition of the particular form of religion does not necessarily follow from the wording of the oath. The Jew can take the oath as well as the Christian or any one who believes in God.

The First Amendment to the Federal Constitution provides that "Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof."

"The full and free right to entertain any religious belief, to practice any religious principle and to teach any religious doctrine, which does not violate the laws of morality and property and which does not infringe personal rights, is conceded by all," says the Supreme Court of the United States in Watson vs. Jones, 13 Wallace 728.

But the "State has a perfect right to prohibit polygamy and other offenses against the sentiment of mankind, notwithstanding the pretense of religious conviction by which they are advocated" (Mormon Church vs. United States, 136 U. S. 49).

It has been expressly stated in Turner vs. Williams (149 U. S. 279) that an act of Congress prohibiting the entry into this country of anarchists is not an abridgement of the First Amendment to the Constitution. Yet, polygamy and anarchism are defended by their advocates as religious convictions.

The views of Mr. Wittner as a "true atheist" are not religious but are the negation of religion, not protected nor intended to be protected by the constitutions of this nation and these states, however freely he may be permitted to enjoy them as a personal right.

But, on the other hand, Congress has the power to prescribe, and has prescribed from its earliest history, the conditions upon which anyone may enter the service of the government, and that he shall sign and take an oath as a prerequisite is sanctioned by the law and custom of more than a century. Atheists are not excluded but exclude themselves from public office, if they cannot take the required official oath, but their personal right to think as they please is not abridged, because they cannot consistently qualify for the public service.

It will be interesting as well as informative to those who hold to the right to repudiate all religion and yet enjoy the official emoluments of the nation, which in conviction and practice is religious, to review the opinion of the Supreme Court of the United States and its elucidation of the subject rendered in February, 1892, in the noted case of "The Church of the Holy Trinity vs. United States (145 U. S. 227).

Congress passed an act (23 Stat. at Large 332) prohibiting anyone from prepaying the transportation or assisting in the importation of an alien who might be under contract made prior to his immigration to perform labor or service in the United States. Trinity Church contracted with a Rev. Mr. Warren, an alien residing in England at the time, to come to the United States as its rector and pastor. The wardens of the church were indicted in the Federal Courts in New York and adjudged to pay the prescribed penalty of $1,000 by the Circuit Court. The Supreme Court on appeal and without dissent reversed the decision on the ground that the intendment of the act included common or unskilled labor but not professional or ministerial services.

"We find," said Justice Brewer, who wrote and delivered the opinion of the court, that the title of the act and reports of committees "all concur in affirming that the intent of Congress was simply to stay the influx of cheap unskilled labor."

"But beyond all these matters," continued the court, "no purpose of action *against religion can be imputed to any legislation,* state or national, *because this is a religious people. This is historically true.*"

The court then proceeds to review the historical record, citing the Commission of their Majesties Ferdinand and Isabella to Columbus, prior to his sail westward; of Queen Elizabeth to Sir Walter Raleigh in 1584; the charters of King James to Virginia in 1606-1611; the compact made by the Pilgrim Fathers in the *Mayflower,* 1620; the fundamental orders of Connecticut under which a provisional government was set up in 1638-9; the charter to William Penn granted in 1701; and quotes from these instruments pregnant passages indicating the deep religious sentiments of the early colonists, their acknowledged faith and dependence on Almighty God, adherence to Christian doctrines, and high purpose to establish here a Christian nation.

"Coming nearer to the present time," continued the court, "*the Declaration of Independence recognizes the presence of the Divine in human affairs* in these words: 'We hold these truths to be self-evident, that all men are created equal, that they are endowed by their *Creator* with certain unalienable Rights, that among these are Life, Liberty and the pursuit of Happiness. . . . we, therefore, the Representatives of the United States of America, in General Congress Assembled, *appealing to the Supreme Judge of the world for the rectitude of our intentions,* do, in the name and by the authority of the good People of these Colonies, solemnly publish and declare. . . . And for the support of this Declaration, *with a firm reliance on the protection of Divine Providence,* we mutually pledge to each other our Lives, our Fortunes, and our sacred Honor.'

"If we examine the constitutions of the several states, we find in them a constant recognition of religious obligations. Every constitution of every one of the forty-eight states contains language which either directly or by clear implication *recognizes a profound reverence for religion and an assumption that its influence in all human affairs is essential to the well-being of the community.* This recognition may be in the preamble, such as is found in the constitution of Illinois, 1870: 'We, the people of Illinois, grateful to Almighty God for the civil, political and religious

The Mayflower Compact

liberty which He has so long permitted us to enjoy, and looking to Him for a blessing on our endeavors to secure and transmit the same unimpaired to succeeding generations, and so on.'

"*It may be in the familiar requisition that all officers shall take an oath closing with the words, So help me God,*" declared the court.

Then, the court cites the constitution of Indiana of 1816, as to the administration of oaths, which "shall be esteemed the most solemn appeal to God," and the Declaration of Rights and the constitution of Maryland, 1867, "that no religious test (Concluded on page 19)

Do You Know About Katydid?

Not Many People Know That Katy's Music Is From Fiddle and Bow

By S. F. AARON

Illustrated by the author.

"THAT thing," declared the professor of biology to his more or less attentive class during a field excursion in the early autumn, "is a katydid; one of the long-horned grasshoppers the family name of which is *Locustidae*. Those more truly called locusts, from long usage of the name even in ancient times, are the short-horned grasshoppers, the *Acrididae*, which share the distinction of being insect musicians."

The first and last statements in this profound commentary, from one too generally informed to be always especially accurate, are in error; the rest is all right enough. The large, green, pale-winged insect captured with some difficulty and brought to the instructor by one of his more enthusiastic pupils was not a true katydid, but merely a relative thereof, one of the many closely allied and generally similar species sometimes termed "false katydid."

These insects and the family of crickets (*Grillidae*) to which they are also closely related and of the same order (*Orthoptera*) are noted above all other invertebrate animals for their musical inclinations. They are played upon sound-producing organs attached to them, but none the less may be termed fiddlers from the manner in which the sound is produced.

Not only distinct as species are generally termed, but characteristically different in form and habits from all others of the long-horned grasshoppers, the accuser of poor Katy and its mate, which may be Katy herself, might be more correctly called leaf hoppers, had not that term been given to another group of bugs, for the true katydid is a dweller, solely, in trees of the denser woodland, knowing nothing of grass. In size also, a matter of bulk of body and breadth of wing, if not in length, it exceeds all other forms of our North American long-horned grasshoppers.

These horns as referred to are nothing more than the antennae which are the highly sensitive smellers and in these creatures the organs of hearing also. In one group they are exceedingly slender and longer than body and wings; in the short-horned grasshoppers they are club-shaped and rarely longer than the forelegs. The members of this latter family are the true locusts and properly so called; among the species are those that constituted one of the plagues brought upon the Egyptians prior to the Exodus of the Israelites and the same, or an allied form, along with wild honey, helped to feed John the Baptist.

These same kinds still swarm throughout Southwestern Asia and Northern Africa; a closely allied species is the famous Rocky Mountain locust of our western plains that from time to time has destroyed everything green in the regions of their migrations, compelling the farmers of Kansas and Nebraska to emulate the forerunner of Christianity.

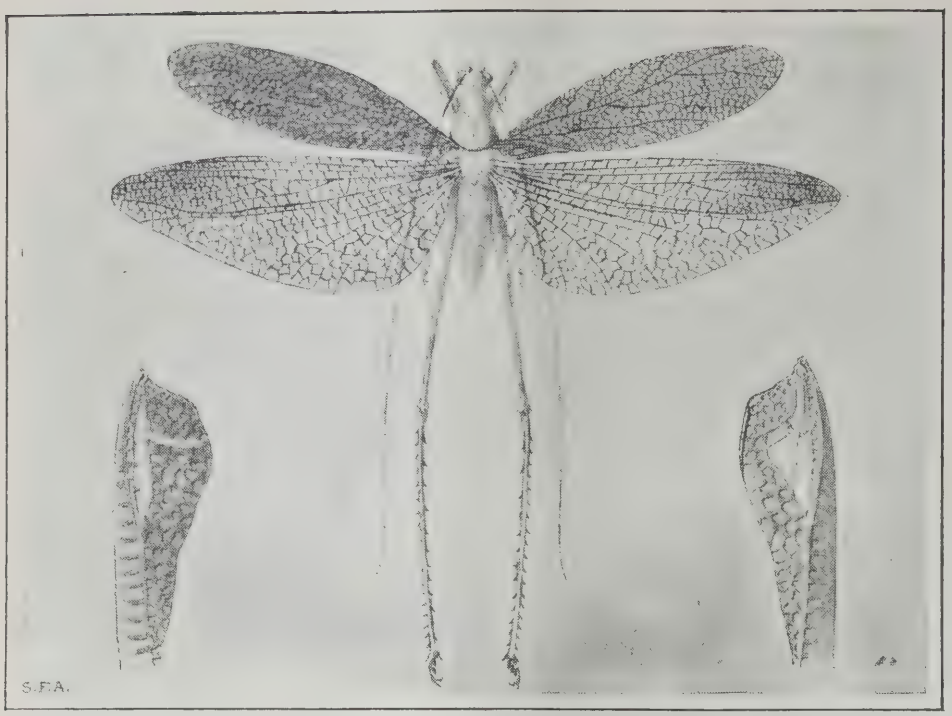
The professor's final assertion as quoted merely expressed a common error that has too often got into print. The Rev. Dr. McCook, of ant and spider fame, and Dixon and Eddy in a recent work are chief offenders. No short-horned grasshopper stridulates in any manner other than to make a cracking noise of the wings when flying; in no case do they scrape the spined shanks over their wing covers. These spines of the long tibiae are as sharp as briar thorns and are used entirely to insure a purchase against grass blades, weed stems or twigs when the creature climbs or leaps; they would instantly tear the wing cases to pieces even if these were designed for resonance.

Katydid and Katy. Upper figure is the male stridulating. Lower is the female, with wings extended, charmed and attracted by her suitor's serenade.

Among the musical insects of pronounced ability we must not overlook another species commonly called locust, but properly the *Cicada*—one of the sucking, true bug species. These large-winged, stout-bodied, swift-flying insects are castanet players, their instruments being resounding plates beneath their bodies, these clapping together to make a sound resembling a hurdy-gurdy. The dog-day harvest-fly and the seventeen-year locust are our best-known species.

The long-horned, leaping *Orthoptera* all draw the bow over a resounding surface and although they lack a knowledge and practice of the science of music as developed by civilized mankind, they can produce sounds more faithful to time and quite as pleasing to our trained ears as the Moro, the Bushman, the Zulu, the Eskimo and the American Indian. I would far rather listen to a sonorous katydid than to a Bornese tom-tom or a Singhalese fife. And again: no instrument invented by man can produce the volume of sound in proportion to size nor send forth a resonance equal to the fiddling of the katydid, nor can any vocal organs whatever. In actual comparison thus the roar of the lion would be a whisper.

It is not difficult to trace the sound-producing peculiarities of the long-horned grasshoppers and the crickets to their specific sources. From the manner of making these sounds it is natural that those of the two families bear a close resemblance. A first consideration is an easily discernible difference between the species of the one and



Above—The big angle-wing locust (male) flying. Also, upper sides of stridulating membranes, left wing with transverse bow, right with longitudinal ridge on inner margin. Below—Violins and castanets. (*a*) Membranous portion of the katydid's left forewing; underside. (*b*) Same of right forewing (upperside). (*c*) Portion of the katydid's forewing. (*d*) Portion of a tree leaf. (*e*) Underside of a *Cicada*, incorrectly called "locust."

the other; the long-horned grasshoppers possess but one color scheme; the crickets are any color but green.

Those forms of the latter most familiar to us are the black crickets of the hearth and other sheltered places; the little dusky grass cricket, probably the most numerous of all insects in fields, meadows and woodlands; the big, fat, round-backed cave cricket more common in crevices and crannies than we commonly know; the white tree crickets that are the authors of prodigious and rhythmical sounds; the white weed cricket, more lowly minded, persistent and even louder with its fiddling; the dark brown and long-bodied mole cricket named because of its subterranean habits and its broad, digging feet, a creature seen less than its low, harsh note is heard. There are others also, more rare, but none the less interesting to the specialist.

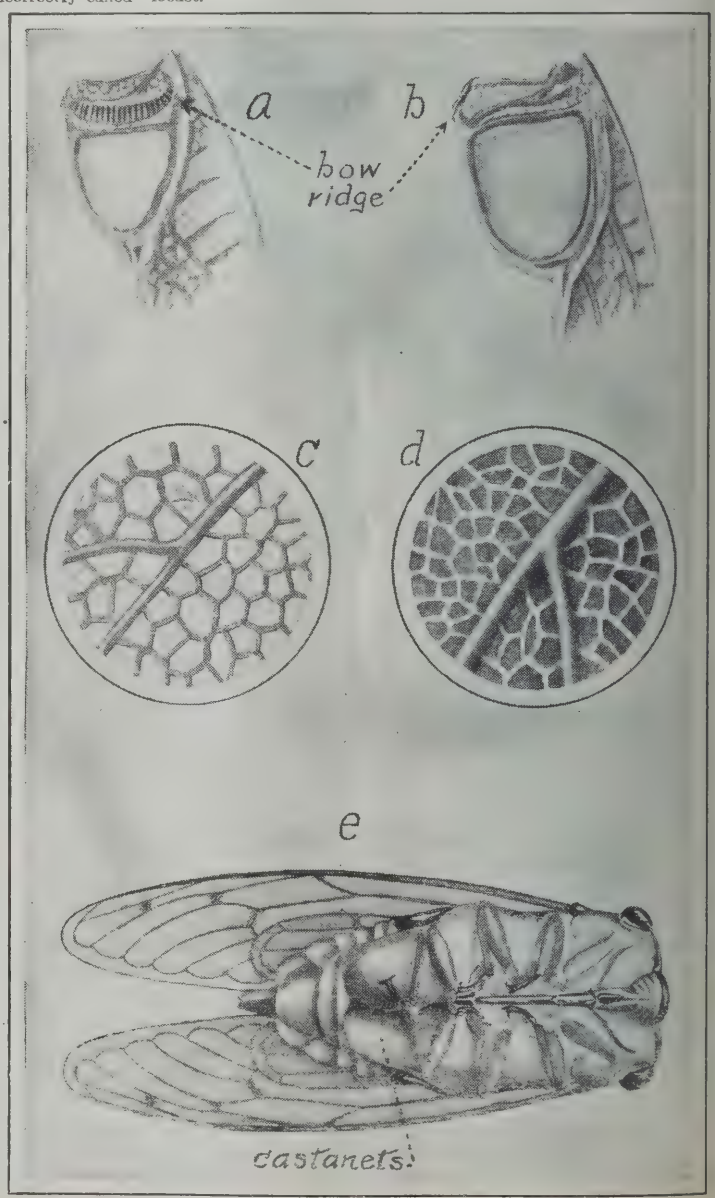
In the long-horned grasshoppers we note at once the constant characteristic of uniform green, even to the delicate veinings of the paler, transparent, fan-shaped and folding hind wings which are used solely for flying. These creatures are among the most extreme examples of protective resemblance; their wings closely imitate the leaves of the grass weeds and trees whereon they dwell, even to the larger and minute veinings as seen under a magnifying glass. The lowly field and meadow forms have narrow wings, those of the tree-loving katydid are broad and rounded.

We have the cone-headed locust which plays a tune on his fiddle that sounds like: *Brrrrrrrrip, Brrrrrrrrip,* oft repeated. The smallest is the vulgar locust, a name given because of its abundance. This insect fiddles its notes, *Zip, zip, zip zeeeeeeee, zip, zip zip zeeeeeeee,* with never-failing accuracy. The big angle-winged locust, most often called false katydid, stridulates like the sharp striking together of two small, glassy pebbles, continued ten or twenty times.

There are also several slender species generally known to scientists as Scudder's locusts, named after a famous entomologist; they play so softly upon such a high key that their performances are nearly inaudible to the human ear. They have, in common with all forms of life, nearly impossible scientific names. *Microcentrum retinervis* is that of the angle-winged species; *Conocephalus ensiger* is more plainly the cone-head. But self-preservation is Nature's first law and the average nature lover who has little time for the study of nomenclature and synonomy has every right to guard his jaws.

The fellow that accuses Katy has been long known as *Platyphillum concavum,* though I believe this name is to be changed for one having a prior application. Katydid will hold, however; no amount of renaming can affect that universally adopted cognomen and it is a fitting name. This insect is perhaps as often heard and talked of and less seen than any common creature large enough readily to attract attention. It nearly always occupies the higher trees, rarely coming within twenty feet of the ground, except in cut-over forests where it may be best sought by the collector.

The stridulating of all the long-horned grasshoppers and crickets is performed very simply by the rubbing of one forewing over and against the other, the basal portions being composed of wide, heavily veined membranes of transparent film, practically tympana of stretched chitine that are wonderfully resonant. The veins bordering these membranes are unusually heavy and bracing; it will at once be observed also that these sound-producing organs lie flat upon the back or dorsum of the insect and at right angles to the (*Concluded on page 18*)



Peaceful Penetration South of Us

Is the United States Becoming Imperialistic, or Is It Commercial Expansion?

By THOMAS ANTONY

WHEN the Allies were dividing the spoils of victory around the conference table at Versailles, the United States expected nothing, asked nothing, got nothing, nationally speaking. We had no thought of our own political or territorial aggrandizement. At the same time, we were *not* pursuing such a disinterested, idealistic policy in our own hemisphere. While we were battling the Central Powers in the interests of freedom and democracy, we were at the same time conducting a campaign of conquest in the Latin American and in the Central American countries.

Committed to Economic Imperialism

For some time past, unknown to the great majority of our citizens, we have been committed by both Republican and Democratic administrations to a policy of economic imperialism. This policy of expansion has been developed through the medium of commerce and trade—primarily through government loans by American banking interests wherein the bankers received the active support of our State Department, and of our navy when it was needed. But recently testimony was given before a subcommittee of the Senate Committee on Foreign Relations which sought to prove the following:

The moneyed interests of this country have found in Latin and in Central America unorganized governments, peon labor, and vast undeveloped natural resources. They found government officials, either corrupt or shortsighted, who have been willing to mortgage the future of their countries for a present mess of pottage. The most recent important development in this system of peaceful penetration is *the government loan.* The provisions of some of the loan indentures are so burdensome as virtually to make the borrowing countries vassals to American banking interests and their exploiting allies.

A cursory survey will reveal the dominance of the United States in the following countries:

In Cuba, the United States has a navy base. By treaty, we have the right of intervention, and the Cuban Government can incur no loans or dispose of no territory without the consent of this government. With one and one-quarter billion dollars of American money invested in Cuba, the commercial and the financial life of the island is largely dictated by absentee landlords and bankers located in America.

The situation in Haiti we will review later on.

In 1916, the United States, claiming that Santo Domingo had violated a part of the Roosevelt agreement, landed two thousand marines, without a declaration of war, and Admiral Knapp of our navy dismissed the president and the congress and declared the country under martial law with himself as military governor. Sovereignty was reinvested in the Dominican Government in 1923 after its having ratified acts of the military government including *three loans* negotiated by American officials, and an agreement to permit the United States to collect the customs and to administer the finances of the country.

Panama has been under the control of the United States since the Roosevelt Administration, with an agreement providing for the disbanding of the Panamanian Army, and for the taking over of any additional territory considered necessary for the protection of the Panama Canal.

In a speech on the floor of the Senate on June 19, 1922, Senator Borah, now Chairman of the Senate Foreign Relations Committee, said:

"We went to Nicaragua in 1910, I believe. In my judgment, we never had any sufficient reason for going. Nevertheless, we sent our marines there, landed them, took possession of the country, marched to the capital, killed some two hundred Nicaraguans, and placed in control as the nominal President of Nicaragua, a clerk or employe of a corporation of Pittsburgh. We maintained him there for a number of years, and he could not have remained in the capital of Nicaragua forty-eight hours, as seems to be conceded by every one, without the presence of the American marines who kept him there. He was a dictator of the Nicaraguan people, and made dictator by our navy, under orders from Washington.

In Honduras Marines Were Landed

"During the time that our created —so-called—president was President of Nicaragua, there was a treaty with Nicaragua proposed . . . At any rate, the treaty was favorably reported, was considered in the Senate, and finally ratified. I made a motion to consider it in open session, but the motion was defeated. It was considered in secret naturally.

"The treaty which we made with Nicaragua did not in any sense represent the expression of views or wishes of the Nicaraguan people. So far as Nicaragua was concerned, it was made by a government which we set up, which by force we maintained, and which did not represent the views of the Nicaraguan people at any time. We made an important treaty with a helpless people, a people under our military domination."

In Honduras, marines were landed for "the protection of American life and property." That is the formula used to justify military occupation in the foregoing republics.

Economic Control of Five Republics

The United Fruit Company owns and operates its own railroads, port works, and vast plantations in Honduras, which it appears must be protected by American marines at our taxpayers' expense.

Here, then, are five republics in which the economic control of the United States is backed by military forces on the ground.

Then there is a second group of countries composed of Peru, Bolivia, Colombia, Ecuador, and Salvador, in which the financial advisers from the United States directing the fiscal policies of the government have not yet found it necessary to invoke military occupation. Should the occasion arise, no doubt the precedent established in the case of Haiti and Nicaragua would be observed.

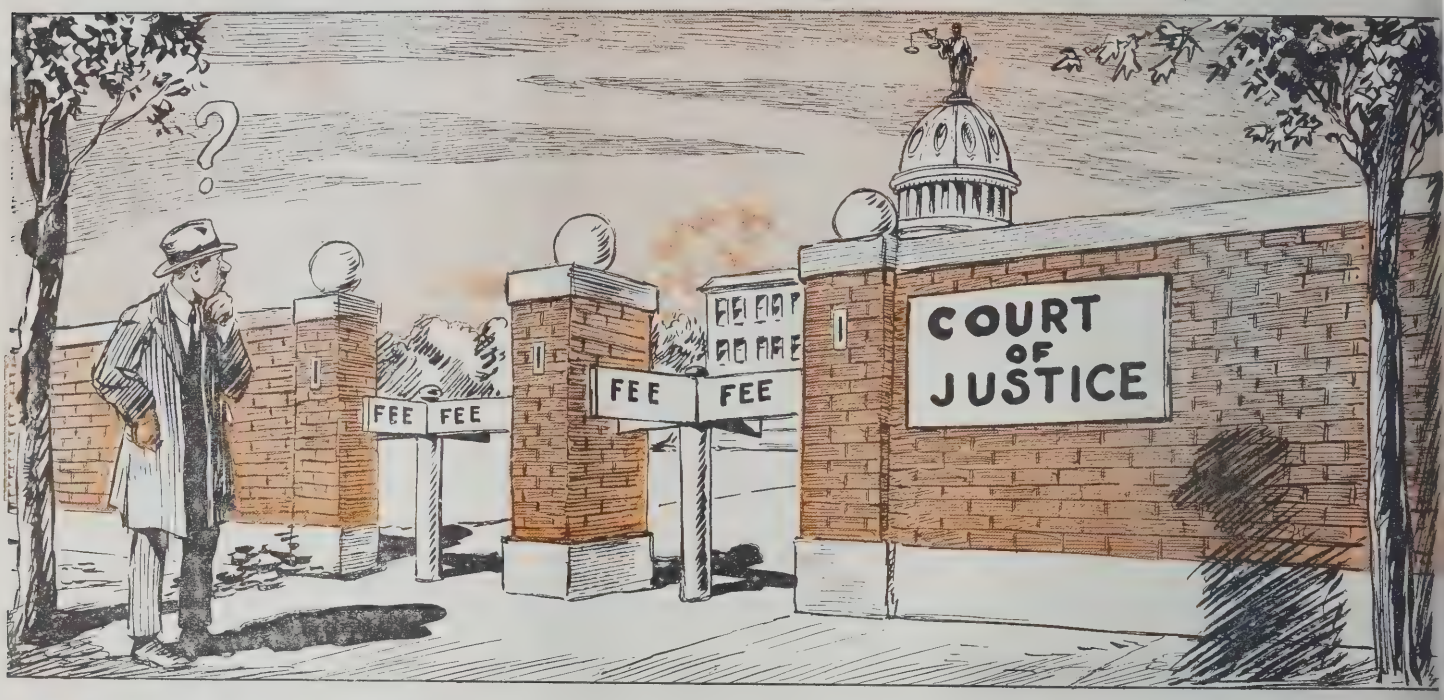
Bolivia obtained a loan of $24,000,000 from a New York banking syndicate which is secured by a first lien on the country's import and export duties, by certain internal taxes, by the stock in the government bank, and in a government-owned railroad. Additional taxes or revenues will be pledged for the loan provided the revenues of those already pledged are less than one and one-half times the amount required for the annual service of the loan. The loan indenture further provides that so long as these bonds are outstanding the collection of all taxes, revenues and income of the republic, will be supervised by a permanent commission of three appointed by the president, two of which will be upon the recommendation of the bankers.

There is a group of three republics: namely, Guatemala, Costa Rica, and Mexico, in which, because of large investments, American bankers and industrialists wield considerable influence over the economic life of the country.

In recapitulation, it will be noted that eleven foreign states have their financial policies directed by interests of the United States, and that in five of these countries the financial agents are backed by American military forces on the ground. In the six remaining countries of Paraguay, Uruguay, Chile, Venezuela, Brazil, and (*Continued on page 26*)

In Court—What Price Justice?

We Cannot Get Justice Without Paying a Lawyer to Get It. Why?



AMERICANS have nothing against lawyers. We raise more of them than any nation on earth. Besides raising them, we elevate them—government is largely the field for young lawyers looking for advertisement to assist them in building up a practice, and for older lawyers who need government office to enable them to look after the interests they serve. Government is a nest of lawyers, some of them intent on the public good, some of them intent that the public good shall not unduly trespass on clients' fields.

But that is not what stirs me up. The people who put lawyers in government can put them out, and as long as this is a government *by* the people, even if it is not *for* the people, I have not the slightest doubt of its security.

What puzzles me is the connection of lawyers with this quantity which we call Justice.

The laws are made to assure us of Justice, yet we cannot get Justice without paying a lawyer to get it for us. A private profession, with certain public privileges, dispenses a service, some of it able, some of it hopelessly incompetent, with fees commensurate (ranging from $250,000 down to $10), and we who seek the Justice of which the laws assure us pay the fees.

Now, what has been sticking in my cranium like an undigested thought is this:

The laws are *ours*; we pay for them. We pay a pretty stiff price each year to keep old laws in repair and provide new ones. Our law-bill has not been figured up yet.

The courts are *ours*; we pay for them. You would not think so to go into a courtroom, but the courts are *ours*, just the same. Not ours in the sense that we can bend the principles of justice to our desire, but in the sense that they are for our use.

Now, lawyers are styled officers of the court, but they are *not ours*.

We support the schools in which they are educated in the law. No lawyer ever pretends that he has paid for his own education. Even a millionaire could not pay the accumulated overhead involved in a law education.

We support the agencies that accredit and license them to "practice" on the tangles, perils and tragedies of humankind.

We build massive temples in which they practice their art; great Roman and Gothic edifices with marble and mahogany interiors, with robed Judges of their work, with clerks and acolytes of all degrees, with libraries and files and officers of authority, and sheriffs and police. No profession is so ornately provided with a noble environment for its work. Not even Doctors of Medicine, not even the Clergy of the Church.

The lawyer's very profession is *ours*, since we establish it.

But when we want to use these law things that we have paid for, we must pay for them again.

When something goes wrong with my water supply, I call up the Waterworks, and the matter is remedied, but I don't have to pay for it. The Waterworks is *ours*, and I have already paid for my share.

When something goes wrong with the sewer, and the proper department is notified, the repair is made without charge, because the Sewer Department is *ours*.

When the peace of the neighborhood is fractured, police appear to restore the broken order, but they demand no retainer and they send no bill, because the Police Force, being *ours*, is already paid.

But when something goes wrong with our Justice relations, and we appeal to *our* law in *our* court, we are told to *go and hire a lawyer*.

Why not go and hire a Sheriff?

Why not go and hire a Mayor?

Why not go and hire a Judge?

And if I am poor and have only $25, do I get $25 worth of Justice? No. I get no Justice at all. I get a boy who has studied law nights, who is glad to get into court to "practice," and he practices on me. The man who is creating Injustice in my relations pays a bigger fee and takes the Justice.

What Justice is there in making Justice depend upon the price that I can pay "an officer of the court," such as a lawyer is?

I have much more chance if I am a criminal. Suppose that I break a law. The policeman arrests me. I am haled into court. The Court says, "Have you a lawyer?" and I say, "No." So the Court appoints a lawyer. And oftentimes these assigned lawyers give a man a good defense and even get an unexpected degree of Justice for him.

But when a sharp trickster jeopardizes my interests in any way, and I appeal to the Court, I must pay the lawyer to use *our* law before *our* judges in *our* courts.

And, I must say, it is rather hard for me to understand.

MR. FORD'S PAGE

"IN THE long run" is a phrase much used when comparison is made of faulty short courses and solid long ones. That the results of right are longer coming, while the rewards of wrong may be immediate, is possibly a mistaken impression. Right may be no laggard and Wrong may be no speedster.

What is fundamentally true, however, is that right has a longer term, a wider circle, a greater endurance than any system of wrong can have. It lasts longer, goes farther and is the basis of men's ideas of the "perseverance of the saints." While admittedly the conception of right develops from height to height, the moral progress of the race shows that it is always right that merges into the higher right, it is never wrong that becomes right, never lie that becomes truth, never cheat that becomes honor. "In the long run" right bears away the victory.

The meaning of this is that the universe is self-protective. Included in that fact is the life of man. The duration of an evil course is fixed and a wrong tendency is sentenced to bring up in failure. The world is foolproof. Within human affairs, a purpose or an experiment is being worked out, Experience being the tutor, and the acquirement of experience producing that wisdom which some call righteousness, but which is simply knowing the way the universe works and coöperating with that way. Instead of morality being against the grain of the universe, it is so deeply ingrained in it as to make of morality, instead of a separate sphere, the normal tone of life.

"In the long run," however, goads some to impatience and others to indifference. The first assert that though the circle of right does come round at last, we shall all be dead before we see it. The others assert that human effort does not hasten nor delay the result. Both are right in that each follows its own angle of the problem.

"It is the part of wisdom to take the world as we find it, not always to leave it so" is a saying of Confucius which has application here. The world is what it has been made, it will be what it can be made, the natural proviso always being that it must be made a better world.

RIGHT courses come more swiftly into their own than formerly and wrong courses are more immediately detected and headed off. The reason is the accumulated experience of the race. It is not necessary now always to repeat the tests of bitter mistakes. Ideas root more rapidly; understanding is swifter and deeper. "In the long run," which expressed faith in the ultimate triumph of right, is not as long as it used to be. The processes of righteousness have gained momentum. While swifter than they once were, they are slower than they will be. Humanity is moving toward the point when perception of right will be immediate.

And here comes in what may be called another law, that of human momentum, which gives the phrase "in the long run" a speedier proof than formerly. For knowledge is increased and principle more swiftly operative than ever before. Ideas of right action which formerly required a century to develop in the national mind may now be planted in a day and harvested in a week. The detection and stoppage of evil is a more instant possibility. Accumulated experience suppresses more wrong courses in proposal than it used to suppress in bitter final failure. We may not use the terms "right" and "wrong" as much in the sense of moral conscience based on moral precept, but we use them more as terms of wisdom and unwisdom based on natural law. Right and wrong have a meaning in railroading as well as religion, in mechanics as well as in morals—with the former holding the more successful compulsion on the thoughts and acts of men.

Reformers who cannot wait for "the long run," and those who see the light but feel they should not suffer until "in the long run" the rest of humanity sees it, have both been taken care of by the universe. The first fulfills himself and finds his joy in efforts to shorten the cycle of truth's acceptance. The other finds a niche in life which permits him to live in one world while inhabiting another. He who sees is already emancipated. Vision is liberty. How can you liberate the multitudes until first they are made to see, and how can they be made to see until they are awakened, and how can they be awakened until they have begun to feel the suppression of life which indicates they have outgrown one form and are ready for another?

The long view is for faith but even the short view gives assurance, for the segment of the circle shows its arc. Wherever one looks today, at however small a portion of the circle, he sees life turning away toward the right, and on every hand in trivial things and great the prophecy of progress is toward the desire and vision of life. Antagonisms, competitions, oppositions, are the other halves of development. And it will continue so, for when we emerge from the contest between the evil and the good, we shall cross the line into the sphere of a higher contest, but one more suited to the native qualities of the human spirit, the contest between the good and the better.

EDITORIALS

The Way of the Substitute

IN 1922, Canada imported from Wales 166,427 tons of hard coal; in 1923, this amount rose to 240,303 tons; in 1924, to 273,433 tons; while, for five months of 1925, an even larger rate of increase was maintained. America exports a large quantity of hard coal to Canada. American anthracite can be retailed in Montreal for $15.75 a ton against $16.50 charged for Welsh coal. In spite of this fact Welsh coal is steadily gaining in favor. Dealers in this coal claim that there is more heat in one ton of Welsh coal than in one and a quarter tons of American anthracite, that it is a cleaner coal and, in every way, better value for the money. Obviously, a large number of Canadian people are already persuaded that this is the case.

Competition is keen, and now comes the strike. If a prolonged stoppage of work in the American anthracite mines should cut off export to Canada for any considerable time, an even larger number of Canadian people will get into the habit of using Welsh coal. As a well-known financial paper remarked, recently, "when people learn to use a substitute for something to which they have previously been accustomed, they are apt to continue the use of the substitute."

The possibility of losing the Canadian market altogether, as a result of the present strike, ought at any rate to be envisaged by American coal operators and miners alike.

Simplifying the Currency System

AFTER a futile attempt to abandon the one-dollar bill and substitute the heavy silver dollar, the Treasury Department is now engaged in an effort to increase the output of two-dollar bills and decrease the number of ones. This is advocated as a measure of economy, the claim being that the cost of supplying currency is the same per bill, no matter what its denomination.

Such an argument is fallacious, since increase in supply does not increase in proportionate cost per unit. That is, it cannot cost a cent and a quarter each for the printing of two thousand bills of one denomination, from the same plate, if that estimated cost is based on the printing of one thousand bills of another denomination under the same conditions.

Most business men will agree that the two-dollar bill is a nuisance in trade. It requires an extra till in the cash box to separate the different denominations, and saves nothing in the matter of change, for two ones are not cumbersome, five dollars in ones requiring but two more bills than are required by two twos and the necessary one to make the five.

Expense could be saved by ceasing the issue of large denominations of currency notes, the thousands and multiples which are never utilized in trade, being held in bank and other reserve vaults. While the cost per unit must far exceed that of a single dollar, the preparatory cost of engraving and make-ready is the same whether one or ten thousand bills of the single denomination are issued.

"Americanizing" German Industry

A STRANGE thing is happening in Germany—a thing that should be of interest to millions of Americans who went into war reluctantly, but for an ideal, and who emerged with a doubt.

Pre-war Germany had been dominated by two iron-handed concepts. One, the theory of Princes that a little bloodletting now and then was good, a thing to be desired, a strengthener for a people. The other, a conviction that superior industrial culture existed in the Fatherland, a mechanical excellence which, combined with the various "according to plans" of the German commercial organization, would lead to world domination. The German sword had but to strike, and the German superior industrial and commercial intelligence had but to "mop up," and the battlefield was theirs.

But the strange thing now happening in the land of supposed industrial genius is this:

A deliberate movement is on foot—and fostered by the government—to "Americanize" German industry.

They know very definitely what they mean by this. They mean the using of common-sense labor-saving methods. They mean the adoption of the short-cuts which Yankee ingenuity has discovered.

Viewed from a pre-war perspective, this is an odd situation. A dozen years ago we sent engineers to Germany for a final education. German efficiency was a postgraduate course in many lines. But Germany goose stepped herself into a mechanical decline. War has taken ghastly tribute, the seven lean years have followed and still they travel a course that is a good ten years or more out of date.

A part of the economic rehabilitation plan, to be attempted with the new tariff laws this autumn, is an "anti-trust" campaign. It is not quite such anti-trust activity as we have known

that is contemplated, for the "octopus" is of a different breed there. Germany has not sought the economies of huge industrial structures which carry a process all the way from raw material to finished product. That is a natural thing; as natural as the process of digestion. But Germany has tried to "legislate" economic prosperity into existence by a series of industrial governing bodies. So-called "syndicates" of manufacturers, small and large, in a given line set prices, both domestic and foreign, and endeavor to give a false stability to an entire industry.

Perplexed by her many war-made difficulties, Germany is beginning to make matters worse by restricting production and increasing the margin of profit on each article produced. This is essentially anti-social; and not unlike the syndicate-rule Germany has heretofore encouraged. And all of this is very similar to the card house of false marks which tumbled about German ears with such disastrous results.

The German General Staff plans were perfect, but failed for lack of accurate weighing of the human equation and because "pure reason" lacked adaptability. Some such weaknesses are being found in the programs of the industrialists of Germany which were so perfect on paper.

Glamour

AN ENGLISHMAN stood with his American hosts on rocks at the highest point where Storm King Highway cuts a notch in a mountain and offers a lordly view of the Hudson and of West Point.

He had arrived that morning, and instead of "rubber-necking" New York his friends had taken him for a country drive. They had known him abroad: but it was his first trip to America.

"Why," he asked, "did you not tell me about this? Why did you not tell me that America is so beautiful? You Americans are a queer lot; if you want to tell us something about your country, you talk about your tall buildings—and your plumbing."

And at about the same time, James Oliver Curwood was finding respite from novel writing in European travel. He looked it all over with a kindly appreciation, but as his trip was about ended grew hard-headed about his observations and gave a newspaper correspondent an interview.

We slop over about Europe, he thought. Like parrots, we chant praise of natural beauties which can be out-matched in our own country. We see as "magnificent spectacles" views which would be dwarfed by bits of our own land. Altogether, Curwood seemed to think, Europe is a vastly over-rated place and ourselves a herd of sheep.

"All America," said another writer, "seems on the point of embarking for Europe. But we shall not always traverse seas and lands with light purposes, and for pleasure, as we say. One day we shall cast out the passion for Europe, by the passion for America."

That was written a good many years ago, by Emerson. The day forecasted has not yet come.

Can it be that we are afflicted with mental blind spots; which permit us to see the glories of Europe, but blot out for us everything American, excepting only skyscrapers—and plumbing?

Test of a Scholar and Gentleman

IT WAS told of Socrates that he went about Athens asking simple questions which pricked the bubble of conceit in her most prominent citizens. And they killed him for it.

So you cannot turn to a Socrates if you feel that know-it-all feeling stealing over you. There is no ugly, graybeard assigned to the job of wholesale gadfly in these modern days.

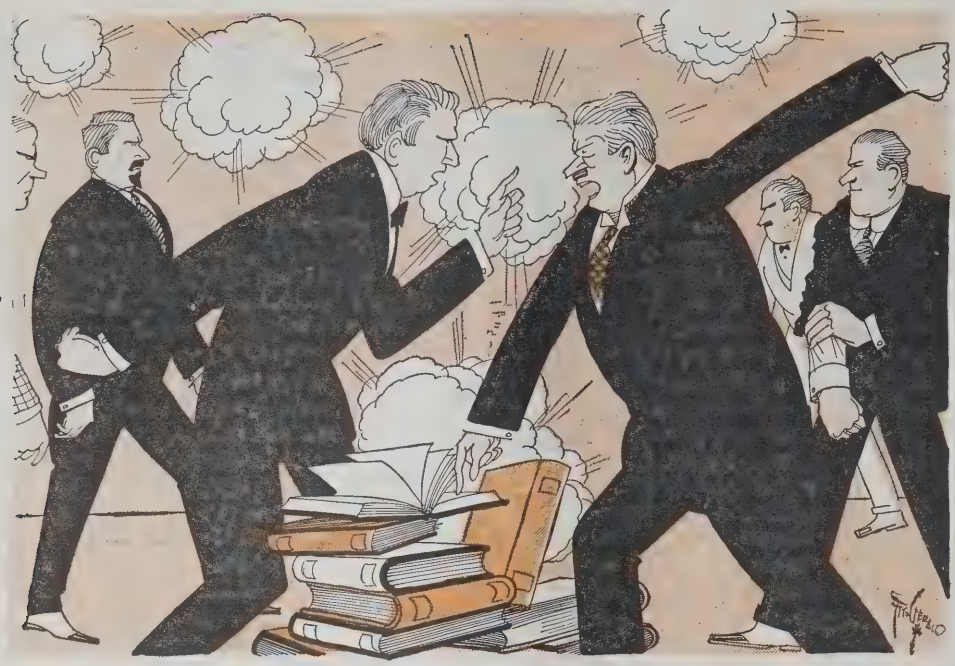
But there is a sure cure for any superiority complex which you may be harboring:

Take an eight-year-old boy into a museum of natural history.

If you can answer even half of his questions you are a very learned man. If you can answer them patiently, you are a gentleman. And if you can do both and emerge from the ordeal with humble appreciation of the clear-eyed logic that guides the boy's racing mind, then it may almost be said that you had reasons for your pride.

Drying Up the Springs

THE Roumanian Government has had to issue half a billion units of paper money in order to pay bills that ordinary taxation was insufficient to cover. The bulk of the government revenue of Roumania is derived from an export tax upon wheat and this tax has been boosted so high that the producers find it impossible to pay sales, transportation and other export costs and sell their wheat abroad in competition with wheat from Canada, the United States and the Argentine. This enforced stoppage of wheat export has dried up government revenue from that source. This illustrates the possibilities of all taxes upon productive factors of every country, whether upon farmers or industrialists. Politicians have an idea that producers can be taxed to the limit without stopping production, but there is a point, as Roumania has found, where it is impossible to produce and sell at a price that will satisfy the tax gatherer and every other charge that must be met.



"Few people have any idea of the great battle now on between the censors of so-called 'wicked' writing in general and the anti-censors."

Is Common Censorship Common Sense?

Many Books, Many Minds Is the General Rule

By THOMAS L. MASSON

ILLUSTRATED BY WILLIAM O. FITZGERALD

FEW PERSONS have any idea of the great battle now on between the censors of so-called "wicked" writing in general and the anti-censors. The coming struggle may be fully as important in consequences as the fight for prohibition.

The trouble is world-wide. Recently the Paris authorities (and certainly Paris is not notorious for being strait-laced) have suppressed a flood of indecent books and pamphlets, and practically in every world city the same difficulty has presented itself. In 1923 President Millerand expelled from the Legion of Honor Victor Marguerite because of his book *La Garconne*. In January of this year bookstores in Hungary were raided by the authorities. It is significant of this widespread movement that Russia is the one exception, or rather Russia doesn't agree, for in June, 1924—in contrast with the strong religious undercurrent apparent generally in censorship—all books affirming God were banned by the Russian censors!

In this country, as I shall show by the record, the clouds have been slowly gathering. The whole question upon its face appears to be a very simple one. In reality it is very complicated and covers practically the entire field of human nature, precedent, tradition, and law and history.

What is proper and what isn't?

Who is a genius and who isn't?

Who shall be the judge?

How far does literature, good or bad, influence life?

What does freedom of speech really mean?

These questions, and many more like them, rise to the surface at once in considering this whole matter. Censorship has always existed and always been denounced. Carried to its limits, it ends in tyranny. On the other hand, physical acts have to be restrained. People in general have to be decent and orderly in their acts or they will be punished. The censors of our current literature claim the same law for mental acts. They say that thought precedes action and if a writer is allowed to publish anything he pleases, his improper writing may cause more damage than if he went out with a gun and shot people up.

The most famous beginning case in modern literature is the case of Gustave Flaubert, who, in 1857, wrote or published *Madame Bovary*. This book was undoubtedly the precurser of all our so-called realistic literature. Flaubert was tried in the French courts, and eventually vindicated of indecency. The book has since become a classic, indeed, a model which has been followed by many succeeding writers (Would it be too much to declare that the great Thomas Hardy is one?) and can be bought anywhere.

Nevertheless, other classics have recently been suppressed. On October 1, 1922, the publishers, Messrs. Boni and Liveright, of New York, filed a damage suit against J. S. Sumner, of the Society for the Suppression of Vice in New York, for allegations against *The Satyricon of Petronius* which they published in a new edition. Previously Mr. Sumner had attempted to suppress this book.

The Society for the Suppression of Vice in New York dates back to its formation in 1873. Anthony Comstock was its first president and for many years was probably the most cordially hated and certainly the most ridiculed official in the United States. He was succeeded in his practical activities by the present secretary, John S. Sumner, who has likewise been held up as butt for clever writers, who have defended the cause of literary freedom.

The most notable beginning case in the recent history of this country was shortly after Theodore Dreiser published his book, *The Genius*, in 1915. This book was suppressed, and the case thereafter thrown into court. My friend Joseph Auerbach, himself a distinguished essayist, defended Mr. Dreiser. Many eminent critics were brought into court to testify that Mr. Dreiser's book was a work of art. It was later reinstated, and only last year a new edition was issued, without any stir. Indeed, this book of Dreiser's now seems quite tame compared with many books since issued.

"This country has been and now is afflicted with a flood of deterrent literature—so called."

There are three channels through which writers reach the public, namely, motion pictures, drama and printed material of all kinds issued in books, periodicals and newspapers. So far as the motion pictures are concerned, their censorship is a separate history, characterized by general stupidity and which in many cases is ineffective. Not the least factor entering into this censorship are the divergent laws in the various states.

So far as the other two channels are concerned, they (Continued on page 28)

Pago Pago harbor wireless mast, highest in the Pacific. In direct communication with San Francisco, four thousand miles distant.

"Neither Fish, Flesh, nor Good Red Herring"

Americans Who Are Not Permitted to Enter America

By WM. LEE CALNON

"THE man without a country" has long been famous in fiction, and now and then a stray case comes into the limelight of public attention. Unless he happens to be a fugitive criminal, such a man generally is able to settle somewhere and acquire citizenship and a flag to follow.

But out in the middle of the Pacific Ocean, in the heart of the tropical South Seas, the Congress of the United States has left for the past quarter of a century an entire people practically in the position of the man without a country.

The American Samoan (8,058 of him, according to the 1920 census) both has and has not a country. He has five habitable islands, one so small that scarcely anyone lives on it permanently. In the sense that in the particular place to which he is native he has a place to live, he has a country. Otherwise he has not.

His islands are domestic territory of the United States, not foreign territory. Were they foreign territory, the Samoan could get a passport and visit American territory, or, if he desired, he could forswear allegiance to his native place, apply for citizenship papers and in due course become an American. But as it is, he owes allegiance to the American flag, but is not an American. He cannot visit the United States. If he should own a ship he could fly the Stars and Stripes on it, but he could not obtain American registry for it.

The anomalous position in which the American Samoan is placed is the result of the fact that Congress has not extended to the islands the Constitution and laws of the United States. Neither has it taken the trouble to give them any kind of political status since the year 1900, prior to which Samoa was an independent nation.

In an official report of Captain W. Evans, governor of American Samoa at the time, that is dated May 1, 1921, and is the latest report in print, these facts are brought out as follows:

"It will be noticed that although England and Germany renounced all claims to the islands of American Samoa, the United States did not necessarily thereby acquire sovereignty over these islands, for their independence had hitherto been recognized by the three powers. However, on April 17, 1900, the chiefs of Tutuila made a formal cession of their island to the United States, and on July 15, 1904, the chiefs of Manua recognized the authority of the United States over their islands. These cessions were never acted upon by Congress, but they were accepted by the President, letters and presents being sent in acknowledgment.

"In 1903 full information as to the conditions in American Samoa was furnished to Congress, but that body failed to legislate for the islands and has never defined their political status.

"By decisions of the various departments rendered from time to time the following points as to the status of American Samoa are established:

"It is not foreign, but domestic territory.

"Customs duties may be collected in the United States on goods shipped from American Samoa unless they are certified to be products of the islands or goods on which duty has been collected in these islands.

"The same customs duties may be collected on importations from the United States as on importations from other countries, in conformity with the convention, Article III.

"Samoans are not 'citizens of the United States,' but owe allegiance to the flag.

"Vessels owned by Samoans are not entitled to registry, but are entitled to fly the flag.

" 'Neither the Constitution nor the laws of the United States have been extended to them, and the only administrative authority existing in them is that derived mediately or immediately from the President as Commander-in-Chief of the Army and Navy of the United States.' (Opinions of the Attorney-General, Vol. 25)."

Except in one way that is open only to a limited number of young men, a Samoan cannot become a citizen of the United States *while he stays in the islands. Yet he cannot leave the islands* without a special permit from the governor and cannot even go from Tutuila to the Manua group (Ofu, Tau and Olasega) or vice versa, without a permit from the governor.

The one way in which some young men can become American citizens is by joining the navy. Most of those who enlist do so in order to have the chance to become citizens and some of them get a chance to see something of the world on board warships. Others are kept in the Pago Pago naval station as members of the "fita fita," or native guard.

Dancing the siva-siva in the public square, Pago Pago.

The half-caste in the islands is a citizen of nowhere at all. The Samoan can own land and does own all but a small amount of "freehold" property. The half-caste cannot own land unless he is able to acquire a little of the "freehold." A half-caste young man might obtain standing by joining the navy. A half-caste young woman cannot do that; she generally refuses to marry a Samoan and has slight chance to marry a white man.

In Western Samoa, which is under British control and *(Continued on page 18)*

Fellers beginning back cut in six-foot Douglas fir.

Buffalo Cowhides and Number One Logs

By F. J. CLIFFORD

"I HEAR the McKay gang are out after buffalo and just skin out the cowhides. First thing they know—and it'll likely be too late—there won't be any buffalo left."

So remarked one bison hunter to another back in the seventies. A strangely similar remark was heard by the writer a short time ago in the Snoqualmie country of the Pacific Coast, when one professional logger said to another:

"I heard somebody say the 'Garrison' outfit is going to log in south of here and take out only No. 1 logs. The people round here will wake up one of these days when it's too late and find there's nothing to log."

By careful inquiry (the logging companies do not approve of their employes giving out promiscuous information) I learned that No. 1 logs constitute about thirty per cent of what is "considered" worth taking off. This includes mighty few small logs of a foot and a half in diameter, except of cedar. There is, therefore, a large amount of useful timber left on the ground to rot and burn when "only No. 1 logs are taken out."

To my question a red-faced timber cruiser replied:

"The logging company must figure they stand a better chance of making a profit by taking out that class of timber. There can be no other reason.

"You want to remember this," the timberman continued earnestly, "the logging game in this big-timber country is one of the most desperate undertakings that men can engage in. In the old days all that was necessary was a gang of bulls, a carload of hay and some chain and they were ready to log. The cash outlay for that sort of thing wouldn't pay for the road surveying that has to be done now before a single log is cut.

"Look up there," he pointed to a tree-clad mountain. "It's about a mile up to the edge of the uncut timber where the smoke is, but it takes five miles of switch-backing to get there. That smoke is from a 'donkey outfit' that cost $70,000 and that doesn't include the 'sky line' and other rigging.

"To get properly 'rigged' for logging in this country, a company must have a quarter of a million dollars of ready money, or its equivalent. And once the money is sunk into a logging outfit, the company has got to keep a-going. They can't quit. If they did it would ruin them. When a rig is not working, men have to be hired to watch it. Then there is the depreciation and interest on investment to figure in. But the worst feature of all is fire. That thing may occur any time during the summer or autumn. More than one logging outfit has been lost that way. Consequently, insurance comes high, especially with an idle rig.

"What's the result today. The 'water's full of logs' (which means that the market is glutted). No. 1 logs are worth $20 a thousand. Cheaper grades will sell for $10 or $12. At that price the company barely breaks even.

"There was a machinery outfit that came out with a rig to handle anything down to eight feet in length and eight inches in diameter." My informant mused thoughtfully. "The thing was being boosted at a lumberman's convention some time ago. A great number of operators were getting interested and began asking questions as to price, et cetera. But the whole thing was knocked into a cocked hat when an old Scotsman got up and remarked with deliberation:

"'Gentlemen, that apparatus will do everything they claim for it. I can vouch for that as we tried one out. But it has one vital weakness.'

"'What is it?' one or two asked, as the old logger hesitated.

"'Well——' the Scotsman remarked ruefully, 'we went broke at it.'

"That settled that idea," said the cruiser as he tossed a partly burned cigaret to a bare spot on the ground. (Strange that smokers are not taught to rub their cigarets out before throwing them away.)

My informant sauntered away and a lumberjack in rough, pitchy clothing and spiked boots stepped up to me and said:

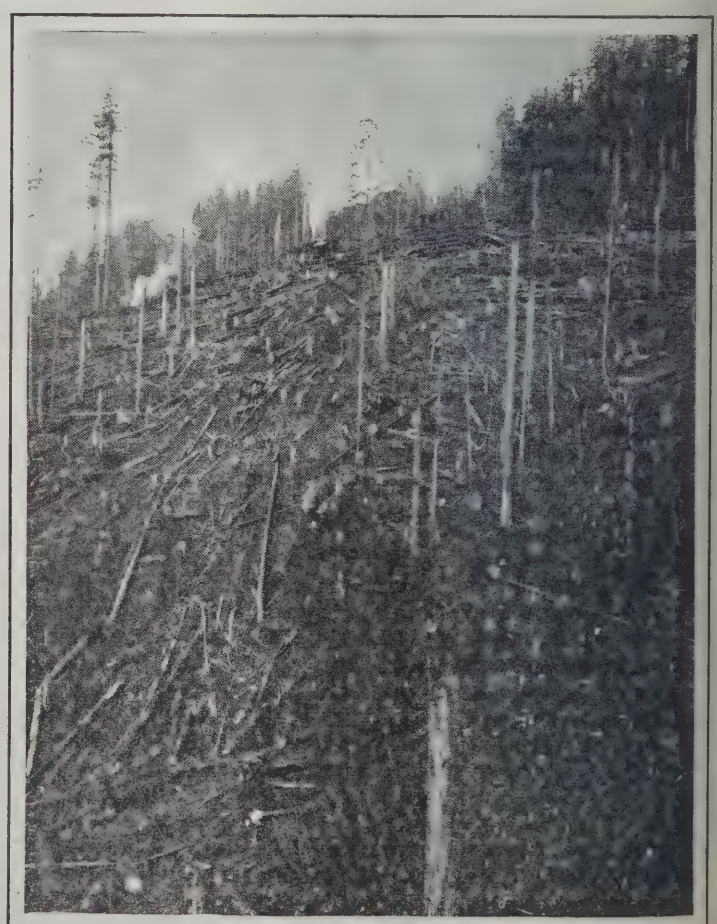
"That timber-hiker didn't tell you all by a long shot. Up there well to the south of that mountain is a lot of big logs. Look close and you'll see them. Well—right there is *three million feet of abandoned logs.*"

"Abandoned logs?" I questioned incredulously. "They will take them out before they quit."

"They can't do it," the logger replied. "The track has been all torn up from that position."

"What is the reason for it? Why are the logs left there?" I asked.

"Blamed if I know," the lumberjack answered. "I did hear something about the logs being too hard to get at. It might have been the 'sky line'



When the logger has finished—a typical "clean job."

wasn't long enough. They were bringing the logs over a 3,400-foot stretch as it was."

Three million feet of Douglas fir and western cedar left to rot and burn—and our forests are fading away five times faster than new growth is replacing. Three million feet of beautiful trees that were growing when Columbus started his voyage of discovery. Three million feet of the Great Creator's handiwork laid low by mankind because—it was too much trouble to get it out.

1—Climbing the spar-tree. 2—Beheading it. 3—Off it goes. 4—Done. 5—"All set."

It is within the power of our forestry officials to withhold the sale of timberlands until the lumbermen utilize every stick that will make a board six inches wide and eight feet long. The time will soon be here when they will be compelled to do it by sheer necessity. Why not do it now? Germany utilizes the tree down to the size of the finger. Japan uses it to the little twigs, and China uses it to the tiny roots—when she gets the chance. Must Americans get down to eating rats and mice before they comprehend economy?

Economy in the use of the timber supply is just as necessary as economy in the food supply; one shelters the body, the other nourishes it.

To cope with the fire hazard in our lumber woods, the logging companies employ "fire bosses" and "spark-chasers." They watch around the donkey engines and follow the loaded logging trains down the mountain. With each flat car carrying from six to ten logs, two to six feet in diameter and forty feet long, the squealing brakes become red-hot. Sparks are thrown by them and have to be watched lest they ignite the debris along the way.

Then there is the ever-present cigaret. It's use is strictly "prohibited" when the men are up in the timber.

"Each man is allowed *two* smokes," the "fire-boss" told the writer. "The first that he is caught with and the second that he is fired with."

But after scrambling to the top where the "hi-rigger" and "hookermen" were working, the first thing I noticed was a half-burned cigaret on a log! Near a coat was another! After sizing me up, one of the men pulled out a fag and lighting up proceeded to smoke. A man to the left and one below us did the same.

When the foreman walked by I expected to see something happen. But it didn't. To my guarded inquiry about it he gave a shrug of the shoulders and a knowing smile.

The majority of man-set fires are caused by the tailor-made cigaret. It is one of the potent reasons back of the smoke-filled air that hides the wonderful scenery which tourists come hundreds of miles to see.

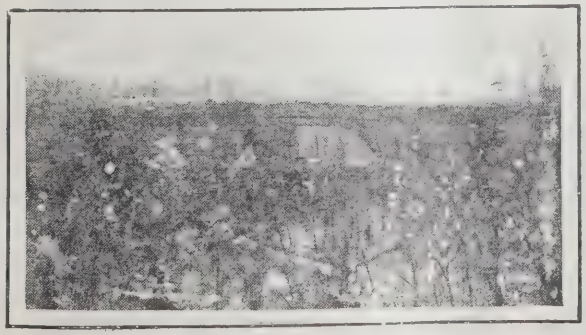
"We are well aware of the destructiveness of modern logging methods on the Coast," continued the forestry man. "But show us a better way. We are always open to suggestions. Our timber here is on high rough mountains. The high-line seems to be the only economical way of getting it to the cars."

Which is all true enough. But—*just as long as our government officials are able to dole out huge blocks of choice timber at $2.25 a thousand—a more economical method will never be used.* That is morally certain.

The brakes should be applied in this race to timber famine. Future generations ought to be considered.

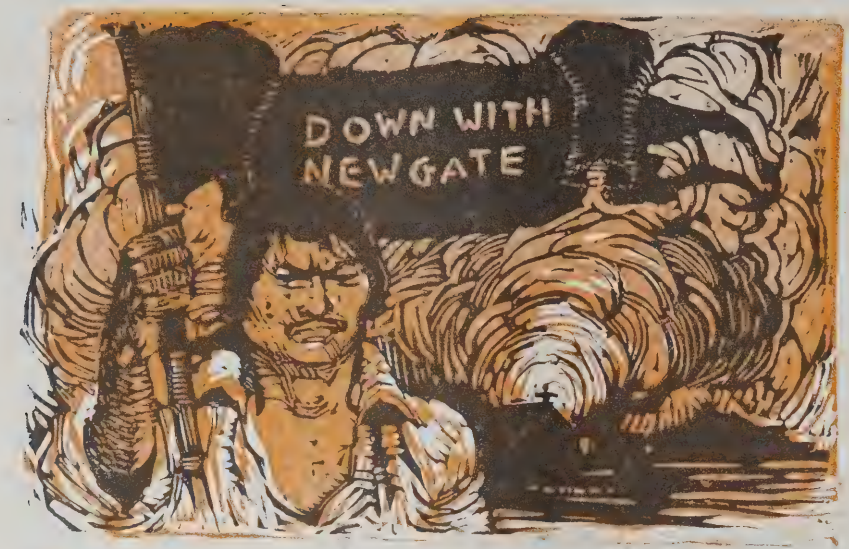
The Natural Bridge of Kentucky

AMONG the natural bridges of Kentucky there is one which because of its size and accessibility is of outstanding importance. This is the great rock arch between Wolfe and Powell counties in the Red River Valley in Eastern Kentucky. This bridge is composed of conglomerate sandstone, the material which forms so outstanding a physical feature along the western edge of the eastern coal field. Rock house blocks of large size spalling off on either side on a narrowing strip of ridge conglomerate developed the initial opening. Wind, frost, and erosion have served to widen the break in this old coal measure sandstone until today the arch is high above the trail which leads up underneath it. The bridge itself is thirty feet broad on top and is very strong and sound. It would easily support two heavily loaded railroad trains were it possible or advantageous to take them over.



The region about Natural Bridge is one of great ruggedness. The same type of rock which forms the bridge forms all of the ridges as far as the eye can see and maintains a well-defined accordance of plateau elevations ranging from 1,300 to 1,350 feet. Underlying this sandstone stratum is found the usual sequence of limestone and siliceous beds which make many caves, rock houses and grottoes. Springs and sinks are numerous and one great balancing rock resembling a flattened sphere is a special feature of natural interest.

Few natural bridges in the Eastern states possess the stately dignity of this splendid sandstone structure.



Romantic Rascals

Lord George Gordon

1751-1793

(Ninth of Series)

By CHARLES J. FINGER

WOOD BLOCKS CUT BY PAUL HONORE

(Copyright, 1925, by Charles J. Finger)

ONE of the tests of a suspected person's insanity is this: Is the patient incapable of managing himself and his affairs? The test, roughly, works well, yet, and there's the pity, almost any eccentric, any faddist, any charlatan who could not stand the given test, seems to be able to enlist tens of thousands in the propaganda of his eccentricity or his delusion let it be never so wild.

Consider the case of Lord George Gordon who had his strong adherents, through thick and thin, until he died insane in Newgate jail. To the eye he stood a handsome man, slightly and gracefully built. He was eloquent, persuasive, charming in manner. He was apparently brilliant intellectually. But of other characteristics those who followed him knew nothing. Knew nothing of his capriciousness, of his shiftlessness, of his egotism, of his vanity, of his uncertain temper and sudden fits of anger.

Holding a commission in the British Navy he served in American waters, became lieutenant, and, in a pique, resigned because Lord Sandwich would not promise him a ship. Then he entered Parliament as member for a seat in Wiltshire, and when Sir George Saville introduced a bill to repeal an act of William III's reign which imposed political disabilities upon those who were Catholics, Lord George Gordon was active in opposition. But the measure passed both houses and had the royal assent, and was followed by another measure in which it was proposed to give the Scottish Catholics the same relief as the English. Then it was that Gordon broke loose, and, as Edmund Burke said, "there were found men deluded enough on pretenses of zeal and piety to make a desperate attempt which would have consumed all the glory and power of the country in the flames of London, and buried all law, order, and religion under the ruins of the metropolis of the Protestant world."

But, to understand how it came to pass that officials were so lax that a flame which might have been stamped out with ease was allowed to grow to danger point, a swift glance at that day is necessary. It was a London in some respects loosely governed. So loosely, indeed, that Hume, in 1775, asked how the Crown expected to control colonies at 3,000 miles distance when it could not secure the respect of English subjects.

It was a London in which, at the end of an election, what a writer called the "rampant spirit of liberty" destroyed scaffolding, benches, chairs, everything, and a howling mob paraded the streets with the wreckage as trophy. It was a London in which the statesman Charles James Fox could deliver a speech in Parliament on a religious question after having passed twenty-two hours in the pious exercise of dice-throwing during which he lost at the rate of $2,500 an hour; when Lord Stavordale, a youth, won $55,000 in a single game; when the Earl of Sandwich sat for hours at highest play, and once, faint because of long fasting but unwilling to leave the gaming table, called for a slice of beef between two slices of bread and thus gave name to the popular thing of our own day. It was a happy-go-lucky, careless, selfish, pleasure-loving, *laissez-faire* London; a London of which Franklin wrote, saying in amazement, "While I am writing this a great mob of coal porters fill the street, carrying a wretch of their own business upon poles to be ducked for working at the old wages."

When the Saville measure came up in Parliament, Lord George Gordon rose in his seat in the House of Commons and made a long and heated speech, declaring that the indulgences conceded to popery had alarmed the Protestants of England, and, growing warmer, said that he had at his back a hundred and twenty thousand sturdy Englishmen who would arise and fight to the death.

Hearing that, the House laughed, knowing nothing of the crazed nobleman's efforts elsewhere. For Lord George Gordon had his agents at work, there were noisy public meetings, and before long a petition bearing 120,000 signatures asking for the repeal of the Saville bill was ready for presentation to Parliament. On Friday, June 2, 1780, London went mad. From all quarters men wearing cockades in their hats marched on Westminster, some sincere enough, others on mischief bent. Soon there was mob fury and the lust for mischief and members of Parliament and peers, on their way to the houses, were openly insulted, and at each new outrage the mob seemed to become more lowering and savage. Gay and debonair, Lord George Gordon rode at the head of his crowd and entered the Parliament house, his followers swarming after him.

Doctor Johnson saw much of the riot and was amazed. "They did their work at leisure, in full security, without sentinels, and without trepidation, as men lawfully employed in full day," he wrote to his friend, Mrs. Thrale, then adds, with scorn, "Such is the cowardice of a commercial place!"

That work was the burning of two Catholic churches, one in Lincoln's Inn Fields, the other in Warwick street. "For six days," says D. H. Montgomery's English History, "London was at the mercy of a furious mob," but in that statement would seem to be inaccuracy for the "furious mob" at first numbered no more than a hundred of the lowest class, fellows bent on plunder, according to the eye-witness, Doctor Johnson. Vigorous measures might have crushed the trouble in short order, but there was ineptitude at the helm, for the First Lord of the Treasury had been empowered to act, but the First Lord forgot. Jack Ketch, the hangman, leaped to the front as leader of the rioters, and was afterward pardoned so that he might hang his fellow ruffians.

On the Sunday following the mob was again at work, largely augmented by waterside loafers and riffraff and criminals. The authorities made almost no attempt to control matters, and everywhere Catholic churches went up in flames, and the homes of wealthy Catholics suffered wreck and pillage. The next day was worse, for grown bolder, the mob sacked Sir George Saville's house and captured Lord

Sandwich, who was rescued with difficulty.

That piece of impudence led to the arrest of thirteen of the rioters, who were thrown into Newgate prison. But there followed the destruction of Fielding's house in Bow street, and of Lord Mansfield's mansion with its priceless library and picture gallery and art collection, things of greatest value thrown into the street and destroyed in a huge bonfire; then, full of the lust of destruction, the rioters fired several dwelling houses in Moorfields. And while all that was going on, at the other end of town was the celebration of the King's birthday, with flags a-flutter, soldiers on parade, and bands playing "God Save the King," and at night, lords and ladies smiling and strutting and parading in the Royal gardens with trees studded with glittering lights.

Soon among the mob there was the cry of "Down with Newgate" and Dr. Johnson has a curiously vivid account of what followed. "On Wednesday," he says, "I walked with Dr. Scott to look at Newgate, and found it in ruins with the fire still glowing . . . they broke open the Fleet prison, the King's Bench and Marshalsea prison, Wood street compter, and Clerkenwell Bridewell. At night they set fire to the Fleet and the King's Bench, and I know not how many other places; and one might see the glare of conflagration fill the sky from many parts. The sight was dreadful . . ."

"So there were let loose murderers, thieves and highwaymen."

So there were let loose murderers, thieves, highwaymen, pirates, housebreakers, all the parasites and foul things that honeycomb and spoil human society. Walpole pictures Lord George Gordon running to and fro among his followers "naming names for slaughter," urging destruction here and spoiling there, and at one time there was danger that the Bank of England would suffer attack. But that other troublemaker, John Wilkes, found his interest to lie on the side of the opposition, and had become a defender of order, riding at the head of a body of Guards.

At Newgate it was like the fall of the Bastille. Governor Akerman, being called upon to surrender the keys, defied the mob. At once men with crowbars, with picks, with axes, with torches, assailed the building; they poured oil and resin on doors and flung brands over walls, then rushed into the burning building, trampling one another to death, releasing prisoners, some of them dying in the fire they had made. Of part of that the poet Crabbe was witness and saw Lord George Gordon in a coach "drawn by the mob, bowing as he passed along . . . By eight o'clock Akerman's house was in flames. I went close to it, and never saw anything so dreadful . . . You can have no idea of the frenzy of the multitude . . . Newgate was open to all; anyone might get in, and, what was never the case before, anyone might get out. I did both, for the people were now chiefly onlookers. The mischief was done, and the doers of it gone to another part of town."

To quell the disturbance cost some five hundred lives, and Lord George Gordon was tried in the Court of King's Bench, on a charge of high treason. He escaped the penalty because of the skill of Henry Erskine, Scottish lawyer famous for his wit and oratorical powers, who proved, technically, that Gordon had not approved the acts of the rioters. But twenty-five of his followers were handed over to Jack Ketch and swung from the gallows.

* * *

Later, Lord George became powerfully attracted to that other romantic rascal of his age, Joseph Balsamo, the self-styled Count Alexander de Cagliostro, forger, cheat and necromancer, who had learned his trade from the Count St. Germain. Balsamo had sold his "elixir of immortal youth" everywhere, had found believers in his "invaluable pentagon for abolishing original sin," and at last, in France, after his quackeries had been exposed, had been thrown into the Bastille for his alleged share in the diamond necklace affair. Released, he had fled to London where Lord George Gordon immediately sought him and took up his cause. At once, Gordon decided that Cagliostro was all that he claimed himself to be, was the real Wandering Jew, was fourteen hundred years of age and more, was able to transmute lead and iron into gold and silver, and much more. And with his championship of the arch fraud, came public denunciation of Marie Antoinette and the declaration that she did, with her own hand, write the order commanding the delivery of the diamond necklace worth some $320,000 which a Madame de la Motte insisted had been seized and taken to pieces by Cagliostro to "swell the treasures of his immense unequaled fortune."

The whole affair is an odd piece of history too involved for discussion here. What does concern us is that Lord George published a letter in the newspapers accusing the queen of France of duplicity and intimating that she was guilty of attempt to defraud and of perjury. The writing of that, as well as the printing of it, was a pernicious piece of sensationalism that might well have involved two nations in war, and at the instance of the French Ambassador, Lord George Gordon was prosecuted, found guilty of libel and sentenced to fine and imprisonment, January 28, 1788.

How he escaped is not known, but escape he did and was apprehended in Birmingham where he was found dressed as a Jew, and proclaiming himself as a member of that faith. His death took place in Newgate prison, November 1, 1793, after he had made a tremendous speech to those about him, extolling the excesses of the French revolutionists and ended by singing the "*Ca Ira.*"

He was a notable example of misdirected energy and enthusiasm.

Do You Know Katydid?

(*Concluded from page 6*)

rest of the wings which extend flatly along the sides, thus insuring further rigidity and consequent resonance resulting from a thin material so placed.

And here we have also one of Nature's departures from rule: asymmetry in any parts of the external constructions of animals is very rare, though internally the usual thing. The flat membranous portions of the two forewings are not like each other precisely; that is they differ only for the combined purpose of making sound as bow and strings on a sort of double fiddle.

The left side of the membranous portion always overlaps the right side. Each side possesses a larger cross vein, which may be observed through a magnifying glass to be roughened underneath by a series of file-like, transverse ridges and depressions, but that on the left side is stouter, longer and more roughened, this being the bow, while the right, file-like cross vein, never used, is merely Nature's common effort toward symmetry.

The right wing, however, possesses a characteristic wholly lacking in the left wing; it is a rigid, upturned inner marginal and longitudinal vein that is opposed at right angles to the file-like bow vein and this ridge is smooth but sharp, so that it offers a definite resistance to the roughened surface of the bow vein, which in the operation of stridulating is passed more or less rapidly across the ridged vein. The inner margin of the left wing is without this ridged vein and turns down instead of up so that, should the insect wish to use the right wing for a bow, it would have no opposing vein to play upon.

Illustrations show this far better than it can be described. We may note also the double fiddle effect which gives that added and peculiar sound unlike anything else in Nature. In some individuals the two-wing membranes are tuned exactly alike; in others they are as far apart as three or four notes and coming exactly together they give an odd combination.

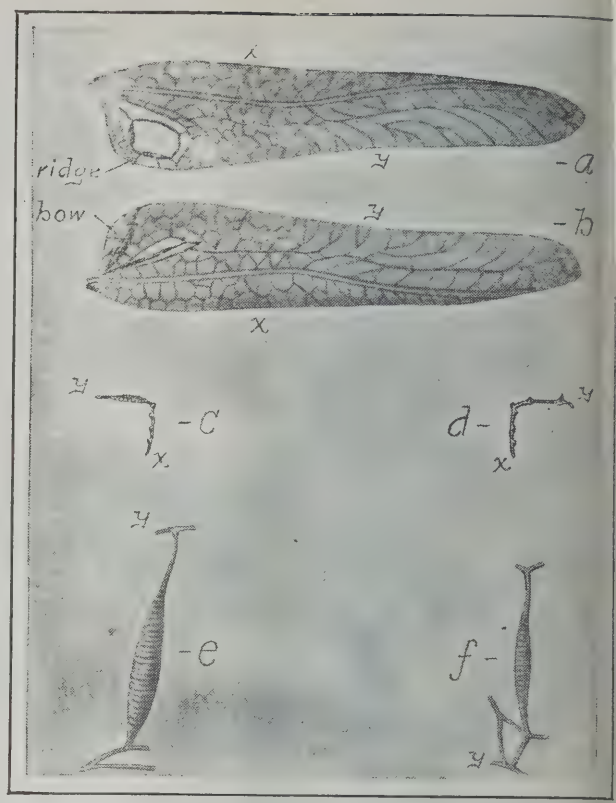
The katydid in its apparent effort to utter human words may be regarded as the insect counterpart of the forest-loving whippoorwill, its woodland notes beginning to be heard at about the season when the vocal efforts of the bird are ceasing for the year.

The katydid is the only one possessing a sounding apparatus that in part involves the entire forewings, they being concaved and braced in a manner to give additional rigidity and resonance; thus the sound carries exceptionally loud and far. I have heard a katydid—the only male occupying a lone grove of trees—more than half a mile away with a windward breeze and a chorus of these insects may at times make themselves audible twice that distance. If by chance one can be located, captured and placed under a jar or within a wooden box in the house its stridulations will waken every member of the family throughout the domicile. The ear-tingling, rasping, echo provoking noise is nearly deafening when one is in the same room; it has the peculiarity of making one's "blood run cold," to use an ancient phrase.

Perhaps the most remarkable thing about this stridulating is its being produced by anything so fragile as these wing filaments. And then, what is the purpose of these sounds? The age-old manner of courting is reversed here, as also by the frogs and toads and certain salamanders. The lady folk of the long-horned grasshoppers and crickets are the seekers. The serenades thrummed by these six-legged troubadours, directed as they are to their hoped-for mistresses, cannot be resisted and the gentler, unmusical ones, though possessing keen sound-receiving organs for definite tunes, seek industriously and widely until they find the players. The females of the angle-wing appreciate only the efforts of the other sex of her species; the black cricket cares nothing for any sounds that do not accord with her peculiar fancy and Katy herself, whether she is rightly or wrongly accused, her actions being both affirmed and denied, deliberately sets out to seek her accuser.

As with all others of their kind and the crickets the length and rapidity of these fiddled notes depend upon the temperature. On a cool night kadydid insists only that "Katy did," but when the thermometer rises, then "Katy didn't" and even "Katy didn't idn't." So that her offense must be something connected with shirking a duty because of the heat. Just before a thunder storm we have even heard that "Katy didn't idn't idn't," whatever that can mean.

Up on the Blue Mountains of Pennsylvania I have with much surprise at first heard the katydids overlook their reputation for giving only nocturnal serenades in late summer and with the sun shining brightly fiddle incessantly throughout the midday.



Stridulating organs of the male cone-head locust—(*a*) Right forewing. (*b*) Left forewing. (*c*) Basal section of left wing. (*d*) Basal section of right wing—all somewhat enlarged. (*e*) File-like cross vein, or bow, of left wing. (*f*) Same of right wing, much enlarged as seen through lens. (*x*) Denotes anterior and (*y*) posterior margins of wings.

"Neither Fish, Flesh, nor Good Red Herring"

(*Continued from page 13*)

administered by New Zealanders, a Samoan is permitted to declare his intentions of becoming a British subject and after three or four years acquire citizenship. Many do this and in case they desire to travel to another country are eligible to passports as are other Britons. A Samoan from British Samoa may visit the United States, but a Samoan from American Samoa may not!

Some odd occurrences result from the lack of standing as a citizen which the American Samoan has.

Some time ago several young men of Tutuila stowed away on a steamer of the passenger line running to Honolulu and San Francisco, their intended destination being Honolulu. They had no permits to leave Pago Pago and their absence being noted the ship was notified by wireless. Found aboard, they were held until they could be transferred to the ship of the same line bound down from Honolulu to Pago Pago, the transfer being made in small boats in mid-ocean. Their adventure netted them only a ride halfway to Honolulu and back again.

Another young Samoan succeeded in getting to Honolulu in some way and was arrested there and jailed to await trial for deportation. He made the claim that while he had come to Honolulu from American Samoa he was not an American Samoan, but a British Samoan who had lived awhile in the American islands before going to Honolulu. His case was still pending when the writer left Hawaii. Its odd feature is that *he was liable to deportation from an American territory if he was an American Samoan;* and was not

liable to deportation from the same American territory if he was a British Samoan.

There is no intent in this article to create the impression that the American Samoan feels badly treated because he has been left without any international political status, or that he is at all worried. On the contrary the average Samoan is perfectly content to remain in his islands and the matter of political status bothers him no more than any other pure abstraction. Such regulations as the American governors promulgate are founded on American law and otherwise the Samoan makes his own laws and follows his own customs. It is the young, ambitious and adventurous natives who would like to get away and see something of the world who would benefit by Congressional action in Washington that would give them a more definite standing.

One American law that has followed the flag to Samoa is prohibition. There likewise is a New Zealand brand of prohibition in Western Samoa. These prohibition laws were aimed to affect the white residents of the islands, not the natives. For the latter prohibition had existed already. The Samoan just naturally left alcohol alone. But since prohibition has come the results have been rather serious. The "wets" blame them on prohibition itself. The "drys" blame them on the law-breaking white "wets."

Intoxication among natives is on the increase and is noticeable on holidays. A white merchant in Pago Pago stated the case thus:

"Before prohibition the native practically never drank liquor of any kind. There was a permit system under which white people got what they wanted and everything they got was imported. It came in bottles and casks from the outside world and it was all strange stuff and mystery to the native. The white man drank it, but the native did not want it and couldn't get it if he did.

The Home-Brew Idea Took Hold Here

"When prohibition came and the permit system was abolished, the home-brew idea took hold here as elsewhere and 'the makings' were imported. At first everybody who started making his own beer or liquor made it by himself, but it wasn't long before they were leaving their native servants to watch it or to help them make it. Pretty soon the servant knew how to make beer and hard liquor. The mystery of it had disappeared.

"Then natives began to make their own in their huts and up on the mountain sides. They made and drank vile beer. They made hard stuff out of pineapples, bananas, coconuts and other fruits. Drunkenness began to be noticeable, especially on native feast days.

"The native cannot stand liquor like the white man does, and the white man in the tropics has to be careful what he drinks."

This Is a Christian Nation

(*Concluded from page 4*)

ought to be required as a qualification for office or trust in the state, other than the declaration of belief in the existence of God." Again, it cites from the constitution of Massachusetts that "It is the right as well as the duty of all men in society publicly and at stated seasons to worship the Supreme Being," and the several towns, and so on, "shall make suitable provisions at their own expense for the institution of the public worship of God." It quotes the constitution of Mississippi, 1832, that "no person who denies the being of God, or a future state of rewards and punishments, shall hold any office in the civil departments of state." Also, from the constitution of Delaware, which required all officials to take, not only an oath of allegiance, but one professing his faith in God, and in Jesus Christ, His Only Son, and in the Holy Ghost."

Congress Must Keep Hands Off Religion

"Even the Constitution of the United States," said the court, "which is supposed to have little touch with the individual, contains in the First Amendment a declaration common to the constitutions of all the states as follows: 'Congress shall make no law respecting the establishment of religion or prohibiting the free exercise thereof,' and so on, and, also provides in Article I, Section 7 (a provision common to many constitutions), "that the executive shall have ten days (*Sundays excepted*) within which to approve or veto a bill." The exception of Sunday from a legislative series is a national recognition of a religious day.

"THERE IS NO DISSONANCE IN THESE DECLARATIONS. There is a universal language pervading them all; having one meaning, they affirm and reaffirm—*this is a religious nation.* These are not individual sayings, declarations of private persons; they are organic utterances, they speak the voice of the people. While, because of a general recognition of this truth, the question has seldom been presented to the courts, we find in Updegraph vs. Commonwealth (II Serg. & R. 394) it was decided that 'Christianity is, and always has been, a part of the common law of Pennsylvania.'

"And in People vs. Ruggles (8 Johns 200) Chancellor Kent, the great commentator on American law, speaking as Chief Justice of the Supreme Court of New York, said: 'The people of this state, in common with the people of this country, confess the doctrine of Christianity as a rule of their faith and practice; and to scandalize the author of these doctrines is not only, in a religious point of view, extremely impious, but, even in respect to the obligation of society, is a gross violation of decency and good order. The free, equal, and undisturbed enjoyment of religious opinion, whatever it may be, and free and decent discussion of any religious subject is granted and secured, but to revile, with malicious and blasphemous contempt, the religion professed by almost the entire community is an abuse of that right. Nor are we bound by any expressions in the Constitution, as some have strangely supposed, to permit indiscriminately like attacks on Mahomet or the Grand Lama. The case assumes that we are a Christian people and the morality of the country is grafted on Christianity and not upon the doctrine of those imposters. And in the famous case of Vidal vs. Girard (43 U. S. 2) this court, while sustaining the will of Mr. Girard, with the condition for the creation of a college into which no minister should be permitted to enter, observes 'it is also said, and truly, that the Christian religion is part of the common law of Pennsylvania.'

"If we pass beyond these matters," continued the argument of the Supreme Court, "to a view of American life, as expressed in its laws, its business, its customs and its society, we find everywhere a clear recognition of the same truth. Among other matters, note the following: *the form of oath universally prevailing, concluding with an appeal to the Almighty;* the custom of opening all deliberative bodies and most conventions with prayer; the prefatory of all wills—'In the name of God, Amen'; the laws respecting the observance of the Sabbath and the cessation of all secular business and closing of courts, legislatures and other public assemblages on that day; the church and church organizations which abound in every city, town and hamlet; the multitude of charitable organizations existing everywhere under Christian auspices; the gigantic missionary associations, with general support, aiming to establish Christian missions in every quarter of the

Absolute Freedom Has Been Guaranteed

globe.

"These matters, and others which might be noticed, add a volume of unofficial declarations to the mass of organic utterances that *—this is a Christian nation.*"

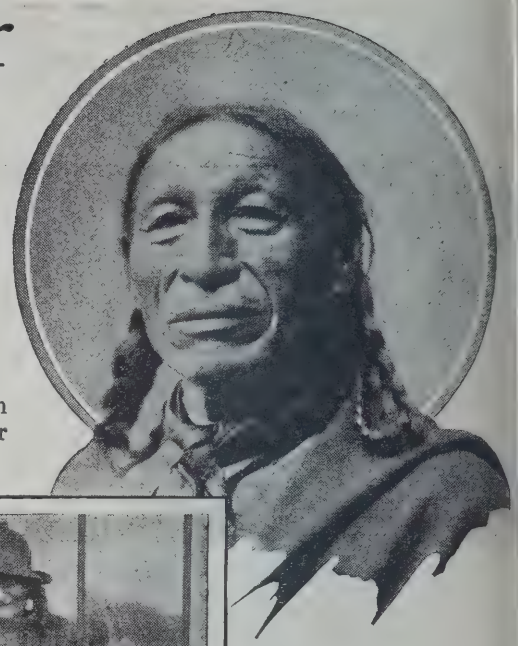
Then, concludes the court, "In the face of all these facts, should it be believed that a Congress of the United States intended to make it a misdemeanor for a church of this country to contract for the services of a Christian minister residing in another nation?"

This opinion of the Supreme Court was rendered on February 9, 1892, thirty-three years ago, and there has been no revolution since that date in the religious convictions and customs of the people of this country as to lead the courts to repudiate the views expressed by the highest tribunal.

A Century of Dishonor

Is It Continued in Our Treatment of the Red Man?

By M. J. M'CREIGHT



Chief Iron Tail.
Left—Indian family.

HELEN HUNT JACKSON wrote of our treatment of the Indians and called her book the *Century of Dishonor*. That was nearly a half-century ago, but the story is just as true and just as interesting today as it was then and much more impressive. It is unfortunate that she could not have lived to revise it and add later chapters covering the last forty-five years to her great work that the present generation might better know and understand the tale so graphically recorded then. The Indian Question is just as much a question now as it was when she wrote of it. The "century," however, has been increased by a half since then. Indeed, the book if properly christened would be called *Four Centuries of Dishonor*.

The Red Man had no printing presses and publishing houses by which his side of the long struggle could be recorded. The story of his relations with his white conqueror is printed only as told by the White Man. The Red Man never had a Publicity Bureau; he has none now; the news we get about the Indian is what is read from the Annual Report of the Commissioner of Indian Affairs—it is about all we ever did get and that was limited to a few dry statistics that the great masses of American people never saw and the few who see them get mighty little satisfactory information.

I am wondering as I write if the last survivor of the great Sioux chiefs is still alive or has died of starvation during the last long cold winter on the bleak barren Bad Lands of South Dakota where the remnant of his tribe has been corralled since the murder of Sitting Bull. Late in March my young son drew from his savings account and sent the old chief a small remembrance and this is what he received in acknowledgment:

> "I received your kind letter with check $10 and I am surprise and thank you very much and I buy some grubs and I had good eat with my little grand son. This winter we have pretty near no foods for the Sioux Indians there all bad crop this year and hard to get foods to eat."

This from a man who is as well off as any of his people, perhaps better off than most of them. This is the representative of the remnant of a once proud and prosperous nation of people to whom the people of the United States stand indebted in the sum of seven hundred million dollars' actual money due them and for which they have brought suit in the United States courts in an attempt to recover it.

This is perhaps the greatest sum that was ever involved in any law court proceeding and is made up of unpaid purchase money many years past due for lands bought from them; for unpaid annuities, materials, supplies, defaulted contracts, broken treaties and other financial obligations, including interest. By authority of Congress this suit was entered in 1923, and one of America's prominent attorneys, himself an adopted chief, says that he will devote the remainder of his life, if need be, in prosecution of the case, and without compensation, if required, in order that the American Nation may be permitted to wipe out the one black page of its otherwise glorious history.

Enslavement of the black people resulted in four years of civil war; strife and bloodshed that almost wrecked the nation politically and economically and left it with financial burdens from which it has not yet recovered, and the Black Man was freed. The Red Man, after four centuries of vain and feeble attempts to hold and defend his home and possessions against the hordes of land-hungry white men, finds himself one of an impoverished and outcast people; an eyesore, tubercular, half-starved, half-clothed, and neglected object of indifference if not of scorn and this by the very people who have enriched themselves and unfairly benefited by his misfortunes—from the people who have defrauded him. The great American people owe one small nation of Indians the princely sum of nearly three-quarters of a billion dollars, a fraction of which would at least permit them now to live in comfort. It would permit them now and then to have some of those luxuries constantly enjoyed by his big debtor.

The slavery of the Indians aroused no great contention among his white jailors such as was aroused by the Blacks. They could not subdue him and by the lash compel him to labor for them in the cotton fields or sell his body from the auction block. But they could with their ever-increasing numbers and their firearms drive him from his home and take possession of his lands and hunting grounds. The Whites did not quarrel among themselves about this for it was one common interest they could unite upon, and did; they wanted the Red Man's property, and when they could not compel him to work it for them they drove him from it; when they could not use him they wanted to get rid of him altogether. When the Indian protested he was handled by force; if he retaliated for broken pledges,

Selling Texas' Golden Fleece

Keeping Wool Argosies of the South Off Rocks of Cooperative Marketing

By MAX BENTLEY

SO-CALLED pooling and coöperative marketing, under contract, of agricultural and livestock products—specifically, Aaron Sapiro's plan—was, last year, offered to the wool and mohair producers of Texas, and quickly rejected.

It was rejected for two reasons: one being that the Texas flockmasters feared iron-bound contract control of their clips would bring them down to ruin; and the other that they believed they had a better method.

The Texas plan, a limited coöperative, is known as the bonded warehouse concentration system. It was evolved in Texas, by Texans, and has worked successfully since 1909. Wool and mohair growers are so thoroughly "sold" to it that when Milton Sapiro, brother of Aaron, asked the executive committee of the Sheep and Goat Raisers' Association of Texas to throw it over in favor of the plan of the Pacific Coöperative Wool Growers, of Oregon and other western states, all that he got was a courteous hearing. His proposal was unanimously rejected.

The Sapiro plan was rejected at the Del Rio meeting of February 14; and at the next quarterly meeting, at Uvalde, Roy E. Aldwell, chairman of the special subcommittee which had turned down the Sapiro plan, rose to defend its stand therein. He said that inasmuch as the subcommittee had been criticized in some quarters he felt impelled to say that the executive committee, in adopting the subcommittee report, had kept the Sheep and Goat Raisers' Association of Texas "off some very dangerous rocks." "The entire Executive Committee concurred in the view taken by Mr. Aldwell."

And at the next meeting, at Sonora, Judge C. C. Belcher, attorney for the association, made the following report on the Sapiro plan (the italics are ours—Ed.):

"This Association at different times has been called upon to endorse and get behind a coöperative marketing plan that has been submitted to your Association by the promoters of such marketing plan, and while this Association believes in a coöperation among the producers, and believes in coöperating with every legislative body, board and commission, that touches the welfare of our people, and believes in working in coöperation and in harmony with every livestock organization in the United States, *still it has not seen fit to recommend to the producers of this country that they enter into a contract that is required by the Cooperative Marketing Association and tie themselves up for a period of five years whereby they obligate themselves to deliver to the marketing association all of their wool and mohair.*

"Our investigation has disclosed that a coöperative marketing plan *has not in the majority of instances worked beneficially for the producer*, and in this instance it was the opinion of the committee who were assigned to investigate coöperative marketing that *it was a rash experiment which would be unsafe to enter at this time*, that it would necessarily involve the abandonment of all the local warehouse companies and would bring ruin to many institutions that have fostered our industry.

"Our Association has not condemned the coöperative marketing of wool and mohair, but it expects to move slowly in advocating an experiment of the kind and will not endorse such movement until it has been demonstrated to be entirely feasible by the example of numerous other similar coöperative marketing associations already in existence."

The Sapiro plan, it was argued, *presupposed too great a difficulty in selling* wool and mohair; at least enough of a difficulty to make necessary wholesale coöperation of producers bound together by contract. Wool ought to—and does in Texas—sell itself. The American production is 250,000,000 pounds annually against a consumption of 700,000,000 pounds; and while the demand for wool is constantly growing greater as new uses arise (such as cloth linings for closed automobiles), the domestic production has steadily slumped year after year. It is a natural consequence of the law of supply and demand that while the Texas cattleman is in desperate straits, the sheepman is prosperous and independent. And, of course, that same condition applies in every other state in which cattle and sheep are raised. Wool paper is very naturally the most sought after of all livestock collateral. Barring the break in 1921 which sent all commodities crashing, wool has been strong and buoyant; its downward movement was temporary only and of a sympathetic character.

The Texas warehouse system takes these factors into consideration and is, therefore, conducted only as a limited coöperative. Its successful operation is of especial interest to sheep growers of the nation, since Texas has become the leading producing state in wool and mohair: 24,000,000 pounds of the former and 7,000,000 pounds of the latter, last year. A warehouse company is a business enterprise returning a profit to its stockholders. It is highly competitive. In some cases it is incorporated, in others, unincorporated, but it is always bonded. It offers three inducements for patronage: facilities for the *voluntary* storage and pooled sales of wool and mohair; all-the-year financing of growers on loans made in the regular banking way; and a profit on operation to stockholders, who may be, and usually are, sheepmen.

Colonel C. C. Walsh, a banker of San Angelo, Texas, and Robert Massie, an outstanding Texas sheep grower, organized the pioneer warehouse company, in 1909. Among their other pur-

poses was the evolving of machinery for relieving banks of the sheep country of the burden of financing the wool grower. There are now sixteen warehouses strategically located in the producing region. The combined capital stock is about $1,500,000, and the outstanding loans exceed $6,000,000.

The operation rests on nothing more than the word of honor between warehouse and grower. There is no compulsory feature whatever, there are no contracts to be signed, no "tying up" of a sheepman's clip. He can come in, or remain out, just as he wishes; and if, after he has pledged his clip to the warehouse, a Boston buyer who is bucking the warehouses takes him off in a corner of the pasture and whispers sweet music in his ear, there is nothing in the way of his withdrawing his clip and selling it independently—except good faith. Few Texas sheepmen, it should be noted, break their pledge.

As a binder, the warehouse companies try to sell their stock to actual growers. And it is a testimonial to their stability that seventy-five per cent of the personnel of stockholders represents flockmasters owning sixty per cent of the whole number of sheep and goats on the Texas ranges. It is a more striking testimonial that the warehouses have handled up to ninety-five per cent of the Texas clip. Even in 1923 and 1924, against what seemed to be an effort of certain wool-buying merchants from "Down East" to destroy them, they handled sixty per cent.

The Texas flockmaster is not in position to affirm positively that the "Down East" houses are trying to destroy the warehouse system. Indeed, many coöperate heartily. But it is a fact that throughout 1923 and 1924 buyers for certain houses went out on the range and induced flockmasters to sell their wool direct to them; in many cases contracting for it six months in advance of shearing, and at prices far higher than those prevailing at the subsequent warehouse sales. And they are doing that very thing now.

The warehouses take this cutting-under philosophically, as the regular order of business, since the whole thing is competitive. If they cannot stand up to competition they go under. None have gone under; on the contrary, they have, all together, since 1909, averaged a yearly profit of ten per cent on the capital stock.

The profit comes from two operations: commissions on wool sales, and interest on money loaned. The commission averages two and one-half per cent of the selling price, forty-cent wool meaning a commission of one cent per pound. The loans are made for six months on the basis of eight to ten per cent, usually the latter figure. Six million dollars loaned represents thirty cents a pound on 20,000,000 pounds of wool, and an interest accumulation of $600,000 annually for division among warehouse stockholders. Thus a sheepman, if he is a stockholder as well as a patron, shares in profits on his own two transactions: the commission on his wool sale, and the interest on his loan.

The total cost of doing the business of a warehouse concentration company does not exceed ten per cent of the volume handled. The net cost of laying down a pound of wool in Boston is about two cents for freight and insurance. The only salaried officer is a general manager, although in a few cases the directors are paid small salaries. It is not necessary to create extensive selling machinery, for every Boston house of any importance sends its buyers to the ground.

The writer has noted that in the storage and sale of wool and mohair the warehouse company has no binding tie on the flockmaster, who can pull out at his discretion. That does not apply, of course, to flockmasters who, at the time, are being financed by the warehouse. In that case, where an advance is made, the wool clip is a part of the security for the loan and cannot be sold independently until the debt is liquidated, except as the warehouse company authorizes such sale—as it often does.

Sheep-grower of the type that is fast disappearing along the Mexican border.

Advances are made up to fifty p cent of the then market value of t security offered. The security includ not only the borrower's expected wo or mohair clip, but the sheep or goa producing the clip, and their increase all of which is covered in a chatt mortgage filed for record. With woo mohair, lambs and mutton alwa salable, and with an increase of sevent per cent on a flock of ewes a certainty i the balmy climate of Western Texa the sheepman's paper is gilt-edge anywhere it is offered.

That is another feature making th sheepman's paper attractive collatera It enables the warehouse company t finance itself independently of banks i its territory, allowing them to len their money for other needed loc purposes. The warehouse compan gets its money in the East, on notes c six months' duration at from four t five per cent interest; and re-lends th same money for the same length of tim at from eight to ten per cent interes It gets it so easily that it rarely eve patronizes the newly established Fed eral Intermediate Credits Banks, al though these institutions were create for the specific purpose of handlin livestock paper. The Intermediat Credits Bank at Houston, Texas frankly bids for the warehouse com pany's business, but doesn't often ge it. Eastern banks make better terms

Texas wool uniformly brings higher price than Northwest wool That is partly due to its better quality —better rams, wolf-proof fences elim inating herding and therefore making cleaner wool, et cetera —but it is also due t better sales methods and stiffer competi tion. The warehouse concentration system has worked so wel that last autumn, six months ahead of shear ing, Boston buyers competing with it were forced to offer, first forty cents a pound and then, in January, fifty-five to sixty cents for May deliveries. At the time that this is written (the second week in June) they are offering only thirty-three to thirty-five cents—and the warehouses are in no hurry to sell. The first public offering was this year announced for June 11, whereas normally they commence on May 10. They are holding out for forty-five to fifty cents and they have 8,000,000 pounds of wool in storage to back up their defiance, with shearing still thirty-five per cent unfinished.

If they are able (Concluded on page 29)

The Gentle Art of Trawling

(*Concluded from page 2*)

etween Portland and Sequin, then eaves overboard his first barrel buoy ith flag attached to show the be- nning of his trawls. His engine set t the lowest speed, the fisherman be- ins to heave out the trawl, each hook eparately, for the least tangle would oil the line. When one trawl is out, ith the rock that holds it at the bot- m, the second barrel is heaved, the wo lines tied together, and the trawl layed out with the same even motion f the hand, until the last trawl is set ith a flag on the buoy to mark the nd.

In offshore fishing the boat must lay by" for an hour r so waiting for the sh to come to break- ast, but we have ime to make the run n to the home cove. t six we are off gain. Now the morn- ng is fully come, all oft and misty, and ife among the islands s stirring. Along the oves the lobstermen re setting out for heir traps, occasion- lly a boat with a pulpit" rigged in the ow starts down the Bay to look for horse mackerel, and far- her offshore the gill etters who have been shing all night are eturning to Port- and, a flock of gulls creaming in their ake as the refuse rom the cleaning is heaved overboard.

As we draw near the place which he fisherman remembers by the marks e has sighted, the flag of his first uoy appears. He sprinkles salt in he stern of the boat to cut what rease may have come from the bait for shad is a greasy fish) then takes is position in the bow. He pulls the arrel over into the boat, passes the ne over a roller set up from the bow, nd begins to haul in. Slowly, under he water, appears a shimmering lotch of white, turning and expand- ng in size as it nears the surface. It roves to be a haddock, and, with a witch of the line, the fisherman snaps from the hook into the pen or kit ehind him and continues hauling. s the eye becomes accustomed to ooking deep into the water, one can ee not only the fish near the surface ut blotch after blotch of wavering hite and blue, each smaller and more ndistinct than the other, marking the ne of the trawl.

Most of the fish are "drowned out" rom lying on the hooks and make no truggle as they fall into the pen. There are haddock and "scrod" or young haddock, pollock with its trim black line, hake and squirrel hake and silver hake, with now and then a brim, rivaling the goldfish in his coat of gleaming mail, besides many uncouth inhabitants of the deep.

Most numerous among these is the skate or "barn door," a great flat creature shaped like a kite and with a face uncannily like a man's. It is a common jest among the fishermen to tie his fins back, put a hat on his head and a pipe in his mouth and hang him up as a mascot. Then there is the sea mouse, the five-finger, and the blister, a beautiful flaming red, looking for all the world like a ripe tomato. There are long writhing eels and sculpin with enormous mouth and stomach. From the maw of one the fisherman takes a good-sized haddock, doubled up, but uninjured. There are a few dogfish, a species of shark, the advance guard of that ravenous horde which, in a fortnight or so, will infest the waters and make all fishing impossible. Even now not a few fish come in on the hooks partly eaten and are thrown back into the water.

Among the islands of Casco Bay.

There are exciting moments in the morning's work. Once the line gets caught on the rocks and is in danger of "parting," in which case we would have to begin at the other end and work back. There is a time when a prodigious amount of hauling reveals no shimmering white beneath the water to show the approaching fish.

"Guess I've caught Old Man Chase," remarks the fisherman and pulls with renewed vigor. In a moment he brings up a lobster trap, chafed away by the storms, yellow with mud, and the paint washed from its bob, but with some repair and new heads still usable.

"Worth a dollar to me," said the fisherman, "and everything counts."

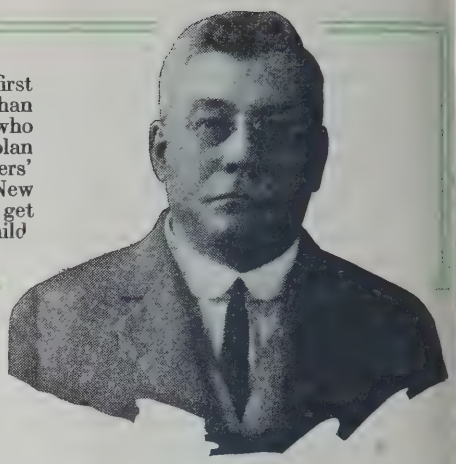
At ten o'clock we are still hauling the trawls; the sun is high and the fisherman sweats in his oilskins. He has not only the task of pulling in the line and snapping off the heavy fish but of hauling the boat along, too. By eleven we are near the flag on the last barrel, not far from the "bla'ting buoy" off Half Way Rock marking the end of our quest. The catch has not been bad, about 900 pounds undressed and including considerable small stuff that will do for bait. The prize of the day's work is a steak cod weighing forty pounds, whose good angel, that permitted him so long a span of life, suddenly deserted him this morning.

At noon we are home for a bite of luncheon, and by half-past twelve we are off again to market. This time the fisherman is not sorry to have some one help him with the steering for he cleans on the way. The bow is divided into three pens, in one of which is the catch. As the fisherman cleans he puts the fish into a second and the bait into the third. The waste he throws into the water, and one more experience which I have ardently desired is mine, to be in a boat with the screaming gulls above my head.

From the four quarters of the heavens they come, following the boat in a drifting, fearless mass, like giant snowflakes borne by a tempestuous wind. There are shiny white gulls, and soft tawny gulls with black-tipped wings, and dark gray gulls; there are sleek, trim gulls and gulls with ragged wings and tail feathers. They make wide circles in front of the boat, then, when a piece of refuse strikes the water, they swoop down, a screaming tangle of beating wings and craning necks and gaping bills.

As we enter Portland Harbor the task is done. The fisherman throws bucketfuls of water over his oilskins, over the shimmering heap of dressed fish, and over the pens of the boat which he scrubs with a long-handled brush, so that all is clean and dripping as we draw up alongside the wharves. Then comes the sale, a bit of an anti-climax, to be sure, for our beautiful haddock and pollock bring only two cents a pound.

JUDGE HENRY NEIL, known as the "Father of Mothers' Pensions," got the first state-wide law enacted in Illinois in 1911. Since then he has traveled more than 100,000 miles, advocating his plan for the states' care of fatherless, needy children who have good mothers. Every English-speaking country in the world adopted his plan after he campaigned in them. The forty-two states of the United States now giving Mothers' Pensions pay these mothers more than twenty-five million dollars a year. The city of New York pays more than four and one-half million dollars a year. In Chicago some mothers get as high as $145 a month. In California some are paid as high as $30 a month per child



Abolishing "Charity" for Children

By JUDGE HENRY NEIL

ONE morning I saw in a Chicago newspaper a photograph of a carload of children who were being shipped from New York City to Kansas. This was such an unusual sight that it excited my emotions, and I began to ask questions about these children.

"Where are the parents of these children?" I said, and some one told me that their fathers were dead and their mothers were scrubbing marble floors in the great office buildings in New York City, and that these mothers could not give their time to the care of their children, so the children had been gathered up and were being sent to the farmers in Kansas, where the sunshine is bright, the air pure and there are plenty of cows for these children to milk.

Finding Out Where the Mothers Were

"But," I said, "if Kansas is such a fine place for these children, why is it not just as fine a place for their mothers?" "Well," they said, "their mothers would only be in the way and be continually objecting to the farmers working these children." You see, I thought that God had intended mothers to be the protectors of their own children.

I next went to a great state institution, where there were 1,600 boys. I went into a classroom where there were a hundred boys. With the permission of the teacher I called one boy at a time over to a quiet corner and asked each boy a series of questions.

I said, "Where did you come from?" And most of them replied, from Cincinnati, or Columbus, or Cleveland, or some other large city.

Next I asked, "Have you a mother living?" And most of them replied, "Yes."

Then I said, "What does your mother do?" With this, the boy would be unable to speak, the corner muscles of his mouth would twitch with emotion; the tears would start down his cheek, and he would put his face into his hands and sob as though his heart would break. Then I knew that I had touched a tender chord and I did not further pursue the subject of his mother.

Afterward I found out from the teacher that most of their mothers were scrubbing the marble floors in the great offices in the large cities of Ohio.

One can hardly go from one large city to another without seeing on the hillsides great sanitary buildings with beautiful grounds, institutions for the care of thousands of dependent children.

I went to the Juvenile Court in Chicago, and the first case I saw there was that of a mother with five little children clinging to her skirts. Mrs. Grey was weak and unable to stand. They gave her a chair before the bar of the court. The testimony was that the father had died three years before, the mother had taken up the double job of earning the living by working all day scrubbing marble floors in the great office buildings in Chicago, and at night coming home to care for her home and her five little ones, a thing which I have since learned no woman unskilled in the art of getting money can possibly endure for many years.

Then the court officers began to figure out that they would send her little Mary and Susie to one institution which took girls, and the boys to another institution which took boys.

Taking the Children Away From the Mother

I saw the mother's face twitch in the agony of despair when she got the first glimmer of the idea that all of her children were to be taken away from her, perhaps forever. I said, "Wouldn't it be more humane, more kind if you took this mother out back of the courthouse and shot her before she fully realizes that you are about to take all of her children away from her?"

Then I said, "Who pays for the food, clothing and care of these children after you have taken them away from this mother?" and they answered, "The institutions are authorized by law to collect from the tax funds, ten dollars per month per child." I then queried, "Why don't you pay the ten dollars per month per child to this mother and let her keep her own children?" And they replied, "The law does not permit it." I said, "Why not change the law?" "It can't be done," was the answer.

Next I went to the legislature of Illinois and proposed a little amendment to this law; which amendment provided that if these mothers were fit and it was the best interest, in the judgment of the court, for the children to remain at home, that the ten dollars a month be paid to the mothers that they could keep their own children in their own homes.

How the States Adopted Pension System

I said: "Messrs. Legislators, I have been to your institutions, I know that you buy good food, that you provide warm clothing, that you build magnificent, sanitary buildings on the hillside, but you can't buy mother love; that is not for sale at any price, and that is what these children are hungering for, and what they need if you expect them to become normal men and women, and home-loving citizens, willing to fight for God and Country."

And the members of that legislature enacted my amendment without one dissenting vote. It was the first state-wide Mothers' Pension Law.

On July 1, 1911, I again went into the Chicago Juvenile Court and saw the first mother pensioned under this new system.

I have since found that it pays the taxpayer to keep these mothers on their rightful jobs—of caring for their own children—and not allowing them to be broken down by the double job.

Next I went to the legislatures of nearly every state. In one year I crossed the United States from ocean to ocean eight times. I spoke in every large city. I advocated that fit mothers of dependent children should be provided with the money to keep their own children at home.

"Mother love is," I said, "one

ssential of normal child life. What ould your life be if you had no mem- ry of a mother's love? Where is the ly of adult life except in the memory f the happy days spent in childhood ith your mother?"

Forty-two states now have this Mothers' Pension system and more an a hundred thousand children are ow at home with their own mothers ho would be in institutions or be otherless on Kansas farms. These rty-two states will pay this year to ese mothers more than twenty-five illion dollars, and it is the best of all ses of the taxpayers' money. No other oney can supply such an amount of y, and hope, and happiness, and other love as this money.

Next I went through every city in ngland, Ireland, Scotland, Wales and outh Africa. I spoke in every city dvocating this new system. This rip took me more than three years.

Now I am trying to get Congress o enact an ideal law adequately to ension fit mothers of dependent chil- ren in the District of Columbia. I xpect this law to be a guide and in- piration to every state in the Union.

When this pension system was first ut into operation the papers named it 'Mothers' Pensions"—although in the aw it was called "The Funds to Parents ct." Then started a bitter contention s to what this new system ought to be alled; some people said it should be alled "Children's Pensions." Bernard haw told me that it should be called 'Young Age Pensions," but I have lways thought that it should be called, 'Horses' Rights for Mothers."

I believe that the best way to revent discontent in this country is o combine the Mothers' Pension system ith our public school system and then ee that every child has proper care in he same systematic way that we now ee that every child is schooled.

This can be done more efficiently nd at less expense than by the resent disconnected, unsystematic ethods.

More than enough money is now pent on child welfare to give proper are to every child needing care, were spent as a part of our public school ystem instead of being spent in a hap- azard way as it is now.

Our schools in this generation will etermine the kind of government that e will have in the next.

Guarnerius Fiddles

AN ATTEMPT was made quite recently to steal a very valuable Guarnerius violin from the home of its English owner, Miss Elsie Southgate. One of the valuable specimens known o fiddle fanciers as a "Joseph," or a 'Del Jesu," this Guarnerius was given o Miss Southgate by the Shah of Persia n token of his admiration for her laying. Similiarly, Paganini's favorite Guarnerius was given—a rich gift—by a French merchant prince.

"I Read *in the* Papers"

I read in the papers that Nova Scotia, the "New Scotland" province of Canada, has the most valuable lobster fisheries in the world, and also that the mineral production per capita exceeds that of any other Canadian province or American state. Notwithstanding these items and the famous apple crop of the Annapolis Valley, the most productive resource of Nova Scotia is the ever-increasing crop of tourists that come there to visit the Evangeline country and to hunt deer and moose and to fish in its renowned waters. Two large steamers are being built to carry summer tourists there from Boston. Thus whatever effect their somewhat detached position may have upon their industries is rapidly being offset by the revenues from tourists that come to New England and Nova Scotia. This is a working of the so-called law of compensation that is delightful for everyone.

The International Jew in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. 3, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set, $1. The Dearborn Publishing Co., Dearborn, Mich.

I read in the papers (this time the Chicago *Sentinel*, an ably edited Jewish weekly) an editorial entitled "Jewish Hypersensitiveness." It follows:

"A recent issue of the *Time* Magazine contained an account of the career of George Gershwin, who is making a name for himself as a composer of popular melodies. The story referred to the musical star as 'young Jew.' Now comes Mrs. A. M. Rheinstrom, of New York, and in a letter to the editor of the said journal she 'takes exception to the nonchalance with which you have discriminated in the status of the subject of the article.'

"'I doubt very much,' continues Mrs. Rheinstrom, 'whether you would speak of other persons in your columns as "young Catholics," "young Methodists," "young Presbyterians," or "young Holy Rollers."

"'It strikes me that this continual discrimination against the Jew can do nothing but foment antagonism and aid ill-breeding, race hatred; it astonishes me greatly that a progressive sheet such as yours should have stooped to such stupid practices. Such editorial implication in your news columns is amateurish and unprofessional bad taste.'

"Mrs. Rheinstrom must be a very good Jewess, since she possesses the weakness of her race in a full measure. The writer of this page read the article in the *Time* Magazine and yet he did not think that any malice or slander was intended by the designation 'young Jew.' Mrs. Rheinstrom's objection simply represents Jewish hypersensitiveness which very often looks for anti-Semitism and finds it in places where it does not begin to exist. The fact of the matter is that we ought to be glad that Mr. Gershwin was characterized by a Gentile writer as 'young Jew.' Whenever American newspapers give accounts of crime they will very frequently tell you that this or that criminal is Jewish. On the other hand, whenever they describe Jewish geniuses they invariably speak of the 'Russian violinist,' the 'German novelist,' or the 'French playwright.' The *Time* Magazine proved to be an agreeable exception in this regard.

"Mrs. Rheinstrom makes a very poor and illogical comparison when she says that Christians are not ordinarily spoken of as 'young Catholics' or 'young Methodists' or 'young Presbyterians' in newspaper accounts. Judaism is much more than a religious denomination, and a Jew is a Jew not necessarily by virtue of his religious affiliation. A Jew may be an agnostic and yet he still passes for a Jew by virtue of his descent from the Jewish race. To say this is of course rank heresy, and now that we have made this statement we are quite prepared for the attacks which may come upon us from those who continue to maintain that a Jew is a Jew only by virtue of his membership in the 'Israelitish Church.'—ED."

I read in the papers that in mid-Atlantic the captains of two vessels, one from a German port and one from a Scottish, had performed a supreme act of humanity. Though one was eastward and the other was westward bound, and they were a hundred miles apart, they raced their vessels through stormy seas until the two met, and the Scottish vessel was able to convey to the German a medicine which saved the life of a dying woman. Acts like this bind peoples together. Two seamen battling for a life is a grander spectacle than benchfuls of politicians debating the questions of submarines and poison gas. Captain Wittenstein, the German, and Captain Gemmel, the Scot, may have met in the North Sea and stood without flinching when shot and shell were the compliments exchanged and death was the arbiter. Their meeting in mid-Atlantic proves them greater heroes still.

Peaceful Penetration South of Us

(*Continued from page 7*)

Argentina, the policy of peaceful penetration has doubtlessly been developing, but it has not yet progressed to such an extent as to permit American domination of the fiscal affairs of these nations. Cognizant of the recent history of their sister republics, the members of this group are no doubt wondering when they also will be compelled to bend their knee.

A new departure was made by the State Department when it announced, as of March 3, 1922, that "because of the vital influence upon our future foreign relations, it is the desire of the government that it be duly and adequately informed regarding such transactions; viz., the flotation of issues of foreign bonds in the American market before their consummation so that it might express itself regarding them if that should be requested or seemed desirable."

Shortly after that, Salvador placed a bond issue through certain New York bankers which established a precedent in partnership between the United States Government and the bankers.

The Secretary of State assented to the loan indenture covering this bond issue.

The bankers, taking advantage of the government's apparent partnership in the enterprise, sent out a circular to prospective bond buyers in which they said in part:

Some Things That Happened in Haiti

"It is simply not thinkable that, after a Federal Judge has decided any question or dispute between the bondholders and the Salvador Government, the United States should not take the necessary steps to sustain such decision. There is a precedent in a dispute between Costa Rica and Panama, in which a warship was sent to carry out the verdict of the arbiters."

The State Department did not authorize such a statement, but by its action it had placed itself in a position where it could easily be taken advantage of.

Let us now return to Haiti and see to what extent the facilities of our State Department and navy have been placed at the disposal of American capitalists in our policy of peaceful penetration.

The Republic of Haiti occupies the western third of the Island of Haiti. It is the second oldest republic in this hemisphere, having achieved its independence in 1804 under the leadership of its great hero, Toussaint L'Ouverture.

Haiti's external troubles date from 1905 when a group of New York capitalists closely associated with the National City Bank of New York secured a concession to build a railroad. In 1910, a banking syndicate of which the National City Bank was a member acquired two thousand shares of the capital stock of the National Bank of Haiti.

The railroad was an unprofitable venture, and in 1913 work on it was abandoned. In that year, the Haitian Government, which had agreed to pay a certain amount for each mile of completed track, refused to make any further payments, declaring that the road was not being constructed according to specifications.

In October, 1914, Secretary of State Bryan wrote to President Wilson of "the urgent need of increasing our force," in Haitian waters, "at this time when a renewal of negotiations seems probable, not only for the purpose of protecting foreign interests, but also as an evidence of the earnest of this Government to settle the unsatisfactory state of affairs which exists."

To Maintain Haitian Independence

In an effort to render conditions more satisfactory to American interests, several commissions were dispatched to Haiti in 1914. In December of that year, a convention between Haiti and the United States was presented to the Haitian Government by the American Minister. An important provision of this convention was the appointment by the United States of a collector of customs. The chief source of revenue in Latin American countries is the receipts from customs; to control customs is virtually to control revenues. The Haitian Government rejected the proposed convention.

On July 9, Admiral Caperton landed marines from the United States warship *Washington*, and bluejackets from the gunboat *Eagle*. On July 27, a *coup d'etat* was staged which neither menaced American lives nor property; order was promptly restored. On July 28, a regiment of marines landed, took possession of strategic points, and disarmed the inhabitants. Admiral Caperton received instructions on August 7 to issue the following proclamation:

"I am directed by the United States Government to assure the Haitian people that the United States has no object in view except to insure, establish, and help to maintain Haitian independence and the establishment of a stable and firm government by the Haitian people. Every assistance will be given to the Haitian people in their attempt to secure these ends. It is the intention to retain United States forces in Haiti only so long as will be necessary for that purpose."

At the request of Admiral Caperton, the election of the president by the legislation chambers was delayed twice. Secretary Lansing's instructions to the American Minister were in part as follows:

"In order that no misunderstandi can possibly occur after election, should be made perfectly clear candidates as soon as possible, and advance of the ele tion, that the Unit States expects to intrusted with t practical control the customs and such financial contr over the affairs of the Republic Haiti as the United States may dee necessary for efficient administratio

Navy Department Seized the Custom House

"The Government of the Unit States considers it a duty to suppo a constitutional government . . . has no designs upon the political an territorial integrity of Haiti."

Philip Sudre Dartiguenave w elected on August 12, 1915. A Unite States Senatorial report has this to sa in reference to the election:

"The American representatives, i the opinion of your committee, i fluenced the majority of the assembl in the choice of a President."

Two days after the election, treaty was presented to the new elected president. It included all the onerous provisions, which und peaceable negotations the Haitian had rejected. It provided for comple customs control and financial receive ship; for the liquidation of all claim of individuals or corporations again the government; for military an police control through the medium a constabulary officered by American that the United States would have th authority to prevent any interferenc with the terms of the proposed con vention; and that the treaty was t remain in force for ten years, an renewable for another ten years at th request of either party.

The president signed the treaty It is contended that in order to pr cipitate ratification by the two house of the Haitian Congress, the Nav Department on August 19 ordered th seizure of the custom houses, adding:

"Confer for the purpose of havin Dartiguenave solicit action. Whethe President requests or not, proceed."

Here is a bit of hypocrisy ofte practiced by the American official They wished to give the impressio that the president was acting volun tarily, and not under duress; that th Haitian Government was a free govern ment exercising its own will, and tha our forces were merely there to assis them.

On September 3, Admiral Caperto proclaimed martial law in the capita and on September 8 he sent a messag to Captain Durell commanding battleship at Cape Haitian, whic reads in part as follows:

"Successful negotiation o treaty is predominant part o

resent mission. After encountering any difficulties, treaty situation at resent looks more favorable than sual. This has been effected by the ercising of military pressure at opitious moments in negotiations. esterday, two members of the cabinet ho had blocked negotiations resigned."

During this period, the custom receipts, which were virtually the only source of revenue of the government, were held up by Admiral Caperton so that sufficient nds were unavailable for government laries and other expenses. Later this rder was modified so as to permit a rtain weekly allowance for current xpenses. The cabinet and house of eputies capitulated under this economic pressure and both ratified the reaty.

The Senate Ratified the Treaty

On November 10, the Navy Department sent a message to Admiral Caperton from which is quoted in art as follows:

"Arrange with President Dartiguenave that he call a cabinet meeting efore the session of the Senate which ill pass upon the ratification of treaty, nd request that you be permitted to ppear before that meeting to make a tatement to the President and to the nembers of the cabinet. On your own uthority, state the following before nese officers:

" 'I have the honor to inform the resident of Haiti and the members of is cabinet that I am personally ratified that the public sentiment ontinues favorable to the treaty; that here is a strong demand from all lasses for immediate ratification, and hat the treaty will be ratified Thursay. I am sure you gentlemen will nderstand my sentiment in the matter. nd I am confident that if the treaty ails of ratification that my governent has intention to retain control Haiti until the desired end is accomplished, and that it will forthwith roceed to the complete pacification of laiti so as to insure internal tranuillity necessary to such development the country and its industry as will ford relief to the starving population ow unemployed.' "

After receipt of the message which aid in effect that if you do not sign, e will stay right here until you do gn, the senate ratified the treaty.

But the American interests were ot satisfied with mere financial conrol of the country. There was a provision in the Haitian constitution that o foreigner could own land. They ould lease it for a number of years, ut could not own it. Certain large merican development companies had een casting covetous eyes on rich and rtile tracts in Haiti so that in the pring of 1917, the draft of *a new constitution* was submitted by American fficials to the Haitian Government hich among other things permitted he owning of land by foreigners.

The Haitian Assembly refused to ratify the constitution with the above provision, and in order to prevent the ratification of a constitution without this provision *General Cole of the Marine Corps dissolved the assembly.*

There was then no power in Haiti which could pass a new constitution so that the occupation, without precedent or authority, arranged for a plebiscite for the purpose. The election was held May 8, 1918, and was officially reported adopted by a vote of 98,294 to 759. Rev. L. Tom Evans, who had for years been a missionary in Haiti, in his testimony before a Senate investigating committee said:

> "The bundle of pink slips (no), significantly showing the fraudulent nature of the whole scandalous business, remained on the other side of the table tied together. The poor natives in charge, as well as the so-called voters, knew those packets were meant for mere show, for even if cut loose their terror-stricken Haitian brothers dared not refuse the "oui" (yes), but asked for the "non" at the risk of being imprisoned and shot as an enemy of the occupation and foe of the United States Government."

Imposing a Loan on the Haitian People

As soon as the constitution was accepted, American interests began to acquire large tracts of rich and fertile lands and proceeded to force off the natives who could not show legal title. *As a result, a serious unemployment problem ensued wherein former small land proprietors were forced to work as day laborers at a wage of twenty cents a day in the highly seasonal occupation of sugar cutting.*

Finally, in 1922, the occupation benevolently imposed a $40,000,000 loan on the Haitian Government, $16,000,000 of which was immediately floated. Just prior to its flotation the Haiti-Santo Domingo Independence Society condemned the loan saying:

"The loan is issued over the protest of virtually the entire Haitian people, and is based on the following illegal steps:

"1. Military invasion by the United States naval forces of the independent Republic of Haiti in July, 1915.

"2. Overthrow of the Haitian Government, seizure of the Haitian custom houses, and other sources of revenue.

"3. Imposition of a treaty through 'military pressure.'

"4. Dissolution of Haitian Legislature for refusal to vote for constitution prepared in the United States, June, 1917.

"5. Imposition of new constitution by illegal plebiscite conducted by United States Marine Corps, giving occupation further powers, June, 1918.

"6. Flotation of loan, terms of which automatically extend United States occupation for at least thirty years."

Again quoting from Senator Borah's speech of June 19, 1922:

"I shall not today discuss at length why we went to Haiti. Suffice it to say that, in my judgment, there was no sufficient reason for our invasion of Haiti, and suffice it to say, further, that if the Haitian people had been a much stronger people, a more powerful people, a people with a navy and army, we would not have gone to Haiti even if the same reasons had existed which did exist. We have some two or three policies with reference to our foreign affairs, and those policies are adjusted to the size and strength of the people. In my humble opinion, the policy which prevailed with reference to the Haitian people was by reason of the fact, in large measure, that they were helpless to resist the invasion and the encroachments of the American marines and the American Navy."

In order to prevent further "entangling alliances" by any department of our government in our policy of peaceful penetration, the following resolution was introduced in the Sixty-eighth Congress, but was not voted on:

"Resolved by the Senate (the House of Representatives concurring) that the President be, and he is hereby, requested to direct the Department of State, Treasury, and Commerce, the Federal Reserve Board, and all other agencies of the Government which are or may be concerned thereunder, to refrain henceforth without specific prior authorization of the Congress from—

Allowed to Work Out Their Salvation

"(1) Directly or indirectly engaging the responsibility of the Government of the United States, or otherwise on its behalf, to supervise the fulfillment of the financial arrangements between the citizens of the United States and sovereign foreign governments or political subdivisions thereof, whether or not recognized *de jure* or *de facto* by the United States Government, or

"(2) In any manner whatsoever giving official recognition to any arrangement which may commit the Government of the United States to any form of military intervention in order to compel the observance of the alleged obligations of sovereign, or subordinate authority, or of any corporation or individuals, or to deal with any such arrangement except to secure the settlement of claims of the United States, or of United States citizens through the ordinary channels of law provided therefor in the respective foreign jurisdictions, or through duly authorized and accepted arbitration agencies."

This is both a moral and a practical issue to which Congress should address its early attention to the end that our marines be returned to this country, and that our sister republics to the south be permitted to exercise their full sovereignty and work out their own salvation. This would be but fair and just.

Is Common Censorship Common Sense?

(*Continued from page 12*)

may be considered together, as belonging to more permanent forms of art, for the reason that all plays that have extraordinary vogue or merit are, as a rule, issued in printed form, and therefore become a part of literature in general.

Adout the Main Advocates of Censorship

It is natural that the fight should center in New York because, while there are other "centers" (H. L. Mencken claims that Chicago is now the literary center of America) it is still true that the main literary production still remains in New York, most of the big publishing houses being located there, or in the immediate vicinity.

The main advocates of censorship have been and still are John S. Sumner, secretary of the Society for the Prevention of Vice; Justice John Ford, of New York; Magistrate McAdoo, and Canon William Sheafe Chase, accompanied by a host of clergymen and others. The Antis include, of course, all the writers and others. These writers swing wicked and in many instances vitriolic pens in support of their cause.

In a typical case, which might be duplicated many times, a publisher issues first a doubtful book. Someone writes to Mr. Sumner that this book is bad. He looks it over and decides that it is. He has the publisher arraigned in court. The judge, who presumably knows little and cares less about the fine points of literature, agrees with Mr. Sumner that the book is bad, and the publisher is fined and the book suppressed. The following day Heywood Broun, the critic on the New York *World*, and other similar critics, come out in a chorus of ridicule of the whole proceeding. Mr. Sumner is pictured as a cross between a moron and a custom house officer. The judge is held up as a Philistine. The excitement and laughter thus raised creates a wide ripple. Later on the publisher sues Sumner for damages, the book is restored and the case forgotten, the book placed on sale—although by the time this happens, the probability is that every one who has wanted to has already read it.

In the case of plays, about the same thing occurs. In September, 1924, M. Anderson and Lawrence Stallings produced a play entitled *What Price Glory*. This was an arraignment of war, about the Marines, the scene laid in the trenches. It contained objectionable language, and was promptly denounced. The police interfered, one or two expressions were eliminated and thereafter the play became an enormous success.

It should be understood that the present writer is not defending either side; he is merely presenting the subject for thoughtful consideration.

There has been and unquestionably is now a flood of indecency which, since the war, has been poured out all over the world. Also, owing undoubtedly to the stimulus of the war, there has been and is an extraordinary amount of good writing. Justice Ford of the Supreme Court, who is a strenuous advocate of censorship, declares that Section 1141 of the Penal Law in New York is the "most carefully worded and comprehensive of the statutes designed to prohibit this form of printed matter (vile books, and so forth) which has come to my attention. In brief, it declares the distribution of exhibition of any objectionable publication, picture or object or the advertising of them in any manner a crime . . . . Yet this law is practically dead today, killed by judicial decree of the lower courts before which it has come for interpretation, and that too in the face of a unanimous opinion of the Court of Appeals, which, in 1884, construed the law and gave to it and every part of it full force and effect. The death blow was struck by the Appellate Division of the First Department in reviewing conviction in another case . . . . our homes are thus thrown open to the entry of every form of disgusting prints which are in those very terms barred from circulation by the law of the State."

Opinions Widely Differ in Court Cases

It is fairly obvious from this that in any case brought into court, about that which is considered "objectionable" there must be a matter of wide divergence of opinion, and therefore it is thrown back eventually into the court of public opinion.

Public opinion in this country rules, but it first has to be educated and aroused.

One of the most celebrated, comparatively recent, cases was that of President Brainard, of Harper and Brothers. In January, 1920, they were convicted of violating a section of the Penal Code in publishing a book entitled *Madeleine*. At that time the counsel suggested a board of state censorship to pass on the morality of books. In July, 1920, the Appellate Division reversed this conviction and thus President Brainard and his firm were vindicated. He claimed that he was the victim of a conspiracy brought by another publisher. In May of 1920, R. D. Halsey was awarded a verdict against the New York Society for the Suppression of Vice for their suppression of Gautier's book *Mademoiselle de Maupin*. During this same month, R. M. McBride, publisher, pleaded not guilty to indictment that J. B. Cabell's book *Jurgen*, was obscene. It may be said that Mr. Cabell's books have been the center for years of a heated controversy, the intellectuals passionately declaring that they are works of supreme genius. As a matter of fact, they are unusually stupid and imitative.

In February, 1921, Margaret G. Anderson and Jean Heap were fined for publishing Joyce's novel *Ulysses* in *The Little Review*, charged by John S. Sumner. This book of Joyce's has also made a great stir. It is a minute account of everything which happens in the lives of certain human beings, and is undoubtedly touched by genius, but I cannot imagine anybody reading it through.

In April, 1921, Dr. W. J. Robinson was fined $250 for publishing *Love in Marriage*, by Dr. Marie C. Stopes. In September, 1921, the police stopped the performance in New Haven, Connecticut, of a play called *Bluebeard's Eighth Wife* and later in October in Pittsburgh they halted the performance of *The Demi-Virgin* by Avery Hopwood. This occasioned the Reverend John Haynes Holmes to remark that in New York nine plays out of thirty-nine were indecent.

It was in the early part of 1922 that the pot began to boil, Magistrate McAdoo, Canon Chase, Mayor Hylan, A. H. Woods and all the dramatic and literary critics taking a hand. In May of that year the *Sons of Hollywood* was barred from the mails and, in June, J. Kidd was fined for similarly sending Boccaccio's *Decameron*. At this time the police made a fuss about Eugene O'Neill's *Hairy Ape* and Magistrate McAdoo got the manuscript and read the play. By this time he had become wary of the critics, and was careful to make no comment, realizing that his "remarks" would be riddled. Later on a number of other books came up for censorship, among them D. H. Lawrence's *Women in Love*. It was in July that D. H. Halsey, before referred to, claimed damages against the Society for the Suppression of Vice for their prosecution of him for selling Gautier's *Mademoiselle de Maupin*, and his claim was upheld.

The Clean Books League Was Formed

A great discussion in the papers took place, in which nearly everyone took a hand, including Henry Holt, the venerable publisher, and Booth Tarkington. This resulted in a general invitation sent out to many prominent men and women, inviting them to become members in the panel from which jurors were selected. In October, 1922, Messrs. Boni and Liveright filed damages against Sumner for his allegations against *The Satyricon*, and during the same month Cabell's *Jurgen* was declared proper by Judge Nott.

The next year, 1923, Justice Ford's

aughter secured a copy of D. H. awrence's book from a circulating brary. Discovering this, he launched n attack on *Women in Love* and there- y laid himself open to the gifted pen f Heywood Broun. However, ater in March, the Clean Books eague was formed, the objec f which was to read and pass n the fitness of new and old ooks. Justice Ford was elected resident and Dr. C. K. Gilbert, ecretary. From this time on n effort was made to get a lean book bill through the Jew York State legislature, ithout success.

The commercial aspects of he problem are shown by the act that in April, 1923, T. E. IcEntregart, representing the Iearst publications, opposed the lean Book Bill because it might pell ruin to the publishers. At his time Bernarr Macfadden, a Jew York publisher of many eriodicals devoted to physical ulture,, and so forth (!), in- ited Magnus Johnson to at- ack the Clean Books Bill in speech. Magnus "done" the est he could.

In May, 1924, the American Booksellers Association in convention opposed any censorship but that of public opinion. Just before this, in April, Rabenold's Clean Book Bill was defeated in the state senate, New York.

In August, 1924, the Knights of Columbus planned a war on all sex literature.

The brief chronological references given in this article are merely the chips on the current of this great agitation.

There can be no question that this country, apparently in common with all other countries, has been and now is afflicted with a flood of deterrent literature—so called. That this stream of poison must have its effect upon the national character, seems unquestioned. On the other hand, we are undoubtedly confronted by the dangers of too much paternalism, and the domination of fanatics. The Constitution gives us freedom of speech. Ever since this country was started, we have permitted genius to go its way, no matter in what field, and have often paid it excessively. It is undoubtedly true that this very fact is taken advantage of by greedy and shameless people who commercialize anything they can lay their hands on.

"Censorship has always existed and always has been denounced."

Selling Texas Golden Fleece

(*Concluded from page 22*)

o get their price it will be the biggest ictory they have yet won. If not, it vill be simply a momentary setback. For the vast majority of Texas flockmasters, large and small, are "sold" o the warehouse system, the Sheep and Goat Raisers' Association of Texas as an rganization is sold to it, and they will all tay sold until a better plan is presented.

The writer was shown the 1924 alances of one large warehouse comany. Last year was supposedly a ean year—the Boston buyers invading he range in unprecedented numbers nd buying right and left—and yet his company handled 4,500,000 pounds f wool and lent $1,300,000. It made a rofit of thirty-five per cent on its apital, of which 12½ per cent was wisey salted away in surplus. It paid the sual ten per cent dividend to its 150 tockholders, of whom more than one undred were actual sheep growers.

The Texas plan differs in every imortant respect from that of the Pacific Coöperative Wool Growers (Sapiro), s the following summing-up will show:

The former ties up the flockmaster n a five-year contract binding him to eliver every pound of his clip to his Coöperative, and giving him no voice n the sale. The latter has no pre-sale ontract feature. Besides being only a entleman's agreement and therefore onenforceable on the producer, it is ighly competitive.

The Sapiro plan provides for the oncentration of the wool at Coöperative headquarters, located at some one entral point. Under the Texas plan it is concentrated at any one of sixteen warehouses scattered over the vastest sheep and goat producing region of America, at the grower's convenience.

The Sapiro plan includes the employment of a sales manager whose authority to sell—when and at what price he elects—is not subject to challenge by the Coöperative rank and file. In Texas the buyer from Boston hands his sealed bid to a committee of practical sheepmen representing the Board of Directors of a warehouse company.

The Northwestern flockmaster must look to Boston for periodical financing. In Texas he looks to his warehouse, in which he has the privilege of being a stockholder virtually assured of a ten per cent return on his stock.

The Sapiro plan is restricted to members paying the overhead cost themselves in commissions or assessments. The Texas warehouse plan is an investment, open to the world. It makes no difference whether a sheepman is, or is not, a stockholder—he can avail himself of its double function of selling wool and lending money.

All of which makes the selling of wool and mohair what it should be in light of supply and demand—easy and practical.

Digging Diamonds

IN GONG-GONG, South Africa, near Kimberley, a diamond digger has found a stone of 110 carats. A curious coincidence is that the same digger, only two weeks before finding the 110-carat stone, found another large stone, which he sold for $4,500.

The African mines, from a production standpoint, have largely replaced the mines of Brazil and India. The African stones do not compare in beauty with those of India. The diamond has been valued by the ancients as well as the moderns. The fact that diamonds may nearly always be sold at par or even more than their first cost has endeared them to the owner.

Diamond deposits are circular or oval in form, and these deposits are inclosed by a wall of carbonaceous shale. Near the surface the deposits consist of a yellowish, friable material known to the miners as "yellow ground," but when, with depth, the limit of atmospheric weathering has been reached, they pass into a partially serpentized rock known as "blue ground." The deposits invariably occupy the vents or pipes of ancient volcanoes, and there is no doubt but that the presence of diamonds indicates their connection with volcanic eruptions. It is believed that the molten rock coming in contact with the carbonaceous material results in the formation of the gems.

The value of diamonds is determined by weight, cut, brilliancy, color, and perfection. Off-colored stones do not bring the prices the colorless stones demand. In the rough the stones average from $8 to $15 the carat for the run of the mine.

A Century of Dishonor

(*Concluded from page 20*)

the army was sent against him; if he revenged himself for murdered friends and for diseased, debauched and dishonored family the answer was a military campaign to compel obeisance.

My first introduction to the Red Man was forty years ago when landing on the frontier at daybreak. A party of Sioux had come to see the arrival of the iron firewagon; they were tall manly looking fellows, clear-eyed and clean-limbed, dressed in their beaded moccasins and trousers with striped blankets drawn about their shoulders, with their long black hair plaited and from which a single eagle feather projected to flutter gently in the morning breeze.

They came to welcome the White Man with their "how" and handshake, just as their forefathers had always done for generations before them, and it was a sincere and hearty welcome. It was their home and hunting ground that we were welcomed to—a virgin country on which still grazed the last of the buffaloes and the antelope; it was the last big game and Indian country; their only remaining native and natural homeland. The iron horse had reached the front door of this vast domain and was already designed to enter, pass through and cover it with sinewy tentacles to the north and to the south while its main trunk was to be extended to the Pacific, nearly two thousand miles beyond.

It was in the days of the beginning of the "winning" of the last great West; it was the start of the campaign for "civilizing" the last of the "Wild West."

The mental picture I recall is of a flower-covered plain liberally interspersed with wood-fringed lakes with here and there a collection of tepees along the shaded border, with romping children and numerous ponies scattered about watched over by bead-bedecked squaws squatted cross-kneed on a buffalo robe busy at some intricate bead work, and others supervising the preparation of stewed saddle of an antelope and service berries against return of the men from the hunt or a fishing excursion.

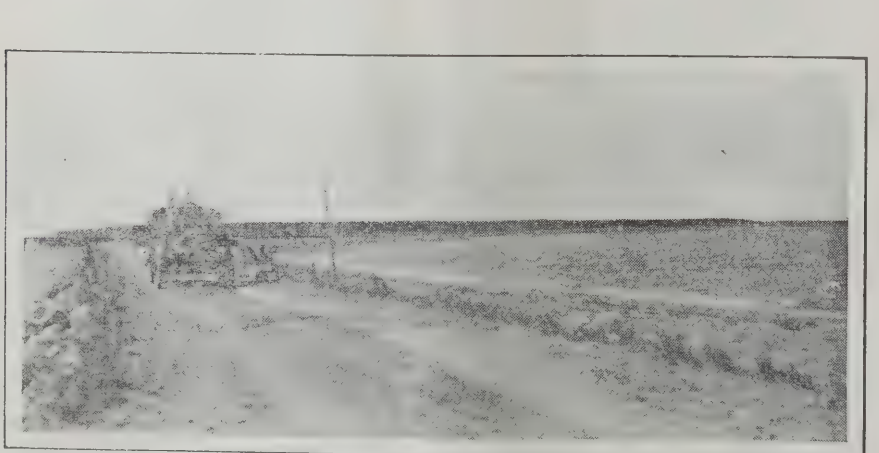
The Garden of Eden could not have been more charming nor was ever on earth more nearly a Paradise or land of Peace and Plenty. But the White Man was coming—and he came in carloads and in trainloads; he came in prairie schooners, singly and in caravans; he spread out like the opening of a fan to the north, the west and the south preëmpting every acre of tillable land, including the lakes and trees that bordered them; they slaughtered every wild thing on top of the ground and drained the beautiful lakes of their stocks of fish; they cut and burned for fuel the wooded sections and made of this enchanted land a ruin and a desolation. Within a year the Red Man was facing starvation; his happy, carefree life was over. The herds from which he drew his sustenance were gone forever; his food supply of buffalo-hump and the robes which that animal had furnished providing his shelter and his clothing, too, were now no more. The rapacious whites called hide-hunters had destroyed them all and their carcasses and bleaching bones covered the vast prairies westward from the Minnesota border.

However, this vast wild region was now being "civilized" and opened up to settlement for the advance of Progress; sod houses and pine board squatters' shanties were dotting the landscape in lieu of the romantic tepee midst green foliage and flowers. The surface of the soil was being seamed and gashed by the breaking-plow in readiness for the No. 1 Hard that was to make the region famous for wheat production. In the mad rush for land and a share of the wealth of the natives that the white looters always expected and got, they soon found themselves without either food or fuel; they had slaughtered the buffalo for their hides and left the carcasses to rot; they had cut and burned the trees and now their own predicament was little less serious than that of the poor Indians whom they had so quickly and ruthlessly despoiled.

But the White Man had friends in the East and means for getting both food and fuel from the settled section of the East over the railroad; he could help himself out of this unenviable situation but it was terribly expensive. The Red Man could not and was allowed to seek means of existence as best he could or starve, so he took himself to gathering up the bones of the buffalo that lay bleaching in the sun everywhere over that great "Inland Empire"; these he gathered into loads of 200 and 300 pounds each and hauled them in rude wooden carts to the railroad terminus trading them for scraps of tainted meat and remnants of cheap calico; traded them for something to eat and something to keep his women and children alive and slightly clad. Fresh meat was imported from the East and was a luxury much too expensive for the poor Indians to afford and so their women kept watch at the slaughterhouse corrals where hogs were kept along with herds of cattle to supply the contractors who were building the railroad into the frontier, slowly but steadily moving westward, and there they fought for the offal that was dumped into the hog yards.

It did not occur to these Whites that the Red people had any rights whatever. They were tolerated only because they gathered up the buffalo bones out of which the White Man could make a profit of 233 per cent. The recollection of these emaciated women and children and their terrible suffering through the cold winters brings pangs to this day. It was the writer's business as an employe to handle the buffalo bone trade along with other duties, and in recent years to assemble some data covering that historic period, and the traffic was found to have amounted to a grand total of $2,800,000 and it represented a herd of thirty-one and a quarter million animals.

A visit to the same locality a quarter century after the White invasion revealed startling changes; the local tribe of Indians had dwindled from a colony of eleven hundred to less than five hundred; and instead of the fine-looking robust manly figures that I first beheld they were slovenly arrayed in White Men's discarded clothes including shoes and soft or derby hats. Nearly all were afflicted with trachoma and tuberculosis and generally were sorry-looking survivors of the former vigorous, healthy and happy families. Their former picturesque camping grounds now were mostly barren alkali beds, formerly forest-fringed inland lakes long since evaporated. The big lake, on which the steamers ran daily their fourteen-mile trips from shore to shore, was crossed in a modern touring car without wetting the tires.



Crossing the big lake in the auto—where formerly the steamboat ran its daily trips of fourteen miles.

Impressions of The Wayside Inn

About Which Longfellow's Famous Series of "Tales" Were Written

By MARY HARROD NORTHEND

IMPRESSIONS of The Wayside Inn at South Sudbury, Massachusetts, are most certain to vary according to the visitor's previous acquaintance with that famous old hostelry.

This old tavern—more than any other of the many which dot the New England coast country—has come to enjoy the dignity of a shrine, with all the attributes and particularly the magnetism which distinguishes such meccas. For anyone to whom the things of the past have any significance at all, an old house or inn or other meeting place, with a background of historical incidents, is a cherishable relic of a superior order, which inspires dreams and visions and in many other enjoyable ways serves to punctuate pleasantly this humdrum modern busy life of commonplace events and monotonously leveling influences. The magic touch of a great poet has imparted to the old hostelry an atmosphere of romance which affects every pilgrim. To such the sight of the prancing horse swinging to the breeze over the porch of The Wayside Inn is like the sight of some old friend.

Many have made the pilgrimage to Sudbury out of desire to see a place about which they have read in Longfellow's famous collection of versified tales (*Tales of a Wayside Inn*). Doubtless these visitors have the memory of some of Longfellow's much quoted lines which they have carried with them from school days and as they see, probably with a pleasant start, that true enough

"Half effaced by rain and shine,
The Red Horse prances on the sign."

they repeat that jingling couplet to themselves and enter the broad porch with suddenly aroused interest.

Or then again, perhaps they recall the poet's description of the building:

"A kind of old Hobgoblin Hall
Now somewhat fallen to decay,
With weather stains upon the wall,
And stairways worn, and crazy doors,
And creaking and uneven floors."

But the visitor sees no marks of age or decay, no dilapidated stairways, no twisted doors, no noisily annoying floors, such as one would expect from the description. Longfellow was writing of the inn as he knew it in its years of neglect. The old place, as the visitor sees it now, shows it as it was in its original heyday form—the scene of an age that is past, its every hall and room as its guests of two hundred years ago knew it. And it is all so strangely familiar that the guest of today finds himself much wishing in his mind that he had been allowed to live when stagecoaches, post riders, town criers, wayside taverns and all the rest were the common events of every day. For, though such places as The Wayside Inn may never have been known to us in life, they seem to bring back to one's mind the memories of things and feelings of something dimly known somewhere before. That is the essence of the lure of antiques and the other appurtenances of life in all the "those days" of history.

There are individuals in this world who are, or would appear to be, utterly cold to the appeal which an old house can have. But in spite of that many of them pay their "duty" calls to places like Wayside Inn. They see the spreading face of the old frame buildings with their old-fashioned shutters and tiny-sectioned windows. They wander in, under the prancing horse on the sign, notice the high-paneled hallway with the picturesquely appropriate coaching scene on the wall paper, into the famous taproom with its still-standing bar opposite the door, its wooden walls mellowed with smoke and age, its colonial fireplace and its pewter and bottles on the shelves adorning the wall behind the bar. They glance out the window opposite the door to see the old-fashioned garden with a bust of Longfellow at the end of the flower-bordered walk. The bust of the poet is a replica of the one which stands in that paradise of memorials, Westminster Abbey. But if they give their imaginations leave to roam with their eyes they may recreate for themselves all the conditions of colonial life, and conjure up the living forms of Washington, Hancock, Adams and Webster—for there stands Webster's desk in a corner of the parlor.

And when they saunter on into the parlor, a typical colonial room of taste and dignity, where Longfellow and his coterie were wont to gather before the cheerful blaze crackling on the hearth, they may vividly realize that on the very spot whereon they stand the poet spent much time and meditated those ideas which later bloomed in the *Tales of a Wayside Inn*. The framed letters that hang on the wall, and those two framed panes of glass which bear the verse and name of William Molineux, may evoke a more than casual interest, for thus the verse and name were engraved on the glass with a diamond by Molineux, and Molineux was the man who walked beside the British troops to protect them from insults during their stay in Boston, a studiedly raised eyebrow and a knowing nod, warning the inhabitants to be discreet. The verse reads:

What do you think
Here is good drink
Perhaps you may not know it,
If not in haste,
Do stop and taste
You merry folk will show it.

and the date is "June 24, 1774."

The large and cheerful dining room, with all its memories, brings even an apathetic visitor into com-

munion with the true spirit of the olden tavern—for within this very room the Marquis de Lafayette, and Captain Wadsworth after his celebrated fight, and Longfellow, and Emerson, and countless other interesting men ate and chatted and had refreshments while stopping overnight or in passing by coach to or from Boston. The old, well-preserved document dated August 7, 1775, detailing all the expenses of a day's journey of twenty-five miles by horse and three meals totaling what would be today a little over a dollar; the many reminders of the days when stagecoach guests made this their favorite resort for stop-overs—these things halt even the visitor who thought he had no feeling for these reminders of the past.

The bedrooms—the one in which Lafayette slept during his visits, with its little partitioned-off corner which his valet occupied (when Longfellow's little daughters went to the inn they slept in the valet's chamber next their poet father), and the larger room which Longfellow habitually used when here—have a tale to tell that commands interest. Similarly the ballroom, done in white with box-like seats running its length where guests stowed their wraps, the platform whereon the darky fiddlers played those spirited reels and jolly contra-dances which comprised the social diversions of our grandparents—of all these associations, perhaps the mention of the fact that divine services were also at one time held in this ballroom and that after a particularly long and tiresome sermon, the devout country folk adjourned to the dining-room below to renew and renourish their flagging physical energy—perhaps this incongruity of functions served by a ballroom strikes the hurrying traveler as something to be remembered and spoken of later.

Guests who are ultra-modern in their interests and background undoubtedly experience a thrill upon first viewing the state carriage in which Lafayette rode when he came to spend a night at the tavern and the stagecoach which belonged to Governor Eustis and was at one time used by Daniel Webster. It is said to be the coach in which Webster rode to pronounce his Bunker Hill oration. These conveyances are so oddly

"It crowned the sombre clock with flame,
The hands, the hours, the maker's name."
—*The Tales.*

old that there breathe few men with souls so dead as never to experience a sense of stimulation at sight of these obsolete modes of travel, and a motive to reflect upon our speedier modern vehicles of transportation.

Or, perhaps, they are attracted by the old Paul Revere lanterns, to be seen around the inn. Altogether there are one hundred and fifty-eight varieties.

The fact of there having been generally used such a variety of lanterns may not impress the visitor, but the appeal of the Paul Revere variety, a pinched or perforated design, which takes its name from the fact that such a lantern was hung on the Old North Church during the famous ride of Paul Revere to Lexington, probably cannot be denied.

They have a greater value and a more striking effect. The lighting of the inn has been arranged for with all the delicacy and skill of one in love with the designs of the past and unwilling to do them violence by ill-judged methods of "restoration."

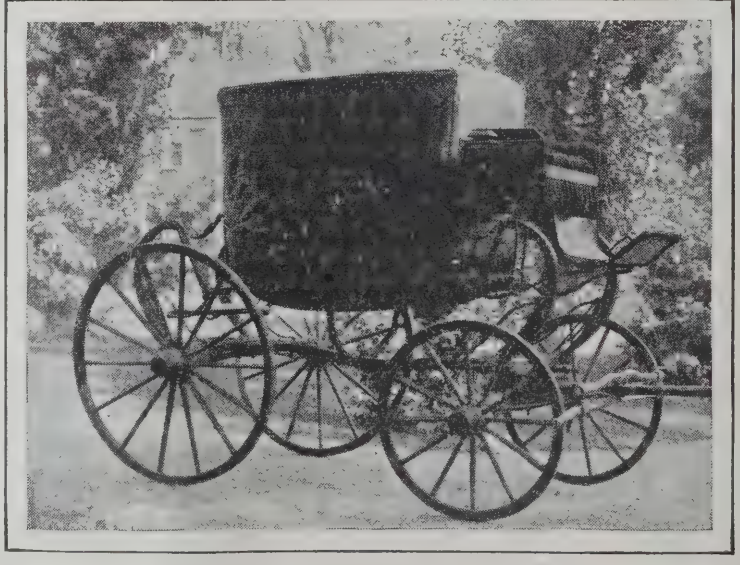
The story of the old inn from the time when it was first built as a dwelling by one David Howe through the period of the Indian raids to the time when the owner's fortunes came to grief and the old mansion was opened as a hostelry, thereafter carried on as such, handed down from father to son for over a hundred years—it is likely that this story, with the story of Jerusha Howe, sister of a one-time owner, who had and played the first spinnet ever seen in this section of the country, can hardly leave the listener cold.

"Built in the old colonial day, when men lived in a grander way"—that is to say, in 1686, this old house by the side of the Boston Post Road has witnessed the growth of America. Within a radius of twenty miles most of the determinative principles of American nationalism were born and flourished. A link between Boston and the interior, this house saw both the exertions of the statesmen and the forthright activity of the woodsmen. It was the scene of many revolutionary conferences, and the military center for the district roundabout. No house between Boston and Worcester was better known than this, none has survived so long with an accumulated fame.

With the departure of the colonial days and the disappearance of stagecoaches from the roads, the old inn fell into disuse. Truly it seemed as if its glory had departed. It sat by the side of the road in lonely dignity, a silent reminder of generations long gone to their reward. It became by turns a tavern, a boarding house, a dwelling for one family. Its spacious rooms were long untenanted. Then the Boston and Concord coterie, awakening to the old inn's significance, began to use it again, for summer sojourns or as the terminal of jaunts into the country. Here Longfellow came to rusticate and to roam around the old place. He was brooding many noble tales in verse about this time, tales that seemed to come with no relation to each other. It occurred to him one day that The Wayside Inn was the natural link between the tales. So with it as a framework and the well-known comrades of many an evening there as mouths in which to put the tales, and the jovial landlord presiding over all, *Tales of a Wayside Inn* was published in 1863 and went out into the world to an immediate literary success.

From that day to this the inn has never lacked interest for the people of the United States.

To save the inn from private exploitation, to preserve it as a shrine for the people, and to maintain the surrounding countryside as a fit frame for the picture which the inn and the poems present, Mr. Henry Ford, in 1923, and at the earnest solicitation of friends of the Inn, guaranteed its integrity and extended its lands. Many modern touches have been eliminated in the desire to present the inn as it was in the great days of old, when it stood in the center of stirring events and formed the setting for some of the greatest figures of our history. Such landmarks of the past are among a nation's most valuable treasures.



Carriage in which Lafayette rode to The Wayside Inn.

Through the garden gate. Longfellow's bust in the distance.

The Lafayette room with alcove to the left where the great Frenchman's valet slept. The original paper is still on the wall.

The Old Red Horse Tavern

Longfellow's "Wayside Inn" at South Sudbury, Massachusetts. A monument to the tastes and qualities of the Fathers.

The old taproom with its bar and deep fireplace. This room was the scene of many conferences during the pre-Revolutionary period. The landlord was a militia officer and the old tavern still contains bills for military supplies. Here drivers bound for Boston rested. Emerson often changed stages here, and there is a letter from him asking about a shawl he had lost.

Above—The old raftered kitchen where huge and savory meals were prepared. Here the colonists could find all their old utensils and start housekeeping again.

At left—The quaint and dignified old parlor, with the Howe coat of arms above the fireplace. In this parlor is laid the scene of Longfellow's "Tales of a Wayside Inn," a volume which has immortalized the place.

IN POLITICS it is almost a commonplace that a party of order or stability, and a party of progress or reform, are both necessary elements of a healthy state of political life; until the one or the other shall have so enlarged its mental grasp as to be a party equally of order and of progress, knowing and distinguishing what is fit to be preserved from what ought to be swept away. Each of these modes of thinking derives its utility from the deficiences of the other; but it is in a great measure the opposition of the other that keeps each within the limits of reason and sanity.

Allis-Chalmers
builds Electric Motors embodying Timken advantages

Lightning—electricity—harnessed, runs electric motors. Electric motors equipped with Timken Bearings run free of chafing, scoring, flat spots, over-oiling, under-oiling—needless burn-outs—*shut-downs.*

On Timken Tapered Roller Bearings the rotor is free of the risk of riding the stator, even with closest air-gap. For with Timkens the motion is all on supremely enduring Timken-made bearing steel. And Timken Tapered Roller design inherently provides true rolling motion, and higher capacity for radial, thrust and shock loads.

Wear is defeated. Alignment is permanent. Friction is negligible. Starting load drops even more than running load. Lubrication and inspection become minor items. Housings are more compact. Motor mounting makes no difference. Drive layouts of every form—belt, gear, chain, direct—are improved.

Lower costs are certain as Timken Bearings, in electric motors, repeat the universal success of 125,000,000 Timkens in every kind of machinery, in power transmission, in rail transport, and in motor vehicles.

Presented in This Issue:

Mr. Ford's Page deals with a matter the discussion of which is more voluminous than the knowledge that exists concerning it. (p. 9)

This seems to have turned partially into something of a woman's number. It is pleasant to record that the women are steadily learning what influences have tried to capture the women's organizations of the country. The attempt has largely failed. We cannot say, however, that all the higher women leaders were altogether true to their trust, which accounts somewhat for the hesitancy of some of them to speak out what they know.

For example, the story written in this number by Courtenay Savage is based on material supplied by one of the "regulars" among the women's leaders. The name was not permitted to be used. Mr. Savage himself seems not to have known much about the matter until this leader told him. This accounts for his stressing some points which this paper long ago made familiar to its readers. However, they will stand presentation from another angle. (p. 5)

The little essay on "How the System Worked the Woman" is short and to the point. The system worked the woman *just as it had worked the men.* But the women found it out! The women exposed it! That is more than the men have done. (p. 8)

Then there are two women writers in this number. Florence Taft Eaton lives in Old Concord, knows it, loves it and can convey its atmosphere in writing. (p. 3)

Edith Dickson tells the sad love story of Mrs. Whitman and Edgar Allan Poe. These letters show both parties in a somewhat better light than the usual tales that have been told. It was outside interference, gossip of which he had no proof but nevertheless believed, that led Mrs. Whitman to break off the engagement. (p. 7)

Here is a country with a brand new commodity on its hands—leisure! What to do with it? It is really astonishing to see how greatly leisure time has grown in the United States and in a generation which exclaims that the world was never so busy. The increase in "spare time" is a great social fact. (p. 4)

A pleasant method of murdering public interest is by ceaseless headline iteration. If you wish to drive the people away from a printed article, put "shipping board," "League of Nations," "the agricultural situation" or some other threadbare phrase in the headlines. "Bromides," the newspapermen call them. The head kills the story. It is tragic; some of the themes are of burning importance. But things of burning importance can also seem to be of no public interest. The public resents the professional publicity method of handling these important matters.

Here, then, is an article, split up into sections because it was too full of dynamite for any single issue—but we dare not do it the injustice of headlining it in a way we know would drive readers away. Read it and see if it doesn't mean more to you than anything you have seen on the subject. (p. 24)

Tom Masson has lived among jokes all his life—written thousands of them—edited millions of them. Yet he says there are only seven. The rest are variations. (p. 16)

If an alienist can go on the stand and get a man life imprisonment for a $5-or-10-days offense, because the alienist thinks the prisoner is a moron or something, what becomes of our 12-man jury system? This question may arise any day. Is a science, newly sprung and undeveloped, to take the place of our laws? Is an experimental alienist, so-called, to become dictator of men's liberty? These are questions which a well-known alienist frankly faces. (p. 20)

To prevent the large accession of Jews to Christian Science, a movement called Jewish Science is being promulgated by Rabbi Levy of Temple Beth El, Rockaway Park.

In many Italian villages bread is taken to the village bakery to be baked, for few homes have fires in them.

The sun is so hot in India that when Dr. E. A. Ross, of the University of Wisconsin, attempted to cross the street without any covering on his head the natives hurried to cover it, declaring he would suffer from a headache from even so short an exposure.

Victor H. Paltsits, of the New York Public Library, doubts the authenticity of the famous Bixby letter which has been ascribed to Abraham Lincoln.

The first railroad passenger and freight station in the world was the old Mount Clare Station, still standing in Baltimore, Maryland. In this station was received the first message ever sent by telegraph: "What Hath God Wrought?"

When Stephen A. Douglas was making a speech in Milwaukee, in 1860, the platform broke down and someone cried out that the "Little Giant" was running for office on a poor platform.

The proportion of sons who read and write in India is seven times as high as that of the daughters.

Recently in Columbus, Indiana, when a paving stone was removed in front of the Salvation Army citadel, a petrified snake was found. For fifty years before the Volstead Law was enacted, the building was occupied by a saloon.

The white population of the British Empire is only 60,000,000 persons while the number of its native race subjects is 400,000,000.

Some Berlin traffic cops now wear red circles on white wristbands to aid them in making their signals visible.

High Lights in New England Scenery

Where Hawthorne, Emerson, the Alcotts and Other Famous Writers Have Lived

By FLORENCE TAFT EATON

N ABOUT the year 1637, the little town then known to the Indians by the romantic name of Musketaquid or Grass-rown River was bought from them y a little company of families from ngland in such a friendly fashion as merit the name then bestowed upon —Concord. Tradition has it that the rincipal on the Indian side of the egotiation was one Squaw Sachem, a quaw of great influence and ability, ho ruled the tribe with wisdom and ill. A wit of the town hints that it as been under feminine dominion ver since! He also elsewhere hints that oncord has "carried on" the peaceful gnificance of its ame by being mong the first nd foremost in very possible cceeding con-ct and war from ing Philip's to e Great War, which Con-rd's quota well aintained her cient patriotic aditions!

Friendly rela-ons were, how-er, maintained ith the Red Men r some years; t later mis-nderstandings d consequent mity led to a ate of bitter war-re, and Concord came a military post, and ring King Philip's War erected veral blockhouses, the site of hich tradition still indicates.

I venture to say that there no other spot of similar size the United States that at-acts so many tourists as does d Concord, Massachusetts. uring the entire open season tomobiles, "barges," "sight-eing busses," and every pos-ble conveyance bring countless mbers of "Pilgrims"—as they e dubbed by the townspeople to the village streets, to the Battle round, to Sleepy Hollow, to Walden. course this all means that there is mething here to see. What is it?

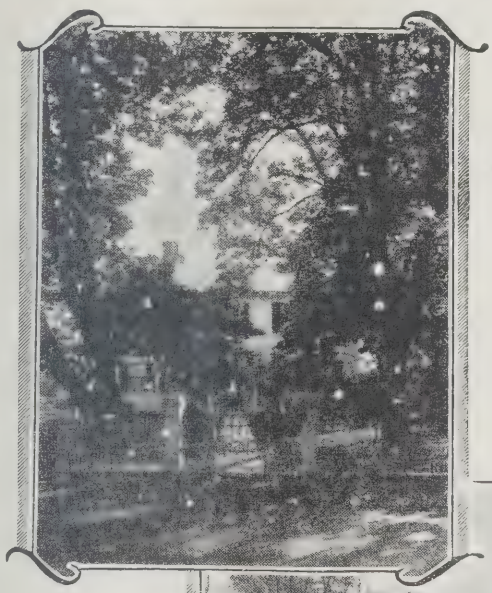
We Concordians are perhaps too t to think that the historic and erary fame of our old town has read abroad and that our Revolu-nary heroes, saints, and literary lebrities are known to everybody. was, however, horrified to find that educated and cultivated visitor m across the water (a young French-man) had never heard of our revered Emerson! I should therefore perhaps say that here, on the banks of our beautiful little river, have lived, at various times, Hawthorne, Emerson, Thoreau, the Alcotts, Frank B. Sanborn, and a score of lesser lights attracted by these brilliant luminaries and our ancient traditions; and that here, on April 19, 1775, was fought the first battle of the Revolution.

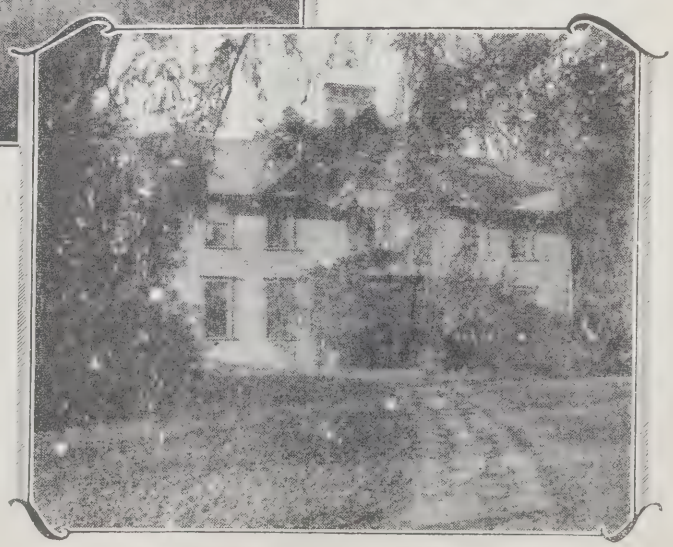
Since I first came to Concord, in 1878, many radical and spectacular changes have occurred. It was then a rather extraordinarily quiet, old-time-y village, where pleasantly simple methods of daily life—entertaining, occupations, dress, and so on—prevailed. We were invited out to "tea," not the present fashionable "five o'clock," but the substantial third meal, where all the good things consecrate to "company"—hot rolls, chicken salad and escaloped oysters, preserves and pound cake the favorite menu—were put on the table at the same time. Evening clothes, except on the most formal occasions, were the exception; and one's "new blue" dress, bought at the beginning of the season, remained acceptably "new" throughout a winter's festivities. People walked, or if fortunate enough to own some not too swift steed, drove, and later bicycled; and youngsters played baseball in roads not a great distance from the center. This was many years before automobiles profaned the village streets. Gas never came, and the electric light and telephone were rather long in coming. They didn't seem, somehow, to "belong."

These were the days, however, when the Giants dwelt among us. One could receive Emerson's kindly smile, often, as he walked to post office or village store, could catch words of wisdom from the "Philosophers" on their way to the famous "School," could—maybe—come upon Louisa Alcott sweeping the flagged walk from her front door; and, moreover, one could at any time pass into the environment of splendid patriotism and historic charm.

Old Concord was, above all things, a place of clubs—historic, literary, and social—conducted with enthusiasm and efficiency. The Social Circle—the oldest, founded in 1782—growing out of the Committee of Safety of the Revolution including twenty-five of the influential and representative men of the town; the

(*Continued on page 29*)





Above—Emerson's home. A walk of marble flagstones leads to the hospitable front door at the right of which is the famous study. Back of the house is a lovely old garden, in which bloom roses and lilies and all sorts of old-fashioned perennials. Center—"Old North Bridge." An exact reproduction of the famous original—where the British and American armies met in the first battle of the Revolution. Right—"Orchard House"—the home of the Alcotts. Can't you see the "Little Women" playing in the pleasant yard, and Meg and Joe starting for their day's work down the flagged walk, with their turnovers instead of muffs to keep their hands warm in winter?

Our New National Asset—Leisure

We Have Now More Spare Time Than Ever; How Is It Used?

By AARON HARDY ULM

WONDER-EYED, puzzled and more than a little perplexed, the American people are discovering a new possession: Spare Time. It is not a new acquisition; spare time, for the run of people, has been on the increase for many years. More of it has evolved during the past fifteen years than probably accumulated during the prior century. The preceding hundred years' production of it, like that of all previous periods, went largely to a comparatively few—to the "leisure classes," the rich do-nothings and the penniless deadbeats. But, lately, time for leisure has been dispersed equally almost with growth in volume. Of that which has evolved in recent years, for example, the common laborer probably has shared in greater extent than the office worker. The employe probably has come in of late for more than the employer. In fact, a very large proportion of the leisure time, that has been recently evolved, belongs to persons with little experience in making use of such a possession. Thus this relatively new acquisition becomes a national problem as well as asset.

Leisure a Problem as Well as an Asset

Some persons rate this development of leisure as the outstanding social phenomenon of the time, presenting possibilities that are as fascinating as they may be far-reaching.

"The problem of the 20th century," says W. D. Ross, an educator writing in the *National Educational Review*, "is not the creation of wealth. The achievements of the 19th century have insured this result. The problem is not primarily the distribution of wealth or the conservation of natural resources . . . The problem of the 20th century is *the conservation, which means utilization, of the leisure time of the people.*"

Walter Pangburn estimates that the people in the average American city of 125,000 population now have, aggregately, a million leisure hours a day. In a year they have leisure time in which, if so applied, a Panama Canal could be built. Amplified nationally, the aggregate is all but incalculable. It is far more than any people of the world ever had before.

This has come about mainly through reductions in the number of hours given to occupational labor. Some of it is due to the traditional basis of legitimate leisure, the accumulation of property. While there are no statistics on the subject it is probable that twice as large percentage of the population now turn incomes from savings into leisure as was able to do so at the beginning of the present century.

Most of the leisure time which Americans now have on their hands, and particularly its wide distribution among all the people, is due to increased production which in turn results from the expanding use of inanimate power via machines.

"To accomplish the work done annually in the United States, at least the equivalent in such kinds as men could perform, would require the labor of three million hard working slaves," say Chester G. Gilbert and Joseph E. Progue, in *Power: Its Significance and Needs*, published by the Smithsonian Institution several years ago. "The use of power gives to each man, woman and child in this country the service equivalent of thirty servants."

These authors estimate that it takes the muscular strength of 20 men to yield 1 horsepower of industrial energy.

In 1919 the installations of primary power employed in manufacturing industries reported on for that year by the U. S. Bureau of the Census totaled 29,504,792, the equivalent of the strength in the muscles of nearly 600,000,000 men or more than 100 times as many as of persons actually employed in the industries covered! In primary power used for manufacturing there was an increase during the preceding ten years of around 35 per cent. The number of men employed per horsepower decreased about 6 per cent; the value of the product, in comparable money units of real value, increased nearly 20 per cent.

The period was marked, as has been that since 1919, by a shortening of the hours of labor, without corresponding lowering of wages, in manufacturing industries. *Wages, in fact, have increased more than hours of labor have been reduced.* Yet the latter amounted to more than all of the reductions made during the hundred years preceding 1909.

How the Hours of Labor Have Fallen

In 1909 only 12 per cent of wage-earners in the manufacturing industries of the country had an 8-hour day. In 1923, 58 per cent of all wage-earners in manufactories reported on by the Census Bureau worked when on full time an average of only 48 hours or less a week. Even as recent as the year 1914, 26.9 per cent of all wage-earners in manufacturing industries worked 60 hours or more a week when on full time. In 1923 only 7.3 per cent averaged 10 hours a day, and only 1.9 per cent averaged more than 60 hours a week of full-time work.

One gets a better and more up-to-date view from studies made by the U. S. Bureau of Labor Statistics as to hours of work in several big branches of industry.

For instance, one of these studies taken at random, shows that hours of labor in the men's clothing industry fell from an average of 51.3 hours a week in 1914 to 44.11 in 1924. In the boot and shoe industry the hours declined from 56.1 in 1907 to 48.5 in 1924. In the steel and iron industry, hours of labor have declined, since 1907, an average of 10 to 20 per cent; in blast furnaces they have fallen 25 per cent within the last five years. In the cotton textiles industry—long notorious for the length of working days—full-time hours of labor shrunk nearly 10 per cent for all the country between 1910 and 1924.

Four and Six Hour Days Are Predicted

The statistics have to do of course only with full-time employment. They do not take overtime or time off into specific cognizance. What these elements amount to is indicated by the fact that in 1924 while the full-time hours worked in cotton mills averaged, theoretically, around 52 a week they averaged actually for all workers only about 44 hours a week. The difference is accounted for by unemployment, illness, vacations and other incidental factors.

The record, however, makes certain that the average of workers in such industries as manufacturing and mining now have from 10 to 20 per cent more time for leisure than was allowed by the operating schedules of plants ten years ago. In many cases it is more. A sufficiently large number of persons now work 44 hours or less a week to warrant statistical rating by the census takers, whereas ten years ago the tables began with a grouping of those who worked 48 hours a week or less. Census reports then grouped those workers who still pursued 12-hour or longer days of toil; now the highest group put forth in tables is that of those who work 60 hours or more a week.

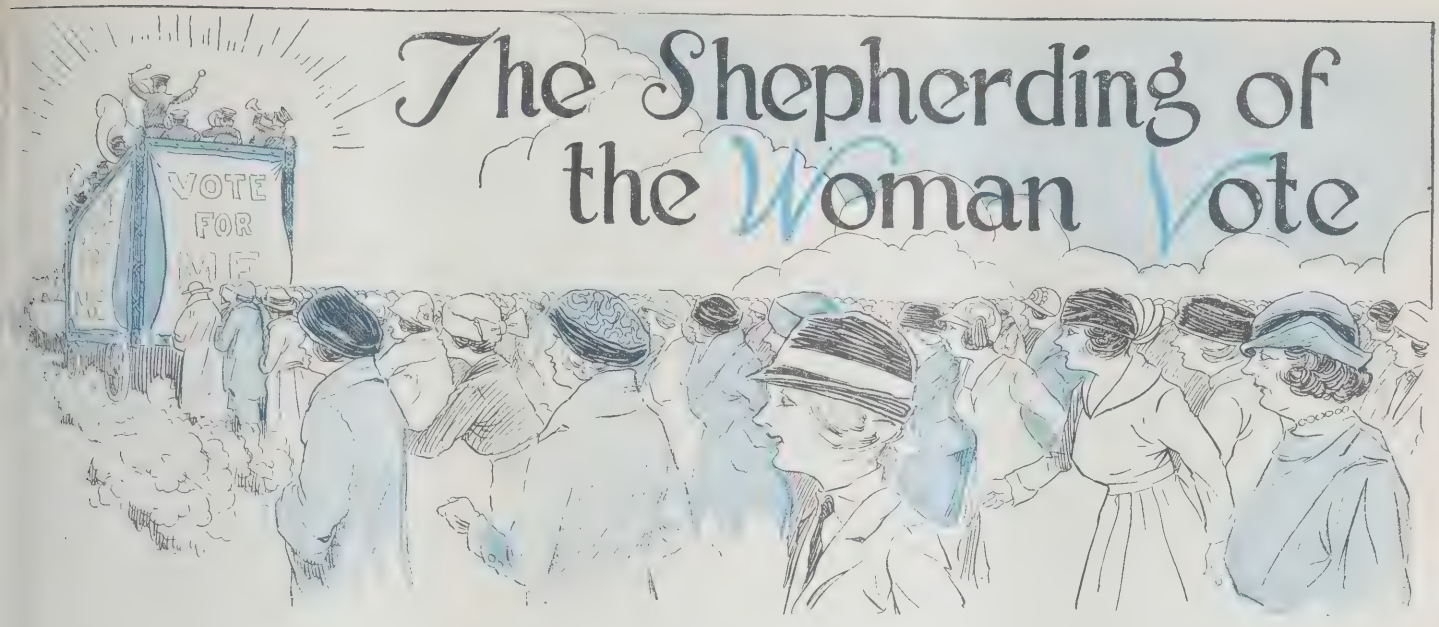
The 12-hour day is gone, the 10-hour day clearly is passing; and some observers say that in another decade the 6 and 4-hour day will be common in that branch of industry classed as manufacturing.

And one result is a great volume of leisure time for millions who until recently had little of that luxury.

And the practice of giving vacations is much more general now among employers than it used to be.

One can only generalize as to the leisure time now available (Concluded on page 22)

The Shepherding of the Woman Vote



By COURTENAY SAVAGE
ILLUSTRATED BY WILLIAM H. FREYSE

THERE is a game popular among children called "Follow the Leader." It consists of unquestioningly following the "stunts" performed by the leaders of the group, and it has been played through the ages. At the beginning, doubtless, some imaginative youngsters set to watch the flocks noted the silly way in which the sheep which they tended followed the leaders, and made the game in imitation of the dumb beasts.

Now, offhand, it may seem both unfair and unkind to commence any article having to do with the practices of American women with a reference to sheep, but there have been so many direct accusations to the effect that the women of the country have made the very serious mistake of becoming the prey of the leaders of the various political *isms* that abound in this land, they all too often have been misinformed and hopelessly misled, that the comparison is almost an unconscious one.

The subject of political leadership for women is one of vast importance, and the accusations of misguided leadership are of such a serious nature that they cannot help but demand consideration. Is it true that women lack the ability or the initiative (it must be one or the other) to think for themselves? Have they been blindly following any leader who could sway their imaginations? If they have been guilty of such pacing behind the band wagon, do they now, by any chance, realize the fact, and are they now in a position to profit by any errors they have made?

The fair way to approach such a subject is to go back to the days of 1920 when the women of the country were presented with the national franchise—and told to vote!

To understand clearly some of the things that were taking place in those first days of woman suffrage it is necessary to recollect that suffrage had been fought for by two great parties of women; one group who calmly felt that they were entitled to a voice in the lawmaking of the country, and made their demands in a dignified manner; the other group consisting of those militant women who found glory in such acts as picketing the White House, and going to jail for their conduct.

The women of the more militant group were known as members of the Woman's National Party, and, immediately the law was passed allowing women to vote, this Woman's National Party began a fight for what its members called "equal rights." These so-called "rights," had they been granted, would have given the women of the country a legal equality with the men—but, *the passage of this bill of equal rights would have made it impossible for any law to be passed that would in any way protect a woman or her child!*

Can you imagine the condition of any country that ceased to protect its home-makers, its mothers? It is one thing for a woman to vote, to have a voice in the making of the laws that concern her home, her children's education, the roads over which she travels, the food she eats—but even to consider depriving her of legal protection is preposterous.

Yet, for a time, the women of the country were so dazzled by the words "equal rights" that the Woman's National Party threatened to become a power. And it was not until such powerful national organizations as the General Federation of Women's Clubs, the Y. W. C. A., the American Association of University Women, the National League of Women Voters, and so on, began to drum into their members just what the "equal rights" law stood for that the precepts of the Woman's National Party began to be discarded by American women as a whole.

There are some who might claim that in rejecting the plans of the Woman's National Party the women of the country were thinking for themselves, but anyone making a most casual study of the situation will quickly note that in reality they were but doing as they were told by their leaders; by the heads of the various clubs to which they belonged, for it is, of course, a well-known fact that all of these women's clubs were quickly joined together in one common bond by the passage of the law which gave the women the right to vote. This union was brought about by the club leaders, and the political representatives of these clubs became known as the Woman's Joint Congressional Committee, a committee which boasted that it represented 12,000,000 women and included every prominent woman's organization of national character on its list.

It was this Woman's Joint Congressional Committee that instituted what has become known as the "kitchen cabinet," a group of women spending most of their time in Washington, many of them holding positions in the Federal bureaus there. These women made a practice of lunching together one day a week, and more or less deciding what they felt would be the best political course for the women of the country to follow; "deciding" because the "recommendations" they sent back to the organizations they represented were pretty much tantamount with an order.

It was this "kitchen cabinet," backed by the Woman's Joint Congressional and 12,000,000 women that passed the Sheppard-Towner Act. Popularly known as "the Maternity Bill," the Sheppard-Towner Act has, as everyone knows, been a storm center ever since it was passed by a frankly awed Congress.

"The great mass of the women turned a willing ear toward any leader who might give them political advice."

As a matter of fact the Sheppard-Towner Act is a well-meaning law, but its physical working out was to be done through the health departments of the various states, *each state to aid the Federal Government*, not as the state saw fit, but as the Sheppard-Towner Act dictated.

That was the rub!

Consider, for instance, the health department of any of the progressive states in the Middle West! That health department is not only adequate, but without exaggeration might be called excellent. To such a state the Sheppard-Towner Act was but a burden, something neither needed nor wanted. Yet, on the other hand, in the mountain districts of a backward state the aid offered is not only necessary but a great boon to humanity, for the doctors of the region are few, and nurses fewer, and the most primitive care is offered to the woman during childbirth and to the child in infancy.

In the light of such a state of affairs it can be easily understood that it would have been much better if the sponsors of this act had centered their activities, not on Washington, and a Federal law, but on any state where the law would have its good effect.

Many a woman knows that fact today, but only because she has seen the working of the Sheppard-Towner Act, and has realized that she had been unwise in voting blindly, unwise in "following the leader," as it were.

The passage and the practical application of the Sheppard-Towner Act really taught a lesson to women—and to the men, too, for that matter, at least so it would seem in the light of what happened later.

It was this way: not long after the Sheppard-Towner Act became a working law a Child Labor Bill was brought before the lawmakers at Washington. This Child Labor Bill pertained, as the name implies, to the labor of children. It was a measure that had interested President Harding, and the bill also had at least the partial indorsement of President Coolidge. With Congress it was a favorite measure, for those who fathered the bill laid stress on conditions existing in those portions of the country where child labor is unprotected. The Southern States, for instance, have long been notorious for the method in which children are employed in the fields and factories, and a frequently drawn picture that brought sympathy for the bill was the plight of the children who worked in the shrimp fields of Louisiana, picking shrimp until their little fingers were numb.

The Child Labor Bill, aided by many and various organizations, went through Congress. Before it could become a law, however, it was necessary that a referendum be taken, that three-quarters of the states vote in its favor. So the Child Labor Bill was sent to the legislatures of the states of the Union to be ratified or rejected as the voters the state thought best.

And something happened that the who had advocated the bill had n looked for. In Massachusetts, f example, one of the first states whe the bill was offered for approval, it w rejected. Other states rejected states in New England, in the Sou and West!

What had happened was thi *the voters of the country had stopped think!*

Most certainly the vast majori of voters of the country believe in t protection of children, but *they r membered that state after state had ve excellently effective child labor laws a ready in operation, and that these stat needed no Federal guidance nor inte ference! Remembered that each state in the long run better able to care for i individual problems than is a Feder Government!*

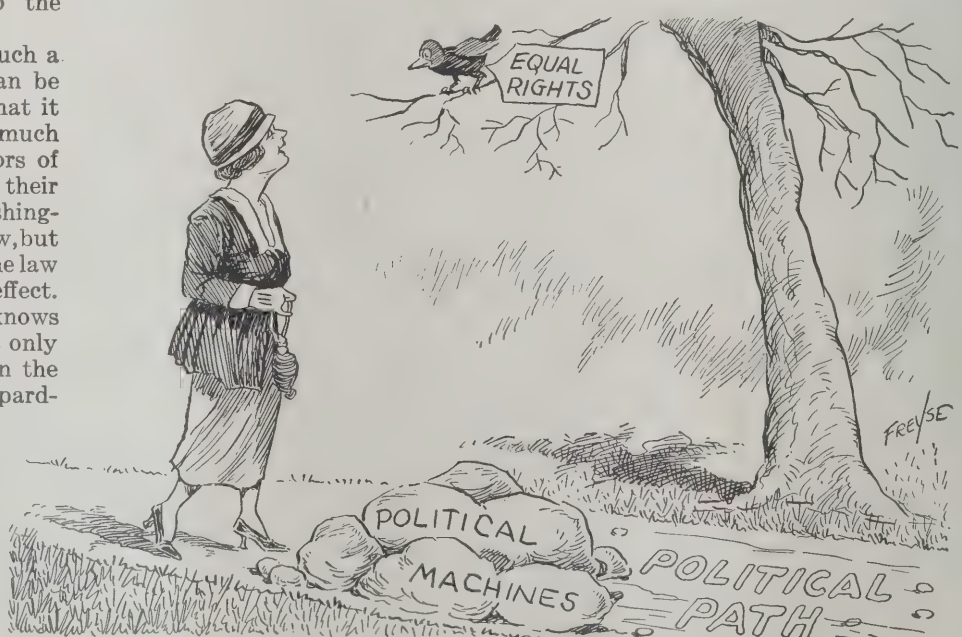
And far more important than tha *by stopping to think, the average vot came to a realization that a centralize government as emphasized by such ac as the Sheppard-Towner Act and th Child Labor Bill is too close to Com munism to suit the American people.*

Of course, those in favor of th Federal passage of the Child Labo Bill will never admit these facts, bu the facts remain. And they remain s strongly, so pointedly, that the grou of workers who have hoped and talke for years in the defense of a Federa Education bill have stopped to thin twice before offering it to a people wh as Nicholas Murray Butler, the pres dent of Columbia University, ex presses it, *are doing their own thinkin for the first time.* Thinking and realizin that they cannot shift the burden o the state to Congress, because Congres is not for the taking care of tha burden.

Of course, the rejection of the Chil Labor Bill doe not mean that al danger of false political leader ship for America women is passed but it would seem that it is not s great as it wa five years ago After all, it is a fact that you ca measure and con tribute to the val ues of political life only as you ca measure by ex perience, and through profiting through any mis takes that have been made.

To rid them selves of the temp tation, the danger, of false leadership, the women of the

(Concluded on page 18)



"More than ninety per cent of the American women were not alive to the dangers that lay along their political path."

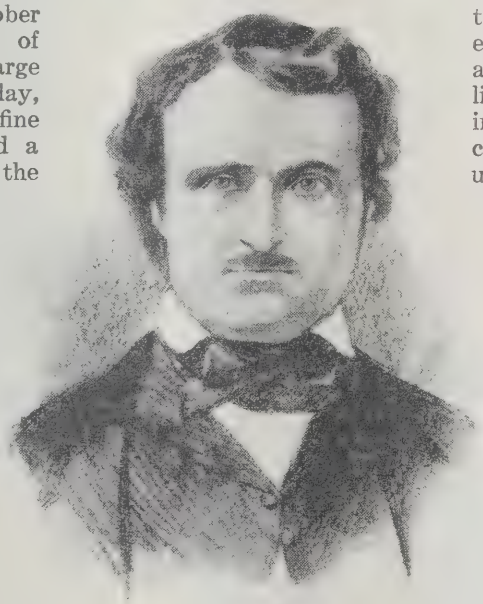
Mrs. Whitman Tells Her Story

By EDITH DICKSON

Sarah Helen Whitman.

FORTUNATELY there are still some houses with garrets where stores of old furniture, pictures, books, and letters form a connecting link between the past and the present. In an old house in Ridgefield, Connecticut, the home of Miss May Rockwell, the New England house-cleaning season in 1924 became the occasion of a holocaust of letters which had accumulated in the attic for more than seventy-five years. As one heaped basket after another was carried down and its contents emptied upon the bonfire in the back yard, a bystander casually picked up a letter, and opening it looked at the signature, Sarah H. Whitman, then glancing over the pages saw references to Mr. Poe. At once memory began to work. Edgar Allan Poe was engaged to Mrs. Whitman and the breaking of that engagement was one of the sensational episodes in his adventurous career. A hasty search resulted in the salvage of three more of Mrs. Whitman's letters, which together furnish an interesting history of her romantic acquaintance with Poe.

The letters are all addressed to Mrs. Mary E. Hewitt, of New York, who like Mrs. Whitman was a writer of verse and who was, also, the editor of sundry annuals, compilations, and periodicals. The first letter, dated October , 1850, consists of eight pages of the large letter paper of the day, closely written in fine script. In it and a later one written in the same month Mrs. Whitman tells the story of the breaking of her engagement with Poe. The circumstances which led to the narration as well as the history itself are best given in her own words.



Edgar Allan Poe.

After an introduction in which she refers to the true feminine style of 1850 to her feelings on first reading some lines by Mrs. Hewitt published in *The Harbinger*, saying, "I thought then, as now, that nothing was ever so sweetly, so gracefully, and so tenderly uttered as your Love's Pleading," she explains the causes which led her to confide to Mrs. Hewitt the history of this trying episode in her life.

"I this morning received from New York a volume entitled, The Literati, for which I am, I presume, indebted to the politeness of Mr. Griswold. In turning over its pages a paragraph which is not more unjust to Mr. Poe than it is in every way painful and wounding to my own feelings arrested my attention. I allude to what is said in regard to the dissolution of our engagement and the incidents attending it. I am perplexed in the extreme to account for the mention of these anecdotes, so obviously painful to me and so uncalled for, even if they had rested upon any reliable authority. The many polite attentions which I have received from Mr. Griswold, the great kindness with which he had always spoken of me, the confidence which I have reposed in him on this very subject and the friendly feelings which have always subsisted between us render his course in this matter utterly inexplicable to me. I am constrained to believe that he has been insidiously and unconsciously wrought upon to give publicity to this piece of gossip by the person who originally promulgated it. I have heard the story before.

I had it is true given Mr. Poe a promise that I would endeavor to obtain my mother's consent to our marriage before the end of December, but unforeseen obstacles presented themselves over which I had no control. Our engagement was from the first a conditional one. My mother was inflexibly opposed to our union and being in a pecuniary point of view entirely dependent upon her, I could not, if I would, have acted without her concurrence. Many painful scenes occurred during his several visits to Providence in consequence of this opposition.

"The story of the Police is without a shadow of foundation. Neither did Mr. Poe after obtaining my mother's consent to our marriage commit any of those excesses charged to him. This consent was not obtained until the evening of the twenty-second of December. On the twenty-third Mr. Poe wrote a note to the Reverend Doctor Crocker requesting him to publish our intention of marriage on the ensuing Sunday. He also wrote a letter to Mrs. Clemm* informing her that we would be married on Monday and should arrive at Fordham on Tuesday by the second train of cars.

"We rode out together in the morning and passed the greater part of the day in making preparations for my sudden change of abode. In the afternoon while we were together at one of the circulating libraries of the city, a communication was handed me cautioning me against this imprudent marriage and informing me of many things in Mr. Poe's recent career with which I was previously unacquainted.

"I was at the same time told that he had already violated the solemn promises he had made to me and to my friends on the preceding evening. I knew that, even had I been disposed to overlook these things myself, they must within a few hours come to the knowledge of my friends and would lead to a recurrence of the scenes to which I had been already subjected, and I felt utterly

(*Concluded on page 28*)

*The mother of Poe's deceased wife.

"Who is behind the committee?"

How the System "Worked the Women"

Things That Are Buried in Organizations

ILLUSTRATED BY W. O. FITZGERALD.

THE other day I was invited to serve on a Committee. Now, if I have a pet aversion, it is Committees. They are devices of the devil to prevent results.

You may point to the Committees of Congress and cite the amount of work they do. But, dear soul, don't you see?—Congress is itself a Committee which would never get anything done did it not say to half a dozen men, "Here, you get this done," and to another half-dozen, "Here, you get that done." The so-called Committees of Congress are czars and autocrats appointed to save Congress from its own committeeism.

I asked the man who invited me to serve, whence this committee idea had come. He began to tell me what it was going to do—abolish crime, or something. I asked him again, who was behind it. He told me who was *on* it. Finally I told him that I did not care a dog's hang who was *on* it; I wanted to know who was *behind* it. He didn't know.

I told him he ought to know. I told him it was a favorite practice of the more intelligent human assistants of his satanic majesty to observe when good citizens were becoming awakened over this or that condition, and prevent their ever seeing the thing as it was, prevent their doing anything about it, by organizing them into a Committee.

You can bury anything in Committees. They are the cemeteries of promised-awakenings-that-were-smothered. General Booth used to say that if the Children of Israel had been ruled by a committee, they would never have crossed the Red Sea (or as Dr. Moffat has it, the "reed" sea). There is a place for autocracy, and nothing of value ever gets done without it. We are all monarchs by divine right until we abdicate to a Committee.

My friend did not know who was *behind* the committee in which they were preparing to bury him, and in which they wanted to bury me. He knew all about the committee and its very respectable members, but he did not see the undertakers beyond the outer rim.

I was put on this train of thought by reading an article about the way women are misled in their efforts to inform themselves upon political questions and to utilize their new-found franchise for the benefit of the race. The article was true. The whole thing was true long before anyone saw it or had courage to tell it. The entry of women into the political field had the effect of throwing the whole system of propaganda and demagogery off its balance, it betrayed itself, in its eagerness for exploitation.

I am glad that the exposure has been made. I am not sorry at all that false women leaders are enraged; their rage will do more to open the eyes of American womanhood than all the printed exposures can.

But I think women can be congratulated that the first fruits of their entry into the field of political issues was the exposure of the system of propaganda. Women can take the credit to themselves. It is a great service to the country. We must not think of the women as the victims of this system, we must think of them as the exposers of it, since but for them the exposure would not have occurred so soon.

For the system that was exposed is the system that has been worked on the men, lo, these many years, and the men never discovered it!

Not a man but will agree that women's clubs and associations and leagues have been "worked" to the limit by all sorts of influences. The difference was, of course, that for the women's benefit they paraded under idealistic forms. That was the compliment they paid to the American women. But the same influences, without the idealistic camouflage, has always "worked" the men. And I think that fact will dawn upon the men as the significance of the women's experience becomes clear to them.

Did you never hear a woman say: "Of course, I wondered why the Club should do that, but I couldn't say anything." Did you ever hear a woman say: "We were going to do this, but someone heard from headquarters, and it wasn't done. No reason was given; no one asked; and I didn't want to seem officious or inquisitive."

Buried, you see. Buried in the organization. Gagged, hobbled and haltered.

And it is the same with the men.

We would never have seen it so clearly, however, had it not been for the women.

So I set it down as a big score to their political service to the country.

MR. FORD'S PAGE

ONE reason, perhaps, for the rather general desire to engage in religious discussion is that it is probably the one subject on which the greatest variety of opinions can be entertained on the slenderest basis of knowledge. The Reality itself and our reasoning about it are not necessarily the same, though our reasoning may be one effect in us of the Reality's existence.

At any rate, it is amusing when one considers the limitations of human knowledge to behold the dogmatists of what is called "science" and the dogmatists of what is called "religion" crowing over each other. They seem so little to realize that all they represent are certain facets of mind. And both of them the same mind. Yet they won't speak to each other. One figures that the other is going down into the pit, and the other figures that the one is steadily receding into the dark ages of ignorance and superstition. The fact is they are both going on together.

There is no reason why religion should not be scientific and no reason why science should not be religious, since it is, after all, a matter of range. Run the gamut of thought and experience, and you include both. If one reaches farther than the other, it is only because we can always see farther than we can leap. "A man's reach should exceed his grasp, or what's a heaven for." A man does not denounce his hope because his hope goes far beyond his hearing. Nor does a man doubt his sight because he can see farther than he can reach. Yet if he damn his hearing as the enemy of his hope, or denounce his hand because it does not function as the eye, he is a fool.

There are science, philosophy and religion, these three, and the greatest of all is a combination of them. It is idle to say that one deals with reality more than the other. They all deal with realities. Facts are not all on one plane. Science is not limitedly material. Religion is not limitedly spiritual. Matter and spirit are terms we use to make distinctions which perhaps do not exist in the way we commonly think they do. They are the poles whose opposition means action and balance—from matter the action to materialize spirit, from spirit the action to spiritualize matter.

Science deals with facts and their relations. It sometimes does not know what to do with its facts, as some money-makers do not know how to use wealth. Philosophy searches for the meaning of the whole, regards truth as the astronomer regards the heavens—as a system—and seeks for the key to the system. Philosophy, were it on the one hand scientific and on the other mystical, would stand as umpire in the world of thought.

Science has reached the point where it can say, "This is a fact forever." Not in all things, but in some. It can say, "Do *this*, and certainly as night follows day *that* will result." Something like this religion seems to lack, not in itself perhaps but in its presentation—"Do *this* and *that* will certainly result." It would be excellent if for a time everyone would just set down what he *knows*, and no more; what formula is *sure* without deviation. We need something of the certainty of chemical experiment.

Not that all religion would have to be brought down to that, but there should be that aspect of it. Even science is not brought to that practical and provable basis in all things; a hypothesis is but the faith of the scientist reaching out, in something like prayer and supplication, into the unknown for facts and truth to light upon it and confirm it. The only fundamentalism is what men *know*, and what they are innately urged to believe and search for. Nothing is ever shaken in religion, philosophy and science except guesses and speculations.

If at times the spirit of science challenges religion to take account of what it knows as distinct from what it reasons or hopes; if at other times religion challenges science to take its nose out of the mud and turn its eyes toward the stars; if philosophy betimes takes them both to task and demands *what they mean* by this and that, and how this and that are related, it is all an indication that the three are *one mind* in *three functions*. They conceive each other to be separate, and the individuals representing them show contempt for each other. Which indicates that with all their wisdom they know least about what is nearest them—namely—themselves and their human society.

All of these thrusts of the mind, now in one direction, now in another, are the struggle of mankind toward self-realization. Blindly they follow paths which they fancy lead apart, but which will merge in unity and light.

> *THE superiority of contempt with which the various departments of thought regard each other is amusing if one knows that leaf and bark and root are all one tree. The wise men do not seem to know that their differences are sections of the unity which is struggling to enshrine itself in human thought. Ecclesiastic and physicist, each is an illustration of this struggle, though one may suspect the other. Neither of their specialties will dominate, save temporarily; both will be merged in truth, which is greater than both. If disputants saw this—but, then, when people see this there are no disputants.*

EDITORIALS

The Court-Martial?

COURT-MARTIAL of Colonel Mitchell is probable, and would be quite natural. An officer who for any purpose or from any motive violates the code of army discipline is automatically subject to court-martial. But to read some of the newspapers, one would think that a court-martial was a hanging or lynching bee. It is, instead, a court composed of officers usually of equal or superior rank to that of the officer on trial—a jury of his peers—and its purpose is to inquire into truth or falsity of the charges brought. It is an opinion of long standing that no fairer court exists than the American military court.

This explanation seems to be necessary because of the attempts that are being made to give the Mitchell inquiry the appearance of a persecutory and condemnatory action. It was flung broadcast through the country that Colonel Mitchell's change in rank from brigadier general to colonel, when he finished his term as chief of the air force, was in the nature of punitive demotion. Such a report was not quite fair to the United States Government. And it is quite as important to be fair to the United States Government as to Colonel Mitchell. The present air chief will in his turn go back to his former rank to make room for another officer's tour of duty in that post. Colonel Mitchell has made statements which the Army, in fairness to Colonel Mitchell and to itself, may consider as calling for the inquiry which a court-martial can give. This inquiry will be conducted with all the high ethical responsibility which Army officers bear toward each other and the Service and the Government. What it will yield is yet to be seen.

There are those who believe that Colonel Mitchell, instead of being the "victim" of a court-martial, has been deliberately inviting such a development to provide him with the best means of getting his views formally before the Government for a decision on their merits. If this is true, any side-propaganda to the effect that Colonel Mitchell is being "persecuted" by being given this trial, will be doubly unfair. There are indications, however, that certain influences are not too scrupulous to take this means of attacking confidence in the Government.

The Government and the Army are certainly not out to punish any man whose zeal for the military safety of his country leads him to proclaim the possible sources of danger. If there does exist personal spite or prejudice, it is reasonably certain that a court-martial, instead of furthering it, will expose and destroy it.

The First Warning Signal

GREAT BRITAIN now confesses herself in the grip of Russian revolutionary power. The alignment of certain vital elements of British trade unions with a definite and ordered destructive program directed by the Soviets has been established at the bar of public opinion and in the court of history. There is no doubt about the *fact*. England feels at last the tentacles of her would-be destroyer. The war was but the cracking of the shell from which emerges a more terrible thing, and the real struggle is about to commence.

No words need be wasted in an attempt to help the people realize how profound is the import of these facts. The profoundest facts are never deeply realized. But it should be at least the beginning of a sense of significance that the Prime Minister of Great Britain has risen in Parliament to deliver such a warning as has never been heard before—not to the community, but to the Communists. He accused the trades unions with having both the will and the power to destroy the productive and necessary economic peace of the country.

"But let me say this in conclusion . . . . If the will to strife should overcome temporarily—for in this country it could only be temporarily—the will to peace, and if we are ever again confronted with a challenge the nature of which I have described, *no minority in a free country has ever yet coerced the whole community.* (Cheers.)

"The community will always protect itself. The community must be fed, and I am convinced that if the time should come when the community has to protect itself with the full force of the Government behind it, the community will do so, and *the response of the community will astonish the forces of anarchy throughout the world.*" (Cheers.)

There, in brief compass, is confession, warning and prophecy. It describes the course of free nations' reaction to the long-ignored fact of revolutionary borers in their midst. That reaction, when it comes, "will astonish the forces of anarchy throughout the world." Anarchy, Sovietism, revolutionary Communism have never yet faced a free people.

Lowden, Capper and Sweet

FREDERICK WILLIAM WILE fittingly writes of Aaron Sapiro. It is natural for all, sometimes even for the Christians, to help their own. If Wile in journalism wishes to cooperate with Sapiro in this questionable business, it is quite all right, provided the Washington *Star* doesn't object.

This paragraph, however, concerns neither Sapiro nor Wile. It concerns Frank O. Lowden, of Illinois; Senator Capper, of Kansas, and former Governor Sweet, of Colorado.

Mr. Wile, who apparently has inside information, says, in the Washington *Star* of September 4, that Sapiro expects to put these three gentlemen on the stand. Mr. Wile ventures the statement that Senator Capper regards Mr. Sapiro as a genius.

We think it is a kindly act to suggest to these gentlemen, in view of the possibility of their going on the stand as Sapiro witnesses, that they search the country over for a successful Sapiro cooperative. We suggest further that they inquire why Sapiro is not on the coast where cooperatives are thick, and why he has transferred his activities to parts where he is least known. If Mr. Lowden, Mr. Capper or Mr. Sweet can obtain knowledge of a successful Sapiro cooperative now in existence, THE DEARBORN INDEPENDENT will give the fact national publicity.

News Beat of the Future

THE *Shenandoah* disaster was reported by farmers and country newspapermen. They did a good job of it. The nearer one got to the scene, and the more small Ohio dailies and weeklies one read, the more one learned of what really transpired. The country newspaperman and his farmer neighbors proved themselves equal to the task when the big news story "broke."

It suggests a coming change. Events will not continue to be confined to great cities where mighty presses roar. Events will scatter everywhere with our wider transportation facilities. Events that transpire in cities today are all of the same kind. Put a New York head on a Chicago paper, and print Philadelphia local news in Detroit, and there would be no difference. The bulk of our local news originates at the police sergeant's desk—whose blotter is transcribed for our evening or morning delectation, at the hospital receiving desk, in the divorce court, or in the gossip corner of the city hall. Local news that originates outside these sources would not permit the publication even of a weekly now where we publish teeming dailies. There is no variety in this news; it is always and everywhere the same.

But the really big news of the day is beginning to "break" elsewhere. Observers and reporters will be everywhere, for "everywhere" will be the news beat of the future.

Is It for High Schools?

IT IS amusing to read the drivel which continues to follow in the wake of the defunct Scopes case. By perceptible degrees a twisted meaning is given the event until now some writers are bewailing that Mr. Scopes was "prohibited from making scientific research" and that the children in his care were denied the privilege of delving deeply into biological problems. Mr. Scopes, of course, knows nothing of evolution except what he has read in the textbooks, and much of what he knows by that method he will have to discard in ten years, if he still follows the textbooks, because of the revisions which will ensue. The great difficulty in the educational aspect of the controversy is that there are no biologists teaching evolution in the high schools; there are merely teachers who are just one jump ahead of the pupils in the study of the textbooks.

A scientist who is a naturalist and an evolutionist writes us a letter, one paragraph of which we lift from among other wise observations to share with our readers:

"Beyond doubt evolution should not be taught in the common schools any more than higher mathematics or spectrum analysis of the stars, for the simple reason that it cannot be comprehended, except by specialists of long training. If 99 out of 100 high school teachers of biology or science were asked what they knew about the gradational variations between species and genera of marked transitional character they would be at sea."

There Are Always Two Sides

A WOMEN'S club magazine contains an article on the World Court. Its purpose is to educate its club member constituency into the pros and cons of the argument.

The article contains exactly 157 lines of type.

Of this amount, the magnificent sum of seven lines is devoted to a consideration of the opposed point of view.

And of these generous seven lines, one line is used to state the question, "Upon What Is Opposition to the Court Based?" One line and two words (counted as two lines) are devoted to the answer. And the remaining four lines are used to show that the opposition is baseless.

So that of 157 lines, only one line and two words are given to stating the other side.

Where are club women to get the facts bearing on public questions if this one-sided policy is to be followed by club publications?

A glorious example of Gothic architecture in the picturesque village of Burgos.

A Wanderer in Spain

Where Life Steps on Like a Mule Team

By V. S. PRITCHETT

—August, 1925.

WHEN the bird in one of Baroja's books said, "I seem to be looking for something but I am not," he went to the heart of the matter. Spain is a traveling, ambling, searching, this way and that way, discursive country. Life, like conversation, drifts from vagueness to vagueness, from idea to hope, from hope to despair, from despair to protest, and from protest to sunny resignation. Life steps on like the walking of a silver donkey, or like a mule team, straggling, jingling, sagging from one side of the road to the other. Bells and wandering.

Who was it poured the breath of wandering on the air? Castile, that tremendous, bony table-land, a cruel, bare, lifeless plateau, sun-beaten like a copper pan in the summer, frozen and iron-bound with cold, and lashed by the wind in the winter—what joy can there be in taking its lank, starved roads? Why did Don Quixote take the shadeless stretches of La Mancha, that pitiless country? Or Borrow, every road in Spain? Why did Baroja send his characters everywhere by road? What is the impelling spirit that sends them, sends us all, out on the roads with a grim fatalism and makes us find in Antonio Machado's lines the joy of the bittersweet of our journeyings?

"Never when they come to a place are they asked where they have come from. When they journey they ride on the back of an old mule. They do not know what it is to hurry, not even on feast days. They drink wine when there is wine to drink. Where there is no wine they drink fresh water."

As soon as one puts foot into Spain one feels the arms of travel pulling at one.

Last in Europe to build railways, today with perhaps the worst railway system in Europe and certainly the slowest, Spain is still the country of the road. When the fastest trains do not exceed thirty miles an hour and the average is nearer fifteen or twenty, even railway traveling has all the characteristics of a stagecoach ride. Hour after hour one rumbles from wayside station to wayside station, stopping indefinitely amid a hubbub of peasants in rugs and shawls, and with their belongings and animals around them. The train is only another beast of burden. The peasants treat it with the same lack of respect, with the same familiarity. Everywhere dust and the eternal sun. Everywhere shouting, smiling and confusion. Oily black smoke belches from the engine and blackens everyone and everything. At whatever hour of night one arrives at stations—and Spanish trains generally arrive at junctions at three in the morning—the platforms will be littered with peasantry as in a refugee encampment, waiting, walking, sleeping on their sacks and bundles until their train wanders in. One has the sensation of traveling vast distances, of being transported across a continent in a night, of taking part in an exodus. One leaves Madrid in a roasting sun and arrives at three in the morning at an old town standing high on the table-land, in biting cold. One is cool in Madrid and one arrives thirteen hours later in the roasting heat of Seville. As one goes south the stations (already easy-going, dirty places) become hotter and dustier. Trees—poplars and

planes—are planted on the platforms, and men in high-crowned hats and black-shawled women are sitting under the trees drinking and talking. The train comes as a pleasant social incident, like the arrival of a diligence at an inn. The crowd thickens. One sees the bright uniforms of the armed police. The train wanders out as casually as it came in. No one notices it except the beggars who, half-naked, sing a song of thanks for the pennies and bread that have been thrown to them. So in sun and dust and song life wanders away.

Like the slow wandering music of Spain are the journeys. They fall from note to note. After hours of traveling the spirit of the country gradually seizes one. As the sun warms the limbs and contents the heart, so the slowness and the wandering lull the mind into a meditative idleness. Hard and harsh as the jars of life may be, harsh as the twang of a guitar note, yet one is glad to drift and let the rhythm of this crude Spanish life master one's own. As after days of tramping in strange country one feels its mountains, its plains, its roads, its roofs, its rivers are part of one, as though the soul had marched forward and gathered the world into itself as the foot gathers paces; so it is with the long-drawn-out wandering of a Spanish railway journey. One feels the blue and ocher table-land of Castile with its heights, its snow-crowned Sierra, its cracked, drought-smitten valleys, its light-flooded leagues, its walled towns sunk into the earth, its violet silhouettes piercing the sky—Burgos with its spires, the hot roofs of Valladolid, the sun-eaten walls of the Keep at Medina del Campo—one feels it all within one, and one knows one is abandoned to the spirit of wandering. One feels one may be a new Quixote.

And the roads? And the inns? And the food there? And the beds? And the people? Travelers' questions. How many scores of times have I taken the Spanish roads! To Alcalà de Henares one day, where Cervantes was born, a great center of learning once, a pale, deserted, bare place now, with heavy arcades to the streets and hard-voiced bells in the churches banging the irregular hours. What a wind was cutting from the Sierra that day. Over fifty miles of treeless plateau, brown, gray, bony, and as bare as the back of a mule old in the harness, the wind cracked like a drover's whip. It was winter and the river beds—bone-white and dried up in the summer—were bulging with red swirling water. Line after line of straggling mule teams, with loads of charcoal, meal and flour, swayed and rumbled.

To pass the night in some of the tumble-down hamlets of the wilder parts of Castile, particularly in the less frequented spurs of the Sierra Guadarrama, is an adventure. One sleeps in cavernous *posadas* and, amid the most genial company, one eats the roughest food. There is the Inn of the Rat in Manzanares el Real, a desolate heap of roofs crouching at the foot of a ruined castle. The inn is a dingy little wine-shop with a big open fire at the back where all the horrors of the cooking take place. The men of the family sleep in benches standing in recesses. When I arrived there one winter night at about eight o'clock I sat down at the table in the kitchen, and immediately a pig squealed and ran from under the table. I was shown into an upper room with eight beds in it. It was stone floored, and had one window. The old innkeeper apologized for the absence of his wife who was away at the market in Colmenar, and within a few moments was telling me all his family history and all his troubles. How the village was starving, and how the *Marques* who owned the land had taken the best land from them for purposes of his own. "If we weren't such a peaceful lot here we would have thrown the old uncle into the lake and burned his house," cried the old man dolefully. I listened for two hours to his troubles. Heard his father was a queer man who had married twice. The first wife had lived for twenty years after her marriage. Then the father married again, and this woman went mad within three years, and was now the talk of the neighborhood. She was then eighty-four, and her husband had long since gone to join his first lady.

Typical street scene in Cordova, Spain.

Little by little I managed to steer the innkeeper to the subject of food. I asked him what he had. He replied with true Castilian hospitality, "We

have everything. Whatever you say I will bring."

"Well, what meat have you got?" said I.

"Meat?" he said. "That's difficult now. You see, if I had known you were coming I could have got something. But we don't kill until the day after tomorrow."

"Well, chicken?"

"That's difficult. At this time the chickens are scarce and make poor eating, what there is of them."

"Eggs?"

"We sold all our eggs this morning. Tomorrow I could get you a pair. But now, it is impossible." Then brightening up—"But what have you brought yourself?"

Happily I had some bread and cheese with me. The innkeeper made me some very hot and watery bread soup and cooked some horrible *bacalao*, or dried and salted fish, which one can buy in strips in any of the *ventas* or *posadas* of Castile. The people live on *bacalao* and round beans and gristly veal, bathed, of course, in olive oil, and sharpened with garlic. That night I slept on a tressle, a mattress stuffed with wood shavings. At midnight laborers and their wives came into the room, and, politely wishing me a good-night, took off their boots and got into the beds with all their clothes on. The window was closed and shuttered, and there we all slept, or tried to, eight of us!

Better Fare May Be Found in the Asturias

The traveler fares better up north, in the Asturias. The country is richer. There is more rain. There is good pasturage for cattle. One summer I left Santander and for a fortnight tramped the lordly Picos de Europa. Santander itself is a clean, white seaport, with that air of sea-going prosperity one finds in all the ports of Spain from Valencia to Bilbao. The Asturians are energetic, progressing people. They were the first to drive the Moors out, and ever since they have been producing good cider and good lawyers. For a fortnight my limbs toiled over the goat tracks and cowpaths of the Asturian mountains, under skies piled and blue, over the stone walls of the mountains, the confines of which have not been mapped. Peasants tell tales of wolves and bears in these mountains, and travelers are warned. I saw nothing wilder than a shepherd, and he was wild enough in all conscience. He was covered in brown sheepskins tied about him with leather thongs. He carried a horn and a satchel of hide. He was a tremendous man with black shaggy hair like a mountain ram. He had large wild eyes like an animal's. Finding me lost in the mountains and night falling he guided me over the pass. He told me how he hated the life of the mountains, living day after day in the lonely passes minding the cattle. As I left him at the top of the pass I heard his wild voice calling to the cattle and singing snatches of roaring song. The echoes rose like startled birds and flew about the necks of the mountains. I picked my way by moonlight over the black mountain, eight miles of boulders and streams and goat tracks, to a little eagle's nest of a village called Oseja, at the top of a profound gorge. Most stories of horrors of Spanish inns are to be distrusted, but every now and then one strikes a bad place—an inn like the inn of Oseja.

A Wayside Inn Where the Odors Were Violent

I arrived at midnight and had great difficulty in persuading the old lady who kept the filthy place to take me in. She gave me oily, gristly veal, and bread to eat; and without much delay packed me upstairs to a small and evil-smelling room. The inn was a cavernous building. Downstairs was a workshop and a kitchen and a hall, all three littered with refuse, old barrels, boxes, bottles, wine skins, jars, food. Chickens and goats had their home in the hall. The odors were violent. But in addition to these odors my room had ones of its own. In the morning I discovered that two newly flayed goat-skins were hanging by the window, and some meat! Below were a piggery and a yard full of donkeys, goats and calves. I passed a terrible night.

I had long talks with the Asturian peasants and the long and short of all their conversation was that everything was wrong. Everything was the fault of the bad governments. I got side-lights on the continual agrarian differences, the quarrel between the rich farmers and the poorer ones, and so on. The innkeeper at Oseja, in whose appalling inn I had suffered so much, was more bitter than any. He said his region was the most beautiful in the world and that the church and the government beggared it. It is the same tale wherever one goes in Spain. "What is going?" you ask anyone. And the reply comes back smilingly, "Disasters! Calamities! The bad government . . . " The land quarrel does lead to immigration. That is certain. The youths of Asturias, despairing of ever making headway in their own mountain passes, go off to South America for ten or fifteen years and leave the women to carry on. Sometimes the villages are left almost only with the women. The young men talk of going to Cuba as though it were nearer than the next market town, so strong is the custom.

Among the Olive Groves of Andalusia

When one goes over the long stretches of Extremadura one sees little but uncultivated land in many parts. The big proprietors inclose the land for shooting and hunting. The peasants tire of their fruitless labors and go abroad. In Andalusia it is the same, though there they labor on the olive groves of the nobility. A few moments' talk with any of them soon reveals the deep discontent there is in this beautiful country. But it is the same story. "The bad governmen . . ." and there it ends. Well said th proverb "He who talks against Spai is a Spaniard."

Andalusia in spring is a paradise flowers. Earth and sky are prodigious generous in light and color. Mile aft mile one tramps the red roads und avenues of dancing eucalyptus, acro wide *dehesas* where the fighting bul are bred, up mountain sides lined wit thousands of marching olives an vines. The air is soft and suave, an one inhales a delicious idleness. But is a traveling country. One canno remain still without drifting into tha heaviness of spirit and day-long vacuu of mind which settles upon all wh stay. The monotony of Seville, wit all its spring and glory, the enchant ments of its narrow streets, of it white houses, its spectacled window with its gypsy-dull people with thei ceaseless talking about nothing in th world except bulls and women, deaden one.

But get on the road and the wind o travel blows away inertia. One ca tramp to Ronda in its red mountains in its purple and golden mountains, th hillsides gay with almond blossoms, th road jingling with the bells of silve donkeys carrying their loads of burnin oranges. Malaga on the Mediterra nean with one of the most perfect cli mates in the world, one can go to where sugar cane and oranges an lemons, and strange tropical thing thrive in the hot blue air. Who wil ever forget the color of the sea a Malaga, and the coral light of the sk when the sun has gone down after day of copper heat

Men and Women, Donkeys and Mules

If I were t write about all th roads of Spain tha win the traveler' heart, and tell also of what is mor important: of the contented, complain ing, resigned men and women wh ride their donkeys and drive thei mules there, I should never end. life is a road, the tale of the Spanis road is as endless as life itself. But a one treads those plains which brough forth their Cortes and Pizarro, thei Don Quixote—for was he not a rea person after all?—something of thei great wandering spirit enters one' heart. Here the breast of the earth i warm. The great arms of the earth seem to draw one and to clutch one to th breast of the soil with the cry of th Andalusian mothers, "My blood! M blood!"

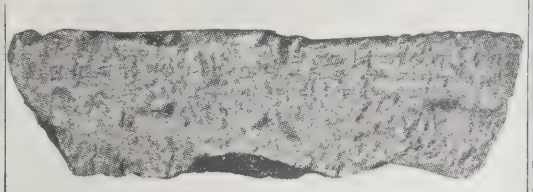
Spain is a country steeped in ro mance, and Andalusia is romance' fountainhead. It bears the same rela tion to Spain as Gascony does to France In it there still survives that indescrib able air of things Eastern which is reminder of the many years of Moorish domination. There yet remains tha fatalism and misty glamour that belongs to still more distant lands.

Paving Not a Modern Improvement

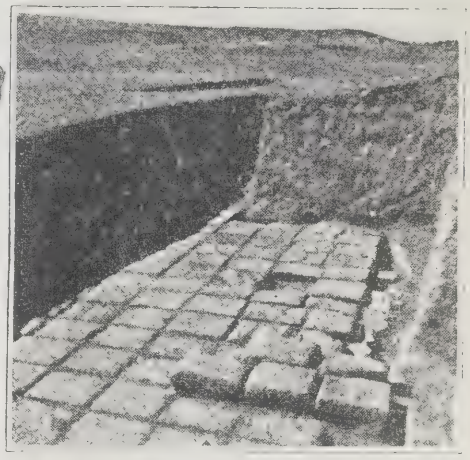
King Nebuchadnezzar Drove His Chariots Over Pavements of Asphalt and Brick

By FRANK DORRANCE HOPLEY

The sacred way, Babylon.



Paving block of the Procession Street.



View of Procession Street, east of Etemenanki.

WHEN the average citizen recounts the glories of his home town or city, and boasts of its modern improvements, he is always sure to include in the list paved streets.

In reality, the paving of thoroughfares for the use of pleasure and commercial traffic is not at all a modern practice, and dates back to long before the Christian Era.

Nebuchadnezzar, King of Babylon from the year 604 to 561 B. C., was a thoroughly up-to-date monarch in regard to improvements. It is stated that during his reign he practically reconstructed the entire city. When he had completed a piece of work which to his mind was especially worthy of credit, it was his custom to record it upon the walls of the city, that his name might be honored by future generations who might read the story.

In the so-called "Procession Street," which led from the king's palace to the north wall of the city, have been found some bricks, upon which, according to the translation, was inscribed the following:

"Nebuchadnezzar, King of Babylon, he who made Esaglia and Ezida glorious, son of Nabopolassar, King of Babylon. The streets of Babylon, the Procession Street of Nabu and Marduk, my lords, which Nabopolassar, King of Babylon, the father who begot me, had made a road glistening with asphalt and burnt bricks; I the wise suppliant who fears their lordships, placed upon the bitumen and burnt bricks a mighty superstructure of shining dust, made them strong within with asphalt and burnt bricks as a high-lying road.

"Nabu and Marduk, when you traverse these streets with joy, may benefits for me rest upon your lips; life for distant days, and well-being for the body. Before you I will advance upon them. May I attain eternal age."

Another inscription that has been found states that Nebuchadnezzar credits his father, Nabopolassar, who reigned from 625 to 604 B. C., with having laid the first asphalt block pavement of which there is any record.

In the great Throne Hall of the Palace of the King, in the city of Babylon, there was a pavement of burnt bricks, each of which had cut into it the name of King Nebuchadnezzar. These bricks were set in asphalt, and, according to a writer in the *National Geographic Magazine*, were so firmly welded or mortared together that it was impossible to part them without destroying the bricks entirely.

Today, motorists who speed along the national highways of America, only imitate the Babylonian monarch who, more than two thousand years ago, rode in his chariot over a glistening pavement of asphalt and brick.

It was on Pennsylvania Avenue, in the city of Washington, D. C., in the year 1876, that the first asphalt pavement was laid in America, and from then until the present the increase in the mileage of paved streets has been enormous. Every town of any size can today boast of its smoothly paved streets.

There are few persons who realize that the construction of a pavement is as much of an art as the building of a house, and, perhaps, more so; that the brain of the chemist and engineer, as well as the brawn of the man who rakes the hot mixture, or guides the roller, must be exercised before a pavement that will last for a reasonable period and not break down under the traffic of the modern city can be laid.

A city street, over which thousands of vehicles pass each day, unless it be constructed to bear the load which is imposed upon it, retards commerce and delays the promotion of trade.

In the selection of the best type of pavement to be used in any particular location, many things must be considered, among them: Ease and smoothness of traction; slipperiness; resistance to impact; ease of cleaning; noiselessness; ultimate cost, including maintenance for a given period.

Each type of pavement has its good qualities and defects and each its ardent adherents. In some localities the preference is given to brick; in others to wood block, while in others, granite block, concrete or asphalt is chosen. Since the work on Pennsylvania Avenue, the art of paving has been greatly developed until now it has reached almost an exact science.

The most famous avenue in the world, perhaps, is Fifth Avenue, New York City. It is the show street of the Western Hemisphere, with its big hotels, magnificent churches, handsome residences, and its almost unending throng of pleasure-seekers from all parts of the globe.

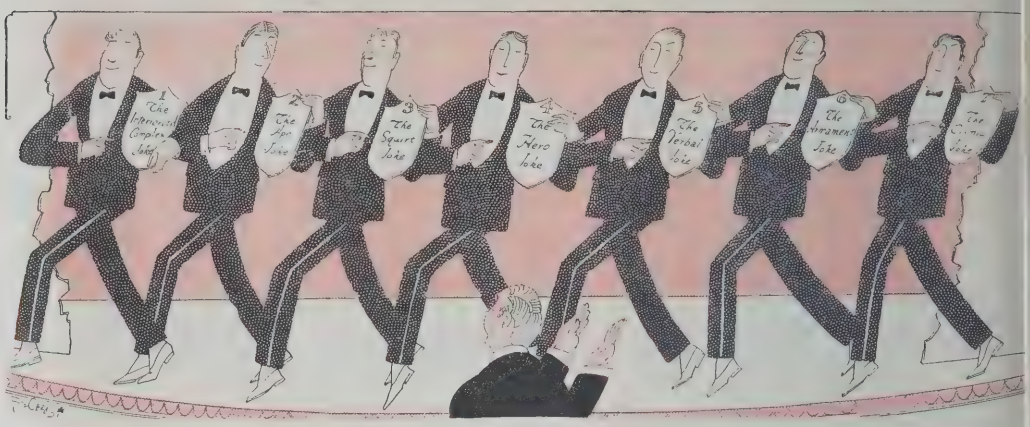
Fifth Avenue was paved in the year 1886 with granite blocks upon a concrete foundation but, notwithstanding the care taken in its construction, within four years the pavement was in a very unsatisfactory condition. It was patched from time to time until in November, 1896, the work of putting on a sheet asphalt pavement, as it is called, was begun. This pavement lasted until 1913, when it was resurfaced.

The traffic on Fifth Avenue has always been heavy, and in recent years has increased enormously. In a traffic census taken at the Worth Monument in 1885, in 11 hours, 5,460 vehicles passed; 6,300 in 1896, while in 1904, vehicles totaling 12,068 passed over a similar section of the avenue in 12 hours.

In July, 1917, at Fifth Avenue and Forty-second street, now conceded to be the busiest corner in the world, a census taken from 8 a.m. to 6 p.m. showed that 16,960 vehicles passed. In 1923, the number had increased to more than 20,000, the majority of which were motor-driven.

Today, from Washington Square, with its fountains, its beds of brightly colored flowers during the summer season, its great white (Concluded on page 32)

There Are Only 7 Jokes



1 The Inferiority Complex Joke
2 The Sex Joke
3 The Squirt Joke
4 The Hero Joke
5 The Verbal Joke
6 The Ornament Joke
7 The Chestnut Joke

"In general these seven original jokes cover the entire field of humor."

By THOMAS L. MASSON

ILLUSTRATED BY W. O. FITZGERALD

DID Mark Twain say there were only twenty-nine original jokes, or was it less? Every once in a while I see some reference to a statement supposed to have been made by him, to the effect that all jokes come from a few ancestors, accumulating courage and atmosphere as they go along. The number has been variously estimated from seven to twenty-nine.

The late Robert J. Burdette, himself a very considerable humorist, estimated, I believe, the number of original jokes at seven. My own estimate is seven, and—as old Bill Jones would say if he were alive—I can prove it.

Since Mark Twain and Bob Burdette have passed into that bourne from which no joyous laughter echoes back (which doesn't prove that it isn't there), a lot of mundane laughs have flowed under our bridges. But, after all, there are no new ones—they only seem so. There is probably nothing older in the world than the first joke. It may have been the one which Eve played on Adam, and which is now being revived by the younger generation under the explosive ejaculation, "Applesauce!" Certainly the newlyweds are the oldest comic characters in the world. It may have been the joke that the whale played on Jonah—his gills vibrating with quaint merriment—when he remarked, "You were a stranger, and I took you in."

"The first joke may have been the one Eve played on Adam."

The mother-in-law joke could scarcely have been the first one, as those first newlyweds—if we are to go by the Bible—didn't have any mother-in-law. When the *in-laws* began to appear, however, they made up in number, ferocity, curiosity and offensive amiability for the first omission, and they have now spread so they cover most of the inhabited parts of the earth.

That there are only seven jokes in the world among so many human beings seems a bit too thrifty on the part of a parsimonious providence, or whatever it may be that dispenses jokes. But in sober reality this is a generous stint and so much more in proportion than in other departments of life. In the literature of sex alone there are never more than *three* characters, represented by the "triangle" of the unsuspecting husband, the unsuspected best friend, and the misunderstood wife. But out of this triangle, think of the jokes, many of them quite grim!

Ten years ago it would have been impossible to classify properly these seven original jokes. Psychoanalysis had not then been invented. Psychology in general—which, next to humor-classifying, is the dullest science in the world—has come to the rescue. There are seven jokes, and only seven, because there are only seven attitudes. That is to say, we can laugh only in seven different ways. And if laughter is dying out, even seven ways may seem too many.

When you come to reflect upon it in this simple manner, you will see how easy—and how inevitable—it all is. Two college boys were discussing the death, followed by the usual funeral, of the father of one of them. The other boy, more curious than sympathetic, asked:

"Is your father really dead?"

"What do you think he is doing?" asked the other, "practicing?"

Now this is a very old friend, dressed in new academic clothes. It is precisely the same joke that passed current during the war when a young American was detailed by his *in-laws* to go to Paris and look up grandma, who had wandered away from the home fires. He discovered that the old lady had died at the same time a distinguished Russian general had also passed out. In the confusion the two coffins had got mixed; he completed his investigation too late to remedy the matter. So he cabled back: "Grandmother buried yesterday with full military honors." These jokes spring from the same parent, not because they are mortuary, but because the funereal atmosphere is evoked to bring up to the mind the sharp contrast of an incongruous picture, easily visualized. Nobody is hit off. No satire is implied. No truth is expressed. Nothing of consequence occurs. We don't even believe that these things happened. We see a picture suddenly presented which acts as a shocker upon our traditional, conventional thought. We laugh. This joke (with its companion) is number five on my list. It is verbal. It depends entirely upon a certain arrangement of words, and has no other significance. It is word-play and nothing more.

Yet here must be noted a surprising phenomenon: at least it seems so, until we come to understand the essential human quality of all jokes, and that is that this word-play has a serious side. Half the time it deals with these plays on words, puns calling up incongruous pictures for a laugh, and the other half its play on words has back of it a really profound idea. That may make it belong, in part, to another number. *Punch* pictures a socialistic agitator in a park, quite impassioned, shouting to his meager audience: "On the dawn of the horizon I see a new Error." (How often, indeed, is an Era an Error!) Here is an abstract idea turned into sharp satire by the misuse of a single word.

Let me now begin respectably at the head of my list, with possibly the greatest joke of all, the father of them all, "the head and front of all thy offending," namely, and to-wit: the ancient and honorable I. C. (Inferiority Complex) joke.

Nothing, doubtless, can be older than that joke. Adam felt the coming emotion of it in his sense of inferiority, his utter helplessness in taking the apple. If his wit had then been as sharp as that of a lad belonging to a later generation, he would have smiled courageously at Eve and said, "There ain't going to be no core!" just to prove what we now know to be so true:

that it often takes only bad grammar to make a popular humorist. The most prominent and notable form this I. C. joke assumes is that of the henpecked husband. I refuse to give any examples. The subject is too painful. But this joke does not stop here. It is man's relief from his own sense of weakness. It is a kind of mocking sublimation. It is not all defensive, but there is in it an element of defense, as when Mark Twain, when asked at a dinner in London by an English lady if he had seen Queen Victoria, replied, "No, I was out when she called." Or when, similarly, Eugene Field, also addressed by an English lady who spoke of the inhabitants of America as if they were primates and asked if this country were not rather wild, replied: "Dear me, yes: when I was caught I was up a tree."

The Inferiority Complex joke at its best—if not its funniest—is perhaps best indicated by Abraham Lincoln's remark when he once addressed a girl's seminary. When called upon at last he rose and said: "Young ladies, I have been looking at you and you have been looking at me—and I have the best of it." That is an instance of humility with a fringe of humor: for the idea of a homely man like Lincoln comparing his appearance with a group of handsome girls is incongruous enough to raise an inward chuckle. Another example is that revealed by Oliver Wendell Holmes. Short in stature, he attended a medical meeting of very tall men. "I feel," he said to one of them—presumably the tallest—"like a three-cent piece among a lot of pennies." We know about the chronology of that repartee from the reference to the three-cent piece.

The Inferiority Complex joke, as thus defined, is a late comer among the traits. The psychoanalysts tell us that to it is due a large part of what success may come. Most of the big humorists are supposed to have had it in excess, at least, in the beginning. When they begin to recover from it, and feel superior, their humor falls off in quality. Mark Twain had it, Bill Nye had it. Artemus Ward—Lincoln's favorite—had it. He held himself up to ridicule, especially in his waxworks lecture, thus making others ridiculous with himself. That is what the I. C. joke in its purity does—it pulls everyone down to one's own level. It is a cruel joke. The henpecked husband may thus be a pitiful figure: but in some subtle but none the less definite way his wife is made to seem even worse. The fact that, in the joke, she never knows that she is worse seems, somehow, to make it all seem still worse.

We come now to the Ape joke, a comprehensive and imitative affair, the *motif* back of burlesque, parody and the more abstract satire and irony. It is not only imitative, but shot through with dramatic sense, from mere acrobatic horseplay to the finer sort of farce. Perhaps it has best been indicated by the novelist Fielding who, in his introduction to *Joseph Andrews*, intimates that to raise a laugh it is only necessary to depict human beings as they are—that makes them ridiculous. This leads me to note in passing that, in spite of the belief to the contrary, brevity is not always the soul of wit. The Ape joke is the pattern for burlesque. In its abstract form it is a satire on Man. *Gulliver's Travels* is an Ape joke *in extenso*. Parody, farce, burlesque, satire—yes, all these various refinements of the original—spring from the same source. The success of the Ape joke, tenuous or climactic, depends upon the accuracy with which

"Most young fathers are quite innocent in their effort to show that their own brilliancy has at last come out in the child."

the imitation is made. It is essentially mimicry. Most of the jokes that are told of the people of other countries are Ape jokes. In telling them, we imitate the gestures and the utterance of the Irishman, German, Frenchman, Italian or Negro. The success of the joke so largely depends upon the mimicry! Harry Lauder, who mimics the Scot better than anyone, tells a story of two of his countrymen getting on a trolley and seeing a pretty girl. One of them whispers, or burrs, that he knows (kens) her.

"Shall I introdooce ye?" he asks.

"Wait, Mon," replies Sandy, "she hasna paid her fare yet."

The point of this joke would be lost if it were told in plain speech of two Americans. This indicates the process of building up the background for jokes, going on all the time. Thus an atmosphere of thrift has for generations been slowly created by professional wits around the Scotsman. Now, every time we meet one or hear of him, we begin to smile involuntarily in advance at the prospect of some shockingly stingy display. In his case, the historic process is plainly indicated. It began with, or was largely weaned, by Samuel Johnson. The tradition was fostered by every succeeding English writer who mentioned the "dour land." Mark Twain capped the climax when he remarked that there were only two Jews in Scotland—they could not get money enough to escape. There is naturally a basis for this Scotch affair, just as for the Negro, the Irishman, and so on. But it must be remembered that the actors themselves, perhaps subconscious of the reputation fastened upon them, actually imitate this exploited characteristic. Thus I have known Irishmen to make conscious bulls, merely because they were Irishmen. Few of us realize how we are so unconsciously playing up to the estimates of us made by others.

I have named the fourth joke the Squirt joke, because it seems to deal so largely with water. The degree with which water, in every form, enters into popular humor, from seasickness to garden hose, is well-nigh incredible. Without running water, probably half the comic writers in the world would be out of a job. Most of the motion picture comedians must have the constitution of a porpoise for they appear to pass their time like drowned rats, flooded from bursting plumbing, or drenched to the skin with seltzer bottles and rubber hoses. This Squirt joke is by no means, however, confined to material things. Expressly, it is the joke which deals with the misfortunes of others, and is probably the most extensive joke there is. There seems to be no human infirmity so distressing, or no tragedy so horrible, which does not serve as a fair mark for the joker. Deaf persons particularly have furnished a considerable literature of jokes. One considered the best in a collection of my own concerned itself with a man who saw a house on fire and hastily and repeatedly rang the bell until finally a deaf lady appeared.

"Madam, your house is on fire."

"What's that?"

"I say your house is on fire—flames are bursting from the roof."

"What did you say?"

"Fire! Fire!"

"Is that all?"

"Well, it's all I can think of."

This Squirt, or misfortune, joke deals with all subtleties of thought, so that, quite often in tracing it, it does not reveal its true character except under rigid scrutiny. *Punch* remarks, anent the news that an electric toothbrush has been invented by an American, that this will doubtless do away with the old custom of sending one's teeth to the local power house to get them charged. Probably nothing in the human anatomy causes, on the whole, more downright discomfort than teeth, yet a misfortune so common to all of us is a perfect mine for the wits, and dentists' wheezes are always in order. The best cover that *Life* ever ran pictured a small boy writing the word "Liar!" on the door of a "painless" dentist. Prolific sources of the Squirt joke, besides garden hose and the dentists, are the blind, the lame and the halt, hell, baldness, poverty, ugliness—in fact, nothing is sacred in the whole range of human misery.

We next have the Hero joke, which is quite largely responsible for all the children's sayings, and in this one respect worthy of more comment than I can well give it in a limited space. All of us have delusions of grandeur, which our practical sense of shame throttles down to innocuous displays of conceit. The intelligentsia, generally childless and shameless, are also ignorant and can get rid of their self-worship complexes by writing bad poetry or criticism and getting it praised by their own limited circle, but common people, who produce nothing but children and have to work for a living, have no relief except through their offspring. Hence their subconscious ingenuity excites itself by putting into the mouths of their children the wisest cracks in the world. That other parents don't think them wise, and that they are generally stupid, doesn't matter. They all laugh anyway for there is a defense conspiracy among all parents to hang together outwardly, a kind of reciprocity in applause. Most young fathers are quite innocent in their effort to show you that their own brilliancy has at last come out in the child. One of them will tell you what Junior said, after his mother had asked him how naughty he thought he was, but he—the father—doesn't need to state that Junior's brilliant wit, upon this historic occasion, was inherited from the male side.

Charging It to Her Grandmother

We trace the Hero joke through all of its manifestations, from the blatant badinage of Bernard Shaw in his depreciation of Shakespeare (compared, of course, to G. B. S.) to the story of the little girl who, visiting her wealthy grandmother and being told not to ask for anything to eat, suddenly appeared in the midst of the company exclaiming: "The kitchen is full of cookies, but what is that to me?"

And there are still two more jokes. Let us consider them briefly before we arrive at our conclusion. One of them is what I call the Armament joke. It is self-defensive. It is that by which we repel the attacks made upon us. A young woman is shopping in Paris. The new salesman is what we would term "fresh" in America. He doesn't know his place. The attack is Gallic.

"How much is the muslin?" she asks.

"One kiss the yard," he replies.

"Give me ten yards—that will be ten kisses. You may charge it to my grandmother." (Note the French precision in calculation.)

In Fear of Not Being Misunderstood

Oscar Wilde was defensive when he remarked that he lived in constant fear of not being misunderstood.

The last, but by no means the least in importance, is a joke which is quite difficult to name, but is by far the most valuable. It deals with a much broader sense of values. It is sanitary, often a form of patriotism. It is impersonal, not in its definitions but in its principles. In its best and most representative form it is probably the finest fruit of the reflective faculty. After some deliberation I have given it the name of the Cosmic joke. The humorist thus sets himself apart. He becomes a spectator. His mission, based on truth, is as a corrector of human imperfection. He does not hesitate to employ exaggeration. His wit is penetrating. Telephone operators, he declares, humanely should work eight hours and sleep eight hours, but not the same eight hours. A committee, he declares, should consist of three members, two of whom are absent. In England a woman appears in court and tells the judge that her husband has been trying to strangle her for twenty years. Whereupon a Cosmic wit, reflecting upon the British temperament, remarks, "It is just this dogged persistence that has made us what we are." Mr. Chesterton asks, 'Why condemn Christianity, when it has never been tried?" And so on.

With the incomplete structure I have erected, the curious and interested reader can go on and work the thing out for himself, if he is tired of cross-word puzzles. In general these seven jokes cover the entire field of humor. They are:

1. The Squirt joke. Dealing with the misfortunes of others.
2. The I. C. (Inferiority Complex) joke which serves to sublimate one's own sense of inferiority.
3. The Ape joke. Dramatic. Racial. Imitative. Character.
4. The Hero joke. Narcissus complex working through others.
5. Word-Play joke. Puns. Pictures created through adjustments of words. Verbal, and so on.
6. Armament joke. Defensive.
7. Cosmic joke. Impersonal. Looks down upon this little planet. Deals with principles.

Shepherding of the Women's Vote

(*Concluded from page 6*)

country must measure their politics in the terms of which they are most familiar; have got to think of government in almost the same terms as they think of the management of their homes. Then they must search and find the truth as they see it regarding the accepted political machines that govern their home town or city. After all, the sidewalk and road before the house, the milk and food on which the children are fed, the schools which the children attend—these are political issues, and they are also the daily interests of the women of the country. You might almost say that the women of the country should feel compelled to play a definite and independent part in politics because straight thinking and voting are the only sure methods a woman has of keeping her home safe, and of protecting the future of her children.

Considering the political status of American women of today it would seem in the light of their recent activities, including the presidential vote of 1924, that they have at least turned their faces in the right direction—if they have not actually stepped forward. The seeking of leadership and the finding of the wrong leaders set the women of the country back at first, set them back a good four or five years—but the rule of the *ism* is passing, and in its place is growing a definite line of political thought that is in keeping with the best traditions of this great nation.

Embraces Two Races

BELGIUM is made up of two distinct races, Walloons and Flemish. These people are equally divided speaking a language as widely different as English is from Spanish. But though racially and linguistically the Belgians make up a sort of house divided against itself, politically and religiously they constitute as staunch a national entity as does French-German-Italian speaking Switzerland, and they have stood together through the centuries under various rulers. The Walloons may be said to form the French-speaking half of Belgium, for though a very few in and out of the way districts know only the French-like old Walloon language, modern French has replaced that speech for the vast majority of the Walloons. The other half of the Belgian partnership is made up by the Flemings, whose speech, Flemish, differs very little from Dutch. The Catholic people of Flanders, however, have been divided from their kinsmen, the Protestant Dutch, by a religious gulf for hundreds of years and prefer to cleave to their fellow-religionists, the Walloons.

YOUR CAR IS TOO GOOD A CAR TO NEGLECT

How to Get the Real Value that is in your Automobile

The whole story of keeping down repair bills and operating costs

THESE hollow dust-proof fittings replace the grease and oil cups on your car.

THE secret of satisfaction with any car depends on the care you give it. *Regular* care.

80% of repairs that do occur are *your* fault. You may not believe this but investigation has proved it to be a fact. And 5 minutes' care—of the right kind—every 500 miles, will prove it to the satisfaction of your own pocket book.

For a recent survey among garages and repair shops brought out the startling fact that *80% of all repairs on moving parts come from one cause—lack of proper lubrication.* Neglect!

Your engine suffers least. It's the hard wearing, dust-exposed chassis bearings that are the source of most repairs. Largely because oil and grease cups are so hard to reach—so easy to overlook. Oil passages become filled with grit. Then every drop of oil that does reach through the bearings is a grinding compound. Here's the cause of squeaks and rattles as well as repairs.

Now you can end this. Put the Alemite or Alemite-Zerk Lubricating System on your car. It cleans bearings as it lubricates. The same high pressure system used on the most expensive cars. Clean, easy to use—you'll never have to crawl under your car. You can lubricate the vital bearings in a few minutes. It invites regular use.

Instead of oil and grease cups you have a hollow dirt-proof fitting on each bearing. Simply press the nozzle of your Alemite gun against it. And Zip! Fresh lubricant shoots entirely through the bearing. You can see the old gritty grease forced out. Pressure up to 3,000 lbs. does it.

Just do this every 500 miles. Give your car the lubrication it deserves. Taxicab fleets have proved that it will reduce operating costs 1c to 1¾c per mile.

"Reg. U. S. Pat. Off."

You can get the Alemite or Alemite-Zerk System from any dealer. Install it yourself. It will save its cost in clothes alone. And it will probably cut your repair bills in half. For you will get the real value that the maker puts into your car. THE BASSICK MFG. Co., 2660 N. Crawford Ave., Chicago. Canadian Factory: Alemite Products Co. of Canada, Ltd., Belleville, O.

ALEMITE
or Alemite-Zerk Systems are priced

$6.50

and upward according to the kind of car, and include compressor fittings and special tool for installation.

(PRICE IN CANADA AND WEST OF ROCKIES SLIGHTLY HIGHER.)

Are Alienists to Rule Our Laws?

"Psychiatrists" Are More and More Influencing Criminal Court Decisions

By HOWARD W. BOWMAN

THERE comes in the study of the psychopathic clinic as it at present functions in connection with the criminal courts of many of the larger cities of the country a most pertinent question: Are a few psychiatrists, professional practitioners of a comparatively new science, to be the arbiters of our liberties, instead of the body of the people who determine the laws?

Mention has been made in previous articles of the manner in which psychopathic analysis is made of individuals, how their mental age is arrived at and how the psychiatrists would have the governing agencies treat the mental delinquent, yet the laymen, after learning of the practices and theories of the psychiatrists, would like to know whether this new science will not destroy certain protective barriers that our laws have thrown around us. The answer of the psychiatrist is that the general scheme of social adjustment will be changed if his suggested mode of procedure is adopted.

When Dr. Arnold L. Jacoby, head of the psychopathic clinic, operated in conjunction with the Municipal Courts of Detroit, was asked the question: "What defense will the offender have against the recommendations of the psychiatrist?" he promptly replied:

"There will be no defense."

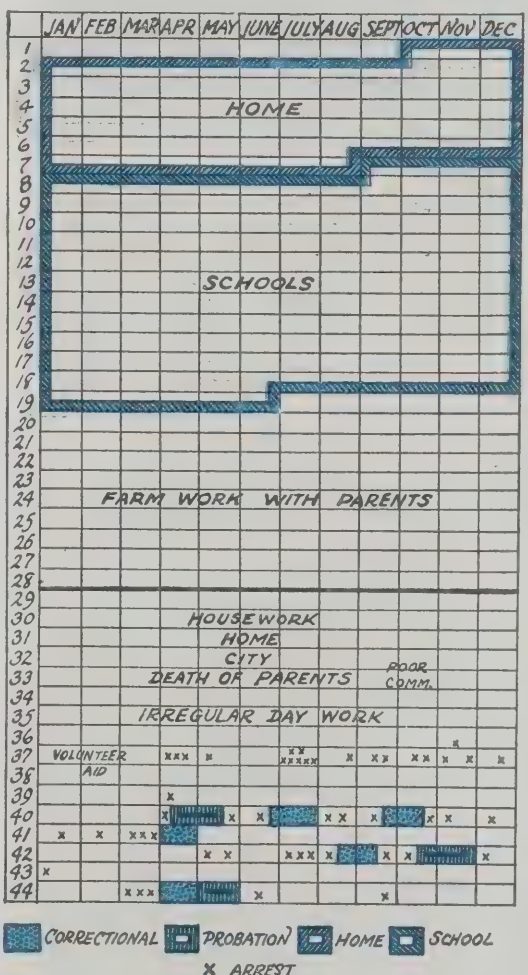
It was expected, when the question was put, that the answer would contain some highly scientific explanation but its mere simplicity seemed to make it all the more startling. Therefore, the next question that came to mind was:

"With this science put into practice will not our personal liberties be abridged?"

"What must be done to meet the problem of mental delinquents in our social life will not be doing anything more than has been and is being done in the case of insane persons," said Dr. Jacoby. "We must get rid of the idea we must punish the dementia praecox case by placing him in a dungeon. The mentally deficient burglar must be quarantined. It would be up to those in charge of the institution where he was confined to say when he should be released.

"No, the individual will have no defense. The great problem that confronts society today in the treatment of criminals is how to do away with the contentiousness of the law. The day the psychiatrist hopes for is the day when all this contentiousness is eliminated. In a recent celebrated murder trial in Chicago the psychiatrists, or mental experts, called by the state, pleaded with the state that they be allowed to meet with the experts for the defense and 'talk the case over' giving each other the benefit of their knowledge and experience, but the state said, 'No, the public wouldn't consent.'

"If the prosecution is to place psychiatrists in a position where they will recommend that the individual be given institutional care, it would only be keeping up the contentiousness we now find in the law to have psychiatrists appear in behalf of the offender. By this method social adjustment—for which we are striving—would not be served. The contest must stop."



The home period of this woman's life indicates on the chart that from the summer of her nineteenth year, when she completed her schooling, until she was twenty-eight years of age she remained at home with her parents, working on the farm. For the next three or four years she worked intermittently at home and in the city at housework. In April of her thirty-third year her parents died within a few weeks of each other. She drifted downward in the social scale until we see her arrest record beginning in her thirty-seventh year. From then on to the present she has been arrested repeatedly for drunkenness and disturbing the peace. Each star on the chart indicates an arrest.

Then the rather blunt question was asked: "Are we to be judged for our offenses by experimental standards or by the common sense of our fellow citizens?" And the reply was:

"Both. The experts' standards take into consideration a common-sense basis of inquiry."

"The contentiousness of the law only retards social adjustment. I recall having a man in the clinic who sat down and very frankly recited the manner in which he had committed an offense charged against him. There was no question but that he was guilty of the offense, and he was a mental problem, but his lawyer 'beat the case' for him and thereby supervision of his future conduct was lost."

One of the eastern states has enacted "some forward-looking and practical legislation." One law requires "a psychiatric examination and study of every person indicted by a grand jury for a capital offense, or any person who is known to have been indicted for any other offense more than once, or to have been previously convicted of a felony." The State Department of Mental Diseases is called on to "cause such a person to be examined with a view to determine his mental condition and the existence of any mental disease or defect which would affect his criminal responsibility."

A man in this eastern state was recently charged with murder and under the caption, "The Better Way," the *Mental Hygiene Bulletin* thus reports the case:

"Note that the psychiatrists appointed . . . are not asked merely to declare the person as 'sane' or 'insane' but are permitted the wider and more sensible latitude of discovering the presence or absence of 'any mental disease or defect.' The man in this case was examined by four psychiatrists. . . .

"The next step in this unique display of common sense in medico-legal affairs was taken when the trial began. Twelve jurors were drawn in forty-five minutes without a challenge. The district attorney to whom the reports of the psychiatrists have previously been given then outlined to the jury and the court the facts of the case.

"He described the crime and emphasized the utter absence of a motive, 'as sane beings understand the term.' No hatred of the victim existed, no quarrel had taken place, but the defendant was urged by God, according to his story, to commit the crime. He pointed out that 'ordinarily, insanity is a plea used by the defense. The state

puts in its case and the defense then tries to prove that the defendant was insane at the time he committed the act. As we see it, however, it is not the duty of the district attorney to prove an innocent man guilty, nor yet to prove an insane man sane. Rather it is his duty to lay before the court and jury all the facts in the case and to bring out the truth.'

"In suggesting the alternative course, which, he declared, he proposed to follow, this prosecutor displayed rare judgment and unusual social insight. 'In view of the psychiatrists' reports I cannot conscientiously argue that this defendant is sane and if the court directs a verdict of insanity, I shall not oppose it.'

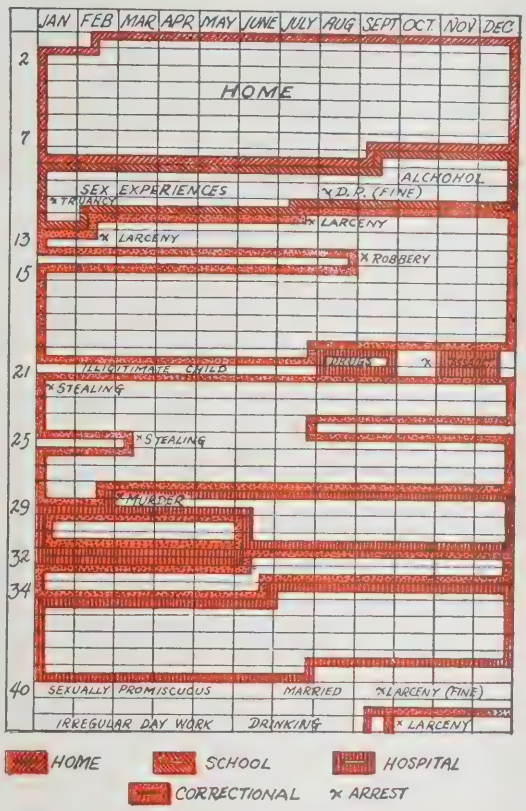
"He then put the various alienists on the stand, all of whom briefly explained the reasons for their conclusions. Not one was cross-examined. At the end of their testimonies the counsel for the defense asked the judge to order a verdict of 'not guilty by reason of insanity.' The jury quickly returned this verdict and the court then committed the defendant to the State Hospital for the Criminal Insane for life. Less than half a day was consumed in this trial . . . .

"The defendant's insanity was of an obscure type, not affecting his intellectual faculties, and to casual outward appearance it might, and did, escape detection for years. None but trained psychiatrists could reasonably hope to establish an accurate diagnosis. In all likelihood an unscrupulous prosecutor, eager for self-aggrandizement, would have had no difficulty in convincing a non-medical jury that the defendant's alleged insanity did not exist, with a resulting verdict not in accord with the facts. We commend this action . . . and a common-sense prosecutor to other states. Surely it is a better way."

Let us see what happened. First, the prisoner pleaded not guilty; second, the jury was drawn (although for what purpose it is not quite clear unless automatically to return the verdict ordered); third, the prosecutor "outlined the facts"; fourth, the psychiatrists testified the man was insane; fifth, the judge ordered the jury to return the verdict of "not guilty"; sixth, the prisoner was committed for life. *That section of the Constitution of the United States that permits and requires a full trial by jury was not strictly followed.*

Several eastern and a few western cities had already either actually installed psychopathic clinics in connection with their criminal courts or were considering doing so when the innovation was suggested in Detroit. At the height of the discussion in Detroit there arrived a psychiatrist to lend his aid. One of the tests brought with him was a small card, some four inches square, upon which a design in black lines was drawn not wholly unlike that of the ace of spades on a playing card.

The test was this: the card was exposed to the gaze of the subject for ten seconds and then withdrawn. The subject was then given pencil and pad and told to draw the outlines from memory. One of the sides of the original outline on the card was larger than the other three sides, and what was expected of the subject was that he note this and reproduce accordingly. When the visiting psychiatrist learned that an outsider had taken one of these cards to a number of business and professional persons, "submitted the test" and found none had noted the enlarged side, this psychiatrist spared no pains in informing the outsider that it was effrontery on his part to have undertaken the giving of the test as he was not a trained psychologist.



A study of this woman's case revealed the fact that until the autumn of her seventh year she was at home with her parents. Until June of her twelfth year was spent in public schools. There her conduct was as characterized. The stars indicate arrests, one for disturbing the peace and one for truancy. At twelve she was sentenced for six months for larceny. At 15 her first robbery was committed, and she received a sentence until her twentieth year. The next eight years were spent very largely in prison and in her 28th year she committed a murder, for which she was placed in a hospital. From then until her death she alternated between an insane hospital and prison.

At about the same time one of the prisoners held for the "early morning session" on a charge of drunkenness was brought in and called upon to do the test. His hand trembled and his lines were pronouncedly irregular, wavery.

"Dementia praecox," was the pronouncement.

Returned to the "bull pen" the prisoner, after some questioning, told something of his life history. He was a graduate of Cornell University. He said he had been drunk for a month but—"If I had a couple of good drinks this morning my hand wouldn't shake.'

Then came a woman, a widow who resided on the East Side, and who worked as a cashier and bookkeeper in a coal office to support her two small children and her aged and crippled mother. She had been in financial straits, had held some accounts open that had been paid and used the money—it was a small amount—for food for the home. Her manipulations had been detected; she was arrested.

She was given the tests and although memory does not exactly serve at this time she was pronounced "mentally deficient." Fortunately, a sympathetic judge to whom "IQ's" were then—and still are—somewhat of a mystery, placed her on probation. To date, that has been her first and last appearance as a defendant in court.

Some time ago a psychopathic analysis, with its attendant recommendations, found its way to the bench of one of the judges, and, because of its rather extraordinary character, was printed and commented upon to great extent in the newspapers. What it said in substance was that the subject was not yet of a mental state that would warrant his commitment to an insane asylum but recommended that a term in prison might bring about such a result, et cetera.

These instances, however, may not fairly be regarded as representative. Whether the psychopathic clinic is a forward step toward the treatment of social delinquents and the hope of curing their criminal tendencies, is a question not as yet answered to the entire satisfaction of the skeptic.

A Sight Celestial

THE Emperor Trajan, hearing the Rabbi Joshua say that "God is everywhere present," observed, "I should like to see Him." "God's presence is indeed everywhere," replied Joshua, "but He cannot be seen; no mortal eye can behold His glory." The Emperor insisted. "Well," said Joshua, "suppose we try first to look at one of His ambassadors." The Emperor consented. The Rabbi took him into the open at noonday, and bade him look at the sun in his meridian splendor. "I cannot—the light dazzles me." "Thou art unable," said Joshua, "to endure the light of His creatures, and canst thou expect to behold the resplendent glory of the Creator? Would not such a sight annihilate you?"—Goodhugh's "Lectures on Bibliographical Literature."

The
Mississippi
Gulf Coast

Every Day in the Year

—you may play—on the Mississippi Gulf Coast. It's incomparable in autumn and winter. It's typically American and it's truly Southern—warm and leisurely, with a generous measure of that hospitality for which the Old South is famous. . . . You'll enjoy the grinning Southern colored boys—good-natured and responsive, constantly alert to serve you. You may golf—every day if you wish—under huge live oaks draped with Spanish moss, in groves of Southern pines fragrant and tangy.

Excellent boating, fishing, riding and tennis. Don't forget to bring your bathing suit along because you'll probably need it. . . . Splendid hotels, comparable to those of your favored summer resort—and within your means. . . .

Unusual opportunities to acquire excellent Gulf Coast properties for investment or residential purposes.

All the more attractive because of its nearness to the large centers of population.

Less than a day away on the famous

Panama Limited,

leaving Chicago 12:30 p.m., St. Louis 4:02 p. m., carries a through sleeping car to Gulfport, arriving at 11:55 in the morning. Immediate connection same station—special service to Biloxi, Ar. 12:45 p. m. and Pass Christian, Ar. 12:45 p.m.

Our Mississippi Gulf Coast booklet will tell you all about it. Send for your copy.

to farmers and their families. The recent increase there is probably the least for any large group but if calculated for a long period of time, say fifty or a hundred years, it probably is as great as for any.

"Seventy-five years ago the average agricultural worker could care for but twelve acres of crops," says a recent bulletin put forth by the U. S. Department of Agriculture. "Now, considering the United States as a whole, he can attend to at least 34 acres, and in some States where large power units are common the average is more than 100 acres, while on many individual farms it will run as high as 300 acres."

Those who made the report estimate that the total primary power, aside from human energy, now available on farms in the United States amounts to about 48,000,000 horsepower units, as against only about 6,500,000 in the year of 1850. In 1850 all of it was supplied by mules, horses and oxen. Animals now supply *only about one-half* of all the power used on American farms. The remainder comes from windmills, steam engines, gas engines, electricity, gas tractors, automobiles and trucks.

More gains in the matter of labor economy in farming have been made through the use of power than by improved methods of utilizing the soil. Production per man has doubled and trebled while per acreage production for all the country has increased only slightly.

One result of increased production per man has been the release of men from farming for employment in other industries. In 1920, for example, farmers and planters per million of population were only a little more than half the number recorded in the census of 1850. Curiously, the number of farm laborers per million of population increased during that period.

Increased per man production in agriculture as in other industries has been transmuted, in much part, into better living conditions rather than into leisure.

Unquestionably, however, farmers have more time for leisure than used to be available to them. But the greatest progress toward economies productive of leisure time is to be made in their realm.

How Efficient Sawmills Increase Output

There still is an immense amount of room for like economies in other realms.

"We have sawmills where the output per one man hour is 15 board feet, and we have sawmills in which the output per one man hour is 353 board feet," says Ethelbert Stewart, Commissioner of the U. S. Bureau of Labor Statistics, who has been keeping tab on such matters for the last forty years.

"If all the sawmills of the United States were as efficient as the average sawmills now in existence, it would require less than one-half of the present number of men employed in the industry to produce the total output, while if the highest efficiency prevailed in all the plants practically 45,000 men could do the work now being done by 392,000 men."

He shows how the same is true of numerous other industries.

We have barely more than skimmed the surface of the vast reservoir of inanimate slavedom—power—that is available for the production of more and cheaper products and also for increasing the time generally available for leisure.

Public Recreation Facilities Are Progressing

The cities of the country are now spending around $50,000,000 a year on public recreation facilities, such as parks, playgrounds for children, and golf courses—of which last there are now several hundred that are publicly owned.

The work of more than fifty organizations interested in the promotion of public recreation have established a coördinated bureau, under semi-government auspices, in Washington, for working together in developing national facilities, such as are afforded by the scenic parks and the forest reserves, for the use of the general public out-of-doors.

Some observers contend that processes of education must be changed radically before Americans as a whole will utilize to the full of enjoyment and benefit the new leisure that has come to them.

Localities and Food Fads

MANY races, many foods, many fads. The luxury of one people is the bane of another. An attempt is being made to introduce snails as an article of food in certain London restaurants. The French, of course, regard snails as a delicacy, while Britishers almost shudder at the thought of eating them. Yet English folk eat mussels, whelks and winkles, which in some countries are regarded as being unfit for human consumption. In England the eel is relished by many people, but in Scotland it is detested by nearly everybody. Rabbits are looked upon as vermin in some parts of America and Australia and are seldom served at table. In Britain rabbit is a favorite dish. Swede turnips are often eaten in Scotland and Canada with other vegetables, whereas in some parts of England they are cordially disliked and given only to cattle. Turnip tops in Scotland, again, are not considered worth cooking. But in Covent Garden they sell by the ton.

Ford

New Beauty Has Not Crowded Out Traditional Reliability

Interest in the attractive appearance of the latest Ford cars can never supersede regard for the quality of materials and workmanship that has made the Ford car the world's leading automobile value.

Ford cars enjoy their remarkable reputation for reliability and long-life only because such fine materials and such careful, accurate workmanship go into them.

In every part of the car, quality has been steadily improved and the high standard set, is maintained uniformly by ceaseless testing, inspection and checks.

The very volume of Ford output necessitates absolute accuracy in every manufacturing operation. The steady, forward flow of production is dependent on parts fitting together perfectly; inaccuracies would interrupt and delay assembly. And to this precision must be credited largely the uniformly fine performance and freedom from trouble of all Ford cars.

When you see the smart-looking cars now offered by all Authorized Ford Dealers, bear in mind the high standard of quality they represent.

Detroit, Mich.

NO INCREASE IN PRICES

A Question—and One Answer

This article comes in three sections: there is too much dynamite in it to print it all at once. It is going to make a few farmers mad; but it will make many farmers think; and, best of all, it is certain to make hosts of farmers glad, because *it contains an idea.* Most discussions of this subject lack *ideas.*

By GEORGE H. BROWNELL

IT IS a question that serves as the label on each of the four drawers of two steel filing cabinets in my office. It is a question concerning which, in January of this year, an industrious secretary found, by actual count, that I had collected more than seven thousand clippings, pamphlets and bulletins; beginning with 1904 when, as a verdant knight-errant self-sworn to the cause of agricultural betterment, I was graduated from the University of Wisconsin.

It is a question concerning which, probably, during the past two years, as much spoken and written language has been used in this country as has been used about any other one subject, in a similar period, since language was invented.

The question is: "What's the Matter With Agriculture?"

There isn't anything the matter with agriculture as an *occupation* for the individual. There is a lot the matter with the *industry* as it has been, and still is, handled by individuals; not only the men actively in charge of our farm land, but also those persons in financial, railroad and legislative capacities who have played a most important part in shaping its destiny.

We have too many acres engaged in producing. We have too many farms and too many farmers.

Instead of being regarded as the source of our food supply, agriculture's chief use has been that of serving as a medium for gambling. The crops were a by-product, the holding for the rise the chief aim of the owner. Until 1921, land in this country had enjoyed a perpetual bull market. The deflation of values, beginning that year and still with us, brought us to our senses.

From now on the price of farm land will closely reflect its earning value per acre. Not entirely so, because American soil is the most desirable soil to own in all the world and there is just so much of it. American soil will always command a premium over exact earning value because its price to some extent will anticipate the steady increase in our population and reflect our confidence in a perpetual national stability.

In practice, the business of farming in this country has consisted largely in raising such crops in such manner as would meet the payments on the mortgage until such time as the owner could sell the farm at a profit.

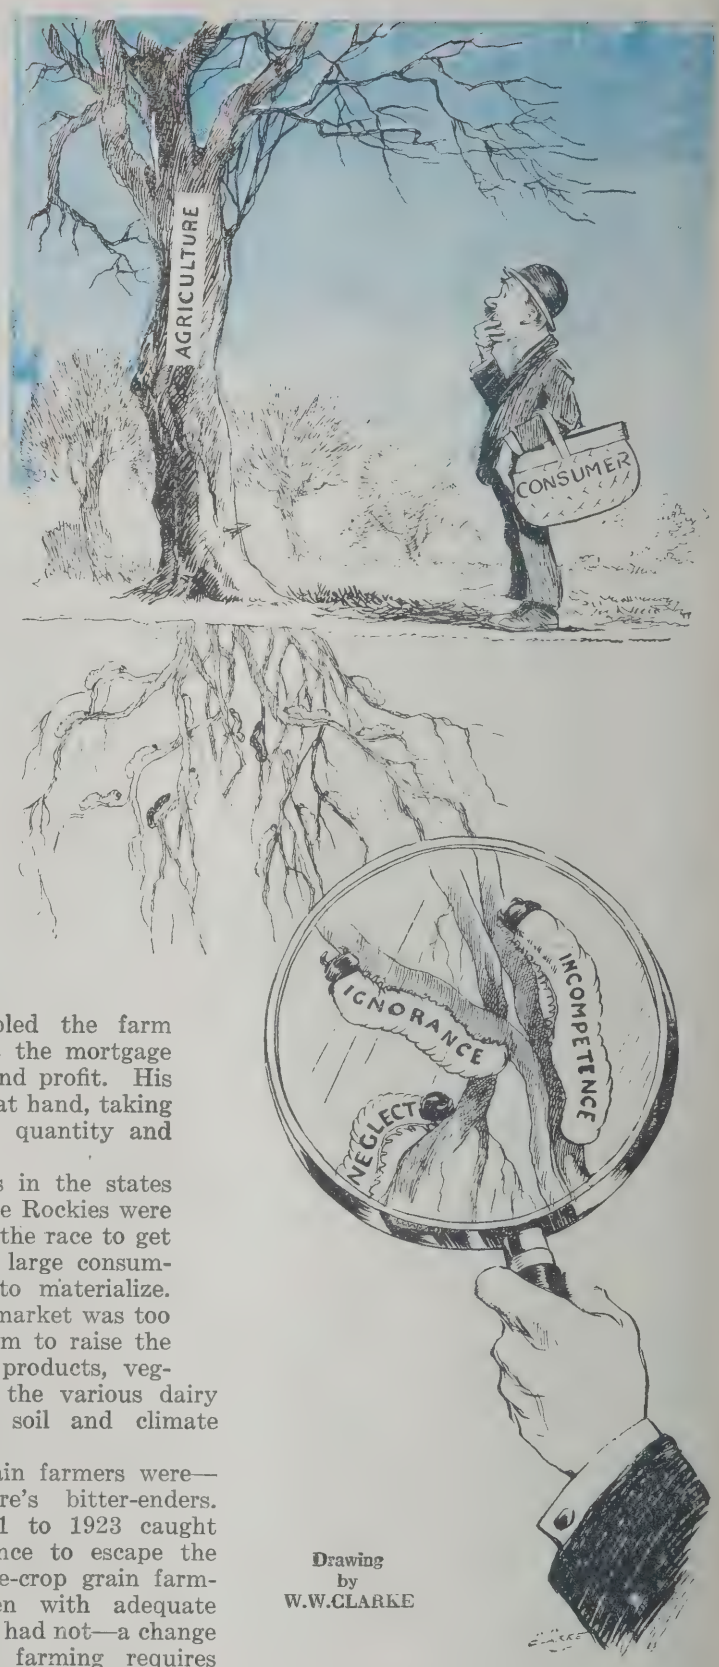
The practice began at the Atlantic and extended to the Pacific in a period embraced by the nineteenth century.

In the East and the Middle West the growth of population enabled the farm owner to beat out the mortgage with greater ease and profit. His markets were close at hand, taking foodstuffs in great quantity and variety.

But the farmers in the states lying just east of the Rockies were not so fortunate in the race to get clearance. Nearby large consuming centers failed to materialize. The distance from market was too great to permit them to raise the quick-consumption products, vegetables, fruits and the various dairy foods, even where soil and climate were favorable.

The western grain farmers were—and are—agriculture's bitter-enders. The slump of 1921 to 1923 caught them with no chance to escape the penalties of the one-crop grain farming system. Even with adequate capital—which they had not—a change in the system of farming requires several years to accomplish. The low price of wheat was caused by too much wheat being fed to a market suddenly cut off from a foreign outlet. And this low price of wheat worked destruction in two ways: it reduced the farm's earning power so that the mortgage payments could not be met and it almost totally destroyed the demand for farm land.

The farmer could not realize enough from the sale of his crop to meet cost of carrying and mortgage payments, neither could he sell his farm at a price that, in most cases, was even a half of what he had paid for it.



Drawing by W.W.CLARKE

In times past, eastern and middle-western farmers have been through the same experience due to the same causes. But the effect has been less disastrous because the boom-time preceding failed to reach the same height and the fall was much shorter. Soil and markets favored the eastern and middle-western farmers in times of adversity. Ten years from now the grain-growing states will show that

they have profited by their present-day lesson.

Already the one-crop system is vanishing and in its place there is arising a form of diversified farming that includes dairying, fruit-raising and the growing of products for local consumption. Already Minnesota has become the leading butter-producing state of the Union and dairying authorities are agreed that the Dakotas, Montana and Nebraska are destined to supply the greater part of the butter consumed between the Atlantic and the Rockies.

Butter, cheese and condensed milk are three compact, high-value products that may rightfully be produced in the western country and shipped anywhere to market without the commission of an economic crime, so common in the distribution of other farm products.

The man who expects to realize his chief profit from the sale of his farm as a whole is not deeply interested in maintaining that farm as a machine for the growing of farm products.

From the beginning of our agriculture in this country we have directly departed from the European system of soil-conservation and have employed the system that would yield the largest quick profit with the least expense and effort. Each wave of emigration that swept westward was consumed with the thought of gaining an immediate competence regardless of what might be the effect on the soil. It was presumed that the natural increase in land values would be such as more than to offset the value of the fertility mined from the soil.

It was this haste, this disregard for the value of fertility in view of the greater prize to be won by selling the farm, that is one of the chief causes of the present-day agricultural depression. Fertility was something that need not be measured or charged for. It was not included in the price of the product; it was not treated as one of the leading causes of the depreciation of farm land value.

It went away from the farm and into the stomachs of the people in the cities. It built those cities. It made living in the cities that much less costly and that much more attractive. It encouraged other industries to rise because wages could be kept low in accord with the low cost of living.

The cities continued to grow and industries continued to arise and expand. The demand for foodstuffs became greater and greater. America was engaged in building the greatest nation on earth, by the simple process of robbing agriculture of its chief active asset.

The slump of 1921 has a deeper meaning than that of being the after effect of an overproduction stimulated by the World War. In reality it marks the final decisive protest of American soil against the ravishment it has been subjected to for the past century and more.

It marks the moment when the long-dominant speculative idea of land-owning gave way before the convincing fact that a farm can no longer be skinned fast enough or deep enough to outstrip a mortgage; that farming has become a business in which the future sale of the farm is certain to create a lesser profit than will the proper, year-by-year operation of that farm as a food-producing plant; that the present-day market value of a farm is directly dependent on its earning power per acre.

Another and equally harmful effect of the speculative system of farming was the failure of farming to hold its sons to the soil. Long hours of menial toil, a low standard of living, the near-certainty that the farm would pass into other hands before it could be acquired by will or purchase, all operated to discourage the farm youth of each generation.

The cities beckoned. Industries of all sorts demanded workers and management. The flow of manpower out of agriculture was inevitable. The more progressive, courageous type, demanding more of life and determined to get it, entered into the myriad avenues of industrial endeavor that were opened during the last half of the last century. The less active type, the men who feared to test their mettle elsewhere, who were satisfied with farming and its small slow returns, were, and are today, left in charge of our agriculture.

There is a thought in connection with this withdrawal of virile manhood from agriculture that is worthy of study by one of those medico-efficiency experts who seek the cause of a man's failure in his daily diet. Calcium, phosphorous and iodine are the three elements that seem to be essential to a well-rounded physical and mental development; also necessary are a supply of leafy vegetables and plenty of sunlight. In the milk, vegetables and outdoor work, secured by the farm lad, there is a plenitude of all of these requisites to sturdy growth and sound health.

Some day one of these experts may prove beyond a doubt that our farm lads, who have become great leaders in industry, finance or statesmanship, are simply the result of an ideal mating of good parentage with the right combination of food and outdoor employment; they may prove that these young men would have left the farm regardless of what inducements the farm might have offered; that such men cannot resist the urge to seek the clash of combat with their fellow men, the presence of obstacles against which to pit their powers.

And none of this may be encountered in the slow-moving tasks of turning a furrow, cultivating, reaping, milking or performing the customary chores on a farm.

Certain it is that out of our entire present rural population there has not risen a single great leader to serve agriculture as a spokesman and champion.

The crux of the situation is that agriculture is short of working capital and short of managerial ability. It cannot get capital because capital demands good management. It cannot get good management because good management demands adequate capital with which to work.

Ask yourself just how you would receive the proposal of a farmer who came to you today and said that he intended to incorporate his farm, issue preferred stock up to the limit of its forced sale value and then put out an issue of common stock of which he asked you to purchase a few shares.

The only farmer whose common stock you would buy is the farmer who wouldn't come to you with any such proposal because he doesn't need your money. He is a successful farmer—and there are many such, despite all this talk to the contrary—because he is a good manager.

If such a man should come to you with such a proposal, he could get your money in an hour's time—plus a pencil and a sheet of paper. You might not understand all of the figures put down on that paper, but you would know by the way he talked and figured that he knew his business and could be safely trusted to pay you good dividends on your money.

"It is my fault," says this writer, "that my farm doesn't pay."

Was this Michigan farmer right when he said: "These fellows around here are farming because it gives 'em a cheap place to live. Most of them tried to hold a job in Detroit, but it was too much work and no chance to talk about their troubles."

Farming as an occupation is one thing; as an industry it is another. Most farm profits have been made out of increases in the value of land—not out of farm products.

Agriculture has not raised a single great leader to solve the problems of the farm. If a farmer incorporated his farm and offered to sell stock in it, how much could he sell?

The unsuccessful farmer—the one who today constitutes 90 per cent of the army of malcontents and criers-out against the injustice of their lot—couldn't get a dollar of your money. Something in his manner of speaking would tell you that he did not possess the gift of management.

But the thing that would stop you absolutely from investing a cent in his project would be the fact that he could not figure; he could not show that familiarity with production processes and operating costs which a man must possess if he is to succeed in any business.

Viking Who Trembles at a Pencil Stub

Somewhere in a mid-western state there is a farm whose deed stands in my name, but whose uncertain destiny rests in the hands of a huge Scandinavian who fairly trembles at the sight of a pencil-stub. Records of any sort are as a pestilence to him.

For the long time that I have owned this farm I have been inflicted with one pencil-hater after another. Once, for a year, it was conducted by a young Scotchman, Sandy, in a manner that gave me both pleasure and profit. Never have I known such completeness and accuracy in inventory figures, items of current expense and receipts, records of farming operations in general.

But such a gem could not long remain hidden. A month to a day before his year's contract was up, Sandy explained to me that he was a month away leaving; that he was to enter the employ of a gentleman owning a farm of twelve hundred acres in another state at a salary of more than four times what I had been paying him.

He wrote me later about his new job; about the dormitory for the single lads and the neat houses for the married employes; about their baseball diamond and winning team made up of the men composing his staff of husky, happy workers; about their stopping work promptly at six and paying the men a higher wage rate for overtime.

Pinned to his letter was a trial balance sheet which showed that the net earnings of that farm for the previous month were more than nine hundred dollars. The statement was not his own; printed at the top was the name of a nationally known firm of certified public accountants who, I know from experience, take a wicked delight in blasting one's hopes in the matter of net earnings.

Sandy Made Money When He Ran the Farm

Sandy made money for me when he ran the farm, with the minimum of supervision and prodding. The huge Scandinavian has lost money each year, despite equally favorable conditions, continued oversight, pleading and prodding.

Why don't I fire him and get another? For the same reason that on a congested country highway I never wheel around an auto—I simply run into another, equally slow-moving.

It is my fault that my farm doesn't pay. As I shall later attempt to explain in greater detail, I am engaged in running a business enterprise of such small size that I cannot afford to pay for competent managerial ability. Herbert Hoover, with his great executive ability and food administration experience, would make a first-class manager for the delicatessen shop near my home; but I know that the Greek gentleman who owns it would object strongly to paying the salary Mr. Hoover would ask for his services.

But the larger share of our farms are still run by their owners. Nothing stands in the way of their keeping such simple records as will point out the source of their losses or profits. Banks and manufacturing enterprises furnish practical, easily kept record books for the asking; as also do the extension departments of many of our agricultural colleges.

On several occasions, at public gatherings of farmers where I have discussed the subject of farm-accounting, a gentleman—always located in the rearmost seat for fear he would learn something—has risen and asked the city slicker how a man can keep records when he is working in the fields or barns from before sunrise until long after sunset. He has insisted that I tell him just how a man can do any figuring when he is so tired at night that all he can do is to fall into bed after supper.

Learning to Figure Right, Not at Night

The first time this question was fired at me I was at a loss for an answer such as one must give instantly if he is to silence the heckler by putting the laugh on him. My embarrassment must have shown itself to the village banker who sat near me on the platform. He saved the situation by an act that won my eternal gratitude.

Rising, and holding up his hand until complete silence prevailed, he meantime said to me in a stage aside: "Let me handle that fellow. Poorest farmer round here; lets me do all the figuring on how to get my interest on his mortgage."

"Clarence," he called to the too-tired gentleman in the rear, "if you'll just learn how to figure right, you won't need to work so hard that you have to figure at night."

Possibly a prosperous old Michigan farmer was right in what he said to me one night as we were driving to his home after a meeting held for the purpose of forming a purebred sire association—that wasn't formed. He said: "These fellows around here don't want to make anything more than a bare living. They're farming because it gives 'em a cheap place to live where they can be their own boss. Most every one of 'em has been to Detroit and tried to hold a job in an auto factory. They got let out because they couldn't stand the pace. Too much work and no chance to talk about their troubles."

What he told me, in effect, was that the farmers in that part of his state were largely composed of men who were using the farm as a last-resort market for their labor; that they were farming because farming was the only job they could hold.

What Happens When Farmers Are Coddled

Since that night the thought has often come to me that farming everywhere is suffering from the fact that too many farms are being run by men too incompetent to hold any other kind of a job.

This fact is certain: That despite all the private, state and government help now being given to agriculture, we have made no real progress. We have done little that actually tends toward the accomplishment of the only purpose worthy of consideration, which is to provide the people of this country with an ample, fair-priced food supply and at the same time pay those who produce that supply a fair return on labor and investment.

But there are few among our statesmen, editors and industrial chiefs who dare to come forth and say this to the farmer. Statesmen want the farmer's vote, editors want readers, nobody likes the idea of telling the truth to people when the telling is certain to give offense.

Instead, it is more healthful politically to lay the blame on the tariff, the railroads, the banks, the alleged grasping monopolies, the speculators, the middlemen—anybody, in fact, except the man on whom the blame should wholly be placed. And that man is the farmer himself.

For the purpose of getting the farmer's vote, or for the purpose of creating soft jobs for themselves, men flatter and commiserate the farmer into believing that a gigantic conspiracy exists to exploit the farmer both in what he buys and what he sells.

Exactly the opposite is, of course, the truth, yet so constantly and so artfully has the farmer been assured of his martyrdom that now he fully believes it. Pampered and coddled by every conceivable form of subsidy and free assistance on the one hand, and told of what a pitiable victim he is on the other, the farmer has come to believe that nothing he himself can do is of any value.

Now Just What Is the Remedy for This?

What, then, is the remedy? What are we going to do about a situation wherein we cannot effectively help the farmer, nor will he help himself?

The answer is: Nothing.

Refreshing, perhaps, it is to learn that there is at least one person in this country who has no infallible remedy for agriculture's ailments.

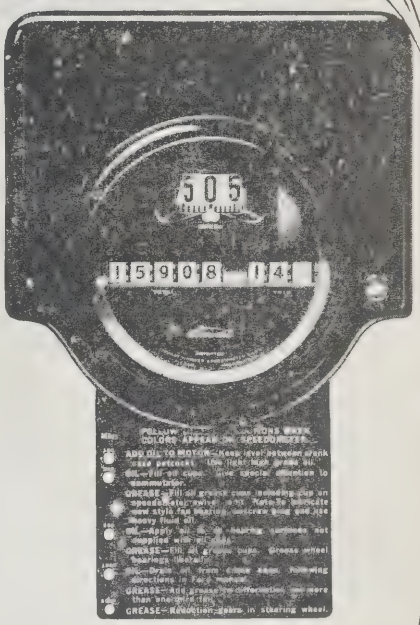
But if I am confessing to an inability to provide a remedy, I am by no means at a loss to predict what is going to happen to agriculture in this country.

(*This article is continued next week.*)

Stewart-Warner Accessory Family for Your Car

WE know that you will be glad to know JUST WHICH are the best accessories to have installed on your car—just as you like to know which is the best store to trade at—or the best shoes to buy. Accessories add as much to your car-life as the many other things with which you surround yourself add to your home life. Stewart-Warner Family of Accessories fill all the accessory needs for every car. All under one name—with one assured quality—and at a reasonable price. Ten million cars now carry Stewart-Warner Products—the most pronounced success in the accessory field. This is your assurance that you are buying time-tried Accessories for your car—universal satisfaction. Ask your dealer to show you the Stewart-Warner Family, and you will learn what the "Family" word means.

STEWART-WARNER SPEEDOMETER CORPORATION
1826 Diversey Parkway, CHICAGO, U. S. A.



Stewart-Warner Speedometer—Special Model for Fords
Colored dials tell when to lubricate
Complete, $15.00
West of 100° Meridian, $15.50

Stewart-Warner Electric Windshield Cleaner
Complete, $8.50
West of 100° Meridian, $8.75

Stewart-Warner Bumpers

Stewart-Warner Double Bar Bumpers
Front—Nickel, $14.00
Rear—Nickel, $14.50
Front—Black, $12.00
Rear—Black, $12.50
(West of 100° Meridian add $2.50 to these prices)

Stewart-Warner Shock Absorbers
Per Pair, $13.50
West of 100° Meridian, $14.00

Stewart-Warner Rear Vision Mirror
For Open or Closed Cars, $2.00

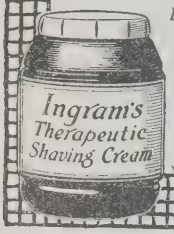
For Tough Beards or Tender Skins

YOU will find relief and comfort in a jar of Ingram's Therapeutic Shaving Cream. It rapidly softens the toughest beard and prevents shaving irritation. Its exclusive properties soothe and cool the skin and heal troublesome little cuts. It leaves your skin soft, cool, invigorated and refreshed.

Thousands of men have told us that it makes shaving a pleasure—no longer a job to be dreaded.

If your druggist cannot supply you, send 50c. for the blue jar that contains six months of shaving comfort. Or send 2c. stamp for sample.

Frederick F. Ingram Co.
Established 1885
17 Tenth St.,
Detroit, Mich.
Also Windsor, Canada



Made particularly for tender skins

LAW STUDY AT HOME
Become a lawyer. Legally trained men win the highest positions and biggest success in business and public life. Be independent. Greater opportunities now than ever before. Big corporations are headed by men with legal training. Earn

Fabre used to startle evolutionists, not excepting Darwin, with the problems he offered to science by facts he met. He established the fact that insects know exactly where to drive their stings to reach nerves. He stated that no wild grass has been discovered that might have been the ancestor of Indian corn.

Mrs. Whitman Tells Her Story

(*Concluded from page 7*)

hopeless of being able to exercise any permanent influence over his life.

"On our return home I announced to him what I had heard, and in his presence countermanded the order which he had previously given for the delivery of the note to Doctor Crocker. He earnestly endeavoured to persuade me that I had been misinformed, especially in relation to his having that very morning called for wine at the bar of the hotel where he boarded. The effect of this infringement of his promise was in no degree perceptible, but the authority on which I had received this and other statements concerning him was not to be questioned.

"I listened to his explanations and his remonstrances without any word of reproach and with that marble stillness of despair so mercifully accorded to us when the heart has been wrought to its highest capacity of suffering. Nor was I at that bitter moment unsolaced by a sense of relief at being freed from the intolerable burden of responsibility which he had sought to impose upon me by persuading me that his fate for good or evil depended upon me.

"I had now learned that my influence was unavailing. My mother on being informed of what had transpired had a brief interview with Mr. Poe, which resulted in his determination to return immediately to New York. In her presence and in that of his friend, Mr. Pebodie, I bade him farewell with feelings of profound commiseration for his fate, of intense sorrow thus to part from one whose sweet and gracious nature had endeared him to me beyond expression and whose rare and peculiar intellect had given a new charm to my life.

"While he was endeavouring to win from me an assurance that our parting would not be a final one, my mother saved me from a response by insisting upon an immediate termination of the interview. Mr. Poe then started up and left the house with an expression of bitter resentment at what he termed the intolerable insults of my family. I never saw him again.

"The most exaggerated, and to him, deeply humiliating rumours were now rapidly circulated in relation to the circumstances attending our separation and Mr. Poe was purposely led to believe that they were sanctioned by me. In retaliation for these supposed injuries, he permitted himself to say some very ungenerous and unkind things of me, all of which 'my friends' were careful to report to me. These I freely pardoned in view of the terrible humiliation to which he was subjected in consequence of all that had occurred in Providence. This he portrayed to me in a letter which I received from him a few weeks after our separation. He spoke of the agonies he had endured, agonies known only to God and to his own heart and which had passed his soul thro' fire."

Later in the same month of October Mrs. Whitman wrote in reference to a published poem of her own.

"I received a letter from Mr. Poe requesting me to allow him to say that our marriage was only deferred on account of my ill health, assuring me that he blamed me for nothing that had occurred and entreating me to say that I at least had not authorized the terrible stories that were in circulation concerning him. I dared not reply to this letter, but I took pleasure in thinking that the last verse of my song would be understood as an avowal of my innocence.

"Since his death many persons have supposed that the ballad of Annabel Lee contained allusions to certain passages in this song. I have been the more willing to believe it as a sentiment in the fifth verse of the ballad is almost identical with an expression in one of his letters to me."

In a brief memoir prefixed to the volume of Poe's poems published in 1859, the version taken from Mr. Griswold's account is as follows: "The day was appointed for their marriage; but he had in the meantime made other plans; and to disentangle himself from this engagement, he visited the house of his affianced bride, where he conducted himself with such indecent violence, that the aid of the police had to be called in to expel him. This, of course, put an end to the engagement."

This is the story which Mrs. Whitman declares to be without a shadow of foundation.

A highly romantic account of the last interview between Poe and Mrs. Whitman is given in an article which appeared in the autumn of 1923. According to this story, the afternoon before her wedding Mrs. Whitman "had come in to find the parlor outraged by the stale, sweet reek of wine and by a wildly pacing figure whose voice in greeting her was dulled and thick.

"Mrs. Whitman knew that she had failed. But there was still before her the ceremony of renunciation, the full Victorian close. She must see Poe, she must return his letters and all that he had given her. A rude break was unseemly, and it was required of her that she should say farewell. Apparently, however, she felt that she could not bear the torture; for before she came into the room where Poe was waiting with entreaties, she had drenched her handkerchief with ether, a wise precaution against the moment when the pain should grow too great. What happened, thus, she never knew."

The persistence in all published references to Poe and Mrs. Whitman of tales of their separation so different from hers makes it seem but fair that her own story should be known.

High Lights in New England Scenery

(*Continued from page 3*)

Saturday Club, founded by May Alcott, one of the *Little Women*, and comprising among its members Emerson, Alcott, Louisa Alcott, Sanborn, and a host of lesser lights; various literary, domestic, and social clubs; and a "Mothers' Club," presided over, on the occasion of the writer's first appearance at its meetings, by *Miss* Peabody and *Mr.* Alcott, enthroned side by side on a sofa!

Concord has greatly changed as time has passed. The Giants have departed. We are none of us celebrated now, and Concord is not unlike any other attractive residential town, although I confess that we who live here think there is no other quite so attractive or altogether delightful! As for automobiles, we have, I venture to state, more to the square rod at all times than any other town in the United States, bearing those who wish to see where the Giants have lived, and to tread the spot where heroes and patriots fought for independence; but we, the townspeople, are proud not only of the Concord of the past, but of the present.

What would first interest a visitor to Concord? He would very likely ride up the historic Lexington Road, over which Paul Revere galloped during his famous "midnight ride," "waking the villagers out of their sleep" and bringing the alarm "to every Middlesex village and farm." He would also surely wish to stop and read the tablet in reference to this ride, as well as those seen in various parts of the town commemorating the many celebrated persons and places.

Pretty Grape Vine Cottage deserves a pause, for in the original cottage lived Ephraim Bull, who evolved the famous Concord grape; and here, protected from vandalism and the too-often ravaging tourist, is the original ancient vine, enjoying a ripe and honored old age.

Hawthorne's "Wayside" comes next —literally a "House by the Side of the Road." The name—Wayside—is his own fancy; and to a friend he wrote, "I sat down by the wayside of life like a man under enchantment." Here he lived at various times, before and after going to Europe, and wrote many of his famous books. After returning from Italy he topped the house with a small square addition, which he dubbed his "Tower."

This he used as his study, and wrote standing before an old high desk which, with other furnishings and surroundings, is religiously cared for and preserved. Rising abruptly behind the house is a beautiful wooded ridge along the summit of which runs a winding path, always known as "Hawthorne's Walk." This was his outdoor study, and here, on his "mount of vision," as his wife called it, he would pace to and fro under the sheltering trees, meditating upon the romances maturing in his fertile brain. The "Ridge" is of added interest as the spot from which the farmer-soldiers fired upon the retreating British on the occasion of the memorable fight. During the latter part of his life Hawthorne occupied the "Old Manse," where he wrote his *Mosses From an Old Manse*. Later on "Wayside" was the home of and owned by Mrs. Daniel Lothrop, the "Margaret Sydney" whose *Little Peppers* have delighted countless numbers of young people.

A winding path under the larches at the base of the hill leads one to what perhaps is the objective of more pilgrimages to Concord than any other spot, however famous—the "Orchard House," home of the Alcotts, the beloved *Little Women*. Before purchasing Orchard House, Mr. Alcott had owned Wayside—then called "Hillside"—where his interesting family of merry girls filled the old house with mirth and busy life. Orchard House has since been purchased by a group of the townspeople, called the "Louisa May Alcott Memorial Association" and in it have been collected all possible of the original Alcott belongings—furniture, household equipment, ancient garments, and the interesting and amusing bric-a-brac of the time. To this famous house come motor buses and automobile loads of people by the thousand, every season, who are shown the house and its contents by the courteous ladies who have charge of it.

Among the visitors are the sentimentalists who weep as they ask about the ancient Alcottiana, and also the relic-hunting fiend from whose covetous fingers the precious mementoes have to be chained in their places.

Next to the Orchard House is what remains of the old School of Philosophy, that interesting outgrowth, started in 1879, of yearnings for the Infinite and the revelations of Speculative Philosophy—the whole an enterprise possible, I venture to assert, only in Concord!

A little nearer the town stands a plain, square, white house, shaded on the north by a row of solemn pines, which is the mecca of every scholar and lover of the best in literature and poetry who visits Concord. This is (*Concluded on page 30*)

PLOWMAKERS for THE WORLD

A Bit of History

He started seventy years ago. A workman, designer, inventor and even salesman; that was James Oliver, plow builder, who gave to the world the chilled plow and founded the Oliver Chilled Plow Works, now the largest plant in the world devoted exclusively to the manufacture of tillage implements—implements which are in universal use wherever agriculture is practiced. *Plowmakers for the World.*

Background

Seventy years of progressive manufacturing as a background. Three generations of farmers turning the soil and preparing their seed beds with Oliver-built tools. The name "Oliver" made known the world over for sturdy, dependable, honestly-built implements designed to make their particular job better and easier done.

Experience

The Oliver implements of today are what you might call the fruit of three-quarters of a century experience. Each complete new tool, each improved part is the result of that experience, plus careful study and exhaustive field experiments. The latter, paying for itself in the farmer friends it makes and keeps.

Oliver Implements Built for Tractor Use.

*Gang Plows * * Sulky Plows * * Disc Plows * * Marsh and Brush Plows * * Road Plows * * Disc Harrows * * Spring Tooth Harrows * * Spike Tooth Harrows * * Listed Corn Cultivators * * Field Cultivators * * Corn and Cotton Listers * * Orchard Implements * * Cane Implements * * Subsoilers.*

"Why the Boss took a special interest in me"

"I WORKED as hard and long as anybody, but somehow I didn't seem to be getting anywhere. Why, I don't think the Boss even knew me by name until he received a letter from the I. C. S. telling him that I was studying at home in spare time. He called me into his office immediately for a long talk and from that day he took a special interest in me and helped me to get ahead.

"'I always feel safer in promoting an I. C. S. man,' he told me the other day, 'because I once took an I. C. S. course myself. I know I can depend on the man who is ambitious enough to study his work at home in spare time.'"

Why don't *you* take up a home-study course with the International Correspondence Schools and show your employer that you're preparing yourself to handle bigger work? He'll be glad to know about it and you'll be surprised how quickly it will lift you out of the rut and start you on the up-road to Success.

You can't afford to drift along much longer. Write today for full details and let us tell you how you can get a better position by studying an hour a day with the I. C. S. in the quiet of your own home.

Cutting Diamonds

Amsterdam is the recognized diamond market of the world, although the trade is losing much business through migration to Belgium, where rival diamond cutting establishments are prospering, due to the lower wage rate paid workers. The cutting of the precious stones is a fascinating work. The old familiar adage "diamond cut diamond" is literally true, for in cutting, sawing and polishing, diamonds and diamond dust have to be used to make any impression on the stones. South Africa produces the most valuable and attractive white and blue stones.

(*Concluded from page 29*)

the former home of Emerson. Back of the house is a lovely old-fashioned garden, full of roses, lilies, and all sorts of old-time perennials; and under the pines and straying into the grass is a literal carpet of lilies of the valley. The famous "study," at the right as one enters the house, contains a wealth of precious souvenirs, memorials of Emerson and his work and of the many famous writers and literati who were his friends. This room is preserved as nearly as is possible as he left it. His writings, both essays and poems, are too well known, loved, and admired, to need even an allusion here. In this home have visited from time to time scholars, poets, famous people from every part of the world; in contrast, all the school children of the town were in turn entertained during the life of Emerson's daughter, the beloved "Miss Ellen" of the whole village. Emerson himself, besides his wonderful mentality and poetic genius, possessed a fund of dry and kindly humor, to illustrate which many amusing stories are preserved. A member of the family was once asked to give, if possible, some little quotable anecdote illustrating his inferred interest in animals. The only instance she could bring to mind was his being once asked by a friend to furnish a short inscription to be put on the collar of a dog named Spot. "Out, damned Spot!" was suggested by the revered philosopher!

In the center of the town, surrounded by greensward and spreading trees, is the "First Church," a reproduction of the one containing the original timbers of the church in which the First Provincial Congress was held in 1774, of which John Hancock was president. A tablet relates its history to the visitor. This church is neighbored by the old Wright Tavern of Revolutionary fame, where, the morning before the famous battle, Major Pitcairn of the British Army "stirred his brandy with bloody finger," remarking that he "would stir the damned rebels' blood before night." Opposite is the village Green, containing the Civil War monument, that in memory of the heroes of the Spanish War, and, recently placed, a tremendous and beautiful boulder in the side of which is set a bronze tablet commemorating the beloved dead who honored Concord in the World War.

Leading from the Green to the east is Monument street, over which every tourist and pilgrim who comes to Concord passes, on his way to the Old Manse and the Battle Ground just beyond. The Old Manse is undoubtedly the most picturesque—if not the most interesting—of the famous old Concord houses. Its appearance—weatherbeaten and guiltless of paint—is attractive and romantic in the extreme. It was built for the Rev. William Emerson, an ancestor of the poet, in 1765, and it is probable that more ministers have lived or been entertained in it than in any other structure ever erected! An odor of sanctity should surely hallow its present and future residents. In one quaint little room, always known as the "Saints' Chamber," the walls are autographed by the various holy men who have occupied it. The Old Manse has its ghost, too; but as it always appears in one special room where it is said that at least a thousand sermons have been written, I do not wonder at its being haunted. Emerson made his home in the Old Manse at different times, and in the same room in which Hawthorne wrote the *Mosses*, Emerson wrote *Nature* and some of his best-loved poems.

Just beyond the Old Manse is the Battle Ground, where was fought the first battle of the Revolution. The "Old North Bridge"—a reproduction of the original—connects the opposite banks of the river where formed the two opposing forces. A plain granite shaft marks the position of the British. This bears a beautiful inscription:

Here
on the 19th of April, 1775
Was made the first forcible resistance to
British Aggression.

On the opposite side, where were marshaled the militia and minutemen of Concord and those of the surrounding towns, and where was given Major Buttrick's famous order "Fire, fellow-soldiers, for God's sake, fire!" stands the beautiful and impressive "Minute Man" of Daniel Chester French—a work of art which some claim he has never later surpassed. On the massive granite base is cut this verse from Emerson's well-known hymn.

By the rude bridge that arched the flood,
Their flag to April's breeze unfurled,
Here once the embattled farmers stood,
And fired the shot heard round the world.

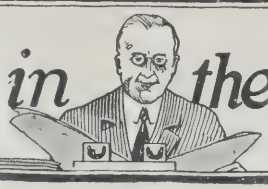
It has been truly said that "few towns can furnish a poet, a sculptor, and an occasion."

No one, however, should visit Concord without paying tribute to the memory of Thoreau by visiting Walden Pond, just outside the town—a romantic sheet of water, surrounded by acres of beautiful woodland.

Emerson also immortalized Walden by his poem *My Garden;* and here, on the shores of the beautiful sheet of water, probably one of the most noted in the country, Thoreau wrote and dreamed, sheltered, when shelter was needed, by the small bare hut built mainly by his own hands, at an expense of only about $30, and the cost of his luxurious living in this establishment averaged, for eight months, a little more than a dollar a month!

A cairn of stones marks the site of Thoreau's hut, upon which Time long ago laid his disintegrating finger, and the tourist who visits Walden in memory of Thoreau reverently adds one stone to the simple memorial.

"I Read *in* the Papers"—



I read in the papers that Finance Minister Caillaux told the French Senate that he was going "to negotiate with people having the habit of solidly balanced budgets," meaning the American people. This, of course, implies that the French budgets have not been solidly balanced. They are a tax-shy people, and have been ever since the Revolution emancipated them from the extortions of the salt tax and other impositions. French budgets have, therefore, been largely based on loans, a very dangerous foundation indeed. Just the same, the amount they are now paying per capita is just about half what the plodding Britisher is paying.

I read in the papers of another original American idea. It is car ferries. The car ferry steamers that transport whole freight trains across Lake Michigan were the first in the world. They were started in 1888 and have been widely adopted. The car ferries on Lake Baikal in Siberia, across the Baltic between Germany and Sweden, across the English Channel, and between Havana and Key West were all designed after our Lake Michigan ferries, which originated a generation ago. The Lake Michigan ferries are operated throughout the winter though the ice often reaches three feet in thickness. It costs no more to operate one of these big Lake Michigan car ferries than a locomotive, and the movement of the cars is more rapid than when they are upon rails. The distance between the east and the northwest is greatly shortened by avoiding the long rail route around the south end of Lake Michigan, and much additional time is saved by avoiding the congested Chicago terminals, the neck of the nation's rail bottle. Yet there are those who say that foreigners are more original and daring in engineering projects!

I read in the papers that London's slumland refuses to be deslummed. When government authorities, in the interests of health and sanitation, invaded the East End armed with demolition orders and blue prints, Limehouse rose in its wrath and serious disorder prevented the carrying out of the clean-up campaign.

The Ministry of Health is making every effort to wipe out every dilapidated, disease-infested structure in the various boroughs of old London. Limehouse and Stepney are notorious for their uncleanliness. It is planned to raze the old buildings and erect modern accommodations for the teeming population of this district. The area under consideration is more than nine acres, about 2½ per cent of which consists of streets. One-fifth of the district is given over to fish-curing, the remainder being devoted to little hole-in-the-wall shops and dingy, dirty hovels whose residents live among their pigeons and chickens.

The resistance shown by the inhabitants illustrates the British principle that "Every Man's Home Is His Castle."

It is impossible in these days to treat a district full of hard-working people as if it were a howling menagerie. Home ties are sacred—in the slums or on Notting Hill.

I read in the papers (everybody did!) that Babe Ruth bungled into trouble again. It took rank as news with the Tennessee trial and Bryan's death. There was something real in all three occurrences. There seems to be little real to the public in the condition of Europe or the international debt situation, or the League of Nations. If the instinct of the people is right, we may conclude that there is a lack of reality in these things. And if there is reality, it has been veiled by the tactics of those who make these great matters their private business and attach them to motives of private profit. Suppose that the people of the United States could be given to understand the world situation as clearly as they understand Babe Ruth's case! But that would not suit the purposes of the private manipulators of the world situation. It would quickly dispose of that situation and create a new one, but not in the way the private manipulators desire.

I read in the papers of a meeting with a king in Central Asia who wanted to know if he could ride from his domain to Washington on horseback, and who had utterly no comprehension of what an ocean is. The antithesis of this Asiatic potentate is the Samoan Islander, and other South Sea natives, who think of the world as an ocean with many islands in it. They are also in perfect accord with Wilbur Glenn Voliva's Zion City ordinance which proclaims the world to be flat.

That's *One* Reason Why I Want 100 Men

who can earn $600 a month

The demand for Fyr-Fyters is growing fast. Five hundred million dollars annual fire loss, 17,000 lives and the mortal dread of fire that's in everybody are reasons why we must get men in our open territory to take orders and supervise installations of Fyr-Fyters.

Selling Fyr-Fyters is comparatively easy, so powerful and convincing is the story of fire losses. Previous selling experience although desirable is unnecessary. Without charge we train our men to become competent salesmen in a short time, and they also become real fire-prevention experts. Earnings start immediately, no investment in stock or territorial rights asked.

Big Earnings Possible

Payne averaged $20.77 a day for 217 days, Graham and Mendenhall each averaged $100 a week working only part time; Depries made $500 one week; Hill sold 1400 Fyr-Fyters in one sale. In our records are many other instances of earnings of $50 to $60 a day and incomes of $3600 to $7200 a year by Fyr-Fyter men.

An Amazing Story for You to Tell

Read your daily paper, listen to the fire alarms, ask your local fire chief, notice the inflammable material everywhere and judge for yourself the need of Fyr-Fyters and why we are able to make this offer. Let us tell you the sensational story which sells Fyr-Fyters so rapidly and puts men in the high-earning class so quickly.

Fyr-Fyters bear the inspection label of the (Fire) Underwriters Laboratories; are used by Standard Oil, Ford Motor Co., International Harvester and many other of the largest concerns in the world.

Factories, stores, garages, auto owners, warehouses, schools, hospitals, farmers, private homes and other places use thousands of Fyr-Fyters. Thousands more await their installation. The market is vast, unlimited, and your earnings as a Fyr-Fyter Representative are only limited by your ambition and desire to work.

This Opportunity Is For You

Among Fyr-Fyter men are former clerks, mechanics and others who saw in Fyr-Fyter their real opportunity. Now we are ready to appoint 100 more. It is *your* opportunity, your chance for $5000 or more, easily and quickly, from your first year's effort—$100 a week to start. Fill out the coupon below and mail immediately for full details of our offer.

This is the Fyr-Fyter, greatest of fire preventive appliances. Made by the Fyr-Fyter Co.

867 Fyr-Fyter Bldg., Dayton, Ohio.

THIS COUPON GETS DETAILS

The Fyr-Fyter Co., 867 Fyr-Fyter Bldg., Dayton, Ohio.

I would like to know more about a position on the Fyr-Fyter Sales Force. Kindly send details.

Paving Not a Modern Improvement

(*Concluded from page 15*)

arch erected in honor of the Father of his Country, to as far north as 110th street, a distance of more than five miles, stretches a broad highway of glistening asphalt, over which an endless stream of vehicles wends its way.

While many of the streets of London can boast of an enormous traffic, that portion of the Thames Embankment which lies between Blackfriars Bridge and the Westminster Bridge, and known as the Victoria Embankment, is one of the most heavily traveled thoroughfares in the British capital. Its construction was determined upon by the House of Commons in 1862. What is now one of London's most imposing and important avenues was, at that time, occupied by the mud banks of the River Thames and fringed by low, squalid dwellings.

Up to 1905 the surface of the Embankment was of water-bound macadam. At that time the introduction of street cars, or trams, as they are called in England, upon the Embankment, resulted in an increased concentration of traffic, and the rapid increase of motor-propelled vehicles rendered the roadway extremely difficult and costly to maintain. In 1906, a number of different kinds of pavements were laid there as an experiment. Today, nearly the entire Embankment is paved with asphalt, which has seemed to be the most popular surface for that avenue.

Traffic statistics on the Victoria Embankment show an average of more than 10,000 vehicles (excluding street cars) daily, between the hours of 8 a.m. and 8 p.m.

A pavement, which for durability may be said to hold a record, is that on the Avenue de Paris, which connects Paris with Versailles. During the war, over this roadway there passed day and night an unending stream of huge motor lorries, armored trucks and cars, baggage wagons, and artillery of all kinds. It might have been expected that the weight of the traffic and its continuance would have disintegrated the pavement, but for the many months to which it was subjected to additional burden, it stood up under the strain surprisingly, and but a small amount of repair was necessary.

And South America must not be forgotten when it comes to famous pavements. In the city of Rio de Janeiro, Brazil, the Avenida Central is the show street of the capital. It stretches for miles with a broad expanse of roadway on either side, and a row of lamps, shrubs and beds of flowers in the center. It is the Fifth Avenue of the Southern Republic, and has a traffic commensurate with the size of the city.

(C) Underwood & Underwood

Street of Stabia, Pompeii.

In point of view of length of service, one of the most remarkable pavements in the world, perhaps, is that on Vermont avenue, in the city of Washington, D.C., which was laid in the year 1879, and for more than forty years has given perfect service. The traffic on this street is, of course, much less than that on the other avenues cited, but for the length of time during which it has given service the record is a remarkable one.

With the advent of the motor car, and, especially, the motor truck, in such enormous numbers as have been produced during the past few years the question of durable pavements extends far beyond the limits of the cities. The main arteries of commerce, the roads leading from one city to another, are called upon to bear a burden of traffic which, in many cases, is equal to that of a city street.

How to meet the conditions found in the country districts which these roads traverse, is the problem of the paving engineer today. Perhaps, the solution may be found in paved streets, running across the continent and linking together the cities of the nation by a "glistening, high-lying road," such as King Nebuchadnezzar was wont to enjoy as he rode in his chariot through the city of Babylon. The ancients built their roads for all time.

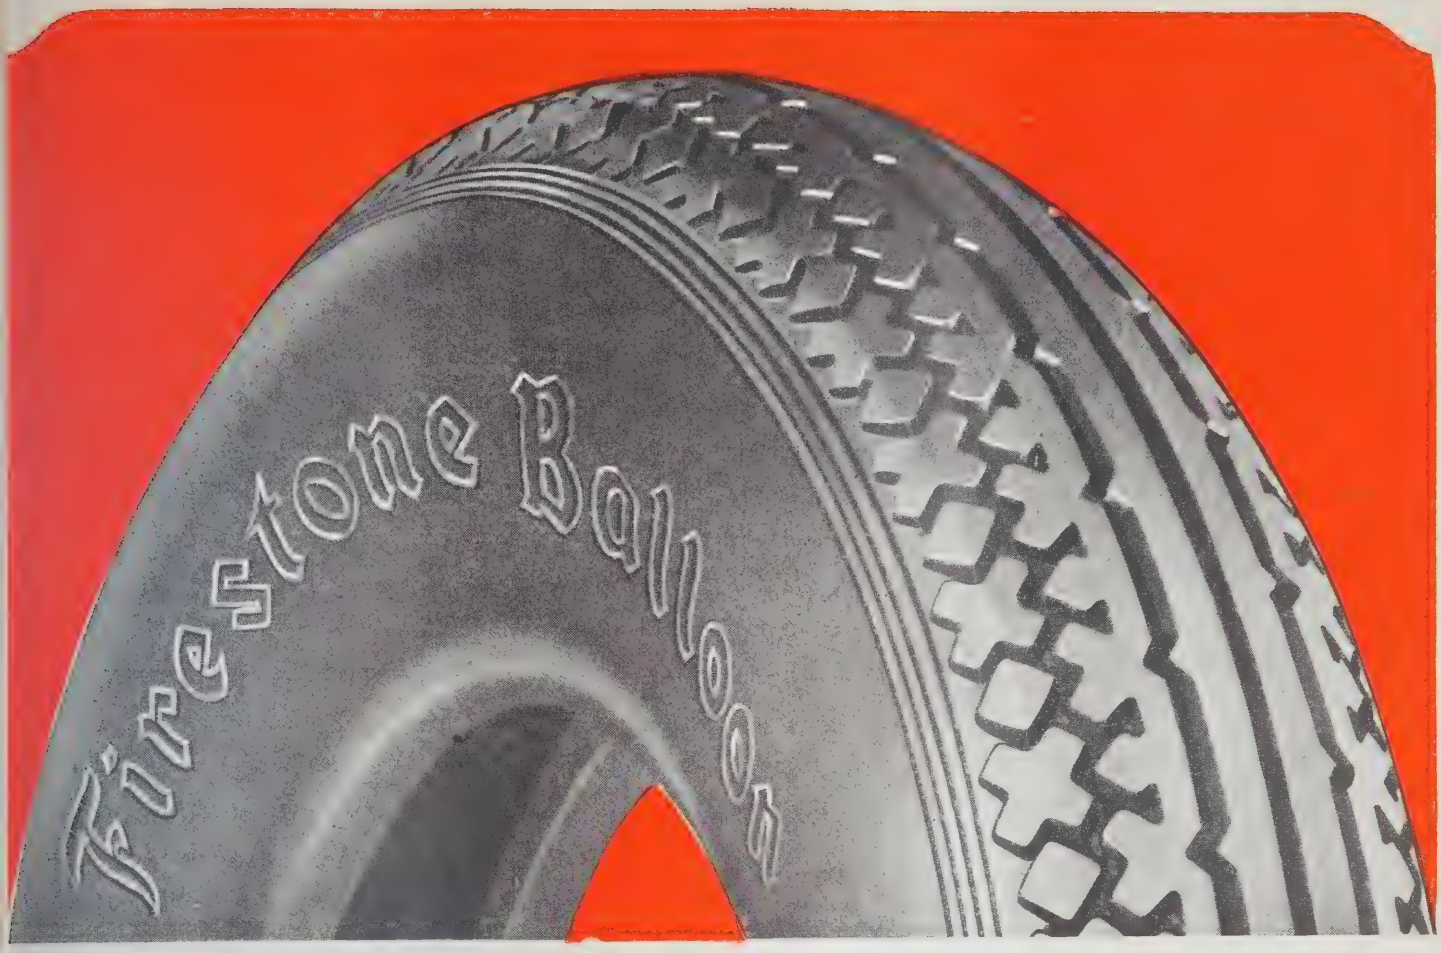
Benedict Arnold, After the Revolution

VERY little has been written of Arnold outside of his traitorous conduct in connection with the attempted surrender of West Point to the British. Through a correspondence with Major André, Arnold, then commanding West Point, offered to surrender to the British; and to consummate the plan Arnold and André met at midnight on the shore of the Hudson, September 21, 1780. The capture of André frustrated the scheme, and Arnold fled to the British sloop of war *Vulture*.

The British made him brigadier general and he fought the American Army at Richmond, Portsmouth and New London, Connecticut. In December, 1781, he sailed for England with his family, who were pensioned by the British Government. He received about $31,755 for his alleged losses in deserting the Americans. Failing to get a position in the army he was forced to take up the trade of merchant. He carried on trade with the West Indies, but returned to London in 1791.

War between France and England exposed his shipping to great risks and Arnold on one occasion was captured by a French ship, but managed to escape. The British Government still refused to give him active service in the army and he turned his attention to fitting out privateers against France to recover his lost fortune, but being unsuccessful, weighed down by private debts, and despised by America and the British Empire, he sank into a state of acute melancholy, and died June 14, 1801, regretting, it is said, his treason.

His first wife gave birth to three sons. His eldest sons received commissions in the British Army; and his second son by his second marriage, inheriting his father's daring and military ability, rose to be a lieutenant general, was made aid-de-camp to King William IV and was created a knight. Arnold's other children held honorable positions, and one of his grandsons, Captain William Traill Arnold, a brave fighting man, was killed in the Crimean War.



Specialized Service for Light Car Owners

The Firestone policy of specialized service finds its highest expression in the dedication of Firestone Plant 2, exclusively to the building of tires and tubes for light car owners.

Firestone early recognized the special needs of these motorists and provided for them in the largest factory in the world designed, built and devoted to the manufacture of small-size tires and tubes.

Special machinery and equipment, arranged and systematized for perfectly balanced construction and huge production, have made Firestone light car tires and tubes preferred among millions of owners.

The highest expression of Firestone quality and value is the Full-Size, Gum-Dipped Balloon. This pioneer among balloon tires—and the leader of them all—was made possible by Gum-Dipping, Firestone's *extra* process for strengthening the walls to endure the extra flexing strain.

Consult your Firestone Dealer. He, too, has been specially selected because he believes in quality, service and square dealing. He will show you that never before have owners been able to buy so much safety, comfort and economy as he can give you in Full-Size, Gum-Dipped Balloons. See him today.

CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

By observing United States weather reports and operating their furnaces accordingly, the Field Museum in Chicago estimates that it saves $10,000 annually in fuel costs.

The owners of 300,000 dogs in the city of Berlin threatened to parade them through the streets of Berlin as a protest against the mayor's proposed increase in the yearly dog tax from $7.50 to $10.00.

For violating the Kentucky "gossip" law, a Covington, Kentucky, editor was fined $15. The case had to do with an account of the action of the city commissioners in borrowing $50,000 to pay city expenses and the mayor brought the charge.

President Roosevelt said, "Good crops are of little value to the farmer unless they open the door to a good life on the farm."

In the Aleutian Islands in Alaska the temperature never falls as low as zero and tropical heat is experienced in summer.

A rural boy baby may expect to live seven years and nine months longer than his city cousin.

Donald Monro, a British army surgeon of the eighteenth century, called to the attention of his men the wonderful hygienic code of Moses.

Five out of every eight applicants to the British Army recruiting office in 1924 were rejected on account of mental or physical defects.

The largest tree in Hutchinson, Kansas, grew from a cottonwood cane stuck into the ground as a joke by Judge W. R. Brown in 1874.

Important! The result of a horse race is published in England within two minutes, and throughout the world in ten minutes. Betting is almost equal to drink among England's curses.

When you ride by airplane from London to Paris, Great Britain helps pay your fare, for the Imperial Airways Company is subsidized by the British Government.

Bright's disease was named after Richard Bright, an English physician who died in 1858.

In the last two years, British commercial airships flew 1,879,000 miles with only two fatal accidents.

Telephones in some sections of Bulgaria are sealed, and civilians are not allowed to use them.

"Of all the signs we use in writing the one that conforms best to what it signifies is the interrogation point. Down below is a round atom. It is the bowl of the world. Up above rises the augur's wand asking questions of the unknown."—*Fabre.*

An orchestra of young men playing the guitar and mandolin accompanied by girl singers sitting before them is a part of nearly every little Jugoslavian village cafe.

Bertrand Russell says the greatest potential force for world peace is international finance. (If so, does it not also become the greatest potential force for world war?)

After a seven-week religious revival in Herrin, Illinois, scene of the tragic battle between miners and strike breakers some years ago, it is claimed that all is now peace and harmony.

"Money has no purchasing power," declares a prominent economist, and explains his theory thus: "There is no law compelling the acceptance of money in exchange for labor, or commodities. The law simply makes it a legal tender in payment of debt. Hence its value must be measured by its debt-paying power." The idea is technically correct, of course, but the difference will never be noticed if one offers the price asked in cash.

An entry in an old circuit rider's book shows that one family paid him 135 pounds of lard while another purchased a hat for the rider's wife.

The sod roofs of small houses in the mountainous sections of Norway are used as pastures for goats as well as shelter.

Syndication of much of the general matter in the Methodist Christian Advocates of the northern states, the merger of two leading Presbyterian weeklies, with the evident financial distress of many other denominational organs, has caused an inquiry in the Southern Methodist conference which has developed the fact that many church members neglect to support the church press. The aggregated mailing lists were shown to be about 150,000.

The first historical mention of a balloon is a record of an aerostat carrying several persons that descended into the city of Lyons during the latter part of the reign of Charlemagne (742-814), the flyers being charged with being sorcerers and condemned to death.

American postmasters had the franking privilege in the early days.

On April 22, 1684, a scientist at Oxford read a paper describing a certain province of Nova Scotia where "there is so great a quantity of salt peter in ye fields, that ye oxen are so salt that they cannot eat their flesh for three or four months of the year."

Wireless will soon be used in the Alps to summon rescue parties to the aid of tourists, who become lost in the wilds.

If the thirty pieces of silver which Judas got for betraying Christ had been placed at 4 per cent interest, assuming their value to be half a dollar each, the Judas Foundation today would claim a mass of gold equal to 345,000 globes the size of this earth.

Change of Address

1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue:

Mr. Ford's Page this week discusses certain aspects of universal balance.

This week's number offers a wide variety of interest. Running through the articles I see that they appeal to the Naturalist, the Taxpayer, the Fiction Reader, the Philanthropist, the Politician, the Sportsman, the Sociologist, the Student of American Character and Literature, the Farmer, the Artist, the Journalist and the Traveler. Most of us are some or all of these to some extent.

"Is Nature Cruel?" Since Tennyson said "red in tooth and claw," and John Fiske portrayed the war of the grasses, some have thought it is. Others not. The terrified rabbit, running for its life, is peacefully grazing a moment after. "Is Nature Merciful?" Maybe. (p. 2)

In your capacity as a Taxpayer do you want to know how much or how little you owe? A concern whose business is to get cities into debt publishes a book showing how little we owe. This present article shows how much we owe. It is probably wise to take both views. (p. 3)

As a Fiction Reader you must have read *The Virginian*, by Owen Wister. No? Then you will. And if you are one of those who knew *The Virginian* in his prime, you will want to know the author, too. Strange how much we know about Owen Wister's books and how little about himself. (p. 5)

Everybody wants to be a Philanthropist. We know (or think we do) what we would do if we had a million dollars. Everybody would "do good" if he could be supported while doing it. Here is the story of a man who was a "kept" philanthropist for a time, but suddenly decided that he would go into the world of business and be a real self-supporting philanthropist. (p. 6)

As to the Politician, the beginning of the above paragraph will not fit. Everybody does *not* want to be a Politician. But every citizen should supply himself with sound political facts. All political facts are not interesting. The more interesting they are the less likely to be true. (p. 8)

The Sport knows "the thrill around the corner," for these are days when records are likely to be broken any time. Record-breakers cannot pre-advertise their stunts. They happen when they occur. This writer has seen records made, broken, made again. (p. 12)

The Sociologist or Alienist (that may mean you, in an unprofessional sense) wonders a great deal about what is happening to the nation. Are we all going daffy? Are we all turning criminal? It is no use guessing about it. Get the facts. Here are a few. (p. 15)

Sam Slick illustrates certain American characteristics. The prototype of our own *Uncle Sam*, of Dickens' *Sam Weller*, of Mark Twain's *Connecticut Yankee*, he is nevertheless the invention of a Nova Scotian. (p. 16)

You may be a Farmer or not. It makes no difference to the thought-stimulant contained in this article. Mr. Brownell has something to say that sounds like sense. (p. 20)

The Artist in us rejoices in beautiful conceptions beautifully carried out. Here is one of those instances. (p. 22)

The Journalist sometimes confuses the ability to build words with the ability to manage affairs. Horace Greeley was a great editor but a failure as community manager. (p. 26)

The Traveler to Chattanooga rises in the morning to find a a noble promontory that fascinates the eye. Lookout Mountain, every acre has its tragic history. (p. 32)

Loggerhead shrike killing a chipping sparrow. A young deer mouse and a grasshopper already grace the thorn tree shambles.

Do You Consider Nature Merciful?

Sometimes She Appears to Be Cruel

By R. S. WALKER

ILLUSTRATED BY S. F. AARON.

IT IS perfectly natural at times for you to think Nature is cold-blooded and unmerciful. In giving lectures on Nature, I have found that there are certain stories which related do not fail to cause a few persons in my audience to whisper among themselves, "How cruel Nature is!"

One of the stories which almost invariably evokes thoughts of cruelty in Nature is that of the loggerhead shrike, a bird which preys on small animals like mice and grasshoppers, but who will sometimes kill the young of other birds for food. The shrike not being fitted with claws sufficient to hold and tear up its food, like some birds of prey, impales its food on the thorns of trees like the honey locust, or on the barbs of a wire fence. But these thorns are merely to hold the food while the bird eats.

In the animal kingdom many species destroy the weak. Young spiders devour the weaker ones and when they gnaw their way out of the silken egg bag, those that come forth are so vigorous that they never need help.

Is Nature unmerciful for destroying the weak before they enter life's battle?

A certain professional man living in the South resigned a lucrative position to grow cotton on a sea island twelve miles from shore. It was a tempting opportunity, for the boll weevil was destroying the crop on the mainland. The crop came on, but a great disappointment came with it. The little weevils flew twelve miles across the waters and destroyed the crop! Was that an unmerciful act of Nature? Humanity was simply learning from experience the limits of flight of a small insect. Much of our scientific knowledge comes to us in as expensive a manner.

In the year 1921 I was hiking across Raccoon Mountain in Tennessee in company with four boy scouts who I knew were city bred. Halfway up the mountain the cries of a dying rabbit met our ears. I warned the scouts to proceed with caution when nearing the spot, and told them of the habits of the banded rattlers in this mountain. When we reached the spot, the rabbit was breathing its last. The rattler had struck the young rabbit and its death seemed unmerciful, yet the reptile was acting according to its instincts.

The young of some species of fishes will swim in their mother's mouth to escape danger. The aquatic plant known as bladderwort constructs a device that so much resembles the mouth of a fish, it captures many small fish in this snare by taking advantage of the habits of the little fish, on which it feeds!

So in many instances he who is seeking for evidences of unmerciful acts in Nature will find what seems to be such a case, but will also find an act of mercy on the other side of the ledger to balance the deed!

In some species of the violets in addition to the sweet-scented flowers, Nature seems to take extra precautions that they do not become extinct, for she gives them what are called cleistogamous flowers close to the base. These closed flowers are self-fertilized, have no odor or perfume and remain well protected from the invasion of insects. In the open flower on the same plant she gives the fertilizing insects both perfume and nectar! There is nothing but wisdom and the best of reason expressed in this plan of Nature.

Man in his own conceit has long regarded lightly the importance of every life—plant or animal—beneath him. He has too long looked on them as slaves or servants. Nature has bestowed her blessings on each. Behold the little salamander that lives out in damp woodlands, under logs: should it lose a limb, Nature is so merciful that she sends another to take the place of the one destroyed.

Nature maintains no charitable institutions. She strikes at the root of evils and therefore the necessity for the establishment of charitable institutions does not arise. Her laws are the very essence of eugenics. If man were as just and exacting, how many of our charitable institutions would decay for lack of some one to use them!

We have learned that to obtain mercy through Nature we must obey her laws. Alteration in Nature's laws would mean universal chaos.

Cotton boll weevil on a cotton boll.

Plunging Over the Precipice of Debt

Showing How States and Cities Vie With Each Other in Spending Public Money

By ALLAN L. BENSON

IT IS easy to go to a state legislature or a city council and vote "aye" whenever a proposition comes up to spend other people's money. It makes a legislator popular with contractors. It increases the number of political "friends" who will be useful to him at election time. It may also increase the legislator's self-esteem. There is no telling how much of a thrill may come with the juggling of millions when one has been accustomed to disposing of an annual personal income of a few hundreds. But it is hard on the public that pays the bills. It makes the high cost of living still higher. It means less left to the worker after he has paid his part of the "overhead" of life. Nobody escapes who eats food, wears clothing, sleeps under a roof or spends a cent for anything else anywhere in the country.

Not one American in ten thousand realizes how mad these state and municipal legislators have become in the matter of spending public money. If they had been content vastly to increase taxation, as they have, and stopped, it would have been bad enough, but not so bad. Instead, they have spent all the taxation and then plunged the states and cities deeply into debt.

Bonded Indebtedness Increases a Thousand Per Cent

Since 1913, the bonded indebtedness of the states has increased almost a thousand per cent. In 1913, this indebtedness amounted to $279,141,382. At the close of 1924 the bonded indebtedness of the states was almost ten times as much—$2,368,959,646.

If the members of state legislatures and municipal councils had been chosen exclusively from lunatic asylums they might have spent more. Yet they could not have spent much more because they could not have got much more to spend. The gentlemen whom we elected to office raised all they could by taxation.

Men who in other matters are supposed to have some sense appear to have no sense at all in this matter of debt. Consider the case of Governor "Al" Smith, of New York. He and his predecessor, Mr. Miller, had a debate in New York a few weeks ago about a proposal to plunge the state into debt $100,000,000 more. Smith is for it. The people are going to vote upon it this autumn. They are going to vote upon it because the state constitution makes it necessary to do so. The proposal is to make the money available to the legislature at the rate of $10,000,000 a year for ten years.

Probably the money is needed, though apparently a great real estate melon will be cut if the scheme goes through. They are beginning to cut it already, as a matter of fact, from funds already available. But Former Governor Miller expressed the opinion that a hundred million would be needed during the next ten years for more prisons and hospitals. He opposed only Smith's plan to vote the entire hundred million at once. He thought it should be voted ten million at a time. He hadn't a hundred million dollars' worth of faith in the legislature.

Take the Case of New York for Example

"Al" Smith, when he is not a politician, is a business man and, while not a great one, is supposed to have common sense. Former Governor Miller is a corporation lawyer and is also supposed to have judgment that is better than the ordinary.

Yet what are the facts about this situation in New York? Here are the facts: New York, in 1913, had a bonded indebtedness of $135,355,000. The state's indebtedness, at the close of 1924, was $308,491,000. This increase of more than 100 per cent in 11 years should be enough, it would seem, to make men of ordinary business sense cautious. But during the same period, legislative appropriations in the State of New York increased from $50,011,422 in 1913 to $150,840,295 in 1924. In other words, the state legislature appropriated $100,000,000 more in 1924 than it did in 1913.

Now if you know anything about the way the legislature of New York wastes money, or how the legislatures of most other states waste money, do you not think that if ten million a year is needed for parks, prisons and hospitals that it could easily be obtained by taking ten million a year from that big hundred million increase that has been put on since 1913? Why bond the state for a hundred million more when the state legislature is spending a hundred million a year more than it did 11 years ago? Anybody who knows the least thing about legislative expenditures knows that there is enormous waste and extravagance in this hundred million dollar swell. Why not cut out ten million of this waste each year and avoid a hundred million dollar bond issue?

This Concerns People in All the States

You who live in the other forty-seven states may not think that this has much to do with you. You are wrong. It has. Where do you think New York City gets the money to pay a third of the entire national income tax? It gets part of it from the State of New York and the rest from the other states. It is almost impossible to lay a tax anywhere without hitting people everywhere, our affairs are so interwoven. Taxes stick to merchandise like flies to glue. Whether you buy a prune or a piano, it is loaded with the taxes that were imposed at the point of production, the taxes that were imposed on the railroads over which it traveled and the taxes that were laid in your own home town. Whether he knows it or not, every resident of the United States is concerned with what is raised everywhere in the country by taxation and bond issues. And what the State of New York has done in spending, wasting and bonding has been done and is going on in most of the other states.

Michigan's bonded debt in 1913 was nothing; now it owes $74,432,659.

Illinois' bonded debt in 1913 was also nothing; at the close of 1924 it was $101,270,800.

Pennsylvania's bonded debt in 1913 was $659,160, but at the close of 1924 it was $48,046,320, an increase of more than 700 per cent.

Some Examples of "Plunging" in Various States

Indiana jumped from $1,149,615 in 1913 to $1,755,615 in 1924, which shows that debts can be kept within reason if legislators are so disposed.

Iowa had no debt in 1913, but in 1924 owed $22,000,000, also a good record as records nowadays go.

California owed $13,806,500 in 1913, but at the end of 1924 owed $94,439,500.

Kansas owed $370,000 in 1913; $28,500,000 in 1924.

Massachusetts owed less in 1924 than in 1913; $72,523,172 in 1924 and $83,163,913 in 1913.

Vermont owed nothing in 1913 and $1,934,531 in 1924.

Minnesota went from nothing in 1913 to $46,739,000 in 1924.

Nebraska owed nothing in 1913 and still owes nothing: the same is true of Wisconsin.

During the same period, Colorado more than tripled her debt by increasing it from $3,154,000 to $10,000,000.

Missouri went from $6,048,839 to $28,000,000.

Kentucky owed nothing in 1913 and $5,953,081 in 1924.

New Jersey was out of debt in 1913 but is $44,000,000 in the hole now.

Florida has the best record of all the states. In 1913, she had a bonded indebtedness of $601,567. Now she owes nothing.

So far as wasting and taxing are concerned, the cities have done worse

than the states, though the debt figures do not show it. The cities have increased their bonded debt, since 1913, only about 250 per cent, though some of them have gone far more deeply into the mire. Detroit, for instance, swelled a debt of $9,374,354 in 1913 to $172,121,296 in 1923, an increase of about 1,800 per cent.

Cities Are Limited in Their Indebtedness

Two reasons explain the relatively favorable showing that the cities are able to make with regard to increased bonded indebtedness. First, cities are limited by the legislatures as to how deeply they may go into debt. There is but one way to escape these limitations and that is to apply to the legislatures for permission to go beyond the old limits. State legislators are usually reluctant to grant such permission, though in some cases it has been done. But, inasmuch as all that municipal legislators want is money, they have found other means to get it. They have increased the assessed valuation of real estate, increased the percentage of its value for which it is assessed, and increased the tax rate. In most cities, these measures alone are sufficient to extend the bonding limit, inasmuch as city charters usually provide that the bonded debt shall not exceed a certain percentage of the assessed valuation of real estate. In other words, municipal legislators have beaten the law and got the money while still maintaining a favorable showing on paper, as compared to the states with regard to bonded indebtedness. The figures show that the cities increased their bonded indebtedness from $1,629,881,636 in 1913 to $4,058,404,697 in 1924, or about 250 per cent, but those who pay taxes in cities know that during this period such charges have increased from 300 to 400 per cent. It is often said, and it is true, that the taxes on a house in a city are now as much as the same house rented for before the war. This is not true of all cities, but it is true of most of them. Some of the smaller cities have kept their taxes down—sometimes have even reduced them until they are now lower than they were before the war.

Some Illustrations of What Is Going On

A few illustrations will show what is going on in the cities of the United States. Akron, Ohio, in 1913, had a population of 100,000. The assessed valuation of its real estate was $106,000,000. Its debt was $3,435,328.

In 1924, the estimated population of Akron was 208,435, an increase of only a little more than 100 per cent. But the assessed valuation of its real estate was $317,000,000 and its debt was $13,236,948. The increased valuation of its real estate was enough, in itself, to yield three times as much from taxation, but nevertheless its debt was increased by almost 400 per cent.

Albany, New York, in 1913, had a population of 110,000, real estate that was valued for purposes of taxation at $102,365,600, and a debt of $2,737,100.

Albany grew slowly from 1913 to 1924. Its population, at the latter date, was only 116,223. The valuation of its real estate for the purposes of taxation was increased, during this period, to $124,263,840 which would seem to have been ample to take care of the increased population. Nevertheless the city's debt in 1924 was $9,665,094, an increase of almost 400 per cent.

From 1913 to 1924, Boston boosted its debt from $77,132,403 to $129,625,400. During the same period the assessed valuation of its real estate was increased from $1,520,974,526 to $1,714,100,000. The population during this period increased only a little—from 733,562 to 764,549.

Buffalo has a similar story to tell. In 1913 Buffalo had a population of 460,505 and a debt of $26,771,294. In 1924 her population was 523,886 and her debt $58,321,270. The assessed valuation of her real estate was increased during the same period from $336,080,105 to $734,104,650.

New York City's debt increased from $1,122,690,042 to $1,391,008,336. This is not because the legislators of New York City are economical. It is because the state legislature has imposed a debt limit upon the city. Without legislative action, the only way New York City can increase its debt is by increasing the assessed valuation of its real estate. This is being done every year, but it is rather a slow process because, as the business section of Manhattan moves northward and valuations increase, the valuations in the old section toward the south often sharply decline. This has reference only to the area between Fourteenth and Thirtieth streets.

Franklin's Spirit of Thrift Not in Philadelphia

Chicago increased its debt from $25,784,600 to $61,045,590, and its assessed valuation from $940,450,200 to $1,297,355,021.

Cleveland was not so moderate. Its debt, in 1913, was $39,471,886. In 1924 it was $124,000,000. During the same period the assessed valuation of real estate was increased from $765,754,880 to $1,288,000,000.

The spirit of thrift that Benjamin Franklin tried everywhere to inculcate is producing no results whatever in Philadelphia. The city's debt in 1913 was $92,866,355; in 1924 it was $253,895,000. During the same period the assessed valuation of real estate was increased from $1,607,916,775 to $2,630,333,197. The boost in valuations was almost sufficient to have doubled the sum received from taxation, but the city authorities were not content with this. They spent $160,000,000 more and added it to the city's debt.

San Francisco increased its debt from $34,040,500 to $76,306,000; Los Angeles from $32,992,651 to $58,631,400; Portland, Oregon, from $13,653,172 to $27,085,500.

A few years ago New York City set out to have a Fourth of July celebration. The money to pay for it was taken from the proceeds of a bond issue. Children who had not been born when the celebration took place will have to help pay for the fireworks.

American cities are ruled by that kind of men. That they are in office is not so much the fault of themselves as it is of the people who send them there. They are utterly unfit to perform their duties. This is proved by what they do. There can be no question about it. The results speak.

Must Pay More Attention to Local Politics

American municipal government continues, as it has always been, if not a failure, at least a very shabby success. We have made the Federal system of national government work well, but municipal government is still the thing that we do not understand. European cities are governed better because they are governed by a different spirit and, to a large extent, governed by experts. Being a mayor is both a career and a profession in Germany and France where success in one city often brings an offer of the mayoralty in another. Mayors serve long terms. M. Herriot had been mayor of Lyons 25 years when, last year, he had to resign to become Prime Minister of France. When he gave up the premiership the people of Lyons again elected him mayor.

We shall have to pay a little more attention to our municipal politics before we have better municipal government in America. And we shall have to provide better municipal government for ourselves before we shall be able to get as much for our money as they get in Europe. In selecting municipal officials we shall have to do as they do there—turn to experts, to men who know something about the business. We are taxed heavily and loaded with debt because we are municipally governed by men who, for the most part, know nothing about municipal government and care less. They have neither vision nor understanding. They are there to serve the interests that put them there and do what they can for themselves on the side. They are not all grafters, by any means, but they are men who are trying to "help their friends"—and themselves—without giving much thought as to what the results of their actions may be to the people at large. Candidates for mayor are usually men of ability in their respective lines, though few of them know much of anything about governing a city. They are also men of respectability, and any good reputations they may have are (Concluded on page 18)

Men Trying to Help Their Friends

Owen Wister—The Man and His Work

An Author Whose Versatility Carried Him Into Many Strange Bypaths

By PIERCE CUMINGS

A Northerner who once remarked with pride that "six of my name fought in the Civil War," he yet produced in *Lady Baltimore* one of the most valuable and at the same time sympathetic interpretations of post-war southern aristocracy ever written.

IT WAS some twoscore years ago that this country lost one of its most promising young musicians, a man whose compositions had been praised by the great Liszt. Chance forced the youthful musician to leave Europe, where he had been studying under the noted masters; and failing health compelled him to visit the rugged Rocky Mountain region. And from these two circumstances there evolved what many critics consider the greatest novel of the West that America has ever produced—*The Virginian.*

Owen Wister's earliest leanings were toward music. Even in Harvard, where he was studying to become a lawyer, he devoted much time to this first love of his.

At Harvard Wister was a college mate and close friend of Theodore Roosevelt. Like the latter he was not too strong. He was descended from blue-blooded Colonial ancestors; and he was a keen lover of nature. The similarity continued after they left the university. Within a few years each had been ordered to seek health in the West, which in those days was considerably wilder and wider open than it is today.

Roosevelt struck for North Dakota, where for several years he lived the exciting life of a rancher, and where was germinated the thought which eventually resulted in the formation of the Rough Riders and the creation of a new national hero.

Wister went to Wyoming and Arizona. There he heard the tales of the old-time cowboys, even then rapidly passing from the range. He lived their life and gained their friendship; he heard their ballads, mournful songs reflecting something of the spirit of the men themselves. He fought with them, hunted with them, endured their hardships and enjoyed their pleasures.

The result was a series of western stories of such power and such photographic clearness that they have been hailed as veritable historical novels of the highest type.

All his life Wister has been more or less paradoxical. By birth and training a Philadelphian with all the term implies of scholarliness and sedateness, he nevertheless stands out as the nation's foremost recorder of the hectic life of the West.

Owen Wister at work.

Deep in the heart of Philadelphia, scarce a stone's throw from that town's lumbering city hall, Wister is even now at work weaving a tale of the West as he knew it years ago. His office is at the corner of a tall building, high above the rumble and the crash of traffic below. From his desk he can see Broad street tapering away to the south, as that wide thoroughfare stretches toward the Navy Yard. Almost directly beneath his window is the beautiful white dome of a bank designed by the architect Stanford White.

It was in this office that I saw him a short time ago. He had just passed his sixty-fifth birthday on July 14; but his bearing was that of a man twenty years younger. It was hard to believe that he had once been weak, so strong and rugged he was. His frame is sturdy and powerful, and when he speaks it is with an incisive air that gives his words almost the effect of being clipped. He wastes no words.

Like most real men of genius, Wister does not like to talk of himself. He would rather talk about his friends. Characteristically, not long ago he dropped his own work to take up the task a friend had left unfinished at death; and it is of this friend that he would tell you.

Ernest Harold Baynes, naturalist, lecturer, and intimate of both Wister and Roosevelt, died last January. For a long time before death he knew that the end was approaching, and that the greatest work of his life—a book on the animals of the World War and the part they played in the conflict—could never be completed by himself.

He worked feverishly but to no avail. He was brave about death, was Baynes. Facing it, he wrote a poem on death to be published after he had gone. And when he knew that the end was a matter of days, he made one request—that certain of his friends take up the work where he was forced to lay it down.

"I was honored," said Wister, "to be one of those friends."

And so Wister dropped work on the novel and took up the task where his friend left off. There were others, but the main burden fell on him. His part was the writing of the introductory chapters, and it is only now that he is ready to turn back to his own work.

"Baynes was one of the finest men I ever knew," Wister said thoughtfully. "With a letter of introduction from Roosevelt he went to Europe during the war to study the part taken by animals. He met General Pershing who was greatly impressed by his sincerity and aided him in every way he could.

"He visited all the fronts, even going as far as Palestine. He watched the carrier pigeons as they flew over the battle lines; he learned of the labors of the horses and the mules; he knew how the Alsatian sheep dogs detected the presence of the enemy; he saw how canaries were used to discover poison gas.

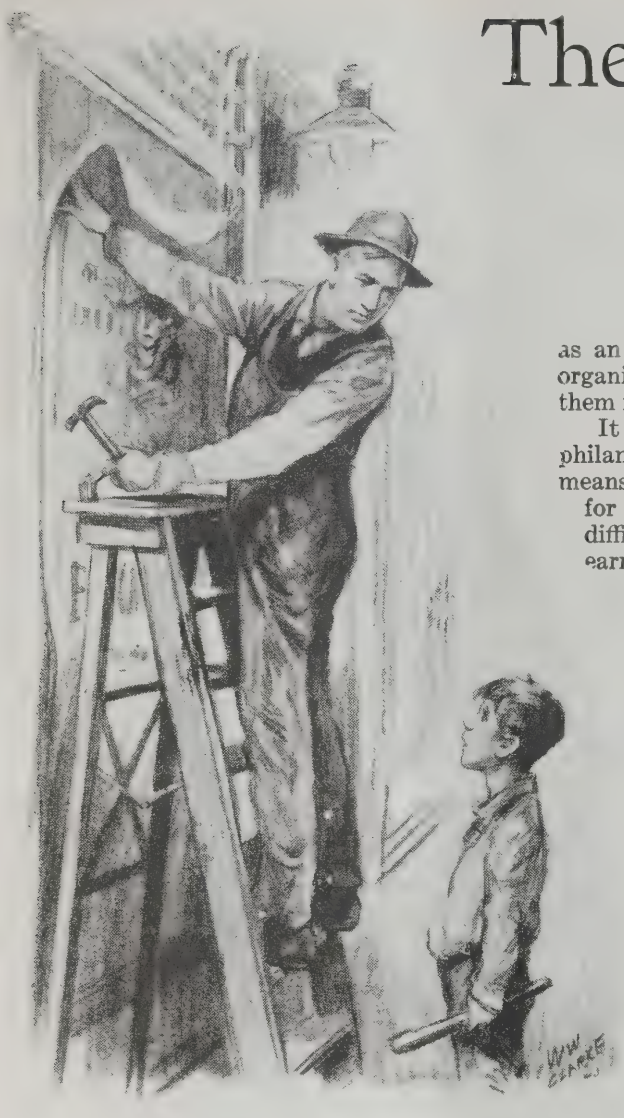
"After his return to this country he wrote a number of beautiful chapters—and then he was stricken with the disease from which he never recovered.

"Baynes was best known, perhaps, as the savior of the buffalo. He it was who interested President Roosevelt in 1907 in the campaign to stop the extermination of the bison. Together they raised money, bought a number of heads of buffalo, and persuaded the gov- (Concluded on page 29)

The Philanthropy of Business

By ARMSTRONG PERRY

ILLUSTRATED BY W. W. CLARKE



"I recognized the voice. It was my old friend, the Boy Problem."

AFTER fifteen years as a "social worker" in a world-wide organization, I stopped one day to inventory results. My job was developing boys, physically, mentally and spiritually.

If a boy came along hungry I would have to send him to the Associated Charities. Our organization was a *philanthropy*, not a *charity*. The difference is that a *charity* gives all its service for nothing and the beneficiary feels insulted because you ask him who he is. A *philanthropy* pays two-thirds of the cost of its service and the beneficiary, who pays the balance, feels that he is doing you a favor by joining your organization.

In the good old days I could chuck a kid into the old swimming hole and yell, "Swim, you little rascal, or you'll drown." Results came quickly. In my philanthropic organization it was necessary to convince the whole community that the boy needed to learn to swim, and then induce them to erect a building for him, raise a large annual budget, issue a prospectus to interest him and give him an expert instructor. Then he might dillydally for three months before he could swim across the tank.

I thought it all out. I decided that I wanted to meet people as myself, not as an official of a philanthropic organization. I wanted to help them in my own way.

It is difficult, even for a philanthropist with unlimited means, to decide on his method for doing good. It was more difficult for me, for I must earn a living.

I had started my professional career on a salary of $40 a month and secured a wife before an increase. I had received no money but a "soccial worker's" salary during fifteen years. My wife was responsible for my having three thousand dollars to invest. No "social worker" ever saved much money unless he married young.

My plan was to invest five hundred dollars in business. The remaining twenty-five hundred would be a reserve fund. Having tried to obey Pope's command, "Know thyself," I was sure that this proportion was correct.

What business? It was hard to decide. It must be honest. It must be one which could be started on five hundred dollars. It must yield a living for two. It must bring me into daily contact with the common people. In all the morning papers I studied "Business Opportunities."

There were many lines of business from which to choose, all money makers. There were saloons, but they were out of the question. A billiard parlor might answer my purpose, but there is always loafing around a billiard room and loafing is bad, even in a Y. M. C. A. Besides, I had seen very young boys play for "stickins." There were barber shops and delicatessen stores, but these did not seem to connect with my plan. The one thing which appeared to be ideal from every point of view was a motion picture theater.

All ideas, I remembered from the summer school lectures, enter the human mind through the five channels of sense—sight, hearing, smell, taste and touch. These ideas result in actions. Actions become habits. Habits make character. With a motion picture theater my approach would be through sight and hearing, the two main channels.

For $500 I could purchase a motion picture theater showing weekly profits of $150. The offer was there in the newspaper in black and white. I went to see the broker.

His name was Goldstein, which had a prosperous sound. He gave me one look and turned me over to his clerk. Then and there I realized that my fifteen years as a "social worker" had done their fatal work. He thought I was after a contribution.

The clerk gave me a list of "picture shows" which were for sale. Before visiting any of them I secured the help of two old friends. One was a lawyer, the other an expert on motion picture apparatus. Neither knew the picture show business, but they both knew me.

The lawyer studied each proposition until he found the weak point. The machinist wormed his way into the confidence of the men in the operating rooms and secured the information which owners and agents omitted.

We investigated fifty-four propositions. I studied locations, leases and license laws, film service, fire prevention and projection apparatus. At the end of three months I leased a deceased beer garden in the slums, took out the round tables, put in a sloping floor with theater chairs. At my wife's suggestion—and she was very brave to make it—we moved our worldly possessions into the rooms over the theater and made our home there. We were next door to a saloon and its rear exit was our front hall.

For years the beer garden had offered free motion pictures as an extra attraction. The machine, screen, fireproof booth and all accessories were still there. There appeared to be no reason why the place should not be reopened as a motion picture theater without delay. I applied for a license.

Nothing happened. After a week I made inquiries. "Have you applied for inspection?" the clerk asked. I had not, for the necessity for doing so had not been mentioned. I did so at once.

The inspectors came—one or two from each of six departments. They ordered me permanently to close all doors communicating with adjoining buildings; take up and reset all the chairs; make the operating booth, a solid concrete structure, eight inches longer and five inches wider; change the electric wiring and put in a larger

switch; have the cellar thoroughly cleaned; purchase additional fire apparatus; and remove the rest rooms from the rear to the front of the building. That was all! It would probably cost a thousand dollars.

In despair I consulted the saloon keeper next door. I didn't like his business but I liked him. He suggested: "See the brewer who owns the building—he can't collect rent until you can use it for a picture show."

The brewer sent me to a politician. He introduced me to an alderman who asked me to meet him at the city hall. In a week I had my license, and all the alterations cost less than twenty-five dollars.

These men had gone out of their way to help me and I felt under obligations. They were Democrats of the tribe of Tammany. I was bluntly asked about my politics at the outset and admitted I was a Republican.

"What do they expect?" I asked the saloon keeper.

"Nothing!" he replied. "Nothing we can do for you will cost you a cent. We're always glad to help our friends along."

He told the truth—time proved it. They continued to help in ways which will appear later.

A "social worker" who does his work without carefully recording and forcefully reporting it becomes known as unsystematic, unbusinesslike, inefficient, and loses his job.

One who keeps the records faithfully and gives the necessary time to all the incidental work becomes known as a man who cannot rise above details, and loses his job.

One who, by superhuman effort, meets all the requirements of his position, breaks down and loses his job.

By careful inquiry among my prospective patrons I learned their taste in pictures. I contracted for film service at a higher rate than any of my competitors were paying. The company assured me that my entertainment would be far superior to that of any competitor. They promised that my youngest picture each day would be only three days old, that at least one picture each day would be shown at my house before appearing at any other in the neighborhood. I wish to say, in passing, that they lied.

I carried home an armful of posters for advertising the first show, enough to cover the front of the building.

Putting on my overalls, I took my stepladder, hammer and tacks and went to work. I was sure that the neighborhood would take to a man who wore his overalls and did his own work. Unlike some other things I thought I knew, this proved to be true.

Before I had driven four tacks I heard a voice behind me: "Say, mister, do you own this movin' pitcher?"

I recognized the voice instantly. It was my old friend, the Boy Problem. It had appeared in a very diminutive, redheaded form. It carried a thick spoke, extracted from the collapsed wheel of some wrecked wagon. It was prepared for war or peace.

"Yes, sir," I replied with all the dignity of proprietorship.

"Don't yez need someone t'help yez?"

I was there to do good. The best thing any man can do for any boy is to give him a real job. "What can you do?"

Quick as a flash the answer came. The blue eyes snapped with eagerness. "Lemme sweep out the place!"

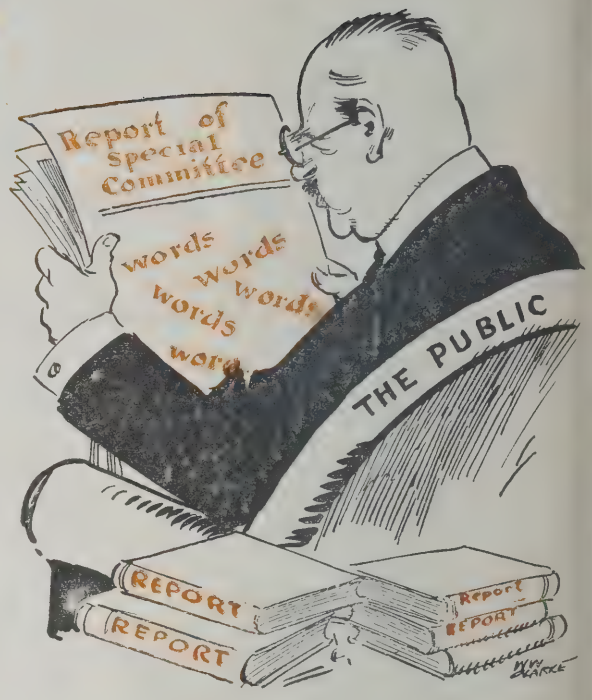
"The broom is inside. Go to it."

In two minutes a swirling cloud of dust came flying from the open doors. Behind it, as I stepped in, was a human whirlwind. The end of the broomstick was agitat- *(Continued on page 27)*

"I was not thinking of money—but the forty boys who were members of my picture organization."

Lands That are Free, Reports That are Nil

By AARON HARDY ULM
ILLUSTRATED BY W. W. CLARKE



OUR OPEN spaces, nearly a half-million acres of them, to which all the people of the country have common title, are the subject of an investigation just begun by the Senate Committee on Public Lands. This is the committee that made an audience for Senator Thomas J. Walsh, of Montana, through the tedium of prizing the top off the Teapot Dome and Elk Hills oil-lease affairs. Walsh is to be active in the new, and immeasurably more far-reaching, inquiry which possibly may be productive of at least a greater volume of sensational disclosures.

The committee is to survey the management of that vast and valuable portion of the public estate that has been set aside or disposed of in some form. One part of it is the national forests—136,000,000 acres, most of which, some critics say, are treeless with little prospect of becoming otherwise. Another is the national parks and monuments—which have become in practice, say other critics, the private domain of favored concessionnaires. Another is the large acreage of mineral lands that has been submitted to private exploitation under leases; and another is the Indian lands.

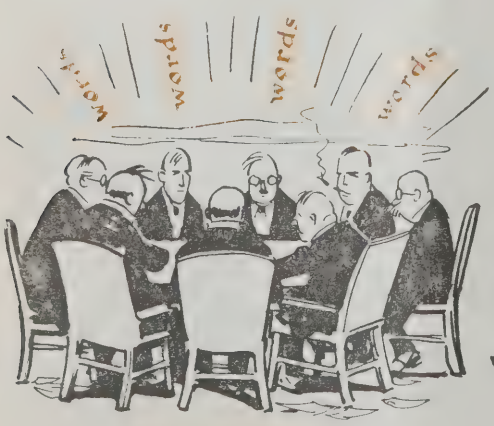
Probably the more pertinent phase of the inquiry will have to do with that portion yet rated as the Public Domain—nearly 200,000,000 acres—which still prospectively is open to homesteaders, but on the whole is undisposed of in any way.

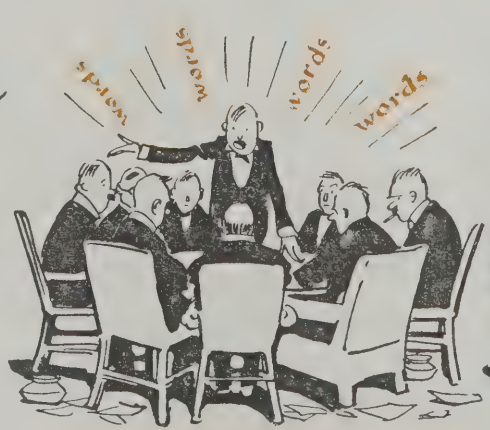
Most of it being arid or mountainous, this land has little attraction for the settler, even in maximum units of 640 acres. Unlike other groupings of our public lands this portion still is "free." Anyone may graze his sheep or cattle upon it, without cost or restriction. It is poorly policed, being, in fact, a true "no-man's" land where feuds often rage to the point of murderous violences. Moreover, it is claimed that this area, on account of the absence of regulation and restriction, is utilized poorly even for grazing. Those so claiming are urging that the land office be permitted to lease it in large units for long periods of time. Thus may pass the last bit of the United States where primal freedom still exists and the laws of nature are hampered little by statute.

A generation has passed since Theodore Roosevelt made the word "conservation" as common as he did the word "strenuous." New powers are now in control and it is a time of checking up on ventures that seemed perfect when first undertaken back in the early years of the century. Conservation as a national policy is more deeply written into the national consciousness than it was when first etched upon it twenty years ago; likewise, on the whole, the established methods of pursuing it. But no longer are all of these methods looked upon as sacrosanct and no one any longer hestitates to question the quality of the management governing their pursuit. This is indicated by a virtual national about-face on the once politically holy enterprise known as reclamation. About $200,000,000 has been invested by the Federal Government in irrigation projects, on account of which there now comes agricultural produce of about the value of that wheedled from soil-less surfaces in Massachusetts. Much else, however, has come, including disappointment for many settlers, considerable profit for speculators and boomers and a knowledge, supported by grim statistics, that the vaunted Government "expert" can be, in making estimates, the most imaginative person going.

For example, a group of 25 projects that were to cost around $2,500,000 actually cost nearly $7,000,000. Where water was to be provided for 100,000 acres the streams yielded enough for only 60,000 acres. Settlers who were to refund the cost and meet expenses of maintenance and operation have been able to pay, or, rather have paid, only about 6 per cent of what is due and no interest. Excepting a few that are successful, these projects—which loomed big and indisputable in the conservation program of twenty years ago—have served to conserve in the main only porky prestige for politicians.

(Concluded on page 31)





MR. FORD'S PAGE

THE world is in balance. Competition and compensation coöperate to keep it so. If the limits of their operation sometimes seem too wide for any relation to individual affairs, it is because we do not see that within the widest circle there are smaller circles, and that compensatory conditions are possible to the individual when the whole world seems out of joint. The atoms are safe even when the rock is exploded.

An amazing proof of the independence of life is that it can be lived when by all the charts and constitutions it seems most unlivable. An age like ours, whose attention is so strongly focused on the conditions of life, needs to be reminded that life is maker of the conditions, and conditions are not the maker of life. Life creates and changes when it will. There is a balance or correspondence between the two. But the starting place for a new series of conditions is not in the conditions, but in Life itself.

The individual is not hampered on his own plane by the fact that his neighbor lives on a lower plane. He is independent in that respect and can lead his own life. His own type of life will create the conditions required by it. Wheat grows of its own nature into its own conditions, though all around it be some less useful form of weed. The wheat does not require the condition of an all-wheat world; but merely its own life.

Other views make men dependent, and dependence leads them to exalt the machine above the mechanic, or matter above mind. More than half the vital energy now applied to the problems of human life, especially in the political sphere, is wasted. It proceeds on the wrong principle and is checked by the limitations which the universe has erected as barriers for its own protection against the destructive misuse of the mental energy which has been placed at the disposal of this race.

The range of man's freedom seems very wide. He can make all sorts of experiments as regards himself. He cannot change the flight of birds nor the procession of the stars. Seedtime and harvest are beyond the scope of his laws. But in all the aspects of his life he has wide room to grope about, to test and try, to accept and refuse, to learn and to remain stubborn—and all this without upsetting the balance of the world. He has freedom as an individual in the mass. He has freedom as a mass in the universe. Freedom enough to use for all purposes, but not enough to hurt the enduring order of things.

Men's resources are always greater than their use of them. Individually and socially man always lives beneath his possibilities. The margin is continually in man's favor. He never exhausts it. The picture of society always in struggle against insufficient supply for its physical needs, or insufficient scope for its spiritual powers, is a false picture. Supply always exceeds demand, and with the increase of demand comes greater volume of supply; it seems to be a universal law.

THE antics of the ring do not upset the circus tent: the flurries and ferments of humanity all have their place in the universe. Man's freedom is as wide as his ability to receive experience. There is no commodity which we so greatly lack, as experience. It is not the turnover of life, but the profit thereof, that constitutes experience. Not what one has seen, not what one has endured, but what one has learned until he knows it in his pulses. The universe waits, well-balanced, while man learns. It is equally prepared for his ignorance and his knowledge; each is a burden equal to the other; the yield of each is experience.

All this turmoil and ferment to which we give various names, and which we conceive to be the tragedy of the world, is really men's energetic experimentation with the forces of life. The more man is released from uncertainty regarding his bread, the more energy he expends in other directions. The ultimate result is the same whatever the character of action may be, namely, the acquirement of more experience.

Of all our possessions we have less of experience than anything else. The processes of experience, often repeated upon us, have not engraved their meaning deeply within us, and so they continue grinding monotonously. What society learns, it does not have to learn again. What it has not learned, it must go through with until it does learn—whether the experience be war, panic, plague or what not. We have learned the experience of plague so thoroughly that plague is no longer among our tutors. We are just beginning to learn what panic means and whence it arises. As to war, that groove in our intelligence seems rather shallow.

Yet whatever the goal, each may reach it when he will, regardless of the mass. In that sense we are all individual and independent universes. Directly we swing into an higher orbit, the laws of that orbit become operative for us. There are higher economics for those who find a higher circle of personal life. What binds on one plane is powerless one step up.

The universe is balanced. Ample provision exists within that balance for all that we deem unbalanced and destructive. The swinging of the pendulum does not disturb the planet's flight, and nothing is destructible but evil.

EDITORIALS

Church Council and "Wets"

WHAT the prohibition report of the Federal Council of Churches may disclose itself to be when studied is not known here; it has not arrived. But what use the "wet" press of the country has made of it is apparent to all. In this part of the country the pro-alcohol press gave five days of headlines in which they gloated over the report. It was plainly all aid and comfort to them. In such quotations as were made it was also plainly at variance with the sentiment and conviction of the churches. It is just here that the "wets" may find their joy to be rather premature. The churches of America did not speak through the Federal Council. Inquiry forces the conclusion that 98 per cent of the membership of American churches do not know what the Federal Council is, and never authorized it to speak, and were never consulted as to what should be published as the mind of the church. It is probable the report will have no effect whatever on the sentiment of the country, but it may have an effect on the Federal Council.

Wage Reduction and Debt Increase

ONE point in wage reduction has not been given attention, yet it is of vast importance in studying the economics of industrialism.

That point is that the wage cut does not measure the full loss to the earner who has ventured into debt.

In other words, *debt increases more rapidly than pay decreases.*

To illustrate:

John Smith, encouraged by steady employment at a good wage, invests in a home for which he agrees to pay $10,000. His wage is one dollar an hour. His only source of income being the exchange of his labor for dollars, the investment represents 10,000 hours at the rate just stated.

But, a change comes. Amateur economists think that the way to help business is to reduce wages. John Smith, therefore, is notified of a 10 per cent cut; his wage henceforth will be 90 cents an hour.

Having agreed to pay 10,000 hours of his work for the home, on the basis of one dollar an hour, John Smith is now confronted with the necessity of paying more hours because he has fewer dollars for his hours.

His original debt representing 10,000 hours is thus increased to 11,111.11 hours, or more than 11 per cent.

If the wage cut is 25 per cent, John Smith must pay 13,333.33 hours of work, a debt increase of 33 1-3 per cent.

At "normalcy," or the price level of pre-war times, Smith, if fortunate, must exchange his labor for 50 cents per hour, a cut of 50 per cent. But then the increase in his debt is 100 or double his contract conditions, for at 50 cents an hour it will require 20,000 hours instead of 10,000 to pay for the home.

This view of wage reduction, as a human effect, is worth bearing in mind.

Advertising

ADVERTISING that brings supply and demand together performs a service. It is a species of information, and only ceases to be that when it becomes dishonest or extravagant. THE DEARBORN INDEPENDENT has established its policy in the absence of advertising and occupies a position in which it is pretty well understood that advertising could not be used as an influence to deter or deflect it.

It is known, of course, that advertising is sometimes used to influence and coerce publications into or out of certain courses. This is seldom the action of the individual advertisers themselves but of certain agencies which attempt to use their clients' accounts as cudgels for their own purposes. Advertisers of the legitimate class do not regard their purchase of space as a lien on the editorial policy of the publication they use; all they are buying is publicity for their announcement, and they have no other thought.

THE DEARBORN INDEPENDENT, in admitting advertising to its columns, has exercised a selective care as to the reliability of the advertiser and the character of the commodity. The space which advertisements may occupy in this paper is limited to 33⅓ per cent, the size of the paper gradually increasing so that the former supply of reading matter shall not be decreased.

We believe that THE DEARBORN INDEPENDENT with its very large circulation among the most intelligent classes in the country presents an advertising medium of genuine value both to the trade and the consumer.

Radio

OF THE approximately 6,000,000 radio receiving sets in the world, about 4,000,000 are in use in the United States; about nine hundred thousand in England; perhaps as many in Germany and the rest scattering.

The significant feature of this distribution of radio receiving sets is that the average European government actually discourages the ownership of them by needless red tape requirements. The object is to control the means of communication not only in time of war but also to censor efforts to influence public opinion. Thomas Jefferson always maintained that truth in the open must prevail; but politicians take care to prevent it if they can.

It is further significant that it is only among certain peoples that this suppression can be secured. The forward peoples prevent it. In emergencies this policy of suppression will clearly place its victims at a disadvantage. But the fundamental disadvantage is the quality which permits it. The worst feature of slavery is not enslavement but the capacity to be enslaved. Free peoples never are enslaved—nor is a free press, a free parliament, a free platform, a free radio.

Ford "Bankers Shares"

WE ARE now receiving inquiries from clergymen in all parts of the country, though mostly West and South, regarding the offer of so-called "Bankers Shares" of stock in the Ford Motor Company of Canada. For more than a year the facts about this form of speculation have been broadcast by newspapers, Better Business Bureaus and Chambers of Commerce, but still the chase after "suckers" goes on. The exploiters of the "Bankers Shares" seem to know that they can ply their art safely because whole sections of our population remain wilfully ignorant of plainest business facts.

What is a "Bankers Share"? It is commonly one share of Ford of Canada stock split up into 100 parts. The name "Bankers Share" is given it for effect. The buyer of a "Bankers Share" does not own a share of stock at all, but the one-hundredth part of a share owned by someone else.

Ford of Canada stock was recently quoted on the stock market at $485 a share. The exploiters of "Bankers Shares" usually sell them at $10 each. That is, there being 100 such "Bankers Shares" in one share of stock, the exploiter gets $1,000 for what is quoted at $485.

The $515 difference between buying and selling makes the deal very profitable to the "banker"—whoever he may be. Usually he is not a banker. He is oftener a faker who has acquired a few shares of Ford of Canada stock and is using the Ford name as a bait to hook the savings of poor people. And poor people, lured by lies of big profits, let their savings go.

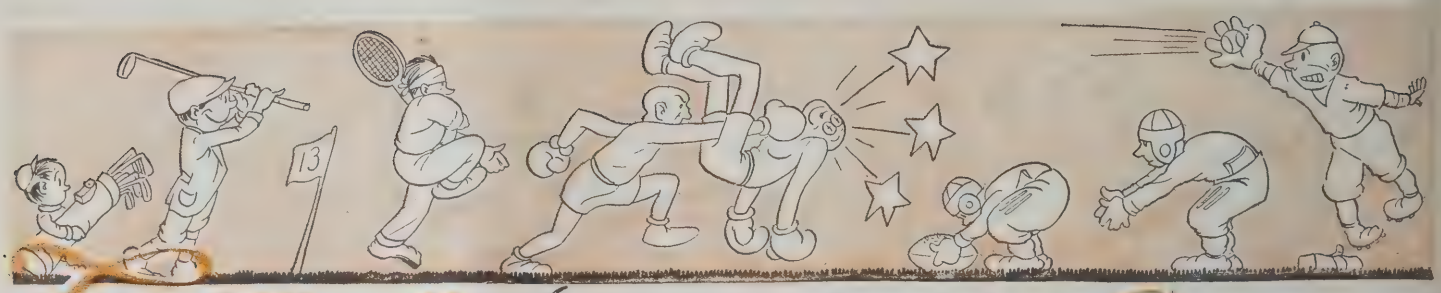
Clergymen, just now, seem to be the particular victims selected to be "permitted to invest." Some of them have exercised their common sense in making inquiries before acting. Others have swallowed the misleading literature whole. The scheme is a product of the swindling type of mind. People should be warned against it.

"Smash the Empire"

BRITISH trade unionism in annual conference disclosed its leadership as anti-British, pro-Russian, and revolutionary. "Smash the Empire" was the accepted slogan. "Put none but Communists on your official boards," was the message from Moscow. A resolution was adopted calling attention to the delectable conditions of the workingman in Russia and Mexico! The ground for the inclusion of Mexico in this bit of rejoicing seems to have been the rumor that some kind of Bolshevik group rules the labor organizations of that country also. The suffering and degradation of labor in both countries is so well known that one wonders what blindness of stupidity can have overtaken British labor leaders to propose such a preposterous resolution. It would be worth the Empire's money to provide free transportation to as many workmen as care to avail themselves of the golden opportunities to be found in Russia and Mexico. It is to be feared, however, that none would go. It is human nature to condemn what it has, yet stick to it like glue.

The Investigations

THE investigations that are proceeding at Washington, called forth by the *Shenandoah* and Colonel Mitchell, appear at this writing to promise little comfort to any particular party and to disclose a state of affairs that all will agree in the end needed attention. The mere matter of arguments which have their weight in predisposing the mind toward one contestant or the other is now being put aside in favor of concrete actions and facts. Plausibility, so easy to obtain in argument, is giving place to actuality, so inseparable from fact. It is quite within the possibilities that all parties in the investigation will come through with draggled feathers, for all of them have been up against a more or less unknown quantity. Some of them frankly have admitted their ignorance; others have put on an air of omniscience. In the end, it will be the bottom facts that count.



The Thrill Around the Corner

By PAUL MACDONALD

WHEN the baseball reporters, seated in the press stand of Sportsmen's Park in St. Louis on May 5, 1925, sent in their early "leads" they observed: "While the weather was clear the temperature was cold. A chilly wind blew across the playing field and swept through the stands, but in spite of the adverse weather conditions a fairly large crowd was out to see Detroit and St Louis play."

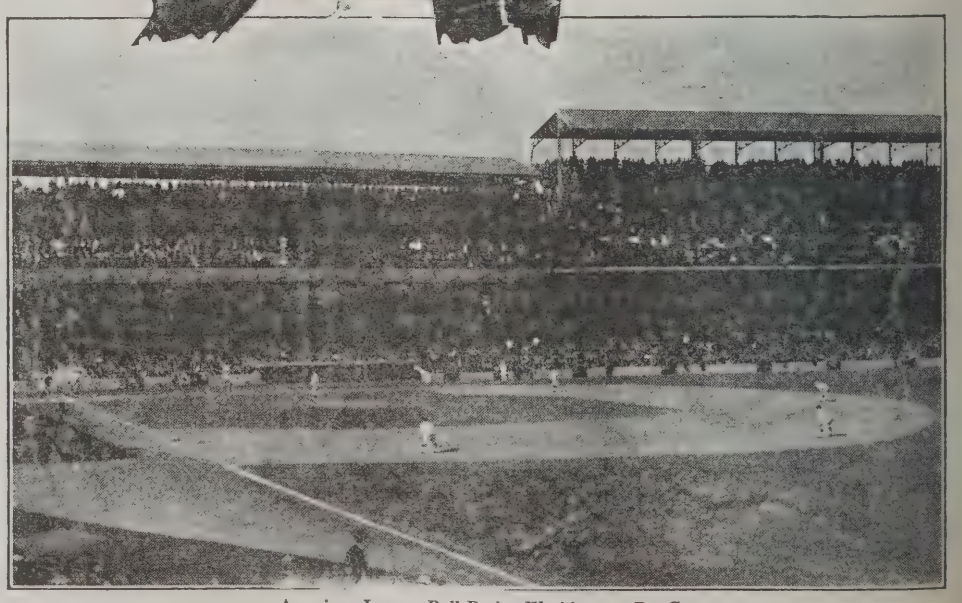
One veteran reporter, viewing the crowd, remarked: "Can you imagine all these people coming out here on a day like this to sit through two hours or more of play by a couple of clubs that stand nowhere; one of them in last place?"

Here was a game that promised nothing in the way of thrills. The competing teams were playing poor baseball at the time and considering the conditions the crowd should have been one of the smallest of the year.

Some day, if you are a follower of baseball, you will probably look up the lifetime record of Tyrus Raymond Cobb and in this record you will find May 5, 1925, designated in large, bold-faced type. It was on this chilly day of May and on the St. Louis playing field that the master player of all time gave his greatest performance at bat. Here, at the start of his twenty-first year as a player, Cobb made six hits in six times at bat off five different St. Louis pitchers. He hit three home runs, a two-bagger and two singles, a total of sixteen bases. It was the first time in baseball history that any player has ever made six hits for sixteen bases in a single game. Several players in modern baseball have made six hits in one game and once, in the early era of the professional pastime, Wilbert Robinson, of the Baltimore Orioles, made seven hits in one game. Several players in modern baseball have made three home runs in a single game and twice, 30 years ago, a player made as many as four home runs in one game, but never has there been quite the complete batting performance that Cobb delivered on that late day of his brilliant career. A thoroughly chilled crowd witnessed a batting feat that twenty seasons of strenuous baseball campaigning by Cobb had failed to equal.

In sports there is always a thrill around the corner. That is what makes the game alluring. Comparatively few football games rise above the ordinary. Most of the matches on the gridiron are poor drama. You find even less good encounters in boxing where the cast of characters is limited to two and the moving drama calls for concentrated action. For one game that holds real thrills you discover a dozen that are profoundly boring.

Left—William Tilden, professional tennis player. Right—Ty Cobb, "King of Baseball." Below—D. Milburn, of the American Polo Team.



American League Ball Park—Washington, D. C

Army versus Navy—Wilson, the Army full-back stopped on Navy's thirty-yard line.

You may attend a thousand ball games before seeing a pitcher deliver a no-run, no-hit game. You may never see one pitched. If you do, chances are that it will be on a day when the attendance is slim, when the prospects for high-tensioned play are apparently remote.

It took a number of World Series to produce super-melodrama such as was the last game between Washington and New York in the 1924 series, a battle that will live as long as baseball is played, a contest in which nearly every thrill that baseball can provide was jammed, a struggle in which the advantage shifted from one team to the other and back again until the end came suddenly and altogether unexpectedly in an extra inning on one of the freakiest hits an important contest has produced, a fitting climax to the most melodramatic of all World Series conflicts.

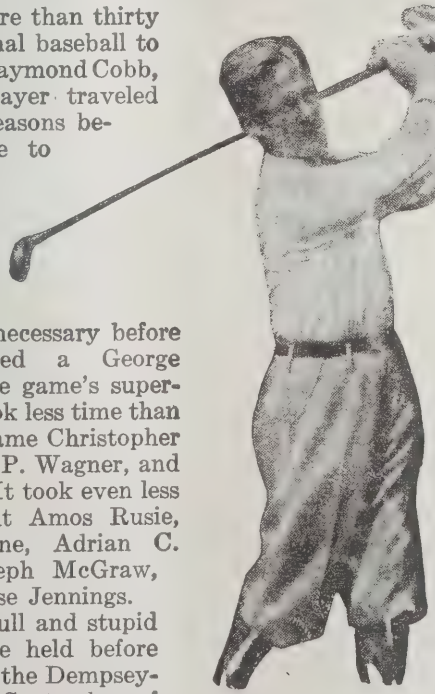
It required more than thirty years of professional baseball to produce a Tyrus Raymond Cobb, and this super-player traveled through twenty seasons before he was able to cram as much batting into a single game as he did on May 5, 1925, in St. Louis.

More than forty years were necessary before baseball developed a George Herman Ruth, the game's super-slugger. But it took less time than that to give the game Christopher Mathewson, John P. Wagner, and Walter Johnson. It took even less time to bring out Amos Rusie, Charles Radbourne, Adrian C. Anson, John Joseph McGraw, and Hugh Ambrose Jennings.

Hundreds of dull and stupid boxing bouts were held before the ring witnessed the Dempsey-Firpo struggle in September of 1923. This fight, for pure melodrama, is unmatched in ring history. Countless spectators sat bored through hundreds of flabby fistic shows before there came a Villa-Wilde bout which probably stands unequaled as an exhibition of Anglo-Saxon moral and physical courage.

Right—Paavo Nurmi, Finnish running champion.

Below—Suzanne Lenglen, French tennis star.



Bobby Jones— "Fore!"

Only once in a long, long while is there a football game that for thrills can match the Army-Navy struggle of November, 1923, or the Illinois-Chicago and Stanford-California tie battles of 1924.

One never knows when any sport will touch the high spot of melodrama. These occasions come suddenly and unannounced. What promises to be a soggy and boresome affair frequently develops into a sports masterpiece; what promises to be a high spot rarely peers above the rim of the ordinary and trivial.

Boxing had to endure the Willards, Fultons, Morrisses, Maddens, Flynns, Meehans, Morans, McCarthys, Brennans, Burkes, Smiths, Tates, Weinerts, Wells, and giants of kindred types before there arose among them a Dempsey. For several years the promoters hunted the farms, hamlets, villages, towns, and cities to find a white man capable of winning the heavyweight championship and when they found one, after going through flocks of brawny men lacking both talent and instinct, they located a man who while he won the title was the poorest fighter to ever hold it. I refer to Willard. During the reign of Willard there continued to flock into the ring mastodonic laborers rather than boxers or fighters and then suddenly appeared Dempsey and swept through the lumbering field. It was practically certain that a man of talent must appear in their midst sooner or later and the crowds kept flocking to the boxing arenas in the hope of being present at the discovery.

A championship bout will always attract a large crowd. Even when seats near the ring sell for $30 or $60 the place will be jammed. There have been a few title battles in recent years that drew $1,000,000 or more at the gate and even then all those demanding seats could not be accommodated.

What draws these vast throngs is the chance that a champion may be dethroned. Human nature always goes for the underdog. There is also ever present in man a desire to be in on the kill. The same lure that fox hunting has for its followers is present in a championship match. New title holders are created ofttimes suddenly. A chance blow on the chin can finish any champion. And the public clamors to be present when a new boxer is lifted to one of the thrones of the boxing kingdom. There is something of a super-thrilling nature about the scene of a falling champion, and every time a champion risks his title he stands that chance. The fatal count of ten is always before him. Every man that opposes him is a possible successor, regardless of how remote

his opportunities may seem.

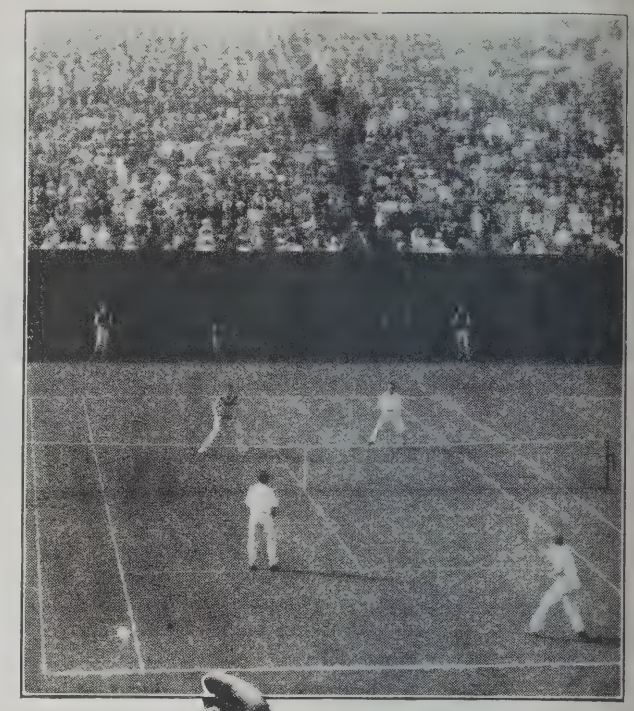
When Jess Willard met Jack Dempsey at Toledo in the first real defense of his championship the title holder was the heavy favorite. Willard was so big, so strong, so powerful compared to the much smaller Dempsey. Few gave the challenger a chance. Willard was expected to pound Dempsey to a pulp because of his superior height, weight, reach, and strength. But it was Dempsey that beat Willard to a pulp. Few times has a heavyweight taken the beating that Willard took in those three rounds at Toledo.

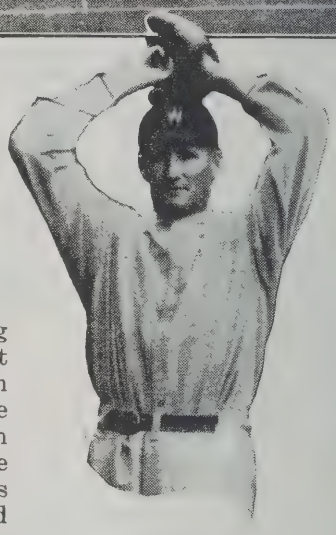
Then there was the never-to-be-forgotten battle between Luis Angel Firpo and Dempsey. The giant from the Argentine was a grim-looking mountain of a man, strong, rugged, and with fierce fighting spirit. Nothing in boxing ever equaled this performance in thrills. Lurid melodrama was stuffed into five minutes of violent action. Still, before the fight, Dempsey was regarded as having an easy time ahead. He would step inside the wild swinging South American and beat him down but when, in the first round, a terrific right swing from the challenger caught the champion on the left shoulder and hurled him bodily out of the ring, the great crowd that was packed inside the Polo Grounds was dumfounded. The senses seemed paralyzed. It was hard to realize.

There has been nothing to equal this fight in ring history, but before the bout none suspected that it would carry a thrill out of the ordinary.

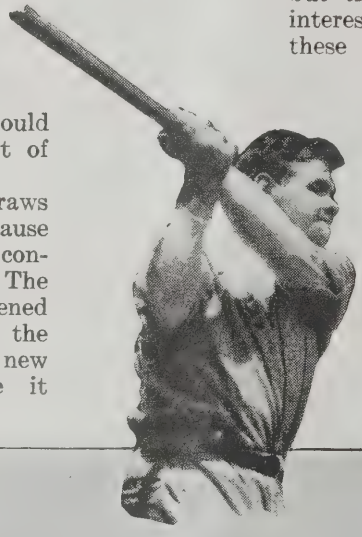
Football draws great throngs because there is always a contest in sight. The game has been opened up gradually and the introduction of new rules has made it possible for the minor college elevens to have a chance against the majors. The forward pass and its attending features are chiefly responsible for the new condition that makes the result of no game a foregone conclusion and provides numerous upsets each season. You seldom see the one-sided scores that were so frequent a dozen years ago. There is always the possibility of one of football's little Davids reaching up and bowling over one of her Goliaths. It is being done frequently each year. Upsets mean thrills and since there is a chance for thrills the public flocks to the stadiums of the gridiron. Few teams have much better than an even chance and the men behind the schedules, recognizing this fact, arrange programs of so-called "big" games. Any game in football is likely to be "big."

Until the winter season of 1925 there was little interest in track events. This sport, fostered chiefly by high schools, academies, colleges, and universities, had a select following but the general public was not interested. Then there arrived on these shores Paavo Nurmi, the phantom runner from Finland, hero of the 1924 Olympic Games at Paris and heralded through two hemispheres as the greatest distance runner of all time. In his first start Nurmi broke two indoor records and suddenly the track sport took hold of the public. There were more than twice as many track meets last winter as in any previous indoor season. Why? Nurmi started it with his record-breaking performance, and with Nurmi in mind every athlete clamored for some of the same glory. They all went out to break a record or two and records began tumbling headlong.





Above—Tennis doubles court at the Germantown, Pennsylvania, Cricket Club. Below—Walter Johnson, Washington star pitcher.



Above—Babe Ruth. Below—A polo game replete with thrills, Meadowbrook Field.

No man ever did so much for athletics as Nurmi. By setting record after record himself he spurred on every American athlete to do the same thing. He urged them on to their best efforts. His performances called forth the last ounce in them. They wanted part of the headlines that Nurmi carried.

Nurmi always drew big audiences but when others started smashing records all track meets drew heavily. There was always the chance of seeing a new mark of some kind established and the public wanted to be in on that. It was not the chance of some American beating the invader, for that chance was too remote, but the promise of a new mark being set is what pulled them to the meets.

George Herman Ruth may go hitless for two solid weeks but the public will still flock to see him. Any time Ruth goes to bat there is the chance that he will drive the ball out of the park. He carries the big punch of baseball and the public loves to see that punch exercised. Ruth has been the greatest individual drawing card the game has known. No man

The U. S. Takes the World's Defectives

Millions Are Spent in Taking Care of Aliens Who "Slipped Through"

By MARIAN K. CLARK

THE recent debate in New York between the present governor of that state and his predecessor in office upon the necessity for a bond issue of $50,000,000 for the extension of hospital accommodations for the insane, one-third of whom are aliens who have neither legal nor equitable claims upon the taxpayers for maintenance, elevates the economic importance of alien defectives to a problem of the first rank.

The present conditions in the state hospitals may be understood by the report of a special commissioner in 1913, which informed the governor that:

Deportable Aliens Now in the Hospitals

"During the past fifteen years from one-sixth to one-quarter of the total state budget has been spent for the maintenance and care of its defective classes, one-third of whom are aliens."

Since that time, however, the Federal Government has continuously admitted defective aliens who have in large measure served to increase the populations in these institutions during the same period of time.

It must be apparent therefore that it is impossible to arrive at any honest, permanent or comprehensive estimate of actual necessary hospital requirements, until the number of deportable aliens now being maintained in state hospitals is determined.

The Assistant Secretary of Labor but recently made the assertion that:

"Ellis Island is now unsuited to handling immigration under the restrictive immigration law because it was built to handle a maximum of 7,000 immigrants a day and today the average is about 300."

This would seem to prepare the way for the suggestion that all deportable aliens now in the state hospitals could be cared for by the Federal Government at that station, pending deportation and with the overcrowding thus relieved the state hospitals would not require at this time further extension of their facilities for the accommodation of *alien insane*, thus permitting a timely and well-balanced survey of the entire situation.

Some of Those Who Are Excluded

If statistics for the past twenty-five years were compiled showing the number of excludable aliens who have been maintained at public expense, and the cost to the several states that have cared for them, the results would be appalling.

The Immigration Law mandatorily excludes:

"Persons who have had one or more attacks of insanity at any time previous to landing, as well as persons of constitutional psychopathic inferiority and chronic alcoholics."

The law is also broadened to include:

"Mental and physical defectives irrespective of their financial condition and ability to earn a living."

This law, however, was abrogated by the "Rules and Regulations" which permitted these specifically excluded classes to land under bond. But even this grant of discretion does not warrant the acceptance of a bond, *known by the immigration authorities to be unenforcible when accepted*, for the admission of an idiot, an imbecile, an epileptic or members of other classes definitely and finally excluded by the terms of Section 3 of the Immigration Law.

Abundant illustrations are available certifying that families of defectives and criminals can be traced back to a single ancestor. Over a period of five years more that 2,000,000 aliens were examined at the detention pen in Ellis Island, and during one single year of that period (1923) some 19,741 *mandatorily excluded* immigrants *were permitted by the immigration authorities to enter the United States.*

The Constantly Increasing Number of Defectives

The definite reasons for the continuation of this practice are the perennial indifference of Congress and the failure of both branches of that legislative body to realize the significance to the nation of the constantly multiplying defective and criminal classes due to the non-enforcement of the immigration law, as well as the misdirected efforts of politicians both state and national in assisting those whose efforts are directed toward its evasion.

The National Committee for Mental Hygiene, in order to ascertain the extent of institutional care of insane, feeble-minded and epileptics in the United States, has from time to time taken a census of the patient population of institutions caring for the above classes of dependents as follows:

Census of the Insane

Jan.1,1910—In institutions in the United States		187,791
In public institutions	95%	178,402
In private institutions	5%	9,389
Jan.1,1917—In institutions in the United States		234,055
In public institutions	96.4%	225,824
In private institutions	3.6%	8,231
Jan.1,1923—In institutions in the United States		267,617
In public institutions	96.5%	258,386
In private institutions	3.5%	9,231
Foreign-Born (all races)	27.2%	70,517

The Care of the Feeble-Minded and Epileptic

The 1923 census includes returns from 528 institutions for mental diseases of which 165 are state hospitals, 148 other public hospitals and 213 private institutions.

The report states:

"Owing to the fact that many patients were both feeble-minded and epileptic and that many institutions were caring for both classes, it was found impracticable to separate completely the two groups in presenting data concerning the movement of patient population. The institutional care of feeble-minded and epileptics is very largely a public matter."

Census of Feeble-Minded and Epileptics

Jan.1,1917—In institutions in the United States		48,021
In public institutions	94.3%	44,798
In private institutions	5.7%	3,223
Jan.1,1923—In institutions in the United States		51,731
In public institutions	92.6%	47,943
In private institutions	7.4%	3,788
In almshouses		13,249

These figures indicate that in excess of 96 per cent of the total number of insane, feeble-minded and epileptics in the United States are being maintained at the expense of the government and that the increase of patient population shows a constantly increasing ratio in each succeeding census.

Reports From the Institutions Are Discouraging

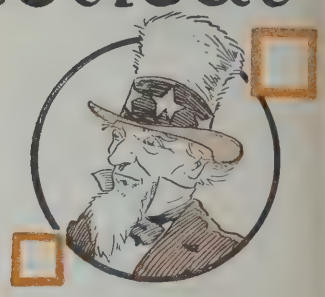
The admission of even one feeble-minded alien represents potential evil to the nation. A yearly succession of thousands of such aliens is so grave in its possibilities as to demand immediate and drastic correction.

Far better an illiterate able-bodied alien whom we can instruct at little cost in time and money, than a defective whose traits will be transmitted to posterity, either before or after he becomes a public burden, by begetting of his kind—the worse evil of the two.

In 1914 it was reported that there were 7,000 feeble-minded children in the schools of New York City, more than 50 per cent of whom were of foreign birth or parentage; today there are in excess of 30,000 and the ungraded classes are multiplying (Concluded on page 25)

Sam Slick

Sam Slick, the Connecticut Clockmaker



Uncle Sam

Original of Uncle Sam and Source of Inspiration for Dickens, Mark Twain and Other Humorists

THE test of life is that it is creative, that it can originate life. By that token, Thomas Chandler Haliburton, of Windsor, Nova Scotia, is one of the most vital literary men that North America has produced.

Judge Haliburton created in 1835 and developed through subsequent years the national character known as Sam Slick of Slickville, Onion County, Connecticut.

For some reason Sam, and the three volumes in which he appeared, has passed out of public attention, but we know what he looks like, we see him every day, he is part of our life as no other literary creation in the world is. Sam Slick is our "Uncle Sam." That figure with his shrewd smile, his goatee, striped trousers held down by long straps, the symbolical Uncle Sam—we are apt to think that he was hit upon by someone in a moment of inspiration, and pictorially set forth to symbolize the United States. Not at all. This figure is Sam Slick, the hero of *The Clockmaker, or the Doings of Sam Slick of Slickville*, as conceived by Judge Haliburton and as drawn by Hervieu, a Frenchman, and Leech, the artist who made *Punch* famous, to illustrate the English editions.

Judge Haliburton and the artists who illustrated *The Clockmaker* and *Wise Saws* created our Uncle Sam for us, without knowing it. They as authors of this achievement are all but forgotten.

Mark Twain's *A Connecticut Yankee at King Arthur's Court* is an emanation from Sam Slick, the Connecticut Yankee. *Innocents Abroad* is inspired by the same model as this quotation will bear witness:

> I've often heerd the ladies say to England, "Why, Mr. Slick, nothing seems to astonish you here. You don't seem to praise anything; you have no curiosity about you. What do you think of that noble structur', St. Paul's Church?"
>
> "Pretty well," sais I, jist as if we had a thousand such, "but it's gloomy and not so big as I expected."
>
> "But Westminster Abbey," sais they, "don't that surprise you?"
>
> "Well," sais I, quite cool like a corneysewer, "its costly but onconvenient for a large congregation. The finish is gimcrack and so is its furnitur'; and them old tattered banners in the chapel look for all the world like rags we tie on sticks in the corn fields to Slickville to frighten away the crows. They ain't fit for a meetin' house like this are; and if they must have flags hung up in it, as we do them we took from your friages, they might as well have new ones."
>
> "Oh," sais they, "did you ever?" Then sais they, "the delightful parks round the noblemen's seats, ain't they very beautiful?"
>
> "Then," sais I, "to answer your question, misses, I have seed a nateral park," sais I, "to home stretchin' clean away across from the Atlantic right slap thro' to the Pacific Ocean all filled with deer and so big these English parks of dwarf trees look like a second growth of sprouts on the edge of a potato diggin' in a new clearin', or a shelter grove in a pastur'."

"Sam meets his old friend, Rev. Ahab Meldrum."

Sam Slick is just as indubitably the source from which the character of David Harum was drawn. The best remembered incident in *David Harum* is the horse trade in which he adheres to the letter of truth but departs from the spirit thereof, and sells a balky horse as one that "stands without hitchin'." Sam living at Boston has a fast horse which will not cross a bridge because it has once fallen through one. This horse he sells for a good price—advertising with literal truth that he would not sell it at any price "*if he did not wish to leave Boston.*" Another fast trotter of his has "the heaves." Slick advertises that his only reason for selling is that the animal is "too *heavey* for harness." The unwary buyer reproaches Slick and only loses more money by betting that the latter had advertised the horse as too "*heavy*" for harness. Sam could beat any man, hands down, at a horse trade, and his talk at all times was the quintessence of the fitting and the amusing. The following excerpts should abundantly prove it:

"The Britisher asks me out to entertain me and then sings 'Brittania Rules the Waves.' My

"Sam pays a visit to the parsonage."

old grandmother used to rule a copy book and I wrote on it. I guess the British rule the waves and we write 'victory' on 'em."

"What do I say to 'em? Why I only say our great a' mighty republic is the toploftiest nation a'tween the Poles. That ain't no boastin'. It's only jist a fact, like all men must die, or any other truth."

"High hills like high folks are plaguy apt to have barren heads."

"Politics are like pea soup, they are all very well and very good when they are deep stirred, but as soon as the stir is over, the rich and the thick settles down for them as are at the bottom of things."

"The bee, though he finds every rose a thorn, comes back laden with honey from his rambles."

His clocks are warranted to run "from July to Eternaty, stoppages included."

In answer to the question of how he is, "hearty as brandy, marm," sais I, "though not quite as strong."

"It's most equal to eatin' soup with a fork when you are short of time."

It is quite clear, therefore, that the man who made a character talk in that fashion originated the American school of humor, as Artemus Ward said, and, as William Dean Howells added, has dominated it ever since.

Just as "The Colonel's lady and Judy O'Grady are sisters under their skins," so many present-day business practices may still, in their essential characteristics, be fairly accurately represented by Sam Slick's methods. This incident may assist in the identification:

> At a time when there is a high duty of 30 per cent on lead imported from the United States into Nova Scotia, and no duty on works of art, Sam realizes a very handsome sum by investing heavily in leaden busts of Washington and melting down the Father of His Country after he has passed the custom house.

The one most quoted expression from *Uncle Tom's Cabin* is that Topsy "just growed." That is cribbed directly from Sam Slick who was read and quoted in Harriet Beecher Stowe's family as he was in every other family throughout the United States.

The Clockmaker was published in 1835 and ran through fifty editions, a greater sale for the time and the extent of the population than any "best seller" has ever known. The *Illustrated London News* of July 15, 1842, has this to say about its popularity in the United States.

> "At Boston, at New York, at Philadelphia, at Baltimore, in short, in all the leading cities and towns of the Union, this little volume was to be found on the drawing-room tables of the most influential members of the social community; while even in the emigrant's solitary farmhouse and the squatter's log hut among the primeval forests of the Far West it was read with the deepest interest, cheering the spirits of the backwoodsman by its wholesome, vigorous, and lively pictures of everyday life. A recent traveler records his surprise and pleasure at meeting with a well-thumbed copy in a log hut in the woods of the Mississippi Valley."

Sidney Smith is regarded as one of the wittiest of Englishmen and one of his sayings most frequently quoted to prove it is that he was "so hot it would be a comfort to take off my flesh and sit in my bones." That is straight, word for word, from Sam Slick.

We use the expression "corn fed" and fancy it originated in our Middle West, but it comes from Sam Slick who always described women in the terms which he uses for horses, one of his most commendatory ones being "fine corn fed."

Dickens' Sam Weller is the cockney Sam Slick and the plot of the *Pickwick Papers* is too much like that of *The Clockmaker* to escape notice, as the universal comment of the times bears witness.

Bill Nye, Artemus Ward, "Mrs. Partington," O. Henry, all have lighted their brands at one time or another at the torch of Judge Haliburton. Certainly no other book produced on this continent has had so widespread and unmistakable an influence.

The Clockmaker was first published anonymously in *The Nova Scotian*, then as a book by the editor, Joseph Howe; a copy of it was loaned to Bentley, the English publisher, who at once issued editions of it. Since the book was never copyrighted the author received no remuneration for it, except a silver salver presented to him by Thomas Bentley with an inscription upon it composed by the Rev. Richard Barham,

"Sam Slick at the annual Nova Scotia market, at which the poor were sold. "'Them that will keep them for the lowest sum get them.'"

the author of the *Ingoldsby Legends.*

Judge Haliburton was a Nova Scotian by birth, a member of one of its great landholding families, a lawyer, a member of the assembly, a judge and, toward the close of his life, when he became a resident in England, he sat in the House of Commons for Launceston.

He was a forthright person in his doing and thinking as well as in his writing. He wrote the first authoritative history of Nova Scotia (Longfellow drew his inspiration for "Evangeline" from it) which he asserted "next to Mr. Slick's History of Cattyhunk in Five Volumes is the most authoritative account of unimportant things I have ever seen." His work was recognized by a ceremonious speech of appreciation in the House of Assembly.

Sam Slick appears in five volumes, *The Clockmaker* of which there are three volumes, *Wise Saws* and *The Attache.* The most important of them is *The Clockmaker* series; in it we have the complete Sam. The plot of *The Clockmaker* is meager, the Squire and Sam make the grand tour of Nova Scotia; its scenes, people, the incidents of the journey give the occasions for the comments, stories and opinions of Sam. He is delineated as people are in real life not by descriptive captions so much as by his acts and words.

"Why is it," asks and answers Sam on some occasion, "that if you read a book to a man you set him to sleep?"

"Jist because it's a book and the language ain't common."

"Why is it if you talk to him he will sit up all night with you?"

"Jist because it's talk, the language of natur'."

"Soft Sawder and Human Natur'"

The language of *The Clockmaker* is "talk, the language of natur'." The books contain very little description; when there is any it is of this order:

"The elder was a pious man; at least he looked like one and spoke like one too. His face was as long as the moral law, and p'raps an inch longer, and as smooth as a hone, and his voice was as soft and sweet, and his tongue moved so 'ily on its hinges you'd a thought you might a trusted him with ontold gold if you didn't care whether you ever got it again or no'."

"Jist look out of this door and see what a beautiful night it is, how calm, how still, how clear it is! Beant it lovely? I look up at them are stars when I am away from home; because they put me in mind of our national flag, and it is ginerally allowed to be the fust flag in the univarse now."

On this tour Sam is engaged in the business of selling clocks to people who don't need them. He does it, he explains to the Squire, by means of "soft sawder and human natur'." He is fully as invincible and surprising a super-salesman as Sherlock Holmes is a detective. He has the quiet voice and manner that Conan Doyle also gives to his character.

Though his speech is that of an unlettered man, the most learned fail to arouse in him any sense of inferiority:

"'I knew you,' I said, 'the moment I heard your voice, and if I had not recognized that I should have known your talk.'

About Sam Slick's Well-Knit Philosophy

"'That's because I am a Yankee, sir,' replied Sam, 'no two of us talk alike; but bein' free and enlightened citizens, we jist talk as we please.'"

Sam deprecates boasting but unconsciously gives a prize exhibit himself. His one subject of boasting is the United States and its citizens.

There is an entire absence of maudlin sentimentality in him. The underdogs whom he encounters are usually "under" because they are lazy or proud or foolish and he wastes no sympathy on them.

Sometimes in sheer desperation at the folly of these fellows, Sam sets himself to pull their cart out of the mud and to set it on firm road. He always does it in a sporting spirit and in perfect good fellowship.

Sam Slick has a well-knit philosophy of life, not profound but practical and the greater portion of the books which he adorns are taken up with inculcating that. It is, that work and thrift are alone worth the attention of a human being. The books are full of such incidents as these following:

"'Do you see that are flock of colts?' said he as we passed one of those beautiful prairies that render the valleys of Nova Scotia so verdant and so fertile. 'Well, I guess they keep too much of that are stock. I heerd an Indgian one day ask a tavernkeeper for some rum. "Why, Joe Spawdeck," said he, "I reckon you have got too much already."

"'"Too much of anything," said Joe, "is not good, but too much rum is just enough."

"'I guess these Bluenoses think so much about their horses; they are fairly eat up by them.

"'No wonder the folks are poor, look at them are great dykes; well, they all go to feed horses. And look at their grain fields on the upland; well they are all sowed with oats to feed horses. And they buy their bread from us. So we feed asses, and they feed horses.'"

And this,

"Pride, Squire, and a false pride, too, is the ruin of this country."

And, so, through three volumes of *The Clockmaker* Sam Slick and the Squire ride along the coast of Nova Scotia, and the world becomes enriched threefold thereby: it gains an expression in literature of the American genus, it gains the famous figure whom we know as "Uncle Sam" and it gains a fount from which English and American humor have drawn abundant inspiration.

Plunging Over the Precipice of Debt

(*Concluded from page 4*)

utilized to elect the rest of the ticket. And it is the "rest of the ticket" that levies taxes, appropriates money and issues bonds.

We are paying for a great deal better municipal government than we have. We are probably paying for better government than we need to have. All we need is government that will serve community interests efficiently, economically and honestly. When efficiency, economy and common sense are so little apparent in municipal government as they are in America, we get what we are getting now—abnormally high cost of living and poor service. It is by no blind chance that the cost of living in cities is so high. High taxes make everything else high. Not a cent's worth of anything can be bought that does not bear its proportion of the load that wasteful, extravagant, ignorant government entails.

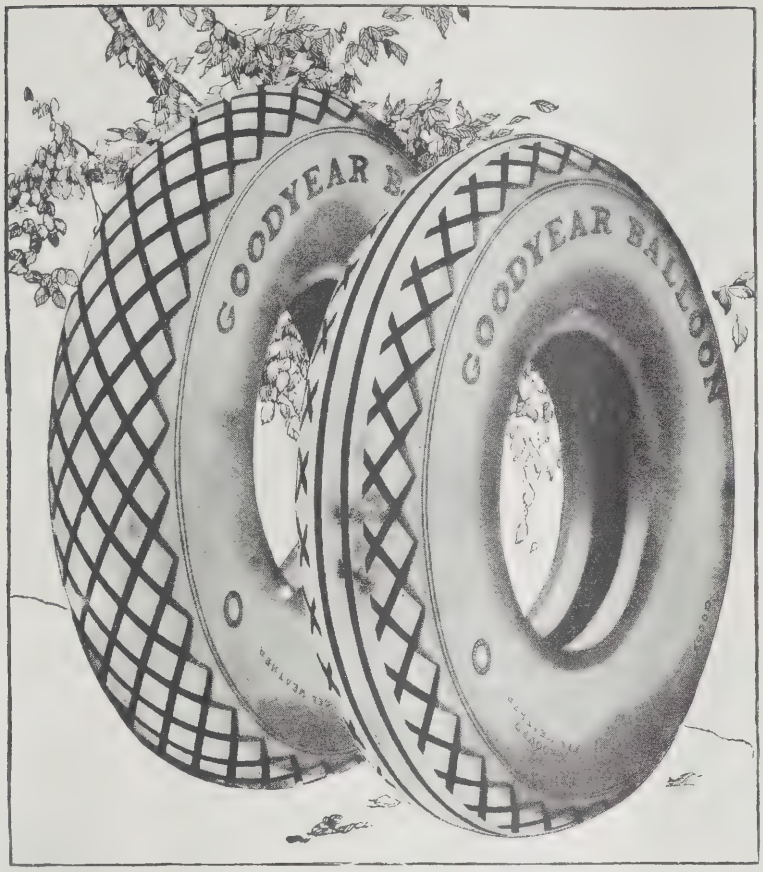
If states and cities continue to pile up debt, living conditions will go from bad to worse. It is as true as it was in Franklin's day that waste brings want. All that taxation takes more than is necessary is waste and the man in the street pays it. He pays part of it every time he spends a cent for anything.

If we who live in cities are fit for self-government the opportunity to demonstrate the fact is still with us.

The Master of the Rolls

IN THE days before printing the old records were always written in a form which made them literally a roll. One sheet of parchment was used and the next one was sewed to its bottom edge, and the process repeated until a document might consist of a hundred or more sheets, or skins, as they were then called, all sewed together in one long strip. A piece of wood was then fastened to either end in the manner of a modern map and the strip rolled up from the bottom into a great roll or bundle. The reader began at the top, slowly unrolling one end as one rolled up the other end on another stick.

From this form rolls came to stand for manuscripts, particularly official manuscripts or court records. The Keeper or Master of the Rolls was then the high officer who kept the records of the English Courts of Justice. Today, the president of the chancery division of the High Court of Justice in England, ranking next to the Lord Chief Justice of England, is called the Master of the Rolls. Originally the Master of the Rolls had the custody of the records but in the course of time this charge became merely nominal.



SUPERTWIST *was conceived, perfected and named by Goodyear, and is used only in Goodyear Tires*

An Exclusive Advantage

SUPERTWIST gives it to Goodyear balloons

In its earlier phases the balloon tire situation was somewhat confused; no one tire stood out from the field as distinctly superior.

Today, however, a man would have to be quite out of touch with current affairs not to realize that this condition has definitely changed.

Whether you talk tires now with people in the cities or in rural districts, you find an impressive unanimity of opinion and preference.

That opinion and preference emphatically indorse Goodyear balloons as the forem st example of combined durability and comfort yet offered in the low-pressure tire.

The widespread belief that Goodyear balloon tires are distinctly more serviceable has its roots in the tires' own splendid performance.

Important in such performance is the exclusive advantage Goodyear balloons enjoy in the now celebrated cord fabric, SUPERTWIST.

This remarkable material, developed and perfected by Goodyear, does things for the balloon tire which are virtually indispensable to superlative service.

Its superiority lies in its greater elasticity; it far outstretches the breaking point of standard cord fabric.

When a Goodyear Tire made with SUPERTWIST strikes a stone, the elastic cords give to, rather than resist the impact—stretching and recovering under the shock, like rubber bands.

This elasticity distributes the blow over a much greater portion of the carcass, minimizes any chance of cord breakage, and safeguards against stone bruise and similar injuries.

It gives the famed ability of the Goodyear Tire to wear long a full chance to function, independent of the likelihood of its life being shortened by mishap.

All Goodyear Tires, and Goodyear Tires only, are now made with SUPERTWIST—which is perhaps why, more than ever, more people ride on Goodyear Tires than on any other kind.

Yet Goodyears cost you no more.

Good tires deserve good tubes—Goodyear Tubes

GOODYEAR

Why Should Not Farming Pay?

Is It Because of Incompetency or Wrong Conditions in Management?

By GEORGE H. BROWNELL

WITH the utmost confidence I make the prediction that, since the lives and the business welfare of our people depend on our food supply and since the present producers of that supply have shown themselves to be incompetent for the task, there is surely going to be a food supply provided for this country by other men and other methods.

The good old force of Human Necessity always gets what it goes after. Men and their families must eat. They will have food. It is food that stands first in the list of their wants. And if these men, now engaged in countless forms of making a living in the cities, are faced with a situation wherein their food supply is jeopardized or is costing them too much, they are going to do something about it.

There will be no sudden exodus to the country; no "back-to-the-farm" stampede. There will be no conscious thought on their part that what they are doing is to insure a sufficient, lower priced supply of food for themselves. Human nature does not respond to calls to duty. Human nature responds to the call of necessity, the beckoning of the finger of opportunity, the chance to better oneself in a new occupation or a new form of investment, either with or without attached employment.

Where human necessity exists, that necessity is bound to be supplied both as a measure of self-preservation and as an opportunity for capital investment.

The money and brains that other industries have so long commanded will flow into agriculture because, first, business in general cannot longer be profitably conducted in a country afflicted with a sick agriculture; second, because there is, even now, a genuine opportunity awaiting in agriculture for the profitable employment of capital.

Farming will be surely, adequately and profitably conducted in this country by the same methods that our other large industries are conducted. Not tomorrow, or next month or, probably, to any great extent within the next ten years. But it is bound to come if this nation is to continue to thrive and live.

There will be no sentiment, no patriotic appeals or help-the-suffering-brother stuff about it. Capital is cold, logical, inexorable. Capital will go into farming for the purpose of safeguarding its present holdings and also for the purpose of making money.

Guided by experience gained in other forms of industry, it will employ the advantages of large-scale production to reduce the prices of farm products and thus increase consumption.

Food will not only be cheaper, but we shall have an even wider variety of food products available to all of the people. Over-production will not be entirely eliminated, but its effect will be much less harmful than it now is. All business ventures suffer a loss at times, but the loss is offset by good fortune attending the manufacture or sale of other products in the line.

No longer will it be possible for millions of wrongly located, poorly equipped farmers to operate by dint of self-sacrifice and public subsidy.

The output of the correctly managed, amply capitalized farm will be sold at a price so much lower than the output of these inefficient farms that it will be impossible for the latter to continue in business.

The host of expedients, subsidies and a low standard of living, now employed by their owners to keep these farms in operation, will no longer be effective in accomplishing that purpose.

The holders of the mortgages on these farms will no longer regard their investments with the same favor when, in the same county, there is located a farming corporation whose securities pay a larger dividend to the holders.

All other industries, except in the matter of wages, have been compelled by fierce competition to reduce costs to lowest level. Not so in farming. Prices of farm products are high because of the enormous wastage and inefficiency in methods of operation. Prices will be lower—and farming will become profitable—when agriculture is

operated in the same efficient, intelligently competitive manner that our other industries are operated.

The entrance of skilled management—and capital that demands skilled management—into agriculture will be brought about gradually by the increasing inability of more and more of our present-day farmers to continue the battle to make a living.

More and more of those poorly located, worn-out farms—described by my Michigan friend as a "cheap place to live"—will be abandoned. The cities will absorb some of their owners and tenants; others will be given employment by those farmers who run their farms as factories.

Hard-hearted? Not a bit of it. The greatest kindness that can be done several million farmers in this country is to take them out of an employment where they can never succeed and put them at jobs that will pay them a regular wage sufficient to give them some of the good things of life.

There are going to be fewer farms and fewer farmers in this country. And, despite this seeming contradiction of economic law, the price of even the better class of farm land will not greatly increase.

The reason for this paradoxical situation which I predict is that farming is due to become a highly specialized business, capable of being adequately conducted on half or two-thirds the number of acres now under cultivation. A farm will be valued according to the profit it will show on a balance sheet. When it is seen that a farm cannot make a profit, it will be thrown on the market and thereby become an influence tending to decrease the price of all farm land.

Farming will become a specialized, highly intensified business but the capital and good management that go into it will not be content with the operation of a farm of present-day average size. There will be absorption and amalgamation of small farms into large units of a thousand, five thousand and more acres directed by an able chief from a central office located in a city or village.

The farm hands will live in the cities—except those employed as watchmen in the absence of the working crew. One of them may be the man next door, the fellow with the healthy coat of tan who, you supposed, was an ardent golfer. They will journey out each day to their respective tasks and come home at a regular hour each night—except on a few days in time of special effort when they will work later just as the boss or the bookkeeper in an office does at a busy time.

All this is not theory, a roseate picture painted to illustrate what may be considered a hobby of mine. Right now, in this country, there are scores of farming enterprises, conducted on a similar large-scale plan, that yield their owner, or owners, a bounteous profit. But there is little heard of them or from them. They make no outcry against the oppression of the farmer by alleged "sinister interests." They ask nothing in the way of help or preferment. No politician is able to weep tears in describing their downtrodden condition.

> ¶ Farming will become an organized industry. The result will be cheaper food prices and larger farm profits. But the old-time method and the old-time farmer will disappear. Nobody decrees this; it is simply occurring. It is the way progress is moving. The man who succeeds is the man who can see what is coming.

Let us take a few figures—as few as possible—out of the Census of 1920 and the Farm Census of 1924.

According to the Census of 1920 there were in this country a total of 6,448,343 farms occupying a total of 955,883,715 acres of land, or an average of 148.2 acres to the farm. There were 503,973,007 acres of improved farm land, or an average of only 78 improved acres to the farm.

The value of all property comprising these 6,448,343 farms was only $12,084 per farm, which average value was determined by figures secured during 1919 when all values were at their highest.

While this 1920 average value per farm of all farm property is too high for today, the fact remains that even this inflated figure represents a unit of capital too small in size for profitable operation in a business with so small a turnover. Moreover, this figure includes the value of the farm home; whereas in the case of the small tradesman, or any other business enterprise, the value of the home is not included as an asset of the business.

Some equally illuminating figures are to be found in that section of the 1920 Census giving the number of farms, by size, that are included in the total number of nearly six and one-half millions:

No. acres in farm	No. of farms
Under 20	796,535
20 to 49	1,503,732
50 to 99	1,474,745
100 to 174	1,449,630
175 to 259	530,800
260 to 499	475,677
500 to 999	149,819
1,000 and over	67,405

These figures show that there are more farms of a size between 20 and 49 acres than of any other size. There are about the same number of farms each in the divisions of 50 to 99 acres and 100 to 174 acres. Beyond 175 acres the number of farms in each division falls off rapidly; approximately 68% of the total number of farms are to be found in the three divisions embracing the farms of from 20 to 174 acres in size.

According to the Farm Census figures of 1924, each acre of the average farm in this country returned during that year only $18 worth of farm products or a total of $2,691 for the average farm of 148.2 acres.

The Greek delicatessen owner, of whom I have spoken, tells me that he has "mebbe two-t'ree t'ousand" invested in stock and fixtures. Upon satisfying himself that I had no connection with the Department of Internal Revenue, he stated that his sales averaged around $60 a day or a total of about $22,000 for the year which, with him, means the farmer's year of 365 days.

He would make no direct admissions as to net profit, but a member of a wholesale grocery firm with whom he deals told me that his customer discounts all bills and should easily earn a net income of close to $5,000.

This net income of $5,000 is his salary and profit on his investment. In addition, his family of five is supplied entirely from the stock of the store and any family man, these days, will concede that the food for two adults and three children for a year will cost close to another thousand, even at wholesale prices.

The Greek gentleman is doing a gross volume of business of about $22,000 a year on an investment of, say, three thousand. The average farm in this country, in 1924, raised products to the value of $2,691 with an average investment in land, buildings, equipment and livestock which I will estimate at $10,000, since this average investment was given as $12,084 in the 1920 Census to cover the boom-time values of the preceding year.

The Greek turns a good part of his stock into cash every day, much of it within thirty days and only a small part of his stock remains on his shelves as long as six months.

Farming can never be conducted in such manner as to follow the quick-turnover plan of a retail store, but there is opportunity for infinite betterment. Crops require time in which to grow; animals require time in which to develop into marketable or milking condition. But the successful farming system of the future will be the one that combines the daily turnover system with the too-prevalent present one-crop turnover system.

The Cloisters—a Monastery-Museum

The Metropolitan Acquires Famous Collection of Antique Gothic Sculpture

By LEONORA RAINES

AMERICAN lovers of art are satisfied now that the Metropolitan Museum of Art has annexed the famous Cloisters of George Grey Barnard, the collection of antique Gothic sculpture at Fort Washington avenue and One Hundred and Ninetieth street in New York. The gift was made by John D. Rockefeller, Jr., who paid $600,000 for the building and museum. The Cloisters is a long way from the Metropolitan, but it will be maintained permanently as a separate branch of the Museum of Art. The Fort Washington building and contents could hardly be separated. They, with the wonderful scenery about, make the Cloisters the most unique antique collection in America if not in the universe.

Mr. Barnard could not have chosen a more romanesque spot for his monastery-museum than that overlooking cañon, forest, and rocks on one side, and the Palisades of the Hudson on the other. It is opposite the site of an old convent and not far from a place known as "Castle Home" on Riverside Drive. The locality is where painters go for long lines, steep precipices, columnar trees. The hills, that are as savage and apparently as untouched as though a part of the "forest primeval," make a background for the sculptures that are as venerable as they.

One catches a glimpse of peaked Gothic turrets from the road, and the sense of the curious is further quickened by the sight of a garden full of old-fashioned flowers growing where and how they will. The severe, unornamented building like a vine-covered abbey makes varying shadows, and as you enter the moss-covered inclosure, a wave of regret rises in the heart as though sacred sod were being trodden on, as though others had long left their atmosphere of turmoil and tragedy. There is reason in the impression, for the spot, while the newest in the Heights, is the oldest in New York, since all along the cliffs, fighters and signers of American Independence fought their fight and stained the hills with their blood.

The gray-carved Stations of the Cross mounted in the lichen-stained wall prepare a visitor for what may be seen within, for the most illuminating and significant lesson in religious architecture ever offered art lovers is there. The building was designed and personally directed by Mr. Barnard. His ignorance of academic rules as well as absence of outside influence was counterbalanced by his experience as a sculptor, by deep feeling and reverence for his subject. Love for each stone and its suitability with the setting—this makes the structure the absorbing and perfect thing it is.

Masons were called on to use wit and help make a harmonious placing for the treasures, and their interest in and reverence for the idea proved their response. One part was torn down and rebuilt many times, for George Grey Barnard felt that the placing for what the statues were originally intended was not consistent. Catholic churches of the Medieval Age were dedicated to art and beauty as well as to piety, and this blending is highly accentuated in the Cloisters.

To all intent and aspect the building is a sacred edifice; divine service could be held there by a formality of consecration, but the sculptor's plan is that its message be educational and descriptive rather than religious. It was erected not only to preserve fragments, but that sculptors and students of art might study the methods employed by masters in one of the finest periods of sculpture creation. From conviction, we all know that no student profits where his emotions are dormant, and from a practical standpoint, if from no other, the objects in the collection are a living lesson in art.

To overcome the crude, hard building brick, the hose was turned on the walls immediately they were laid and before the mortar had dried. This washed some of the lime out of the brick-filling, and as a consequence it is an old Italian rose and appears grim and moldy with time. The building is as austere as the Church of San Damiano in Assisi, but the structure was put up without a model, built by its own laws which were to cover and become part of the architectural fragments. Museums that are built and later filled with a mass of objects, no

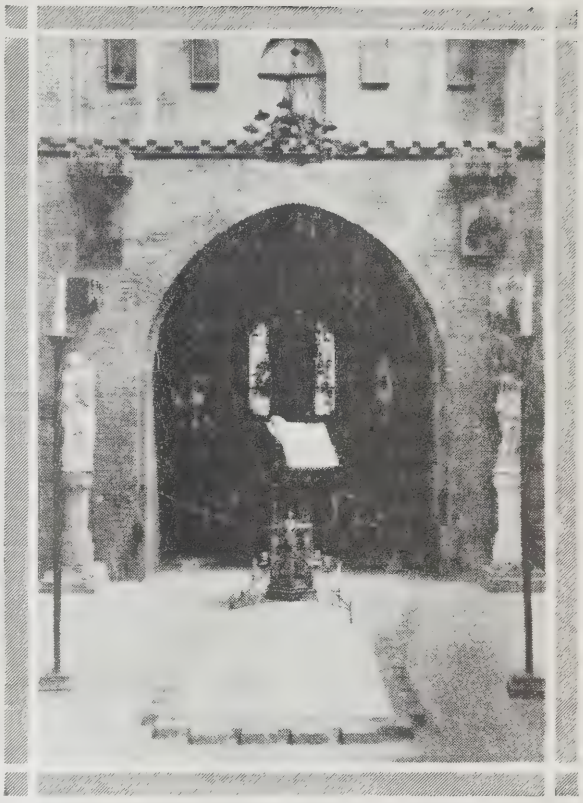
matter how precious, pull one's sentiments different ways, and the opposite of this impression is true in the sympathetic purpose and relationship one stone bears to its neighbor in the Cloister.

Coming into the monastery-museum from the road, one can scarcely believe one's eyes—leaving the twentieth century sunshine to fall into this edifice with its thirteenth and earlier century characters. The building with its contents is more than an art museum, for it is organized with cosmogonic power of imagination, combined art and philosophy. It concentrates the Gothic means of expression as a people of the epoch, and it is Gothic in its purest form. Not a single detail of an old Gothic church is overlooked in the apparently old half-ruin that caps the hill at Washington Heights.

Figures and slabs at the Cloisters are virile, human, vigorous, as was the grand old age from which they sprang, and the museum has an unusual purpose in that it appeals to every class of society and to people of every Christian civilization. Every step of Gothic art is descried in the collection—statues, stations, capitals, columns, carved relief. A feeling of deep reverence is felt as you enter. Both soul and sense are appealed to. You see the Old World church and characters in a sympathetic lighting, if not from sunlight, then from long candles that throw a gentle glow. There is a mellowness of centuries blending with the dim reflection (like all old churches the windows are small) of day, and the ghostly radiance of a lamp of the sanctuary carries out the religious impression.

I first visited the Cloisters at the close of a winter's day. Members of the Archeological Society were there to celebrate the anniversary, and, for the fête, the interior was in vesper garb. Incense was burning. Candles flickered. Smothered in a chapel was a modern music box that repeated Gregorian chants. It was as a scene in an old Italian abbey, the music from unseen singers like a choir of angels. People moving about looked like phantom monks. A sacred rite or a slumber of the dead was in progress, or so it seemed—such was the influence of the old stones and objects. The picture was full of calm repose and solemnity, a picture that is ever living, for any day the guardian draws curtains if the interior be too bright, and if visitors ask, he turns on the music.

Windows filled with thirteenth-century glass, the secret of making which was lost before America was discovered, old church lamps and slabs help supply the atmosphere of a religious inclosure. Capitals of great beauty represent a transition in architectural life, as they are a blending of the classic Corinthian and Byzantine, while at the top are traces of Arabic influence. The statue of St. Denis, first bishop of Paris, holding his head in his hands, immortalizes the legend that, after the bishop was beheaded, his arms grasped the head. There is a slab of a knight and his lady, of the four-



Interior, showing east end.

teenth century, in the floor over a supposed tomb. One of the five black virgins known to sculpture history is there. There are stone gargoyles in all their hideousness; the Way of the Cross, chapels, choirs, tomb slabs—all these are there and have the architectural environment that once surrounded them. George Grey Barnard has reconstructed and visualized the notion of the Gothic Age. Patterns that the Gothic molders adopted from the Moors are in abundance. The entrance columns date back to Charlemagne. The Emperor, it is said, had two nephews—William the Short Nosed, and Roland who blew the famous horn at Roncesvalles. The tragic death of Roland turned William's thoughts to religion. He became a monk and built a monastery in the Herault, the first material help for which was given by Charlemagne. It is from the monastery given his name "St. William's-in-the-Desert"—which he built with the aid of monks and sculptors—that the columns have reached America to perpetuate William's memory.

Mr. Barnard was cabled to return home, but leaving debts and unfinished work did not appeal to him. Weighing the matter, he decided to settle the unpaid wages and make the money himself to do it with, knowing it was but a question of time when things would be righted in Philadelphia. He had seen bits of antique Gothic somewhere, he knew their artistic and intrinsic worth, and he meant to profit and make his discovery pay. The year previous to the Pennsylvania trouble, he had caught a glimpse of carved bits in the woods, picnicking with his family. On that day spent in the

The Cloisters, west facade.

forest, the picnickers spread their lunch near the creek of an ancient battlefield, and nearby was a denuded ruin. Always on the lookout for good bits of carving, the American inquired at a hut if anyone knew what had become of the stones of the church, but the peasants could give no information. Mr. Barnard then started on a tour of inspection. He walked round the place and came upon a pile of soil in which he discovered a statue of the Virgin. In another, he found ruins of a fourteenth-century cloister that had probably lain in the field since the French Revolution. The peasant had inherited or purchased the land with everything on it, and the "stones" were looked upon as so much impedimenta. In every case the owners were pleased to dispose of the "rubbish" to the foreigner.

Once Mr. Barnard began the search for stones, he combed Europe for them. The exquisite marble cross in the Cloisters was unearthed from a tanner's pit somewhere in Italy. He used the same methods of detecting in all countries. The Stations of the Cross formed part of a ruined Spanish wall—these relics that were sculptored a thousand years before the thunder of cannon echoed across Fort Washington.

When Pennsylvania reverses came with the collapse of work and the American was practically thrown out of a job, he thought of his statues and felt it was time to sell. There was no demand for such, for the antiques had never been on the market. But he meant to create a demand by introducing them to trade. The history of ruins of old cathedrals and buildings is ever the same, for there comes a time when the material is used over and over again, and the architecture of a new building so studied as to form just proportions according to old fragments. Instead of being put into structures in Italy, France and Spain, however, peasants in the vicinity of ruins had appropriated and concealed the spoils. When he found ruins composed of heaps of worthless things, George Grey Barnard learned to search through fields and forests of the ancient site, and invariably found something advantageous.

Every cellar near the site of a former church or cathedral was carefully examined, and some of the best statues were laid bare by light thrown from a candle.

After Pennsylvania had paid its debt for the work assigned, Mr Barnard began the Cloisters. He wished students and lovers of antiquity to benefit by his finds, so conceived the idea of placing all carvings together in a suitable place with appropriate background and surroundings. At that time the public knew nothing of his store; he had not a private fortune, and to pay for the land and erect a building, he sold some fine pieces, among them a beautiful statue of Joan of Arc. The result of the sale was the money that felled the first tree and paid for the first load of brick for the Cloisters.

The Thrill Around the Corner

(*Concluded from page 14*)

ever pulled as many people to one game as the slugging giant of the New York Yankees. They come to see him strike out or smash the ball farther than any other man in the game can possibly hit it. And there is always the possibility of Ruth "meeting one on the nose."

Baseball is constantly producing new stars. The public had to watch a parade of mediocre outfielders to discover a Cobb, a Ruth, a Speaker, a Youngs, a Roush, or a Wheat. It was bored by a procession of dull and listless infielders before Collins, Hornsby and Frisch bobbed up. It was some time before a Mathewson appeared on the baseball horizon and his successor still has to arrive. There was a long gap between the speed of Rusie and the speed of Walter Johnson. But none knows on what day of any playing season a new star will begin a brilliant career.

Football holds the same promise. Great players are not frequent in football; good players are. When Willie Heston unlaced his cleated shoes for the last time twenty years went by before the Middle West produced another super-back. He arrived in the person of "Red" Grange, the Illinois comet. Heston was a better player than Grange but Grange is still the only back since the day of Heston that can be placed among the gridiron immortals.

More than 15 years have passed and football has not seen the equal of "Germany" Schultz as a center. It has been a longer time than that since Hinkey played end for Yale but the game has still to show another end his equal. Twenty years have failed to produce a fellow for Walter Eckersall at quarterback.

No one knows on what afternoon one as good, or greater, will appear. None can tell exactly when there will arrive a match for the immortals of the seasons gone by. It may occur in any game at any time. While none can tell all are interested.

Imagine the number of men that play polo! Imagine the thousands that watch the game played! It took many years before America produced a Devereux Milburn and then a Tommy Hitchcock. Hundreds swung mallets before one reached the desired heights. It is worth while waiting for one like Milburn or Hitchcock. It is worth while sitting through polo matches year after year to come upon a Luis Lacy in a heroic rôle such as he played in the last international cup matches on the Hempstead Plains at Meadow Brook. There was something highly inspiring about the courage and the mechanical skill of this determined invader, something that rarely comes in sports.

Golf tournaments attract thousands. Some years ago there appeared in the East a 14-year-old player from Atlanta. Since that time he has been open and amateur champion of his native land. Who knows when tournament play will bring to the tee another Bobby Jones? With the vast number of boys playing golf his fellow may arrive at any tournament. The game has constantly increased its list of star players.

The thrills and upsets that are memorable arrive only upon rare occasions and it is the hope and expectancy of seeing one of these classic pictures and witnessing one of the soul-stirring plays that brings the masses through the turnstiles.

It is the thrill around the corner.

A "Police Court Case" in Pago Pago

AN ELDERLY, dignified Samoan chief walked into the court room in the Administration building in Pago Pago, leading a small, stockily built native, and marched up to the desk of the American judge.

"This man is a member of my family," said the chief, "and he won't obey orders. So I have brought him to you."

"In what way does he fail to obey orders?" inquired the judge.

"He won't bring in food to me."

The judge eyed the culprit, an unusually small man for a Samoan, and the latter grinned pleasantly back.

"Do you belong to this chief's family?" the judge asked.

"Yes."

"Don't you know your Samoan custom; that you are expected to do the work your chief gives you to do?"

"Yes."

"Then why don't you go out and get the food as ordered and bring it in to him?"

"I do go out and get it," responded the small culprit blandly, "but I don't bring it in because I like to eat it myself."

"Under the Samoan custom," said the judge, suppressing a smile and rapping for order in the court to stop a general laugh, "if you don't obey the orders your chief gives you he will throw you out of his family. Then you will be an outcast and a wanderer and no one will lift a hand to help you at any time. You had better control your appetite."

The culprit's grin faded to a look of dismay. In Samoa it is the deepest disgrace to belong to no family; a slander unjustly to call a man a wanderer; utter misery to be one. The small man abjectly promised to obey orders. Discipline thus restored, he and his dignified chief walked out of court together and away toward their village, in brotherly amity.

The U. S. Takes the World's Defectives

(*Concluded from page 15*)

year by year. Reports of experiments conducted by institutions and reformatories are discouraging, in so far as efforts to educate the subnormal or to correct their unmoral and criminal tendencies as a class are concerned.

The United States is harboring a population of 14,000,000 foreign-born with their 16,000,000 children, all introduced through immigration channels and comprising, when taken together, approximately 20 per cent of our total national population. If that prolific blood is tainted it will most assuredly become a liability of no mean proportions, but, if on the contrary it can be restricted to the fit and virile, we can count the invasion of the immigrant an ever-growing asset. By strictly enforcing the exclusion clause of the Immigration Act, and admitting only on the basis of mental, moral and physical fitness and maintaining the legal barriers against unassimilable races and peoples, much may be accomplished to correct past evils.

Some Enlightening Information Regarding Drafts

Since the close of the war a study of the deferred classifications of drafted men compiled by the War Department has furnished an additional indictment against the immigration authorities and a shock-revelation to the theoretical apostles of the melting pot. In reply to a request to the Surgeon-General's office for exact figures with respect to nativity, the following exceedingly enlightening information has been furnished to supplement the already sufficient evidence necessary to demonstrate that immigration may not be dissociated from any single social or economic problem of the nation. The Surgeon-General states:

"According to the Second Report of the Provost Marshal General, covering the period through September 11, 1918, the number of men from 3,764,101 Class 1 registrants, first and second registrations, who were placed in the remedial group was 8,436, in the limited or domestic service group 339,377, and rejected as physically and mentally unfit for all forms of military service, 521,606.

"Our study, published as 'Defects of Drafted Men,' covering the period through November 11, 1918, shows that the latter group was 549,099. In addition to this number, approximately 7 per cent were rejected by the camp boards as physically or mentally unfit for all forms of military service.

"The report of the Provost Marshal General does not report the number disqualified by foreign or native born. Unfortunately also there was no space provided on the form for reporting the physical examination to record the nativity of the registrant. Consequently, in compiling our statistics, it was impossible to assemble the material by race. . . . . We feel in some respects the material assembled for these groups was more striking than if it had been possible to assemble the data by pure racial groups, since it shows to what an extent the general population is affected by the infusion of a comparatively small percentage of a foreign population.

"In this study, both foreign-born and those born in this country of foreign parents are grouped as foreign."

It required five hundred years for the British Empire to establish a national type, while now in the fifth century since the birth of our nation we are in grave danger of domination by alien customs, languages and characteristics.

Statistics show that before the war in Germany there were only five murders to each million of population; in England less than nine; while in the United States there were 118. In 1919 a study of homicide statistics, conducted by the Prudential Insurance Company for 31 cities in the United States with a total population of about 20,000,000, shows:

"That the death rate from homicides in these cities increased from an average of 8.2 per 100,000 during 1909-1913 to 8.8 during 1914-1918 and to 9.1 during 1919."

The significance of these figures becomes apparent when it is pointed out that this increase *immediately followed the decade of highest immigration in the history of the country*, and that it was during these very years that immigrants were being admitted through Ellis Island at the rate of 1,200 a day and being passed as to their mental and physical fitness at the rate of ten, twelve, and fourteen a minute.

It has long been a recognized fact that crimes of all sorts are more numerous in the United States than in European countries. Based upon the census of 1910 it was estimated that:

"Crime, its detection, prevention and punishment had cost the American people $6,000,000,000 per year," and upon the same authority "based upon the increase in population and the rise in cost of living the 1920 census would show expenditures as lying between $8,000,000,000 and $10,000,000,000 annually."

Immigration and the Crime Increase

Further to illustrate the relationship existing between immigration and crime it can be shown that between 1890 and 1900, the *third lowest decade* of immigration in the history of the country, while the population of New York State increased 21.2 per cent the prison population *decreased* 6.5 per cent during the same period of time. Witness, however, the complete reversal during the following decade. From 1900 to 1910, the *decade of highest immigration during the past one hundred years*, the population of New York State increased 25.4 per cent while the *prison population increased* 37.6 per cent. The report of the New York State superintendent of prisons for the year 1910 (following the highest decade) states:

"The increase in our prison population clearly shows that it is due in a large degree to the admission of foreign criminals to the country during the past few years, and more than 54 per cent is chargeable to this direct cause."

Many Should Never Have Been Admitted

The criminal residue following the highest decade of immigration for New York State is illustrated as follows:

1910	Total prison population	4,610
	Foreign born 40 per cent	1,851
1914	Total prison population	4,954
	Foreign born 40 per cent	1,997
1917	Total prison population	4,520
	Foreign born 40 per cent	1,811

Including cost of trial and conviction which averages $1,000 per capita per convict, to which must be added the cost of maintenance, the taxation for alien criminals may well be considered formidable, and should furnish the thoughtful taxpayer food for thought. *That a high percentage of these criminals should never have been admitted to the United States is conceded by prison authorities, government officials and investigators alike.*

In a comparison between statistics of insanity and crime in the seven states having an insane population of more than 10,000 and an average immigration of more than 25,000 up to and including January 1,1917, the following relationship is established:

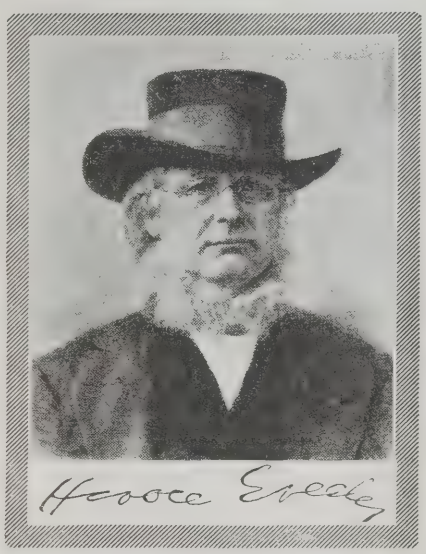
Insane in institutions in the United States by states:	Jan. 1, 1910	Jan. 1, 1917	Av. yearly Immigration
New York	31,280	38,117	234,089
Pennsylvania	15,058	19,436	115,510
Illinois	12,839	16,354	68,722
Massachusetts	11,601	14,096	68,117
Ohio	10,594	12,307	42,003
Michigan	6,699	7,377	36,175
California	6,652	9,698	25,504

The United States has room for millions of mentally and physically sound immigrants whom it can well afford to protect and educate from an economic point of view, but the financial resources of the government should not be applied to an unnecessary and finally useless expenditure for the maintenance of the constantly increasing numbers of alien dependents and defective criminals.

Horace Greeley's Greatest Failure

A Community Ownership Scheme in Pennsylvania Which Ended in Frost

By JOHN T. FARIS



IN 1842, when Horace Greeley was editor of the New York *Tribune*, his eagerness to benefit his fellows led him to the wild lands along the Lackawaxen River, a stream in Pike County, Pennsylvania, which the Indians called Swift Waters.

There was neither canal nor railroad when Horace Greeley looked in that direction to make a practical test of his doctrine of community ownership of property which he had been urging editorially. The Sylvanian Society was organized, and the purpose was fixed to establish a settlement on the lands of Mahlon Godley, who owned seven thousand acres in the wildest part of Pike County. He had built a sawmill and a gristmill on a branch of Shohola Creek, a tributary of the Lackawaxen, and had named the little village that clustered about them Godleyville.

The stock in the company totaled ten thousand dollars, and shares cost twenty-five dollars. Every member of the society must own at least one share. Greeley was the largest stockholder, and he had as associates many prominent men and women.

Representatives of the society went among the trout and rattlesnakes, which were said to be the most reliable products of the place. The first comers, acting for the society, improved the mills, and erected an immense pine structure, which contained the living apartments of the matron, a common dining hall, a social hall, and workrooms. Then other manufacturing establishments were added, including a wagon-maker's shop, a blacksmith shop and a shoe shop.

The seeds of trouble were sown almost at the beginning. Among the three hundred residents were some who did not like equality of labor. Then there were the stockholders who seemed to look on the colony as a convenient repository for wayward sons. These young men were not only otherwise difficult to handle, but they did not like work; they rebelled against the idea that they were subject to direction, and that they were not at liberty to wander away in search of a good time.

The inevitable result of the labor difficulties was apparent when the first season's crops were gathered; then it was found that not nearly enough had been grown to provide for the necessities of the colony. The dissatisfaction caused by the short crop of grain was increased by the good crop of rattlesnakes. It is related that a colonist brought in seventeen large rattlers in a single day, and that the foreman of the colony shoe shop was able to make a pair of slippers from the skin of one of them. These slippers were presented to Mr. Greeley when he paid his next visit to the colony.

In 1845 efforts were redoubled. Lands were cleared. The product of the factories was increased. Shoes and wagons especially found a ready market. Many who had remained were encouraged to think that the hardest days were past.

Everything depended on the crops. For weeks the fields looked well. But July 4 everything was black and dead; a blighting frost, the worst ever known in that county at that season, had visited the Lackawaxen valley in the night.

The colonists read the doom of the settlement, and they hastened to leave. In two days not one was left. Each took his goods and went his way. The colonists had deserted.

It is related that one of the colonists was a farmer who had sold his farm for eighteen hundred dollars and had invested all in the Sylvanian Company's stock; his faith in Greeley was so strong that he thought the project fathered by him could not fail. After the collapse he hurried to New York, and found Mr. Greeley in his sanctum. There he proceeded to tell him what he thought of him. But Greeley—who had been deeply grieved by the failure of the experiment—quietly asked him how much he had lost through the colony. When he told the amount he wrote a check and delivered it to the farmer. The man's faith in Greeley was greater than ever.

The mortgage of three thousand dollars on the colony's property was foreclosed, and a new owner appeared who did much to develop it. But it has since passed through many hands, and all trace of the buildings has disappeared.

A home of a pioneer.

The Philanthropy of Business

(*Continued from page 7*)

ing frantically far above the glow of the red hair and redder face. "Wouldn't it be a good plan to put some wet sawdust on the floor?" I suggested.

"Sawdust is five cents a bucket."

I gave him thirty-five cents. "Get some furniture polish, too," I directed.

Within an hour the Boy Problem had become triplets. Before long I stopped counting—the street was full of it. "See here, Lynchie," I said to my first applicant, "we can't find jobs for everybody in the ward."

"Leave it to me," was the untroubled response, as he swung the wagon spoke with professional grace.

I did. They finished putting up the posters, dusted and polished the chairs, printed dodgers and programs. Having been a printer in my younger days I had installed a press and type to cut down advertising expense. They started to distribute the printed matter through the neighborhood. "Lynchie" gave jobs to as many as he could. A host of others stood around, longingly.

"He thought I was after a contribution and turned me over to his clerk."

Two of the distributors came back with uncirculated advertising. "De cop stopped us," they announced.

I took the matter up with the officer on our corner. "What is the law?" I asked.

"Use your common sense," was the laconic reply. "Have the kids tell the cops, 'It's all right—Dennis says so.'"

The police sergeant swept away my last legal scruple, a few days later. He saw me refusing admission to children who were trying to purchase tickets.

"What are you turning down all that perfectly good money for?" he asked.

"They're too young. The law says no child under sixteen shall be admitted unless accompanied by parent or guardian," I explained.

"Oh, h——, let 'em in!"

It was the last of May when the "grand opening" took place. The first customer was a boy. I told him that I appreciated his patronage. I'm glad I did, for the machine balked and he had to wait an hour before the first picture started.

That summer was a bad season for motion picture theaters, except the open air places. The first week I lost sixty dollars. By the Fourth of July my reserve fund had been drawn on heavily. Saturday and Sunday were the only days when the receipts equaled the expenses.

Although business was so bad there were several encouraging features. Evidently I had correctly judged the neighborhood's taste in pictures. It liked war dramas, with patriotism rampant, and lively comedies. I was astonished to find that it liked, best of all, pictures in which religious sentiment was strong. Men and women would go out with eyes wet after some especially strong presentation of the great, fundamental truths of religious experience. *I gave them what they wanted.*

For music, I started with a blind pianist. He kept up-to-date by visiting music publishers and hearing the newest songs. He was one of a large family and one of the others was always at his side to tell him what was on the screen. His music went well enough with the crowd, until his prompters grew careless. One day a news film was on the screen. King George of England was assisting Queen Alexandra from a carriage. I was horrified to hear the blind boy suddenly shift to "All Night Long He'd Call Her Snooky Ookums!" Shortly afterward I installed an electric player piano.

It made a hit. The grand opera selections went well with the dramatic pictures and there was a good selection for every film. One day when a deathbed scene was about to appear on the screen I started "Hearts and Flowers," and softened it to a whisper. The effect was electrical. Here and there tears began to fall. Then women sobbed.

After the picture Lynchie came to me. "Ain't that a pretty piece!" He exclaimed feelingly.

"Do you like it?" I asked.

"Yes. It's awful nice when anyone's dyin'. A nice place indeed."

Just as business was getting on its feet, a city ordinance was passed which prohibited standees.

Late in October I conceived the idea of showing the greatest picture which had been produced up to that time—"The Battle of Gettysburg." It was being shown in large theaters at prices far above those of the neighborhood houses. The picture must be shown in my house at my usual low price, if at all. It would triple the day's expenses but I decided to take a chance. The prospects were good.

Thanksgiving Day was the logical time. I could open at ten in the morning and if I had good luck I might take in enough to cover expenses.

After the film was engaged and the advertising circulated, I received a tip from a friend that the "big boss"—meaning the chief of the city fire department—was about to make a personal tour of inspection of all the motion picture theaters.

I spoke to Dan about it. "You can't believe all you hear," he said, "but it's just as well to be careful." However, I decided to go on as usual.

At ten o'clock on the morning of Thanksgiving Day, there was a crowd of a hundred and fifty waiting to be admitted. Before we had run the picture through once, the house was full. By noon it was packed. Every inch of standing room was taken. I wondered if I had done wisely in trying to get along without a special officer. I had never employed one and my people had justified my confidence in them by helping me to make my theater the most orderly in the district, but today there were hundreds of strangers.

The picture kept excitement up to a

high pitch. Every time anybody got in anybody else's way, or trod on some other person's toes, I feared a ruction, but all through the afternoon and into the evening everything went smoothly.

At 8:30, when every person who could by any possibility get into the house was there, and there was a long line outside, Inspector Dan wedged himself in through the emergency exit.

"Get these standees out!" he whispered. "The chief is around the corner—be here in five minutes." And he wedged his way out again.

Gathering the ushers I told them what we must do. I set them an example by whispering to some of our old customers: "The fire chief is coming. We must get the standees out, quick!"

It was marvelous how quickly they responded. From mouth to mouth the message ran. In two or three minutes the whole crowd of standees was moving quietly toward the doors. We handed them return checks as they went out.

A big red auto whirled around the corner. Dan came in again, bringing two strange firemen with him. They shoved out the few standees who were not quite out the door and followed them out to where the chief was sitting, unconcernedly smoking a big cigar.

"How does it look inside?" asked the boss.

"All clear—see for yourself." Dan pointed to the door.

"Good. Where's the next one?" I leaned limply against a post as they whirled around the corner, and my crowd came trooping back through the doors.

I was what the boys called "shook." From five o'clock in the morning I had been on my feet continuously, with only a hastily snatched luncheon and no dinner at all. Lynchie's voice had a touch of anxiety in it as he piped up, "Yuh better empty de bowl again, boss." He referred to the pint bowl I had brought down to hold the overflow of small change.

Lynchie had worked as hard as I. "Had any dinner?" I asked.

"Yep. Three pretzels and a lollypop —got 'em off de candy boy," he answered. "You take de money upstairs, we kin run the show. Youse needn't hurry back."

Everything was running smoothly, from ticket window to piano. I was glad to get away for a few minutes. I took the cash and climbed the stairs to my apartment. The bowlful of change appreciably enlarged the pile on top of my desk, but I was not thinking of money.

I was thinking of my experiment in doing good; of the four thousand and more boys who had come under my care during my fifteen years as a "social worker" and of the forty who were members of my picture show organization.

Every type in one group was represented in the other. The boys with whom I was working now came from poorer homes, were poorly dressed, had had fewer advantages, but essentially they were the same.

The four thousand had been members of a great organization. Their membership entitled them to the privileges of a palatial building with a spacious gymnasium, a fine swimming pool, and billiard tables. The program of activities was elaborate, admirably designed to develop them physically, mentally and spiritually. All I had to offer the forty was a job.

My meditations were cut short by a great shout from below. I knew what it meant—Pickett's charge was starting again.

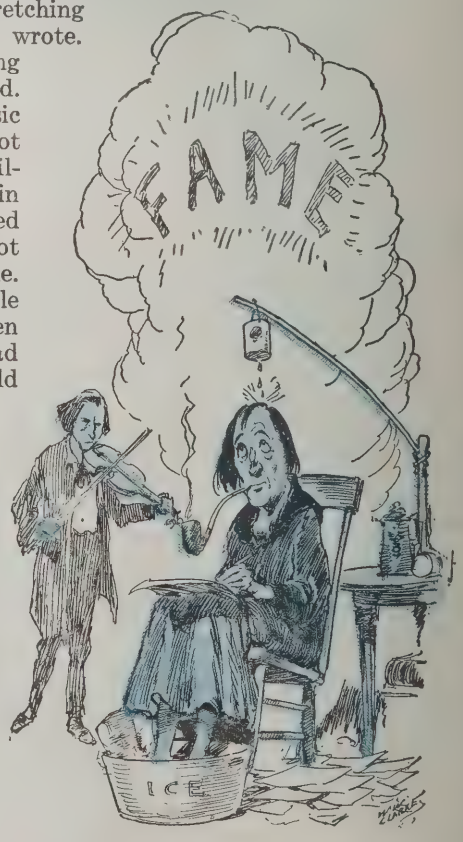
As the roar subsided I heard the clanking of my printing press. To retain, as regular customers, the strangers who came this day, I had set up an announcement containing the next three days' programs and put it on the press. All day long Lynchie had made sure that these were run off fast enough to supply our departing guests. He was getting ready for the final distribution.

Going down, I looked over the house. It was nearly eleven now and for the first time in twelve hours everyone had a seat. Nevertheless, my youthful ushers were patrolling the aisles as usual. The ticket taker was at his post. The face of Brother, with big, brown eyes undimmed by sleepiness, was framed in the ticket window, alert for more customers. One of the larger boys was kicking the foot-power press, with beads of perspiration standing on his forehead. Willie was at the piano, punctuating the "William Tell" overture with well-timed cannon shots executed on the lower end of the keyboard. Outside, the Gettysburg posters were coming down and new ones, advertising tomorrow's show, were being spread to catch the eye of early risers.

Every boy was carrying responsibility; each stood for law and order, according to the neighborhood's best ideals; all had the spirit of service.

Hints to Writers

LITERARY and other aspirants who find a positive pleasure in searching records to find the how, the why and the wherefore; or those who copy externals with a sort of sad reverence, as some pianists wear long hair because Liszt did so; or others who order their affairs in a certain way because certain great men have done certain things: all such are advised that Shelley had the habit of stretching himself on the hearthrug before a blazing fire when he composed. The poet Schiller wrote best when his feet were immersed in ice-cold water. Both Pitt and Fox wrote their speeches after excessive drinking of beer. Tennyson walked in his garden and smoked clay pipes. Liebnitz lay prone on the bare floor when working out his problems. Rossini and Paisello composed their music while in bed. Balzac wrote best when standing. Lafcadio Hearn had the habit of stretching himself along a table when he wrote. Rousseau worked best while sitting in the sunshine with bare head. Alfieri could only write while music was being played. Carlyle could not work except in perfect silence. Milton and Bacon found inspiration in violin music. Dr. Johnson disliked the sound of the violin and could not work for some time after hearing one. Thompson wrote his *Seasons* while in bed in a darkened room. Beethoven often poured water over his head while composing. Descartes could think best when curled up on a sofa with his head covered with pillows. Francis Thompson indulged in laudanum, sold matches on the streets of London and lived in direst poverty; lifted into ease his work was spasmodic. Walter Pater had a prejudice against punctuation and avoided commas, so that the construction of his sentences is at times obscure. So those who copy externals are advised that there is danger in elaborating whims and eccentricities into theories. Other than that there is neither moral nor lesson in this paragraph.—C. J. F.



Why Should Not Farming Pay?

(*Concluded from page 21*)

Farming in the future will include the production of milk and its products, poultry and eggs, vegetables and fruits. All are quick-turnover products, the two first-named being those which can be produced and readily turned into cash every day in the year.

If the price of wheat went to $10 a bushel, there would still be a cry raised by wheat growers that the price did not equal cost of production. The fault lies not in the alleged low price, whatever it may be, but in the fact that the single-crop system of farming can be compared to the efforts of the Greek to realize an entire year's profit from his store by operating it for a single month.

The one-crop farmer is being forced into diversified farming, but he will resist to the last. Habit, tradition, distance from market, inefficiency and —always bobbing up—lack of ready capital, all interfere with the abandonment of the one-crop system and the adoption of a system which requires persistent daily effort.

Diversified farming produces a larger gross income for the year and to a great extent insures against the chance of serious loss such as exists in one-crop farming; but, at the same time, it offers no guaranty of farming success. The wider the range of products, the greater is the skill, judgment and persistent effort required. Diversified farming is now practiced, to a greater or less extent, on every farm east of the Mississippi River.

(*This article will be concluded next week.*)

The Story of the Saltcellar

THE word "saltcellar" is a combination of "salt" and "saler," assimilated in the sixteenth and seventeenth centuries to "cellar," meaning a storehouse. There are two types of ancient saltcellars, the large ornamental "salt" which during the Medieval Ages and later was one of the most important pieces of household plate, and the smaller "salt," actually used and placed near the plates or trenchers of the guests at table, and termed "trencher salts."

In Corpus Christi College, Cambridge, there is a salt vat, or cellar, that once belonged to Archbishop Parker. It is of gold and silver and is beautifully carved, standing about five inches high. The Bishop Fox salt vat at Oxford is another famous piece.

In ancient times the large ornamental "salt" acted as a dividing line at table, between the high-born and those of more lowly origin, whose allotted place was "below the salt."

Owen Wister—the Man and His Work

(*Concluded from page 5*)

ernment to set aside reservations for herds.

"Had it not been for him the American bison would now be little more than a memory.

"Later he turned his attention to birds, and he was responsible for the formation of more than three hundred bird clubs and the establishment of numerous bird refuges. His work for the dwellers of the air also brought him wide recognition.

"After his return from the war he lectured before the Lowell Institute in Boston, and told of his discoveries overseas. The word that these discoveries were to be incorporated into a book was hailed with wide approval. For a time he traveled through the East, delivering a number of lectures.

"During this period his attention was called to the deplorable ignorance in this country about the value of vaccination. As a friend of animals, he made an investigation independently into the use of animals in laboratories, and he came to the conclusion that the charges of cruelty brought by anti-vivisectionists and others were ill-founded.

"Baynes dropped his work on his book; dropped his lectures; and set about to tell people the truth. He made many enemies by his forceful utterances, and they did much to hinder him. They even went so far as to travel ahead of him and try to prevent his procuring halls from which to deliver his lectures. They even attempted to destroy his means of livelihood.

"And then he died—with his great book unfinished.

"When I found that he wanted me to have a share in completing the work I was delighted, and I immediately dropped the story I was writing to undertake it. The book is now nearly finished, and it will be brought out in the fall."

Although Wister's versatility was well known to his fellow citizens, they were astonished a few years ago when he appeared before the coroner to plead for the release of a policeman who had shot and killed a corner lounger when set upon by the man's gang.

Wister presented the case so eloquently that the patrolman not only was exonerated by the coroner but was absolved of all blame by the higher courts. At that time Wister revealed that the policeman, Charles D. Skirdin, was the original of the character, Trampas, in *The Virginian*.

"I first met Skirdin while visiting at Fort Bowie, Arizona," Wister said. "He was then a corporal in Troop I, Second Cavalry. He was one of the best soldiers at the fort, and because of that Captain Fowler, whom I was visiting, detailed him as my personal escort while I remained there.

"We hunted together and made many journeys into the mountains. He was absolutely without fear, and yet had one of the best dispositions I have ever known."

Skirdin's life reads like one of Wister's own romances of the West. Kidnapped from his home near Philadelphia when he was a youngster three years old, he was carried as far as the Mexican border, when he was taken by some traders. Part of his youth was passed with a band of friendly Apache Indians and he became familiar with many of the tribal languages.

Later he became a cowpuncher, a blacksmith, a prospector, a wrangler and a packer. He served as a scout under General Nelson A. Miles in the campaign against the crafty Geronimo. He fought under Roosevelt in Cuba.

His value as a soldier was attested not only by Wister but by General Charles C. Hood, U. S. A., retired, who appeared voluntarily at the coroner's inquest to aid his former subordinate.

Wister comes by his heritage of talent naturally. On his mother's side he is descended from Fanny Kemble, the great British actress, and Pierce Butler, the southern statesman. For generations the Wister family has been one of the most noted and respected in Philadelphia.

Wister's place in American literature is secure. He has been given that rarest of honors, commendation from Henry James. He has been lauded as the outstanding writer of the day by other critics.

He has caught the spirit of the Old West and imprisoned it in his books. He is the biographer of an heroic race, now nearly gone from their haunts. But perhaps the best description of his stories comes from one who was his close friend:

"To read his words," said Theodore Roosevelt, "is like walking on a windy upland in fall, when the hard weather braces mind and body."

History of the Bottle

IN ANCIENT times the bottle was nothing more than the skin of some animal. In the Bible aphorism the putting of new wine into old bottles as an illustration of folly meant that it would be unwise to inclose new wine, still active with fermentation, inside a leather bottle weakened by use and old age.

The bottle of today is invariably made of glass. Until 1880 they were made by hand. The operator gathered the molten glass on the end of his blowpipe through which he blew with his mouth producing a hollow ball which was blown to shape in an iron or brass mold kept nearly red-hot when in use. Only a few shops today practice the art of hand-blowing glass.

Ford

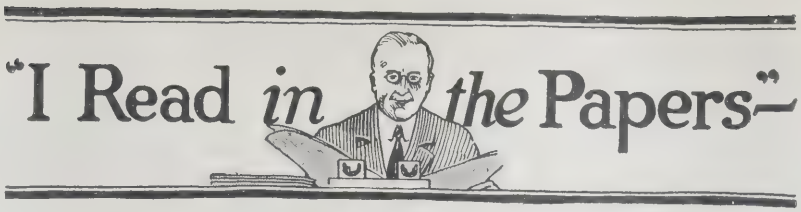
The latest Ford cars are not only inviting in appearance but carefully built and soundly constructed of fine materials to serve you faithfully for years.

The traditional reliability of Ford performance now as always remains the most desirable feature of Ford cars.

To this have been added new beauty of line and increased riding comfort for which the improved body types are conspicuous.

When you see the smart-looking cars now offered by all Authorized Ford Dealers, bear in mind the high standard of quality they represent and the dependable performance for which they have long been noted.

Ford Motor Company
Detroit, Mich.



I read in the papers that Conan Doyle has spirit intimation that catastrophe is to overtake the world, perhaps in 1928. The other day a gentleman traveled from across the sea to tell us at Dearborn that the Great Pyramid, whose measurements, he says, have predicted all great world events, points out another most serious decline to commence May 28, 1928. The various students of Biblical prophecy also agree that the world is facing another test from which we shall be clear probably in 1933. It is interesting to note, in the various publications of these Biblical students, how for nearly forty years previously the dates "1914" and "1918" appeared in their expositions of the meaning of the prophecies. There is no doubt that the world has been on the verge of the New Era for some time, and that the passage thereinto must necessarily be accompanied by the destruction of certain systems which are not in any sense synonymous with New Era principle or practice. These changes, however, occur so naturally that the commonalty never consider them as related to prophecies, divine destiny, or anything of the kind. As to Conan Doyle and the Bible students (not the Bible "experts," for these have no truck with prophecy) it must be said that the latter are about fifty years ahead of him in the announcement.

I read in the papers that for two years there has been no increase in the number of engineering students at schools where men are trained for scientific research. The American Society for Steel Treating at its September meeting considered this research student situation as fraught with peril to the American quest for new methods and new processes that are necessary to maintain American industry in competition with other countries. One famous American technical school now has more faculty members than students. Meanwhile, the university schools of finance and business administration are swarming with young men.

This is all very well, but the stockbroker, banker and others of their kind cannot flourish very long when they neglect scientific research and industrial production. Wealth cannot be created by mere financial jugglery. It can only come from natural resources duly developed and properly applied.

I read in the papers constant references to the problems of street traffic congestion, but little is said of the profits that wait upon a sensible solution. In Worcester, Massachusetts, direct routes were laid through a park and necessary movement of traffic was handled with an economy in time over present roundabout routes that will quickly pay for the cost of the improvement. Newark, New Jersey, figures that a cut-off route which will relieve the central business district will also create new property values in outlying districts, which in turn will provide taxes that will pay for the new street. It would be businesslike for the communities that undertake new projects of this sort to obtain directly the profits from new property values rather than depend upon increased taxation. But, anyway, the congestion problem is rather one of deficient enterprise upon the part of affected communities than anything else.

Lands That Are Free

(*Concluded from page 8*)

It isn't because scientific reclamation is bad but because political reclamation is impossible.

Why were not the facts as to reclamation disclosed long ago in the ponderous reports of those officials who directed the enterprise? The answer may lie in what gentle Oliver Goldsmith—and not cynical Talleyrand as usually stated—said about the words having been invented to conceal and not to reveal truth. If candid Oliver had been familiar with the modern-day annual report of Federal Government department or bureau he would have included figures and all declarative symbols. These reports as a rule *tell nothing* except what their authors want to put forth for their own renown. Read the reports, for example, of the War Finance Corporation as conducted by that arch-philanthropist, Eugene Meyer, Jr.

Yet the annual report comes in handily for purposes of outright negation. There is a rule in some departments and bureaus that material which is thus to be set forth must be treated, meantime, as unpublishable. That is to say, many simple facts and figures cannot be procured while they are live and interpretable because "they are to go into the annual report," which ordinarily comes out so far behind the events as to make it, as current history, only a printed mummy.

The writer once ran into an even more specious barrier to inquiry. In the pursuit of his duties he sought data as to an enterprise paid for with taxpayers' money. "We can't let you have for publication what you ask for," he was told, "because some of the folk in the department may want to use it for private (and the writer trusts profitable) publication in books they expect to write."

The Washington rule—contrary, in theory at least, to that prevailing in most public quarters—that the official may decide as to what extent the public may know of his work, allows for several interesting possibilities. One is scandal like that of the Teapot Dome and the Veterans' Bureau affairs. Another is the use of official information for purposes of propaganda; that is, by feeding it out, so warped, or in such piecemeal fashion as to promote a specific object in the minds of those who control it. If the citizen, or the journalist, could, on demand, get all the information, many misadventures thus promoted would be rendered impossible. To this, the writer may revert at some future time.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of THE DEARBORN INDEPENDENT, the Ford International Weekly, published weekly at Dearborn, Michigan, for October 1, 1925, State of Michigan, County of Wayne, ss.

Before me, a Notary Public in and for the State and County aforesaid, personally appeared Fred L. Black, who, having been duly sworn according to law, deposes and says that he is the Business Manager of THE DEARBORN INDEPENDENT, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management, etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor and business managers are:

Publisher, The Dearborn Publishing Company Dearborn, Michigan; Editor, W. J. Cameron, Dearborn, Michigan; Managing Editor, none; Business Manager, Fred L. Black, Dearborn, Michigan.

2. That the owners holding one per cent or more of the stock are:

The Ford Motor Company of Delaware; Henry Ford, Dearborn, Michigan; E. G. Liebold, Detroit, Michigan; Clifford B. Longley, Royal Oak, Michigan.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: none.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders, who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

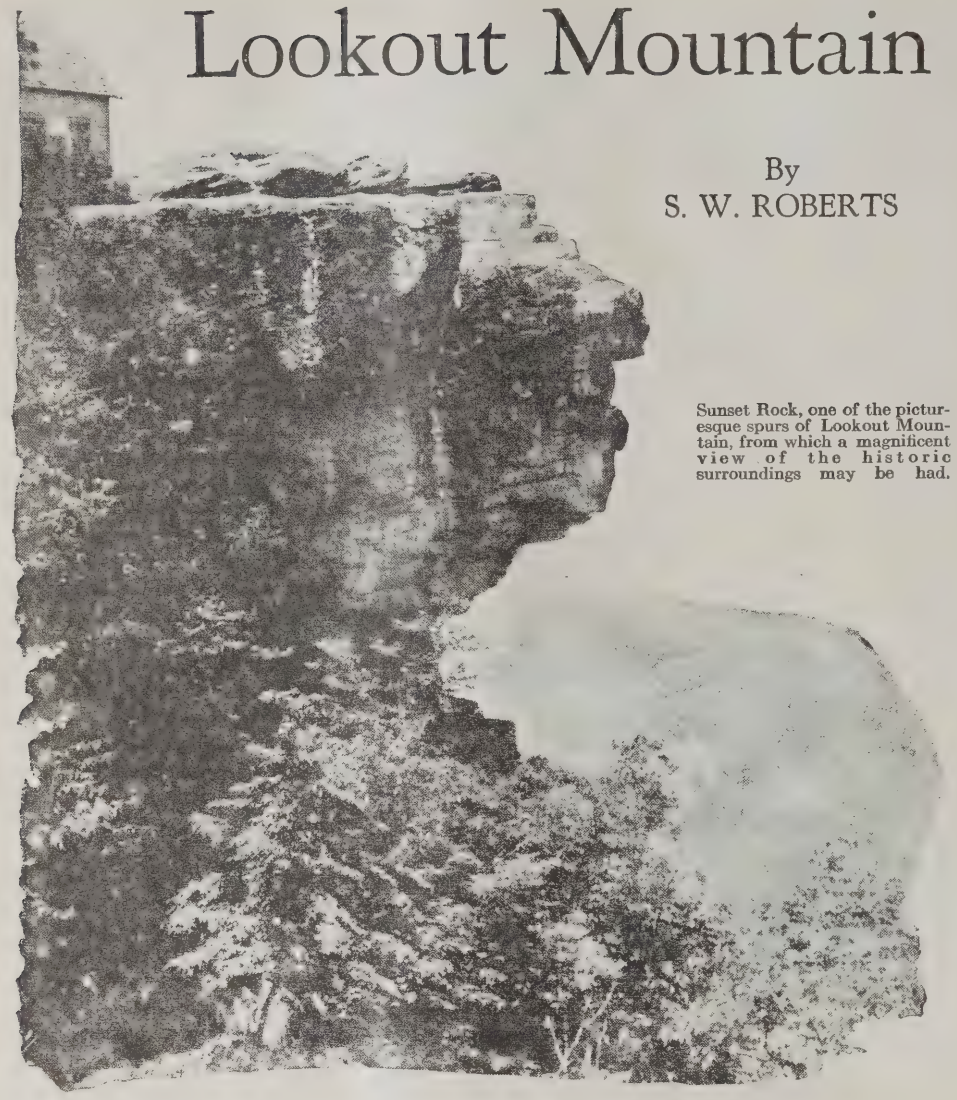
FRED L. BLACK,
Business Manager.

Sworn to and subscribed before me this 21st day of September, 1925.

[SEAL] JESSE W. BALLINGER,
(My Commission expires September 21, 1928.)

Lookout Mountain

By
S. W. ROBERTS



Sunset Rock, one of the picturesque spurs of Lookout Mountain, from which a magnificent view of the historic surroundings may be had.

LIKE an elephant standing in a doorway, Lookout Mountain cannot be claimed by any single state, for its head is in Tennessee, its body is in Georgia and its tail is in Alabama, and yet it is only about ninety miles in length.

Even so, the visitor forgets its various owners and enjoys its beauty and historic value as if it could be toyed in the palm of the hand.

Lookout is not a very high mass of earth and stones, since its altitude is only 2,126 feet in the Tennessee portion, but High Point, Georgia, raises its head 2,392 feet which is the greatest altitude of the mountain at any point. However, the surrounding valleys are so prostrated that Lookout is given a most prominent and dignified position. For its scenic beauty alone, this mountain attracts thousands of tourists each year, yet the historic value, from the fact that during the Civil War a famous battle was fought on its crest and side, has added much to its fame. Point Park, a government reservation on the north end of the mountain, contains 16.5 acres of land, while just below it lies the Cravens Reservation containing 85.35 acres.

Lookout Mountain is undeniably a beautiful creation, whose true geological autobiography declares that at one time it was the bottom of the sea, and the sea waves played golf and marbles over its surface. For years man has been operating an incline railway to carry people to and from the top of the mountain, and this railway is about as rustic as the mountain itself. The oiled road furnishes the automobilist a convenient way to reach the top and the street railway that winds eight miles from the bottom to the top affords one a wonderful view of the scenery of the mountain and surrounding country. Especially is such a trip worthy of joyful exclamation in early spring and again in autumn.

The little town on its top is large enough to be incorporated, but with all the people living there, they have conspired to follow in the wake of Nature's rustic plans and their operations and buildings have been so directed that they harmonize with the rustic plans and add to, rather than subtract from, the natural beauty.

This wild nature spot with birds and trees and flowers and stones and cool air is situated so near the center of the city that in 25 minutes one may change from the noise and bustle of the city to a cooler climate where peace reigns supremely.

For many years I longed to have the opportunity of escorting a human being reared in a mountainless country to the top of Lookout. Two years ago that pleasure was mine when I accompanied a woman born and reared on the plains in the West to the crest of Lookout. When she reached the summit, she perched herself on top of a large boulder and as she drank in the distant sights, her soul melted and she wished that she might be permitted to sit there the remainder of her life! The view is simply indescribable.

Lookout maintains a close vigil over the city of Chattanooga and stares boldly into the face of its companion, Walden's Ridge or Signal Mountain. Raccoon Mountain to her left is no baby itself and in disposition it is wilder than Lookout.

By far the most interesting part of Lookout is that portion of her body that lies in Tennessee, for here is the thickly populated section, with the two government reservations, the incline railway, and the unsurpassed views from the north end of the mountain. However, some four miles from the north end in Georgia is Lula Lake and Lula Falls, far-famed for their natural beauty. These are situated where the top of the mountain gives way to bluffs and palisades and where the water decides instantly to quit the mountain top. Farther down the winding surface, roads with here and there mountain streams and a few rustic bridges make fitting subjects for the artist's brush and vibrate the soul of the poet.

Flowing southward until it changes its mind and decides to turn eastward where it has cut a huge chasm for a distance of about sixteen miles, this rocky cañon is as wild as it was in the days of the adventurer Hernando de Soto.

Umbrella Rock, situated on the north end, has been holding the attention of the people for a century or more with its balanced canopy, and at some time in the past it so impressed a writer of an American school history that he chose it for one of his prominent illustrations which advertised this odd-shaped stone far and wide.

Umbrella Rock is not misnamed, for in the month of June when I raced with a rain cloud from the side of the mountain to its top, I landed under this stone, and although the cloud poured its contents overhead, when I emerged I was as dry as if I had been under the best roof made by man. This experience proved that Umbrella Rock may be depended on to keep one dry in time of storm.

Lookout Mountain often has its crown entangled in the clouds, and when this happens the roads and paths so confuse the pedestrian that he becomes lost. Sunshine, clouds, and snows seem to hold frequent contests to see which can dress the mountain in the most becoming gown; in the meanwhile the birds, and flowers come and go, and the stern-looking palisades hold out invitations so urgent that few persons can pass them by.

Lula Falls, 130 feet high, on Lookout Mountain. They are a cool, delightful place to visit.

Winter snow scene of fairy-like beauty on Lookout Mountain. Below is Umbrella Rock.

Lookout Mountain—Above the Clouds

GENIUS has an infinitely deeper reverence for character than character can have for genius. . . . Character evolves its best products for home consumption. . . . It takes a deal more to feed a family for thirty years than to make a holiday feast for our neighbors once or twice in our lives. Many a blessed woman, who dies unsung and unremembered, has given out more of the real vital heat that keeps the life in human souls, without a spark flitting through her humble chimney to tell the world about it, than would set a dozen theories smoking, or a hundred odes simmering, in the brains of so many men of genius.—*Oliver Wendell Holmes.*

CHRONICLER OF THE NEGLECTED TRUTH

BRIEFLY TOLD

The word "supper" is derived from the practice of sopping bread in gravy.

"Red" Grange, famous football star of the University of Illinois, turned down a movie contract to return to his old job of delivering ice from door to door.

When Germans ride down the Rhine they always sing "Die Lorelei" as the boat goes past the Lorelei Rock.

More than 95 per cent of land and 91 per cent of factories have been restored in the French devastated regions.

The cost of a Hindu wedding, including the dowry of the bride, frequently ruins the family, the bride's parents often mortgaging all their possessions for this ceremony.

"Broncho" is a word originating in Mexico and signifies "mean" and "bad" tempered as applied to a vicious and unbroken horse. A "broncho buster" is merely a horse breaker.

Dr. Banting, father of the recent discoverer of insulin, was baptized in the Canadian Wilderness by the Rev. Featherstone Lake Osler, father of the famous Dr. William Osler.

During May, 89 Moslems and 88 Jews permanently left Palestine because of bad economic conditions there. They started for America.

The famous Yonge Street, Toronto, originated in 1793 as a road from Lake Simcoe that fur-traders from the North need not pass through Detroit when the latter place was taken over by the United States.

France has given permission for 36,000 Jewish families to settle in that country. One Jewish family per village is the rule to be followed.

Blueberries seven-eighths of an inch in diameter have been produced by experimenters in New Jersey.

A pressure tester much like a tire gauge now tests the firmness of apples, doing away with the old-fashioned method of pressing the fruit with the thumb.

The last hanging in England for sheep stealing occurred in 1825. To the plea of the three thieves that three men ought not to die for one sheep, the judge replied: "You are not hanged for stealing the sheep, but that sheep shall not be stolen."

There are two and a half million wives in India under ten years of age.

The ancient Egyptians found the area of a circle by squaring eight-ninths of its diameter, instead of multiplying the square of the radius by 3.1416.

Cattle introduced by early settlers of the Falkland Islands ran wild, but their progeny were gradually exterminated as sheep became the chief interest of the settlers.

Red is the color for expelling demons and hence predominates in the garments of European peasants.

When Carlyle found in a book a statement that displeased him, he drew in the margin a pair of donkey's ears.

Stewart Culin has an old Korean book in which the musical notes are indicated in color.

The Board of the British Empire exhibition at Wembley has decided for Sunday closing.

It is said that many peasants of Czecho-Slovakian Ruthenia were converted to Communism on the promise of the party of free cultivation of tobacco.

The royal Botanical Gardens at Kew might have declined to extinction had not young Queen Victoria rescued them from abandonment.

Guests at the British Government House in Jerusalem dance to music sent by radio from London.

Arabian scientists of the eighth century had balances that weighed accurately to .004 of a gram, which was a degree of accuracy unknown to any peoples until recent times.

The London *Morning Post* estimates that there are 250,000 Jewish Christians in the world.

The *Le Geant*, a balloon built by Nadar in 1863, and probably the largest in history, had a bag of 450,000 cubic feet, and lifted forty passengers.

Corn doctors of Paris sometimes treat patients on the streets while interested bystanders look on.

The paper industry consumes each year some six million cords of wood, the product of more than a million acres of forest, more than sixty per cent of which is spruce, the remainder hemlock, balsam, and poplar.

The average railroad tie, in its natural state, lasts about seven and one-half years; if treated with preservatives about fifteen years.

About three million whitefish, valued at $1,500,000, are caught each year in the Great Lakes region of Canada and United States.

Lieutenant John A. Lord, U. S. N., in charge of the rebuilding of the old historic ship *Constitution*, reports that the work must be done while the vessel is afloat since it cannot stand the pressure of resting on its keel in drydock.

The Salvation Army has 3,000 officers in India.

According to the Lamaist creed, which is the principal religion of Tibet, a human soul may be condemned by the gods to put on the form of a lower animal for various periods of time.

At least one hundred million acres of range and agricultural lands suffer from the devastating activities of prairie dogs which live in the most productive valleys and bench lands.

Watermelons, which were enjoyed long before the Christian Era, and originally were produced only in warm climates, are now raised in every state in the Union except Maine and New Hampshire.

Change of Address

1. Notify us at least two weeks in advance. 2. Give both old and new address. 3. Write clearly.

Entered as Second-Class Matter at the Post Office at Dearborn, Mich., under the Act of March 3, 1879. Additional entry at Chicago, Ill.

Presented in This Issue:

Mr. Ford's Page this week asks whether the economic world appears to have learned anything.

This issue is replete with the three kinds of subjects which perennially command our interest: Persons, Places and Problems.

Among the Persons we find Presidents, Popes and Inventors. Something rather intimate about each of them. The writers of these articles knew the Presidents, or the Popes, or the Inventor—so that nothing comes at secondhand.

It is a White House secret, says Aaron Hardy Ulm, that most Presidents dislike to see their term of office running to an end. Roosevelt said that he "had a bully time." When Coolidge was commiserated on the burdens of his office, he said, "I like it." Even Woodrow Wilson in his bed had a faint hope the people would ask him to stay. So, it seems, the "no third term" tradition was made by the people and not by the Presidents. (p. 5)

Something of the awe surrounding Pius XI is communicated in Samuel Crowther's article, "An Audience With the Pope." The serenity of ancient tradition, of long purposes that even death does not deflect, the great cool halls, the profound simplicity that is found at the very crest of the ceremonial ascent, these are elements of a most interesting narrative. (p. 6)

Take Thomas Edison and his works out of the world, how big a hole it would make! Mr. Edison has lived so long and achieved so much which the present generation found established when it arrived, that his name is often not connected with them. It is good, therefore, to recall from time to time the long roll of this man's inventions. (p. 3)

As to Places in this issue, you may take your choice of North and South and West. Probably you will travel to all three. We speak first for Rugby, not because of its importance, but because of the sadness of its humiliation after ambitious beginnings. It links *Tom Brown's School Days* with Tennessee. For Thomas Hughes, the noted author, established an American *Rugby* in Tennessee. But the world has forgotten it. Still, "Rugby, Tenn." remains. Thomas Hughes' mother is buried there. The little English church is there. And we are grateful to Mr. Whipple for recovering the story. (p. 12)

What city has wrought so continuous a charm as Charleston, S. C.? Its doorways and gateways are known the world around, its homes and its churches share a quiet fame. It is part of the interior richness of this country that such places still remain. (p. 31)

And then there are the northern coast and the Portland Light, and May B. Whiting to tell about them. (p. 2)

Pleasant as the world of Places and Persons may be, there is always the world of Problems. What will you for your Problem? Material or Moral? Here is Traffic, there is Taxes. Yonder is Farming. Traffic is the blood pressure in the veins of our cities—the streets. Rather elaborate and stimulating. (p. 16)

Sunday ranges inside the line of moral problems. If Sunday is being progressively taken away from more and more people, or is being progressively given back to more and more people, it concerns all of us. (p. 14)

Taxes (p. 7), the Farm (p. 24). These farm articles have been the meatiest we have seen on the subject. They provoke to thought and analysis.

And then there is a Nature article, "Barefeet and Chestnut Burs"—very autumnal. (p. 8)

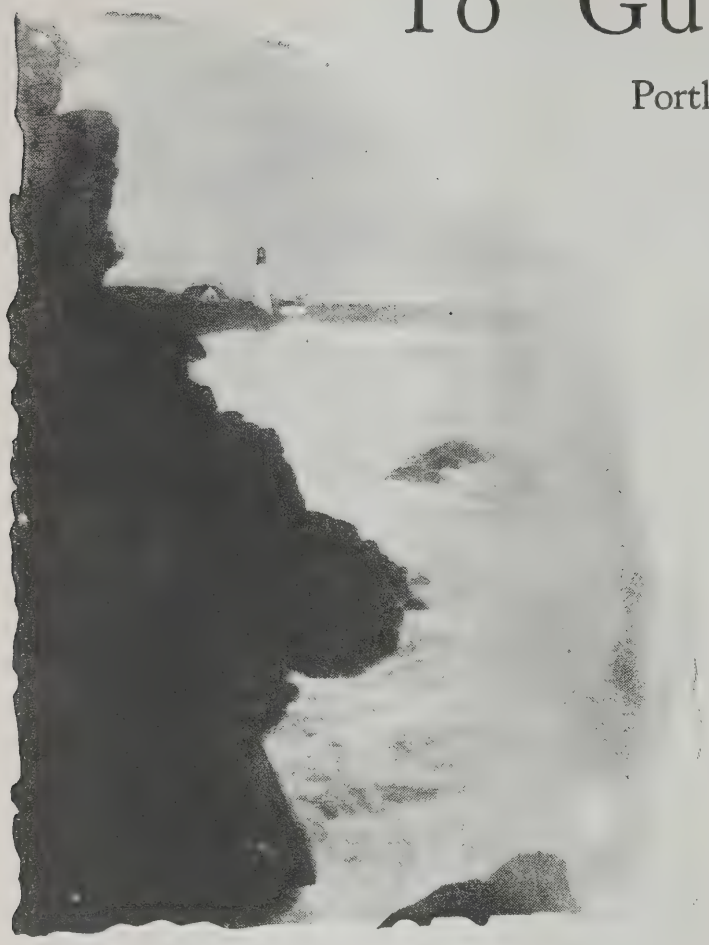
To Guide the Mariner

Portland Head Lighthouse and Its Keeper

By MAY B. WHITING



The surf along the rocks.

SHIPS are called the loveliest creation of man and lighthouses are surely the most beautiful of his benevolences. Back in the dim years of history he placed them at the gate of adventure and they welcomed his homing after the quest. The keeper, too, was held high in honor, his labors sometimes touched with religious sanctity, and even in the blasé present a visit to a lighthouse can arouse a thrill. When we find one of the oldest and most famous lighthouses on the Atlantic Coast with a keeper whose family has been connected for four generations, there is sure to be a story behind.

Portland Head Lighthouse was established in 1790 and the first keeper, Joseph Greenleaf, was appointed by Washington. After long years of service he was drowned while making a rescue off the Point. Yet the situation is not one of the most dangerous nor has it the terrible loneliness that comes with isolation. At the entrance to the harbor rocks are piled, one rugged mass above the other, all in tones of softest gray, circled by the blue water and fringed with spray. Above, the gulls circle with wild, sad cries, and, within a stone's throw of the dazzling white tower, a ship is always passing, for the rocks pitch down so abruptly that there is deep water almost at the very edge.

The keeper of the Light is Joseph Strout, a bluff and hearty soul, the very picture of what a lighthouse keeper ought to be. As a child he can remember talking with his great-grandmother who could tell of the building of the tower. When his grandmother was a girl she came to "help" the family who had charge of the light, working for her "keep" and a salary of fifty cents a week. She married Captain Strout and named her first son for the keeper of the Light. When the present keeper was ten years old his father held that position and, as usual, all the family shared in the labors. So for a hundred years the Light has been the object about which the family life centered, something to be loved and guarded, like a wayward child who may lose the right track.

In the keeper's boyhood lard oil was burned. The government supplied the northern ports in summer and the southern in winter, for care must be taken to keep the oil limpid. About four o'clock in the afternoon the father would say, "Time to get some fat, boys," and they would go down in the cellar, scoop up a bucketful and put it on the stove to warm. When it was so hot that one could not bear a hand in it, they took it to the tower and filled the lamp, then built a fire in the watch-room to keep it from congealing. Some one had to watch all night, for the fire must be tended and the machinery wound every three hours to keep the oil flowing about the wicks.

Those were weary hours for the lad, hours of loneliness and weirdness which even a lifetime's acquaintance with the sea cannot dispel, nights with the surf running and the shimmering moonlight, or, in the dark of the moon, the dim starlight and the unseen beating of the waves, restless as if with the memory of souls they have engulfed.

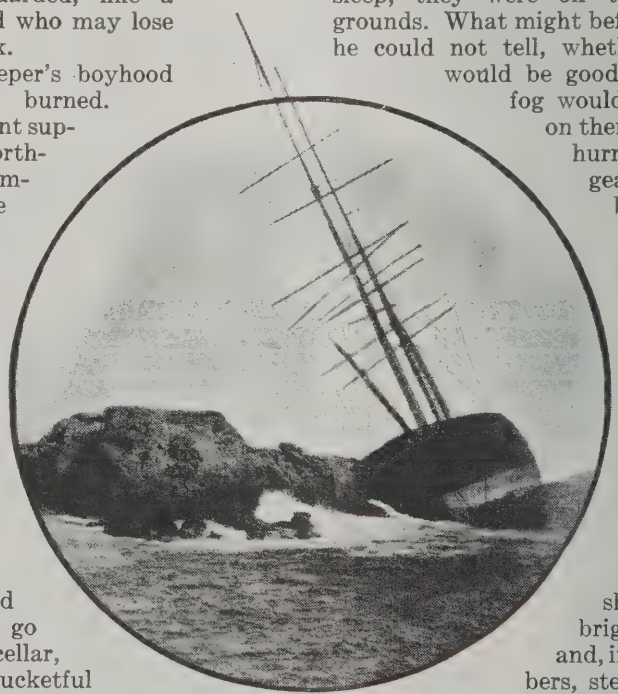
About two in the morning he could hear the fishermen going out in their sailboats. If the wind was still they would be rowing and he could hear snatches of conversation called one to another as they swung past the tower.

"Where be you going to anchor tonight?" would be the usual question.

"Off Cod Ledge, I reckon. Where be you bound for?"

"Guess I'll try Kittle Bottom. So long," and the mystery of the ocean would enshroud them.

The lad knew that they had been baiting from noon until midnight, for that was before the time of cold storage and frozen fish, so that 3,000 mussels had to be secured fresh to bait the trawls. Then, after two hours' sleep, they were off to the fishing grounds. What might befall them there he could not tell, whether the catch would be good, whether the fog would creep in upon them or the squall hurry them home, gear tangled and broken, or whether the dead calm would leave them stranded in the broiling sun. In those days account was made of the larger vessels passing the Light, ships, barks, brigs, schooners, and, in smaller numbers, steamers.



The wreck of the *Annie C. Maguire.*

On stormy nights the noise of the wind was deafening. The September gale of 1780 blew down the bell house newly set up and the bell weighing more than two tons. Besides the din of the storm and the care of the Light, (Concluded on page 22)

Edison's Stamp on World's Work

The Story of Wonderful Things Discovered and Great Things Attained

By ALLAN L. BENSON

EDISON has lived and worked so long that the present generation takes him for granted, so to speak! His inventions are as much of their world as the sun, the stars or the ground beneath their feet—fixed things that seem always to have existed. Most persons on earth today never knew a time when there was no incandescent electric light. Only a few more are old enough to recall the days when there were no electric railways and phonographs. Most of those who go to see motion pictures were not here when the first motion pictures were shown; and of the millions who use the telephone only a small percentage recall the fact that it was Edison who converted Bell's toy into a triumph.

Edison has worn out and outlived more groups of assistants than he himself can remember. Most of the members of the "insomnia squads"—as he called them—who toiled with him over the electric light, sometimes for four or five days at a stretch, are dead. When these men lived, the young men who are working with Edison today were not born. But Edison goes on and on. In his seventy-ninth year he goes upstairs in "high" and looks little older than he did 15 years ago.

An Early Device That Worked Too Well

Those who came to this earth long after Edison began his work may be interested in knowing just what he has done. Three inventions, made when he was a boy, show the playful side of his character, which no one should overlook who would understand Edison because, in his old age, it still persists. One was an automatic device, controlled by a clock, to report by telegraph to his boss, at hourly intervals during the night, that he was awake and on the job. Edison, then a boy of 18, was a railway telegraph operator. It was no trouble for him to call his main office and sign the initials of his station, but the lure to make the thing automatic and mechanical was too much for him. The clock-device was made and worked perfectly but when the boss came around and saw it Edison had to take it out.

Edison's next invention was what he called a "rat paralyzer." The Western Union office in Boston where he worked was overrun with rats. Edison strung two parallel wires across their runway, and loaded them with electricity, after which the rats were electrocuted as rapidly as they sought to set foot on his invention.

Another telegraph office in which Edison worked had formerly been a restaurant and was full of cockroaches. Edison laid two sheets of tin foil side by side, a quarter of an inch apart, attaching one sheet to the positive and the other to the negative pole of a strong battery. As the cockroaches tried to pass from one sheet to the other their bodies closed the circuit and they went up in puffs of smoke.

At the age of 21, Edison stopped joking and got down to business. On October 13, 1868, he applied for the first of more than 1,400 patents that were later to be issued to him. He had invented an electrical device to record the votes of members of legislative bodies. All a member had to do was to touch a button at his desk and a calculating machine at the presiding officer's desk immediately gave the totals for and against the measure voted upon. Edison had not taken into consideration that such a machine was exactly what legislative bodies do not want. The prospect of a long roll call oftentimes serves a purpose, so Edison's first patented invention served to teach him a lesson. The lesson was that it is useless to invent what nobody wants.

His First Patent Teaches Him a Lesson

In November, 1875, Edison came within an eyelash of inventing the radio, but did not know it. He discovered a certain phenomenon, unnecessary to describe because of its technical character, to which scientists gave the name "Edison effect." This discovery is the basis of the present radio tube. Without it, radio tubes could not be made.

Edison's first great invention was in the field of telegraphy. Up to his time it had been possible to send only one message on a wire at a time. Edison first solved the problem of sending two messages in opposite directions over the same wire at the same time and later increased this, step by step, to eight messages each way at a time. About this time, Edison also invented a stock ticker. He had been desperately poor all the while, but now he was in sight of money. The head of the Western Union sent for him to settle up. The company wanted to buy his patents for the stock ticker and the various telegraphic devices. Edison had determined in his own mind that his patents were worth $5,000, though he would take $3,000. He was sharp enough, however, when asked his price, to request the Western Union man to make an offer. The offer was $40,000.

Then Edison Started a Bank Account

Edison nearly dropped dead. The check was made out and Edison took it to the bank. The cashier looked at it a moment and said something that Edison, because of his deafness, could not hear. The cashier handed the check back and Edison instantly came to the conclusion that it was no good; that some trick had been played upon him. It never occurred to him that it was necessary for him to be identified to get the cash and to indorse the check. The next day the Western Union man showed him how to start a bank account.

Edison next started a manufacturing establishment in Newark, New Jersey. He began with no bookkeeper. Instead, he had two hooks. On one hook he stuck bills and on the other he placed memoranda of what he owed.

But when business became pressing, Edison decided to install a bookkeeper. Things were in such a tangle that the bookkeeper had quite a job. Eventually he waded through the mess and announced that the concern, during the preceding month, had made a profit of $3,000. That made Edison feel so good that he gave a banquet to his force. A few days after the banquet the bookkeeper said he had made a mistake in his first calculation and that instead of making $3,000 the month before the business had lost $500. That was not so good. But the next week, after laboring some more over his books, he told Edison that his second figure was wrong and that the business had made a profit the preceding month of more than $7,000, which turned out to be correct.

Some Bookkeeping Difficulties Were Overcome

For some work that Edison did on the quadruplex telegraph, Jay Gould paid him $30,000. But Edison did not long work for Gould. The Western Union wanted him to work on the telephone, which Bell had just brought out. Bell's phone was not practical. It employed a single device for both transmitter and receiver and there was no privacy about it. It blah-blahed whatever it had to say all over the room. Edison invented the carbon transmitter which was in use for many years and made other improvements that converted Bell's toy into a practical, commercial device. For a long time he could not make his transmitter carry the word "sugar" clearly; and he says that, to this day, telephonic conversation is largely a matter of imagination and knowledge of what the other fellow is talking about. "If you do not believe this," he said, "try reading a drug catalog to somebody and see how much of it he gets."

One of Edison's inventions was a loud-speaking telephonic device which could be heard for five or six blocks in every direction. He also invented the microphone which, in its improved form, is now in use in all radio broadcasting stations.

When it came to settling with the Western Union for what Edison had done on the telephone, Edison had in his own mind the figure of $25,000 as the sum that would cover the value of what he had done. But again he asked the Western Union man to make him an offer. The offer was $100,000. Edison accepted on condition that the money should not be paid to him in a lump, but at the rate of $6,000 a year for the 17 years during which his patents would live. He knew he would spend the money in a year or two in experiments if he were to get it all at once. A little later Edison received another $100,000 from the Western Union, with the provision that it be paid at the rate of $6,000 a year for 17 years. This was for a number of telegraphic inventions including the motograph, a device by which messages were automatically repeated from station to station, thus making it possible to cover great distances.

Edison sent a number of men to England to install his loud-speaking telephone and shortly afterward received a cable offering him "30,000" for the English rights. He accepted by cable and was considerably surprised when the check came to find that it was for approximately $150,000. Edison thought the Englishman was cabling about dollars when, as a matter of fact, he was talking about pounds.

The phonograph, which Edison invented in 1877, grew out of his work on the telephone. Observing the vibrations of a diaphragm when actuated by the human voice, Edison had playfully arranged a number of miniature paper dolls that danced as the diaphragm vibrated. The more he thought about the dancing dolls the more he wondered if the vibrations, when recorded in the form of indentations upon tin foil, could not be made to actuate another diaphragm and thus reproduce sound. In this case as in all others when he wanted to make an experiment he drew a picture of what he wanted and handed it to a workman to fashion the device. It was also Edison's custom to mark on the drawing the sum that he was willing to pay for making the instrument. Edison's first phonograph was very simple, so the sum that he marked on the drawing was $10. The machine was nothing but a cylinder, wrapped with tin foil, a crank to turn the cylinder, a needle, a diaphragm and a horn. The workman asked for what the machine was intended. Edison told him that it was something that would talk. The word went around the shop that Edison thought he could make a machine that would talk, just by turning a crank, and there was a good deal of laughter. Edison's own men had not yet learned what he could do.

When the machine was done, Edison turned the crank and repeated into the horn the little verse about "Mary had a little lamb." Then he brought the needle back to the beginning of the indentations and turned the crank again. Edison had expected, at the best, only a few sounds, with perhaps a word or two that could be understood, but to the amazement of himself and everybody else every word came back at him in his own voice.

The story of what had happened got into the newspapers and when Edison, a day or two later, took his phonograph over to the office of the *Scientific American* in New York, such a crowd gathered around the building that police had to be called to clear the streets. Word came from Washington that they would like to see and hear the phonograph, so Edison took it to the national capital. He was amazing a company in a private residence about 10 o'clock at night when he received a message from President Hayes inviting him to the White House. Edison responded and found in the old mansion, besides the President and his wife, quite a company of Cabinet officers, Senators and Representatives. Edison put on a new piece of tin foil and spoke into the horn the little verse about "There was a little girl who had a little curl right in the middle of her forehead," which would have been all right if Roscoe Conkling had not been there with a little curl right in the middle of his forehead. Conkling thought Edison was making sport of his curl, which was always the subject of newspaper banter, and left in a huff. But the others stayed and Edison stayed and it was 3 o'clock in the morning when Edison took his little machine under his arm and went to his hotel. The little machine, by the way, has for years been in the museum at South Kensington, England.

As we have seen, the phonograph started with a great rush of publicity, but it soon stopped short. Edison's idea was that it should take the place of stenographers. He tried to fill this field, but failed. The machine was crude, of course, in comparison to what it now is, but Edison said that stenographers did all they could to crimp it. At any rate, the phonograph was dead for more than 10 years, until one day some of Edison's men, after they had finished their luncheon, sang into it and Edison noticed that the men seemed to be vastly entertained by the songs. This gave him an idea and he began recording music on the phonograph. After that, there was no difficulty about marketing the phonograph. Now there are 10,000,000 phonographs in the United States alone. The song that was sung after lunch that day had great results.

In 1877 Edison went to work on the device that probably brought him more fame than any of his other inventions—the electric light. Arc lights existed, but the problem was to subdivide the current and thus make it possible for a great number of small lights to draw current from a single wire. Edison was not the first to think of it, but everybody who had thought of it said it could not be done. Quite naturally, when Edison did it there was a great deal of scientific incredulity about his reported achievement. The story of what he did and how he did it is so technical that nobody but an electrician could understand it, but it may be remarked in passing that his work with carbon, in connection with the telephone, was of great assistance to him. One of his problems was to find the best material for a filament, and he had tried many things, including carbonized cotton thread. A palm-leaf fan gave him the idea of using bamboo for filament, and he discovered that it worked better than anything else he had tried up to that time. Bulbs were made that gave light for several hours at a time. Edison sent men to India, Japan, China, Java and South America to see if they could find types of bamboo that were still better suited to his purpose and one or two of them succeeded. Bamboo was used for years, but later gave way to metals which are now used.

Probably the hardest work of Edison's life was done on the incandescent light. It was not merely the light that had to be invented, but everything connected with it, from lighting stations to meters to measure the current. Scores and scores of patents tell the story of his activity and his work was done so well that it still stands. The electric lighting system that he invented about 45 (Concluded on page 23)

¶ A consumers' strike against coal is under way in this country. In 1924, with industry booming, railroads carrying more freight than ever before, less coal was called for in the United States than in 1923, or even in 1916.

¶ Even with industry prospering and the shortage caused by the strike of 1922, the 1923 output was below that of 1918.

For some years there have been many signs of public discontent in regard to coal supply and prices.

The story of how the present state of matters has developed is one that concerns every American. It will be interestingly told by William A. McGarry in next week's DEARBORN INDEPENDENT.

When Time Came to Move Out of White House, Most Presidents Desired to Stay

By AARON HARDY ULM

—Washington.

OUT of Swampscott and the gossipy coignes of Washington comes what once was but, alas! no more is heresy, that is, "third-term talk." Maybe it owes to the off-season paucity of political news, or, perhaps, it is only what is becoming a recurring phase of speculation as to every President who gains a second term. But in the present instance the talk is given relevancy by several circumstances which may raise it above the level of idle babble.

First. President Coolidge's status with the country finds no past parallel this side of the Monroe "era of good feeling." This is agreed to by Coolidge opponents as by Coolidge enthusiasts —neither of which, paradoxically, are hugely numerous.

Second. Coolidge—Well, there is the story, parabolically true though probably apocraphal, of the friend who wondered volubly about how he stands the pomp, pressure and persiflage attending his office. Without even a grin, so the story goes, the President replied, "I like it!" No President ever better liked the job.

Third. There is at present no outstanding rival in either party, and of Presidential material of the politically wrought kind the country seems to be unusually short.

Fourth. Because of the circumstances that first made him President there is room for hair-splitting dialectics as to whether the nearly two years as Harding's successor constituted "a term" for Coolidge.

Fifth. Coolidge himself has been meticulously silent on the subject.

An old-timer walking through a White House corridor pointed to portraits of former Presidents and said:

"They show them as they left here. Compare these with ones of them as they came in, and you will see how each of them went away a different man, aged beyond the years spent here, bent if not broken. Yet each of them, George Washington and perhaps two or three others excepted, longed, in his inner consciousness, to stay even more than he ever longed to come here."

There is no drug so insinuating as the impalpable air of the White House. Those who scent it from afar rarely turn away nostrils of hope. And those who breathe it to the full are even less often satiated.

After George Washington quit the Presidency at the close of his second term, the precedent thus set became such an inviolable tradition that there was virtually no "third-term talk" until Roscoe Conkling, with fine casuistry, started, in 1880, the anti-climaxual movement for General U. S. Grant. While Conkling argued that the old tradition applied to "consecutive" terms only, the House of Representatives declared by almost unanimous vote that the precedent set by "the Father of His Country" had "become by universal concurrence a part of our republican system of government and that any departure from this time-honored custom will be unwise, unpatriotic and fraught with peril to our free institutions."

The disaster that befell the movement for a third term for Grant estopped any serious revival of the talk for a generation. Then it was put forth mightily again on behalf of, if not by, Theodore Roosevelt. In that instance a record was made which might supply precedents for Coolidge —one of which, however, he distinctly has not followed.

On election night, 1904, President Roosevelt, who like Coolidge had ascended from the Vice-Presidency, upon the death of the then President and filled out the incomplete term, announced to the country: "The wise custom which limits the President to two terms regards the substance and not the form and under no circumstances will I be a candidate for or accept another nomination."

Although later, friends of his have said, he would have given his right arm for its cancellation, Roosevelt adhered to the declaration until he left the White House. Afterward he spoke about having meant "a third consecutive term" and from then on was an avowed candidate, or perpetual aspirant, for restoration to the Presidency.

There is little doubt that Woodrow Wilson felt the urge of a similar ambition, as indicated, in 1920, by his pre-convention attitude and his post-convention aloofness and later by irascibilities like the one which marked the break with his old secretary, Tumulty. This may explain why Wilson made no effort to name a successor, as, notably, (*Concluded on page 26*)

An Audience With the Pope

American Tells How Pius XI Receives His Visitors at the Vatican

By SAMUEL CROWTHER

ONE of the Popes—I think it was Benedict XV—when giving his parting blessing to a visitor who had been in Rome, say, a week, always said "Addio." But if the visitor had been in Rome for a month or more, then he always said, with a smile, "A rivederci" —which means "Until we meet again."

For whoever has been in that extraordinary city for more than a month always returns. The tourist rushing through the sights misses the real Rome; he sees only a great number of churches—three hundred and sixty-four of them; he is lost in the vastness of St. Peter's and the treasures of the Vatican galleries. He looks at enough paintings and sculptures to last him the rest of his life. They are all of the past and he cannot discover anyone doing anything of today. The dead calm of it all gets on the nerves.

Perhaps he wonders a little at the streets being so filled with priests and students toward sundown—all in long black soutanes and flat, wide-brimmed hats—except the German students, who wear red soutanes. Then there are the members of the orders, some bareheaded and barefooted in brown cassocks, others in white, and so on through various garbs that only an expert can hope to know.

The church stands out as the center of things, but in addition are the ruins of the civilization of ancient Rome—the Forum, the baths, the columns. And the odd thing is that on every ruin some ancient Pope has placed his name—just as though he had built it.

Billions That Belong to No One

With all this is mixed the Rome of the Renaissance, the Rome of Cavour, and the Rome of today—of Mussolini.

The place is so complex that at first it is merely irritating but, as one stays on, a certain charm begins to grow and a month after leaving one wants to go back—and generally does. There is something in Rome which is nowhere else. The things of today and the things of ages ago are side by side and age seems to lose its meaning—a thousand years, two thousand years are nothing. It is all a baffling riddle until one discovers that in the Vatican, which overshadows all Rome, two elements which we are apt to value highly have no meaning—money and time. And death is but an incident. Having discovered this, one begins to realize why Rome as the center of Catholicity is so different from the world without. There is pomp and grandeur on occasion such as even the Orient never saw, there are art treasures and gold and jewels in the churches, not to speak of the churches themselves, that are beyond counting in money, while in the Vatican are thousands of murals and tapestries and marbles beyond price. No one really knows what the church in Rome has, for it has been accumulating through the centuries. You can value it at a billion or at ten billions of dollars—at any sum. There is no measure of value, for the churches could not be taken away and no art treasure has ever been sold. The real point is that none of it belongs to the clergy or, excepting in a very impersonal way, to the Pope. The wealth of the Vatican is beyond calculation, but it is not money wealth. And no one serves for money.

What Priests and Cardinals Receive as Salaries

The *Annuario Pontificio* which lists the priests in the service of the Vatican is a book of a thousand pages; of these priests a few have wealth in their own right but they may not live in luxury. A great number are in orders and have taken the vow of poverty; these priests have nothing and may have nothing. The average income of all the priests in Rome does not exceed five hundred dollars a year at the present exchange value of the Italian lira. The income of an Italian cardinal in Rome, as for instance Cardinal Gasparri, the Papal Secretary of State, is less than a thousand dollars. It is against the rule of the church for a cardinal to walk in a Roman street. Once upon a time they all had carriages and rode out in them for the air; now most of them are too poor to keep carriages, not to mention automobiles, and so they simply have to stay in or, if they live in the Vatican, walk in the Vatican Gardens. These priests pass much of their working days amid magnificence but their personal lives are of the most complete simplicity.

All of this finds its entire expression in the Pope himself. I had the privilege of a private audience with the reigning Pontiff—Pius XI—and it stands out in bold relief against all other experiences. I have met with some kings, quite a number of prime ministers, and was received by the Sultan of Turkey before he was deposed. I have seen all sorts of pageants, spectacles, and shows. But an audience with the Pope is not comparable with anything else. In it is all the magnificence of the ages combined strangely with the personal directness and informality of a talk with President Coolidge.

It is not difficult to be present at a public audience. Any visitor to Rome may arrange for an invitation to a public audience and they are held nearly every day, unless the Pope is indisposed, for it is the belief of Pius XI that he should meet as many people as possible. A private audience is not hard to arrange—provided some good reason exists. If there is no good reason, then there is no private audience. And being received does not depend upon one's religion or race.

The Pope is a very busy man; his power is practically absolute and everything comes to him for final decision. He is assisted by a number of standing committees called "congregations," each of which is generally headed by a cardinal resident in Rome. These congregations are made up of priests who have given their lives to the study of the particular subject of their congregation; unless a man has been working on a subject for, say, thirty years or more his judgment does not carry much weight with the Vatican. That is where the disregard of time comes in; we should hesitate to give the investigation of a great subject to a man of seventy-five—we should be afraid that death would take away the results of his labor. But death means nothing at the Vatican; your cardinal of seventy or eighty has been heading a group and some member of that group is ready to carry on the work without a pause. It would take several pages of this magazine just to enumerate the work and research in Rome and of which the public sees nothing; the workers are all priests and they are up at five in the morning—when the church day starts —and, except for the walk out toward sundown, they are busy until far into the night.

Things That Happen During the Pope's Day

To these congregations the Pope refers all serious questions which come before him and receives from them voluminous reports and recommendations; sometimes he adopts the decisions and sometimes he disregards them. Reading these reports is of itself a tremendous task, not to speak of weighing their contents and arriving at decisions. The appointment of bishops and archbishops and cardinals is all handled through congregations in this same manner. Every fact in a priest's life, every trait and his exact capacity are known and discussed and put down of record before a congregation will recommend his elevation to a higher rank.

It is difficult to say when the Pope's day starts; it is all but continuous. At nine in the morning he receives Cardinal Gasparri and other secretaries. After their business is through with, he passes on to intimate private audiences, which are in fact

personal reports of work done in the field. Then come the private audiences, the semi-private, and the public audiences in order. Then it is one o'clock or after and time for luncheon; this is very simple and to it are asked two or three prelates with whom the Pope desires to discuss some subject. Then he works on in his study with perhaps a few advisors invited in from time to time, and at about six goes out for a drive or a walk in the Vatican Gardens. Sometimes he drives his own motor car, for Pius XI is a sportsman and a famous mountain climber. He wrote a book on mountain climbing. After his bit of exercise he has a frugal dinner and goes to his desk until three or four in the morning, when he says his daily Mass and goes to bed. This program does not obtain on Sundays when there are no audiences. On certain Sundays he says a Mass to which invitations are issued to fifty or a hundred persons—mostly visiting priests or students.

Getting Ready for the Audience

The notification that the Pope will receive you is commonly attended with some ceremony—a member of the household in full regalia brings the card to one's hotel and a fee is expected. But with us the notice came quite informally through an American priest who had been told to tell us to be at the American College at eleven. The dress for a private audience is important; a man must wear full evening dress and a woman must wear a black dress with a high neck and long sleeves, while on her head she wears a black lace mantilla. We drove with Monsignor O'Hern, the rector of the American College, around to the left of St. Peter's and through the Cortile della Sentinella. This gate, as are all the gates, was in charge of the famous Swiss Guard, who wear the yellow and red slashed uniforms designed by Michael Angelo; they carry halberds and belong to ages ago.

We entered the Cortile di San Damaso, which is a paved court about one hundred feet square. On three sides are the apartments used centuries ago by the Popes and now open to the public to view the murals. On the fourth side is the Palace of Sixtus V which is very plain with great windows and from the outside gives no notion of its size—nothing in Rome appears big from the outside. We entered the not impressive door and walked up three hundred marble steps—the levels in the Vatican are baffling. This brought us into the Sala Clementina where a detachment of the Swiss Guard stood at attention.

Some Striking Scenes Within the Vatican

The room was already filling for the public audience. Although the day was very hot with an intense sun, inside it was cool; for the walls are immensely thick, the floors are tiled, and all the many full-length windows were closed and hung with heavy crimson brocade over some sort of curtains which subdued the sun and gave a singular quiet in spite of the number of persons about.

We passed through another large hall where stood two immense gendarmes in black boots, tight white breeches, and great, hairy grenadier hats. We went on through a series of comparatively small rooms; in one were members of the Palatine Guard—an honorary body drawn from Rome which supplies a certain number of men for daily attendance. They looked well in black tunics with crimson facings. In another were members of the famous Noble Guard, some of whom are always in attendance upon the Pope. They are drawn from Italian families of noble rank and there are only sixty-three of them. They looked very smart in black coats with gold epaulets and cross belts and large steel helmets with gold crests. They form the Pope's guard of honor.

We waited for a time in a room hung with tapestries, and then one of the Pope's secretaries in Roman purple came out to say that His Holiness was on schedule with his appointments. We were taken through a throne room—a fair-sized chamber where the Pope receives ambassadors and royalty. It was here that he received the King and Queen of England on their recent visit. It was here that Benedict XV received President Wilson when he came to Rome in 1919. The throne is simply a raised dais with an armchair and a canopy. The next room was much smaller and out of it opened the door into the Pope's study. This room was used as a bedroom by Leo XIII and he died in it. In a few minutes the Pope walked out of his study alone—swiftly and yet without the least haste. He is entirely poised but not at all posed. There is no need for pose; there is nothing about which to pose.

When the Pope Bestowed His Blessing

He was entirely in white, except for the violet stockings of which one caught just a glimpse. Around his waist was a heavy sash of white moire and on his head the little white skullcap which only a Pope may wear. The Vatican is not a healthful place in which to live, and his face seemed very white. The whole impression was one of whiteness and his gold spectacles did nothing to relieve it. The Pope seemed a little weary and detached, yet without being detached in the ordinary sense, for though he spoke gently in Italian it was plain that he was interested. He spoke for perhaps ten minutes—it is hard to judge the time. Then he gave his blessing and moved away as swiftly and as simply as he had come.

We went out as we had come in, but now the rooms were still with kneeling people as the Pope passed through giving his blessing. We tiptoed by.

The Taxograph

By WALT WALTON

YOU have heard of a thermometer, a barometer, a sextant, a chronometer, a telegraph and a seismograph. But do you know what a taxograph is?

A taxograph is an illuminating chart, furnished by the U. S. Treasury Department, which shows the amount of Federal taxes (exclusive of inconsequential payments made under minor subsidy measures), paid by each state and the amount refunded to each state. It is more comprehensive than a Babson report. At a glance anyone can tell the status of commercial development enjoyed by each state. One state (Nevada) received more Federal aid than the amount of its Federal taxes. *Reading between the lines* of a taxograph is interesting as well as enlightening. Try it and see. Here is the official U. S. taxograph for 1924:

State	*Paid in Fed. Taxes*	*Received as State Aid*	*Pct. Returned as Subsidies*
Alabama	$ 9,800,970	$1,705,610	17.40
Arizona	2,131,288	995,331	42.00
Arkansas	6,536,635	1,361,459	20.82
California	129,026,453	2,475,800	1.91
Colorado	15,228,037	1,294,449	8.50
Connecticut	37,006,532	538,009	1.45
Delaware	10,805,101	379,330	3.51
Florida	15,819,827	910,084	5.75
Georgia	19,181,446	2,137,684	11.14
Idaho	1,976,084	905,827	45.08
Illinois	214,840,722	3,390,701	1.57
Indiana	45,767,607	2,034,555	4.44

Barefeet and Chestnut Burs

Things That Pain on the Path of Life

By ROBERT SPARKS WALKER
ILLUSTRATED BY S. F. AARON

The spines are sharp, the burrs are set
Beneath the leaves concealed;
With feet unshod, they must be met
With cunning for a shield.

NATURE is ever cautious. She is the author of beauty, strategy and the camouflage. The thoughts of these bring to memory the many woods of childhood days where grew large chestnut trees, the paths to which were made trackless by autumn leaves. How often my feet crushed a chestnut bur, and when a foot was lifted from the ground, what an array of prickly spines had risen up on my foot to call me stupid! Nature had taught me to be cautious, but enthusiasm without curb had set the habit of caution aside in her race for the goal!

When we come in contact with the painful things in life, whether it be the suffering of the physical body, or of the human soul, in our thoughts of self, we fail to see that the path of life for every individual plant or animal, without regard to its race or color, is beset with hosts of prickly spines, and each and every individual must tread its own path with bare feet. The avoidance of coming in contact with these prickly burs is simply strategy. Being pricked by them, and then devising means to avoid a delay in our progress, develops hardiness and fitness, which qualifies one to survive where others fall by the wayside.

Even though an individual succeeds in the face of competition, somewhere down the road of life, these spines become so penetrating and so numerous that it means a tragic end. In observing how the various species of plants and animals meet and solve these spiny problems, we are struck with the fact that Nature knows no such thing as discouragement or dismay. Ten thousand spines from chestnut burs will be removed by an animal without showing any signs of discouragement. In fact, discouragement is a man-acquired vice. We too often like to be pitied and petted. Man falls to sympathy and too often seeks the route that promises ease and content. This is not true, and has never been true, with the world's greatest missionaries! A route of ease may mean a stupid mind, and an awkward and ill-developed body. Perseverance is the watchword in Nature.

Human beings profit from their losses. The person who loses ten thousand dollars in the purchase of worthless stock will make a hopeless customer for the next promoter. But the principle is not always true with animals.

A raccoon washes its food before it eats. If it cannot have water, it rolls the food in its paws as a substitute for water in cleansing its food. You may throw a quart of ripe strawberries to a raccoon and as it rolls each berry in its little black paws, the fruit is reduced to a pulpy mass and it slips away to the ground. When the animal is ready to eat, it holds nothing in its hands! If it were a human being, after the loss of the first berry, the remainder would be saved. The raccoon will not depart from its instinctive habit of rolling food, even though the practice sometimes brings a loss of food. Fortunately all of its food is not made up of soft berries.

"The red-headed woodpecker." Nearly all woodpeckers have red heads, but this is the only one that has the head all red.

Sometimes we find certain animals with some peculiar traits that appear as natural, and yet it seems that such peculiarities are the result of some physical disorder. For example, between the years 1900 and 1908, when I was a boy, and living on a farm in Eastern Tennessee, we kept a number of goats. Among the herd was one animal who exhibited a peculiar paroxysm when startled or excited in any manner. This goat fell an easy prey to the pranks of boys, who frequently slipped up behind it, and clapped the hands, at the same time screaming loudly. The goat invariably fell prostrate to the ground, and for a few moments lay extended upon one side, with back and legs stiff and straight, as if in a tetanic spasm. After a few minutes, he would regain consciousness, get up and walk about, but, for an hour or more following the fainting spell, would move about in a stiff and stilted gait. (Continued on page 20)

Chestnut burs, now becoming scarce because of the blight that has doomed chestnut trees.

MR. FORD'S PAGE

ONE need not live very long nor be an extraordinary observer to learn that ability to profit by mistakes is not common. Perhaps back of this is the inability to recognize mistakes as such. Some errors immediately identify themselves by their painful consequences; others seem profitable for the time. And these latter are the mistakes from which repeated disaster does not easily wean us.

Just now fully ninety per cent of the general hope for "soundness" and "stability" and "prosperity" represents a desire for the continuance of economic conditions which have disproved their identity with soundness, stability and prosperity a score of times. Social engineering has never taken hold of this situation. We have sanitary engineering, which sees to it that physical conditions conspire in favor of the public health. We have educational engineering, which works toward the end of a general intellectual self-dependence. But we have no economic engineering which rises above the incidents of private profits and competitions to an application of the known laws of economic health to the affairs of all the people.

Most of the great disease plagues are banished from the earth now, by health engineering. Tuberculosis can be banished as easily as reptiles, yellow-fever can be abolished as easily as vermin. Typhoid has been brought by health engineering to the status of a disgrace to any community. But in the economic realm the issue has been so distracted by money motives, that nothing like the progress in other regions of life has been made. And yet, curiously enough, it is in the economic sense that we most frequently speak of "progress."

No one on the earth would ever start a plague in the hope of profiting by it. We know now that a plague is total loss. Few would even start a war for the sake of profit, though those few remain and are potent, and are of the moral status of plague-starters. But who is deterred from starting again on the old economic practices that frequently halted so-called "prosperity"? And when the economically unhealthful practices are at their height, how many are able to say that it is fever and not vigor that is being "enjoyed"?

It is not possible to see very much indication of increased economic wisdom on the part of professors or practitioners of commerce. Governments seem so content to see the wheels turning, that they tread softly past all sorts of irregularities, as if fearing to disturb the process. It is as if former yellow-fever strongholds returned to swamp and former typhoid sinks to their insanitary practices.

Of course, if this is true, it only shows that we have not learned, that we must have more lessons. One excellent point about life is that it continues the lessons until we have learned. Yet there is no ground for complaint; it is the generality of the people who have not learned, all of us together, and nothing, not even revolution, can make up for that. Revolution more often shows how less than the general knowledge is that possessed by the revolters.

THE actual situation anywhere, at any time, corresponds exactly to the moral and mental status of the people. All life is experience, and one level is exchanged for another only when its lesson is learned. Revolution against this natural process redoubles the severity of the lesson. The only way out is up. Modern revolutionary teaching is that the only way out is down. There is a world of difference between the movement to level the classes and the movement to elevate the masses. The movement up is the winner; it is that to which the intelligent mind should ally itself.

This state of affairs may indicate also the need for completing some things which can only be fostered under present conditions. It would be folly to assume that the present is all lost time. Not at all. Even with its recognized imperfections, some matters are forming which are the essential preliminaries, at least, of coming betterments. It may be that the motives, now operative, are bearing their part in making way for the newer motives which are on the way. It is so easy to condemn an incomplete time, and fail to see that it is really one of the indispensable elements of coming completion.

And yet there are indications that our ready turning again to a system that has always broken down is not in total ignorance of its nature. There are misgivings. What men are always glad for is the continuance of material support for the life of the people; that is really the essence of all prosperity; but they are not without inner remembrances that true prosperity in the past has bred many parasites which have at last paralyzed it. That much the lessons of the past have done for us. No matter how many of the old and dangerous practices may seem to have returned, it is lawful to believe that there are this time, more than at any previous recovery, increased sane and sanitary thousands who have not bowed the knee to uneconomic practices.

With each circle we spirally lift a little higher. Though we seem to return where we left, it is always on a little higher plane. Today more minds admit the unity of economic stability and moral righteousness, than ever. That gain cannot be disputed.

"Free Russia" Does It

FEW Americans are disturbed at the exclusion of Mr. Saklatvala from our shores. That gentleman has one profession in life, to which he subordinates everything else, and that is the destruction of the British Empire. Enjoying the liberty with which civilization endows him, he has been elected to the British House of Commons for the better furthering of his object. He was also made a member of the Interparliamentary Union and chosen as a delegate to the United States, whereupon British co-delegates with him resigned, and the United States withdrew its visa of his passport. The friends of Revolution in this country, in their elaborate costume of the Friends of Free Speech, say that our Government has violated human liberty.

There may be something in that. Mr. Saklatvala's essential harmlessness may better have been indicated by his being permitted to arrive and talk to his h art's content. There is no indication that the United States feared Mr. Saklatvala; the feeling seems to be that it would have been discourteous to Great Britain to have afforded its bitter enemy a platform here.

An interesting side light, however, has escaped the "friends of freedom." In Russia, that land of the free, that home of the brave (see Soviet laws and Cheka assassinations) they emulate the United States in this very matter. Russia, to be exact, is the most "exclusive" country in the world today. Russia refuses more passports, going and coming, than any nation has had occasion to do since there were passports. The Trades Union delegates only recently appointed a committee to go into Russia; forthwith the Bolshevik officials began to refuse to visa some passports. One man they did not want because he could speak Russian and therefore, presumably, would not be entirely dependent on the official interpreters for his views as to how free, happy and prosperous the slaves of Bolshevism are. Another man had a reputation for difficult eyes over which to pull wool. So they had no passports. No one has criticized Russia for that action.

And yet the friends of Bolshevism in this country go into spasms of agony because the avowed revolutionist Saklatvala is refused permission to brew his evil medicine on our soil, while their beloved Bolshevik fatherland excludes all who are believed to be honest observers.

But how are the people to know the facts, unless the newspapers tell them? A harder question: Why is it that the newspapers, having the facts, do not tell them?

La Follette of Wisconsin

THE overwhelming support given by Wisconsin to the son of LaFollette is variously interpreted about the country. His nomination was explained on the ground of sentiment—the State wished to honor the father in the son. That scarcely accounts for the election, however. The election clearly indicates that Wisconsin cares for something which LaFollette represented and which it believes neither of the old parties stands for today. The election does not mean a Republican victory, though it was taken in the Republican name. It does not mean even a renewal of a great personal force in the Senate. It means that there is an element in present-day politics which fails to satisfy—more than that, even rouses the opposition of—a people so well educated politically as those of Wisconsin.

It is plain that the country is passing through a period of obscurity for the progressive program. The new conservatism, that which should combine the social spirit of progressivism with the managerial ability of the old conservatism, has not appeared upon the scene according to promise. As to the whys and the wherefores there is wide room for discussion, but beyond question the chief factor to consider has been the lack of progressive power among so-called progressives. Mere discontent is not progressive. Mere opposition is not progressive. A tendency to accept every economic cure-all and campaign for the most extravagant proposals is not progressive. Successful progressivism requires all the ability of the old conservatives with the new vision of social service—a wise management of government for the widest public benefit—and our progressives have simply lacked both the ability and the vision. They are not big men, and when they win a little power they use it in as trifling ways as do the others.

These facts, of course, present all the elements of a period of change. The serenity of the American political pond is due, rather sooner than later, to be disturbed. But the indications as to the character and direction

o the change are somewhat harder to read just now than they have been heretofore. Wisconsin is simply the remembrancer of the existence of a spirit in the country which party machines cannot control.

Dayton—Sign of Intelligence

TO DIVERT their minds from greater troubles, the British people, or such of them as are articulate in their more intelligent Press, amused themselves with the doings at Monkeyville in America, as they playfully described Dayton, Tennessee. A rather disgusting element of the celebration was furnished by some visiting Americans who were not beneath currying British favor by seeming to ridicule their countrymen.

Now, however, rises Professor George McCready Price, M. A. (sometime contributor to THE DEARBORN INDEPENDENT), in the English *Review of Reviews* and informs the English people that the proceedings at Dayton, so far from revealing the Americans as a backward people, prove that "the United States is a more advanced country than England." Such a revolt on a scientific question would not be possible in England, says Professor Price, because the country people of England are not taught the elements of science. The fact that in the mountains of Tennessee there can occur an event which attracts the attention of the world, that event growing out of a method of scientific teaching in the schools of even the more remote parts of the mountains, is the best indication that the Americans have gone further in popular education than the nations which interpret Dayton, Tennessee, as a sign of national ignorance. Professor Price practically says that if you wish to put over some of the speculations of so-called "science" today, you must select an ignorant community, for it cannot be done in an educated community.

Dr. Price quotes Dr. Ritter of the University of California as seeing "signs that the whole battle ground of evolution will have to be fought over again; this time not so much between scientists and theologians, as among scientists themselves." Dr. Price, himself a geologist, follows this course; he keeps the challenge within the lines of science itself.

These are views to which the Editor of the English *Review of Reviews* invites the "serious consideration" of his readers. And they constitute a statement worth considering in this country. That Professor Price goes on to show how easily possible it is for men of the highest intelligence and best education to take issue with the evolutionary hypothesis on scientific grounds, does not call for comment now. But that the widespread interest of Southern States, in the doctrine of evolution in its relation to other things, should have been used in this country as an example of the ignorance of those States, indicates how thoughtlessly Americans may bow to the tenor of un-American publicity. Intelligence enough and mental independence enough to call scientists to the bar, may be expected in a people who in the past have called the political science of the world to the bar and condemned it, and who are now sitting in judgment upon the economic science of the world. Men who ask questions, and refuse to stand cap in hand, are worthy the scientists' best mettle. To treat such people with scorn, shows weakness.

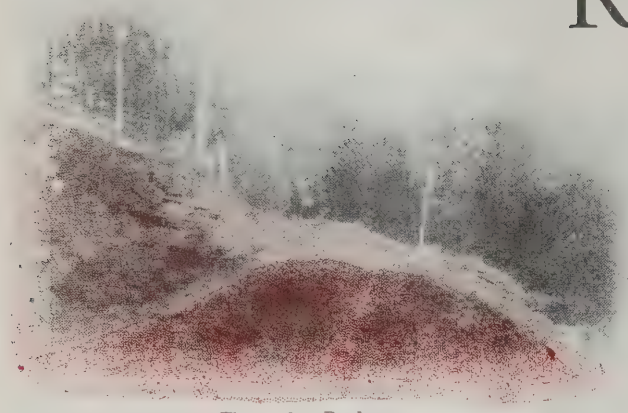
The Debts as Hate Breeders

THE war debts have become the world's chief war breeders since the Treaty was signed. Every nation, to conceal from its people the facts of its financial condition, has exceeded even war frenzy in the invention of falsehoods. And of course no falsehood goes down quite so readily as that which villifies another nation. It is a merry game that the so-called statesmen are playing at the behest of the international financiers, and the result of it is that the United States is being continuously misrepresented before the principal nations of Europe. In parts of the British press, and in all of the French press, it would be impossible to distinguish morally between the Americans and the cannibals of the sea. We know the propaganda to be untrue, and the statesmen know it to be untrue, but it continues to corrode the thought of the nations with suspicion, distrust and contempt. We may imagine to what height the propaganda has reached in France when French ex-Service men have felt it necessary to return the war medals which the American Government bestowed on them. Such actions could only be produced by the grossest misrepresentations of the attitude of the American Government.

In this state of affairs we can only pursue the course we have adopted. We cannot bend to propaganda. The only part of our course that is open to any question at all, is that concerning interest. In their repayment of their borrowings, some of the nations will pay us twice what they borrowed, the interest running in some cases to more than 100 per cent. But even so, the money is probably better thus expended than it would be otherwise. The physical ferocity of the next war is undoubtedly being reduced and its time shortened by the fact that the American insistence upon repayment of the debts is preventing a great deal in the way of heaping up military armaments.

Rugby: the Village That Didn't Keep Its Promise

By HARVEY WHIPPLE



The road to Rugby.

GOING south toward Chattanooga, over the Cincinnati Southern Railway in and out of many tunnels, swinging around curves and crawling over high bridges, you come among hills studded with abandoned enterprises. There are piles of slate, a few rusty overturned dump cars and tumble-down trestles, sawmills with chimneys eaten out by rust and leaning structures clothed in that weather gray peculiar to things that are neglected in idleness. The procession of expectations that have petered out and the whole aspect of numerous threadbare way stations are thrown into relief by the railroad's brightly painted little station houses. One bears the sign "Rugby Road."

From the worn spots about the station a road leads to the Cumberland Plateau—six miles of winding, deep-rutted, rocky way to the little village of Rugby. Rugby is a beautiful place for holiday loitering. That fact has something to do with its past—a past that was once colorful and promising, with important people moving in and out. They came from Boston and New York and from far-away England, the author of *Tom Brown's School Days* bringing the plan of a social experiment in which English school graduates should find their next adventure. That was in the eighties. Rugby was to have been a model colony of Englishmen—second sons and others for whom any of the gentlemenly professions provided a life work which was distasteful, or for which they were unfitted, or which was already overcrowded by a system of class distinction now fast breaking down, which proscribed either entering trade or doing manual labor for a livelihood. At Rugby they were to find a new world and work out their salvation, with Thomas Hughes as chief mentor.

The inception of the idea of an English colony in the Tennessee mountains was almost casual. Before the Cincinnati Southern Railway had completed its line to Chattanooga, Cyrus Clarke, a banker of Newcastle, Pennsylvania, and some associates began the purchase of land on the plateau of the Cumberlands through which it was anticipated the railway would extend its line, then built from Cincinnati to Somerset, Kentucky.

A preliminary line had been run through these lands, where for 70 or 80 miles there would have been few difficulties in construction by reason of the peculiarly level character of the country, scarcely even rolling, and cut only by its rivers in their ravines.

It was during the period of expectation of the settlement of this attractive region and before it was decided that the railroad should extend by a different route,where it is now, due to the difficulties of ascent to the table land, that A. L. Crawford, of Newcastle, overheard a conversation among fellow passengers, strangers to him, on a train, as to the desirability of finding a location for a colony—climate, water, and other important matters being alluded to. Mr. Crawford introduced himself to one of the party, Franklin Webster Smith, of Boston, to whom he mentioned the desirable land held by his friend, Mr. Clarke. Mr. Smith visited the region and pronounced it peculiarly adapted for colonization. An organization of Boston men, first proposed to undertake development and colonization, failed of consummation.

Mr. Smith then went to England in the employ of Mr. Clarke, and he interested Thomas Hughes, John Boyle, and others in the idea of an English colony on the Cumberland Plateau.

Strongly socialistic, but deeply English, the author of *Tom Brown's School Days* saw possibilities in the Tennessee colony for carrying into effect a dream that had been growing in his mind for improving the situation of boys of England who were in the way of slim chances to make their way either in the professions or in the trades for useful, prosperous lives. In a collection of Thomas Hughes' papers, brought together in a little book, *Rugby, Tennessee*, in 1881, we find in a few words the facts of a social condition which he would alter.

"Will Wimble had been tried, it seems, by his parents at divinity law or physic, who when they found his genius did not lie that way, had been given up at length to his own inventions. This kind of humor, on the part of aristocracy, was filling several parts of Europe with pride and beggary, wherever they would rather see their children starve like gentlemen than thrive in a trade or profession that is beneath them.

". . . So in sadly increasing numbers, our Will Wimbles within a year or two of leaving school find themselves stranded."

Obviously the pivotal idea of Thomas Hughes' reform is to be found in the paragraph which he quotes from Emerson, in a prominent place in his book:

"Is it possible that I, who get indefinite quantities of sugar, hominy, cotton, buckets, crockery ware, and letter paper, by simply signing my name once in three months to a check in favor of John Smith and Company, traders, get the fair share of exercise to my faculties by that act, which nature intended for me in making all these far-fetched matters important to my comfort? It is John Smith himself, and his carriers, and dealers, and manufacturers; it is the sailor, the hide-dresser, the butcher, the negro, the hunter, and the

Rugby's store—the picket fence around the stoop keeps the pigs out.

planter, who have intercepted the sugar of the sugar and the cotton of the cotton. They have got the education, I only the commodity.

"This were all very well if I were necessarily absent, being detained by work of my own, like theirs, work of the same faculties, then should I be sure of my hands and my feet; but now I feel some shame before my wood-chopper, my ploughman, and my cook, for they have some sort of self-sufficiency, they can contrive without my aid to bring the day and year round, but I depend on them, and have not earned by use a right to my arms and feet."

Thus, it came about that Hughes put his heart and soul and much of his purse into the dream of a colony which should in its development provide the Will Wimbles among English boys and men with an opportunity to work out their own destinies.

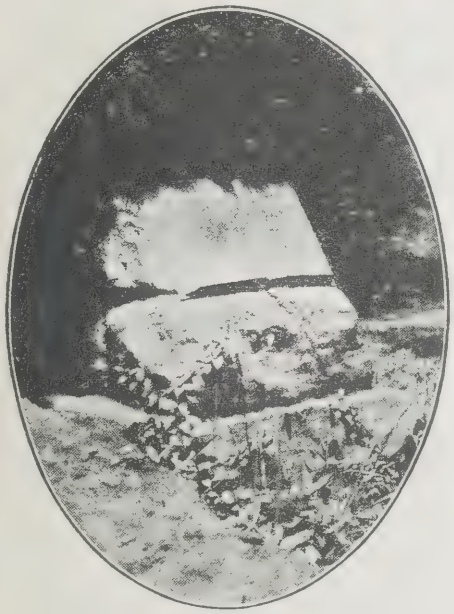
The Board of Aid to Land Ownership, Ltd., was organized in London following Mr. Smith's visit and an option taken on the Clarke lands in Fentress County, Tennessee.

Following this, Mr. Boyle, representing the company, visited Tennessee and was favorably impressed with the country which he found, so that after going over it carefully, he decided that the first colonization enterprise should be located nearer the Cincinnati Southern than the lands upon which option has been taken in Fentress County. Thereupon land upon which the colony of Rugby was finally located was purchased by the London company, Mr. Smith of Boston being actively identified with the enterprise, which was intended to be the initial step toward the larger development embracing the land in Fentress County.

Mr. Clarke and his son, assisting the company in arranging their initial plans, were requested to take charge of the development as might be directed from London. The town of Rugby was surveyed and platted, and a new roadway built to the Cincinnati Southern at a point now known as Rugby Road. This work was started in the spring of 1880 and following that orders came for the construction of a hotel, which was promptly built; a church, an office, and a boarding house, and later a building which should serve as commissary or community store.

The cottage built for Mrs. Hughes.

Mr. Boyle, vice-president of the Board of Aid to Land Ownership, Ltd., reached the scene of preparations well in advance of Mr. Hughes. A score or more of prospective colonists came about the same time. On Mr. Hughes arrival in America, he was warmly welcomed and much attention was paid him so that many became interested in his project. Boston friends did a characteristic thing in sending him several thousand volumes for what was to be the Hughes Public Library, in the new Rugby. Someone reminded the city of Chicago that it had received aid from England at the time of her great fire and it was engineered so that Chicago did the gracious thing and gave to the English colony in America the building in which to house her books, the Boston gift being added to by publishers in other cities.



The grave of Thomas Hughes' mother.

While newspapers gave the development a great deal of favorable attention and visitors were coming over at intervals from Chattanooga and Cincinnati, colonists were arriving almost daily from England. While the thought was first of all agriculture, no land was being cleared and there were delays in getting deeds ready for some who were prepared at once to buy, so there were disappointments and to some practical people even at this early stage of the development, the whole affair seemed to lack direction and definite promise.

As the time drew near for the opening, Mr. Hughes was greatly concerned that the hotel —the Tabard Inn—(having in its stair some banisters brought from an old hostelry at Southwark, England, from which the Canterbury Pilgrims set out) should be completed on time. It was to accommodate fifty guests and had great stables nearby. He was anxious too that the road to the railroad be finished, that no mishaps might mar the arrival or stay of the colonists and guests shortly expected. Road and hotel were ready on time as promised, and Mr. Clarke had brought up omnibuses from Lexington, Kentucky, and with considerable difficulty got the arrivals over the new road, deep in a twelve-hour rain.

The little English church at Rugby.

Colonists increased in number by newcomers added at intervals before and for a year or more after the formal opening which took place early in October, 1880. In less than a month after the opening Rugby's population was 120; every bed in the hotel was taken and the colonists overflowed into the boarding house and into subsidiary barracks and shanties. There were colonists fresh from English schools—from Rugby, Harrow, Eton, and Wellington; with togs and equipage strange even for pseudo pioneers and farmers—guns, rods, racquets. Their owners were full of gaiety, for was it not a lark to recreate along the rocky watercourses and in the beautiful woodland of the Cumberland Plateau?

From the writings of Thomas Hughes for the *Spectator* there are glimpses of the situation at Rugby, when he arrived before the opening, which give an idea of a lack of definite plan and purpose—a lack no doubt entirely unseen by him, whose sincerity and high purpose remain unquestioned. So thoroughly sincere was he, in the enterprise, that he brought his aged mother with him to the colony.

Even before there were suitable lodgings for settlers and guests soon to arrive the early arrivals entered upon the preparation of tennis courts and cricket grounds and cut bridle paths through the woods to the "meeting of the waters" where the Clear Fork and the White Oak rivers join. It was between these streams that the town was built. In mentioning the bridle paths, Mr. Hughes says, in one of his papers, "They are three miles long and cost under 100 pounds, a judicious outlay (*Concluded on page 30*)

Five Million Work on Sunday

Is Not Every American Entitled to a Day of Rest? Movie Houses Think Not—They Call It an "Evil"

By HARRY L. BOWLBY, D.D.
General Secretary, Lord's Day Alliance of the United States.

SINCE the day it was written, "In the sweat of thy face shalt thou eat bread," man had needed his day of rest, following his week of toil. Never in the history of the world was it needed more than in this age of steam and electricity, the age of seventy times seven wonders, the era of swiftly flying shuttles of mind and machinery, of rapid exhaustion of men and materials.

A close-up view of what some industrial plants and corporations and Federal and municipal government departments are doing to put the Sun in Sunday for employes is necessary to a complete knowledge of our progress. Few persons understand the working conditions of men in big institutions, even though they are almost a part of these institutions through patronage and personal observation.

Take, for instance, the Postal Service, the largest single employment bureau in the world. How many persons in the United States have ever thought about the postal employe's Christmas Day? Formerly he had no share in the day which most of the 100,000,000 people of the country have always enjoyed. Due, however, to certain efforts, the postal employe's time of service last year and the year before was shortened on Christmas Day. The prospect for this year, 1925, is that he will have a full, free day for his family and his friends. That, at least, is the tenor of a statement given to me on last January 15, by Honorable John H. Bartlett, First Assistant Postmaster-General:

"It will be my policy, if I am around here next fall, to have the first and second class post offices closed on Christmas and the carriers and clerks relieved of work that day."

Ex-Governor Bartlett initiates the policy and doubtless Postmaster-General Harry S. New will approve it.

Some time ago, the question was asked, "Who put the Sun in Sunday for the Postal Employes?"

The answer was "The Lord's Day Alliance of the United States." Being introduced by Ferdinand Douglas, president of the New York Letter Carriers, at a great meeting in Mecca Temple, New York, recently, I was presented as one who was representing an organization which had put the "Sun" in Sunday for the letter carriers.

To show what progress has been made respecting the continued closing of the post offices since August 24, 1912, by Federal enactment, we cite an article by Honorable Hubert Work, Secretary of the Interior and former Postmaster-General, which appeared in the May-June, 1925, issue of the *Lord's Day Leader*, as follows:

"The Sunday post office, long considered a business and social necessity, has gone into the limbo of forgotten custom, and each year shows a decline in the number of workers employed on Sunday in the diversified branches of the postal service without any appreciable inconvenience to the public."

Dr. Work also says, in the same article, speaking on industry yielding to the claims of the weekly rest day:

"Where the industrial processes are continuous, the problem may be met by successive shifts and the adoption of the rotation system in shortening the hours of labor and giving the worker an alternate weekly rest day."

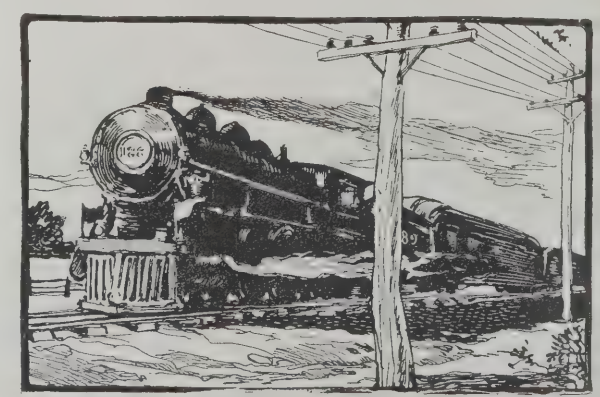
Roughly estimated, there are about *five million men and women and young persons engaged in Sunday work in the United States*, many of whom are under the burden of the seven-day working week. Many efforts have been made to bring about the discontinuance of this unwholesome practice. In trades and trades manufacturers and so-called continuously operating institutions, much work is constantly being discovered that is absolutely unnecessary. The American Federation of Labor, in a letter I received from President William Green, under date of July 18, 1925, makes the following statement:

"In order to make Sunday a rest day, trade unions provide that all work done on that day should be paid time and a half or double time. The increased price is made to discourage Sunday work, not to get the higher price. The declaration of the American Federation of Labor in 1891 would apply at the present time to the moving picture shows on Sunday."

Undoubtedly where the principle of paying time and a half for Sunday has been enforced, Sunday work has been greatly lessened in many stores, shops and various industries.

As the steel industry is recognized as one of the greatest business enterprises in the nation today, we shall call attention to some needed rest-day reforms which have been made in some of the steel companies and corporations, and the need for still further improvement. In the year 1910, the United States Steel Corporation declared that its policy would be a six-day working week for their employes. Apparently the matter received comparatively little attention until the autumn of the year 1914, when attention to the economic as well as the moral values of the six-day week was brought strikingly to the attention of the officials of the Carnegie Steel Company, a subsidiary of the United States Steel Corporation. It was then decided that a greater effort than ever should be put forth on the part of this great steel corporation, for the practical operation of the weekly rest day. In September, 1915, when I visited representatives of the Carnegie Steel Company, to find out how the six-day week was working, I received the following statement from the secretary to the president of the company:

"No one in any company of the Corporation can work any



The seven-day working week sets up a particularly difficult problem for the railroads.

man more than six consecutive days without the previous consent of the Finance Committee of the United States Steel Corporation—and they don't give it. And wherever possible, Sunday shall be given as the day of rest."

Again, in 1923, after complaints had been received by certain persons concerning the infringements of the six-day week, I received, in answer to a letter I sent to Judge E. H. Gary, chairman of the executive committee of the United States Steel Corporation, the following statement:

"I have just received and read your letter of June 23d instant. As you have suggested, during the war, at the earnest solicitation if not direction of the United States Government, we were required to permit our men to work seven days a week in order to secure sufficient supplies for Government war purposes. Immediately after the armistice was signed, we entirely discontinued the seven-day week, and since that time have been operating on the six-day week basis. I am not aware of any infringement. If we should learn of any, a remedy would be promptly provided."

In the same letter, Mr. Gary also made the following statement:

"Also, we are actually opposed to the twelve-hour day, and are hoping that in the comparatively near future that will be eliminated."

Although it has seemingly become recognized throughout the country that transportation lines, including steam railroads, fall in the category of those things which minister to the comfort of said communities, there is undoubtedly good reason for believing that such continuing industries should guarantee a weekly rest day to their employes and that a vast amount of absolutely unnecessary work could be discontinued on Sunday.

Railway Age, of February 28, has an editorial, under the caption "The Seven Day Week," which is very much to the point. It calls attention to some correspondence published by B. C. Forbes in a syndicated article which called forth a flood of letters from railway employes who complained that they work seven days a week. The editorial continues:

"The first employe who wrote to Mr. Forbes asserted that railway employes in general work seven days a week. This, of course, was an exaggeration. The statistics of the Interstate Commerce Commission indicate that the average employe works 300 days a year, while the average general or divisional officer works 312 days a year. It is undeniable, however, that some railway employes do work seven days a week. The average in 1923 for transportation employes (other than those engaged in train, engine yard service) was 348 days for those paid on a daily basis, and 321 days for those paid on an hourly basis. The average for yardmasters, switch tenders, and hostlers was 348 days for those paid on a daily basis, and about 343 days for those paid on an hourly basis. These averages indicate that many employes of these classes work practically seven days a week. Mr. Forbes takes the position that the seven-day week on the railroads or in any other industry is an evil which the industry itself should try to remedy or abolish. It is difficult to find a reasonable argument against this position. As a matter of principle, no man should be required or expected to work every day in the year, no matter what his work is, if it is avoidable. The problem the situation presents to the railways, however, is a peculiarly hard one. They must operate seven days a week. There are many kinds of railway work for which it would be found extremely difficult to provide extra men in order that each employe might have a day off weekly. Because the problem is a difficult one, however, is not a sufficient reason why it should not be tackled by the managements. Unless the managements make a real effort to solve it themselves, as far as it is soluble, it is pretty sure sooner or later to become the subject of legislation. Employes could present a much better case for legislation against the seven-day week than for much other legislation they have got passed. It would be wise for the management of each railway to undertake a study to determine how far it would be practicable for it to go toward abolishing the seven-day week on its lines."

About twenty per cent of the Bell system's 320,000 employes work on Sunday.

The one-day-of-rest-in-seven movement is spreading for policemen.

From the same issue of *Railway Age*, we also quote from an excellent article, entitled "Ford Railroad Has Unique Operating Practices," the following paragraph, as found on page 503:

"Employes in other than train service are on duty eight hours a day during the week, with a general shutdown on Sunday. The only employes at work at all on Sunday are those engine hostlers who may be required to report for duty late Sunday evening to prepare engines for early departure Monday morning, or to care for locomotives which tie up late Saturday evening. Trains are not sent out of terminals on Saturdays unless there is sufficient time under normal conditions for them to reach their destinations before midnight. The entire property is idle on Sunday, the stations being closed and even the crossing watchman off duty."

The "Ford Railroad" here referred to is, of course, the Detroit, Toledo & Ironton.

The big railroads having the greatest mileage in the country, we have no doubt, would find it economically sound, as well as morally and industrially right to provide by definite stipulation a weekly rest day for at least the vast majority of their employes. Just as it was at one time thought that the twelve-hour day could not be abolished, by steel corporations, but which has been abolished, no more to return, we will stake our reputation on the prophecy we made several years ago, that the weekly rest day is sure to come for the teeming hosts of railroad men.

The Interborough Rapid Transit Company of Greater New York, through President Frank Hedley, in a letter of August 4, 1925, informs us that "in the shops and Maintenance of Way Departments, the working conditions of our employes are defined substantially by law and we are conforming in every way to it." In another part of his letter, he says:

"We are compelled to have a full force of employes working on Sundays. However, provision is made to give the men at other times the necessary relief."

One of the big industries of the country which has not been receiving as large public attention from the standpoint of the weekly rest day is that of the railroad telegraphers. There are 78,241 employes engaged in this industry. According to a statement published by the Order of Railroad Telegraphers, as given before the Senate Investigating Committee of 1920 and which has been confirmed as substantially correct at the present time in a letter I received from President E. J. Manion, under date of July 31. it is found that "77.966% of the employes work the equivalent of seven days a week, without punitive compensation for Sunday and holiday service." Mr. Manion

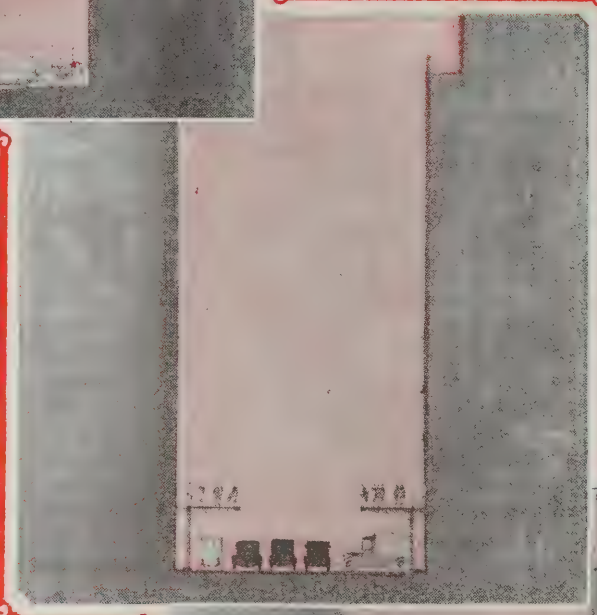
City Doctors Traffic

Are Streets Antique and Sidewalks Out of Fashion?

By J. OLIN

At left—A single illustration of the jammed condition of present-day traffic. Engineers say this cannot be remedied until basic changes involving the expenditure of millions are made.



Right—Step one. Remove pedestrians from vehicular traffic by constructing elevated sidewalks.

I HAVE been discussing American cities with Harvey Corbett, whose knowledge of them is entitled to high respect.

The American city is a weird and wonderful thing. Like Topsy, it "jus' growed." In the last dozen or fifteen years its lacks and imperfections as a residential and business center have been coming home to us with increasing force. Today city planning is one of our livest topics. In most cases it really means replanning.

Mr. Corbett is chairman of a committee of New York architects who have recently turned in cogent and much-needed suggestions anent some of the most pressing problems of their city—this at the instance of the Sage Foundation and the Regional Plan of New York and Its Environs which it sponsors.

Harvey Wiley Corbett is an engineer and an expert on the American city—a deep student of city planning, as the successful architect nowadays perforce must be, and a recognized authority on the city of today—and tomorrow.

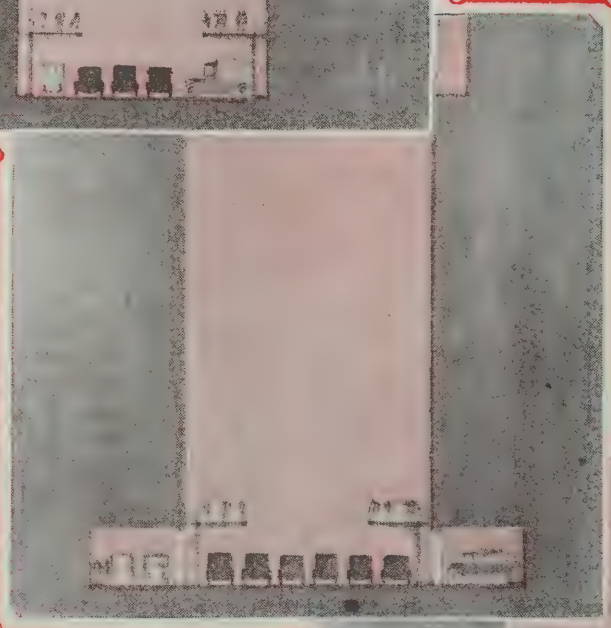
"Not alone New York," said Mr. Corbett to me, "but all the large cities over the land are in a constant state of flux. The life of the average city building is hardly more than a generation and under always changing conditions cities are ever being remade. In other countries there is stability, but America isn't old enough for that.

"Congestion, in one form or another, is, of course, always the great problem. There are two ways of providing against it which go to fundamentals. One is to decentralize, so that extremely congested centers will not exist—the other is to relieve congestion by more adequate provision for traffic and its routing.

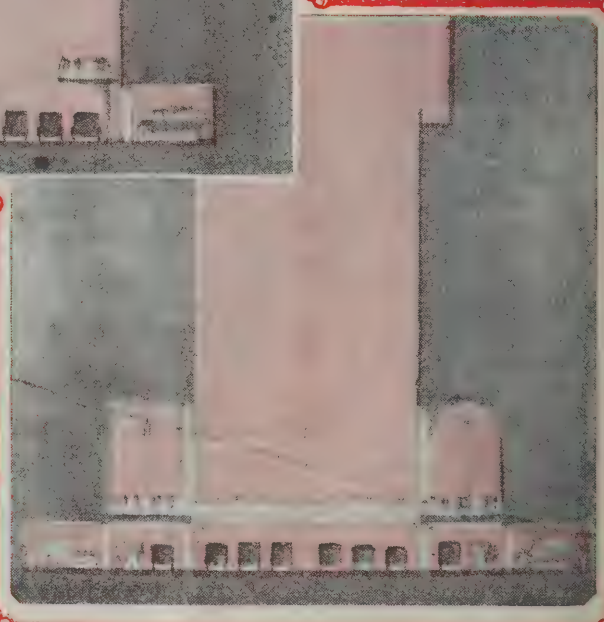
"But industrial leaders, merchants and business men generally oppose spreading a city out thin, as destructive of the very purpose for which they assemble in cities. Cities which are to remain great industrial and financial capitals must provide for greater concentration of business population, not less.

"Natural barriers make decentralization hardly to be thought of for New York, anyway. Manhattan Island is a narrow strip of land surrounded by water.

"Nor can we do much more in street widening in New York," said Mr. Corbett. "Nor cut new streets. In the vastly important Forty-Second street district there is now one acre of street for each two



Above—Step two. Provide special parking place for trucks. The separate levels for pedestrian and vehicular traffic permits two stores to grow where only one existed before



Right—Third step. Construct elevated walks across intervening streets through shopping district. In the center of the street fast-moving traffic lanes in each direction. Beneath all this are the subways.

Reduce High Pressure

Triple-decked Streets for "Rail," "Wheel" and "Foot"

Harvey Wiley Corbett, architect engineer, who proposes the three-level thoroughfare in congested city streets.

HOWE acres covered by buildings. No such ratio of street area to building area exists in any city outside America.

"Besides," continued the architect, "cutting new streets is seldom entirely practicable and ever involves tremendous legal and other expense, and usually delay far beyond the needs of the situation. In fact, it is seldom thought of till it is imperative that something be done immediately to relieve congestion.

"So that about the only solution is to increase the capacity of existing arteries. That lets us out of zoning and other problems, for it makes no difference how the buildings which line the street are able to furnish such a stream of human traffic.

"The three-deck street comes in right there," was Mr. Corbett's emphatic assertion.

"First," he said, "divide traffic into the three natural divisions into which we long ago began its segregation—rail, wheel, and foot. 'Rail' means whatever of it runs on fixed rails. 'Wheel' covers vehicular traffic which runs freely without rails, principally now motor cars and trucks. 'Foot' covers pedestrian traffic, of course."

Mr. Corbett maintains that these three kinds of traffic do not belong on the same level, but each on different levels. We have already put much rail traffic underground and are doing away with more of it on our highways in favor of what he calls "wheel traffic."

"Why not," he asked, "in congested districts, give foot traffic its own level? The grade crossing is a great curse in this country. Millions have been spent doing away with it and more millions will be spent. Why not make a thorough job of eliminating the grade crossing? Loss of life where wheel and foot traffic cross is proportionately fully as great as has ever been the case where wheel and rail crossed on the same level.

"We have already, I say, put much rail traffic underground in our large cities and are doing this more and more. Now let us elevate the sidewalk to the existing second-story level and leave the street level wholly to wheel traffic.

"The sidewalk," suggested Mr. Corbett, "would be carried on a strut a few feet away from the building line, cantilevering under the building to carry the load, and being supported so as to permit steps up or down.

"This would increase the capacity of any thoroughfare, say 200 per cent, even where we did not have the third level for rail traffic underground.

"Our present sidewalk system is archaic. It originated in a day when none could have foretold the throngs which now stop at street intersections to await the passing of automobiles or dodge in front of them.

"Under this more rational arrangement streets would be bridged at the sidewalk level and foot traffic never become mixed with wheel traffic. Shops and stores and entrances to buildings would be placed at the level of the elevated sidewalk.

"This," continued the author of this interesting plan, "leaves wheel traffic where it already is, on the surface of the earth, and where it belongs. Its level doesn't have to be dug out or built up.

"Another thing—when this 200 per cent increase becomes insufficient, because of parking of cars, property owners could be required by law to provide parking space within their building lines, which they cannot do now because cars would have to cross the sidewalks and we should have impossible confusion.

"The minute the sidewalk was lifted, however, and this elevated sidewalk construction could be quite light, for it would carry no weight but that of pedestrians—then owners could be required to furnish

General view of elevated sidewalks and the underpass for vehicles on intersection, with an abundance of light and air.

parking space on their own property. This would result in moving parking quarters back under the buildings, increasing the carrying capacity of a narrow street several hundred per cent more."

Mr. Corbett further pointed out that the triple-deck street idea has the obvious advantage of elasticity.

"It can be tried out," he said, "in small units at a time at a minimum of expense. It calls for no such outlay as would building new streets. Some cities have already incorporated parts of the idea in their street improvements, such as bridging street crossings.

"Perhaps the greatest advantage of the three-level street would be the fact that it permits the uninterrupted development of each kind of street traffic.

"It also," said Mr. Corbett, "would do away with what is an unmitigated nuisance in many parts of the city The sidewalks are used by wholesale concerns and manufacturers as receiving and shipping departments, especially the latter. There are streets in New York which are well-nigh impossible to get through on the sidewalk after midday.

"Besides, you know, it is not the great arterial thoroughfares alone we have to consider, in any case. Retail business is going into the side streets, since on the main avenues it is all but impossible now for people to reach the stores by automobile—and this means long rows of parked cars on narrower streets and a restricted lane in the center often allowing the passage of but a single line of cars.

"Light and air would both be better on the elevated sidewalk level. We wouldn't have to breathe so much carbon monoxide. And shoppers are always attracted to streets where there are no dangerous crossings to be navigated.

"With foot traffic off the streets, the ever-present problem of jaywalking would be eliminated, moreover, and all traffic could be speeded up and flow largely without interruption. Our present pulsating system of traffic flow, alternately stopping and starting to accommodate the flow at right angles, has about reached the limit of its possibilities.

"At the busiest intersections cross streets could be carried under the longer traffic lanes, as New York has already done and is doing in a number of instances.

"You know," Mr. Corbett interrupted himself to say, "this scheme needn't be criticised because of the newness of the idea. Centuries ago Leonardo da Vinci made plans for a double-decked street system for Milan. But his problem was very different. He proposed that the aristocrats should use the upper level and to keep peasants, horses and cattle on the lower.

"Today it seems to me a question of whether or not we accept the traffic classifications I have stated," he continued. "If we do, then let us establish that for future guidance and examine each proposed solution of traffic congestion by that rule, checking it with the rail under, the wheel on the surface, and the pedestrian above.

"We must have some definite rule for ourselves and posterity—else we are going to have sidewalks under this street and over that street, elevated platforms for motor cars, with long ramps, and other changes to add to the confusion worse confounded."

In that Mr. Corbett is unquestionably right. And the plans of his committee are of the few, out of the many submitted, found sufficiently practicable to be retained for serious consideration. Anything which has to do with city replanning must withstand red-taped politicians' disapproval, the cross-fire of property owners and the criticisms of transit companies, not to mention architects, city planners, engineers and many others.

Blowing Up Icebergs With Explosives

THE mine sweeper, an instrument of warfare on the high seas, is being adapted to peace-time uses in hastening the disintegration of icebergs which menace passenger and cargo-carrying vessels in the vicinity of the Grand Banks, off Newfoundland. For the first time, during the 1923 ice-patrol season, the International Ice Observation and Ice Patrol Service of the Coast Guard, United States Treasury Department, employed explosives in blowing up huge ice formations in the transatlantic shipping lanes. The breaking up of the icebergs was thus hastened by approximately two days.

Until this experimental use of a mine sweeper, there had been no attempt to remove this menace from the lanes traveled by ships going to and from European points. Heretofore, ice patrol, as the term implies, has constituted the search for and location of these immense chunks of frozen water and warning vessels to steer clear of them. The Coast Guard cutters *Modoc* and *Tampa*, built in 1921 and 1922, respectively, are usually assigned to the ice region for three months of the year—April, May, and June. These vessels, taking base at Halifax, Nova Scotia, maintain patrol continuously during this period of time, being on duty alternately every fifteen days.

Approximately 10,000 square miles in the vicinity of the Grand Banks, off Newfoundland, are included in the observation of these two ice-patrol ships.

Ac ual scene of iceberg being blown up by mine sweeper in vicinity of Grand Banks, off Newfoundland.

Equipped with field glasses, a person is on watch continuously from the crow's nest of the vessel. His observations are continuous, changing from the *Modoc* and *Tampa*, or vice versa, as they alternate services every fifteen days. Also persons on the bridge of the cutter are constantly on the lookout for icebergs, which are such a great menace to vessels plying the waters off Newfoundland. Transatlantic liners are required to transmit to ice-patrol ships a message every four hours indicating their position, course, speed, and temperature of the sea water.

The positions of these various vessels and the temperatures of the waters are plotted, that the international Ice Observation and Ice Patrol Service of the Coast Guard may determine the limits of the different ocean currents and thereby make known the probable positions and drifts of icebergs. The use of radiotelegraphy is indispensable in broadcasting the knowledge acquired by the ice-patrol vessels. Several times daily radio communications are flashed giving such information as the location of menacing icebergs defining the southernmost limit of ice formations, and telling ships specifically which course to take when navigating in the North Atlantic Ocean.

Ford

Ever-Increasing Public Preference

Year after year, the Ford car has become more and more firmly entrenched in the good will of the public.

Serving so many millions faithfully and at so great a saving; showing its ability to meet all conditions, the Ford has *earned* the world-respect accorded it today.

Now the added beauty, comfort and convenience of the recently announced body types promise a demand for the Ford car that will far outstrip even its great popularity in the past.

Ford Motor Company
Detroit, Mich.

Barefeet and Chestnut Burs

(*Continued from page 8*)

This peculiarity was found in families of certain goats throughout Eastern Tennessee, and the animals possessing this trait became common between the dates above mentioned.

In many of the spiny handicaps in Nature, we find them far outweighed by the beauty and congenial relations that exist between plants and insects. Let us go visit the blooming flower of Dutchman's-pipe (*Aristolochia macrophylla*). This interesting vine seems to be entirely dependent on insects for the perpetuation of its species. The dull, greenish yellow flower is shaped like a Dutchman's-pipe, and the throat has a fine arrangement of hairs, all pointing inward. When the insects pass into the trapdoor, they are held prisoners. The flower produces enough nectar to feed the inmates while they distribute the pollen on the pistil. When the pistil has received the pollen, the hairs wither away to almost nothing, throwing the prison door open, and the small prisoners walk out. If this plant violates the Thirteenth Amendment to the Constitution of the United States, no complaint has yet been made. On the contrary, as soon as the prisoners have been released, they immediately go in search of another floral prison door that is standing open waiting for inmates!

There seems to be no path from the largest to the smallest animal that leads free of pricking spines. The mother bird grieves over the loss of a child. Even so, grief is brought the child that is separated from its mother. A short while ago my boy was presented with a Plymouth Rock chick only a few days old. The separation from its mother had a marked effect on its morale. It constantly complained for lack of motherly affection, and when it received as a substitute the attention from human hands, it constantly showered its benefactor with expressions of appreciation for his efforts in making so small a creature as a chicken happy! It broke the spines of disappointment away by learning to love people instead of fowls. How happy it expressed itself at being hovered by human hands; how sweet became the tiny bubbling of chicken language when its intelligent little head was held against the human cheek! When it was tucked away at night in a soft downy cover—a poor makeshift for the feathered breast of its mother—it was so happy and cheerful that it could scarcely find time to take a nap. It was happy as long as it could hear the sound of human voices. But let a door open and close, or let the conversation die away, and immediately its loneliness set up, and it proclaimed aloud its discontent.

Dutchman's-pipe, noted as an insect baiter.

Its days of association made it human in many ways. An unexpected attachment sprang up between it and every member of my household. Its voice, always expressive of its inward feelings, was rarely silent. It pleaded for constant companionship. However, it became necessary to leave it alone for one day. It cried the louder in its extreme loneliness. The depths of which the spines of loneliness are capable of reaching may be contemplated by what happened to this baby chick. When its benefactors returned at four o'clock its body was stretched out in death! It had called and called and called but no one answered. The stinging pains of its tragic death reached the hearts of the members of my family. Marvelous indeed is Nature, for all this joy and pain was wrapped up in a downy-covered frame whose total weight was only one and three-quarter ounces—much in little.

No insect is so small that it can find a safe path to tread. Did you ever watch the flicker walking out on the ground busily at work searching for insects? See how frequently it lifts first its right and then its left foot and gives its head a vigorous scratching. This it does so often and so forceful that it sometimes approaches the violent state, and unless you know its game, you are likely to misjudge the cause for such seemingly undignified behavior. The bird acts as if its head were infested with mites or lice. Indeed, the antics it sometimes cuts in scratching its head do become comical. As you slip stealthily up to it, behold the mystery vanishes! It has been thrusting its beak through the front door of a colony of ants, and then by dragging its long tongue up and down in the hallway, it has brushed many ants into its mouth. Ants are full of curiosity. While the yellow hammer was doing this, many ants returning home, and finding their front door plugged with an avian beak, climbed upon the flicker's head and the tickling sensation caused by their feet was more than the bird could endure!

Nature is the author of strategy. See how the spider, the tumblebug, and, yea, even the lusty brown toad feigns death! Carnivorous and insectivorous creatures demand fresh food. Activity is proof of its freshness, and before a spider rolls up an insect in its web, it must kick about considerably. The fly or other insect that the toad swallows must give some acrobatic demonstrations first. You may toss any number of insects to a toad, and no matter how hungry he is, it must show signs of life before he is willing to eat it.

Every year, I see to it that a number of toads are kept on my lawn and in my garden. They make such splendid pets that no summer seems normal without them. In fact, a toad is worth its weight in gold as a devourer of insect pests. At dusk they make their appearance on the white cement walk and sit and wait. A toad is one of the most patient creatures around the house. It is easy to observe insects as they go scurrying across a white walk after dark. When the toad sits along a walk, it is worse than the bur-covered soil under a chestnut tree.

One evening just at dusk, one hearty toad was sitting in the middle of the cement walk on a little slope, facing

the twenty-foot incline plane. I held a bunch of small ripe grapes in my hand. They were small but sweet. When I let one grape loose, it went rolling down the walk, but was gulped up as it undertook to pass the toad. The second, third, and fourth grapes that followed were swallowed just as quickly as the first one. The fifth grape seemed to fill his food cavity to the limit. He squirmed about, made many ugly faces, his eyes moving about as if he were choked. He would twist his head back, and presented a most grotesque appearance in the antics he cut. By the help of the claw on the right front foot, he ejected the last grape as quickly as he had swallowed it. Evidently he had reached the conclusion that what he had swallowed was not toad food, though it had action. No sooner than the disgorged grape hit the sidewalk, it took to rolling down the slope. The grape got a hump on itself, and the action was more than the toad could endure. A number of quick hops brought the toad within reach of the fleeing grape, and it was as quickly swallowed the second time as it was the first! The toad seemed to be thoroughly convinced this time that it had swallowed a roving insect of some sort!

Nature's Wild Children Make the Appeal

It is Nature's wild children that will always appeal strongly to the American people. They are made graceful, independent, and beautiful from the very fact they all travel paths which are thickly thronged with spines. It is the conquest of foes, the overcoming of obstacles and the triumph that make the wild flowers beautiful. The cultivated may suffice for a season, but their struggle for food and in meeting competition has been removed from their lives. Hence the cultivated flowers will always be below par when compared to the wild ones.

In the human family, the great men and women are those whose feet have trod the paths that led through heaps of chestnut burs and through it all they have triumphed. The child brought up in luxury has many spiny burs removed from his pathway, and consequently he is not qualified for great achievements. It is the facing and solving of life's most intricate problems and the surmounting of difficulties that builds character of the type we find exemplified in our most stalwart citizens.

The Stings Come Sooner or Later

For me, I would prefer to follow Nature in the wild, traveling with bare feet over prickly burs all along the way. Give me the wild flowers and no cultivated ones except for study. Let me have the wild flowers which grow on equal footing with Nature's other children, and where class distinction and favoritism are unknown.

But to keep her children wild, Nature must ever be alert. To be less than wild means degeneracy and dependency. Thrift, wit, and wisdom abound in all of Nature's children who face the problems of life fairly, bravely and courageously. Remove these problems and degeneracy results, meaning ultimately a reversion to the primitive type.

Every creature in the plant and animal kingdoms with bare feet passes through life among chestnut burs, unless in the human family where wealth carpets the floor. The stings come sooner or later. There seems to be no degree of perfection to be reached by plants and animals, otherwise how can we account for the tragic end that is awaiting each? Nature leaves every plant and animal creation strongly imbued with the instinct to look out for itself. It cannot turn aside and dissipate this selfishness, for that would mean extinction of its species. To become altruistic would mean that it must fall behind in the race of life. The proof that we have that man is brother to every other creation endowed with life is his instinctive selfishness. The proof of his divinity is his thoughts for others.

The Telephone Pole and the Call of the Woodpecker

But one exception in all plants and animals is noticed. This is the instinct that each has for the protection and preservation of its own offspring. Thus the oak leaves the acorn filled with nourishing food for the baby tree; the chestnut fills the brown husk with a rich food for its young; the mother bird will expose her body to death in defending her children; the opossum will carry her young in a pouch until its legs are strong enough to support its body.

The burs that prick each member of the human family, when it comes to choosing a congenial and profitable vocation, are far removed from the paths of all life beneath mankind. Out in a telephone pole near my study, all day long, I hear the call of the redheaded woodpecker. In a hole she has a number of hungry mouths to feed. Her spiny problems are those of providing food for her growing family, and that of escaping her enemies. She is proud of her prospects for a second generation of redheads, but she does not worry over choosing a lifework for them. The problem of choosing a vocation for her children was settled long before the eggs were hatched, as it has been with all other birds, for

"As the years roll by, both daughter and son
Will do what mother and father have done!"

And so the seasons pass and each year's routine is like unto that which precedes it.

Men may make new discoveries which revolutionize the world of commerce, but Nature remains unchanged and unchangeable. She is content to pursue the old familiar paths.

W. J. Bryan and Ben Franklin

"WILLIAM JENNINGS BRYAN advocated having the hen replace the eagle as the American emblem when he spoke here last fall," so goes an Associated Press dispatch from Gretna, Nebraska, dated July 28, 1925.

"His suggestion," continues the dispatch, "at first met with smiles as the possible prelude to a funny story, but the Commoner soon showed his friends that he was serious.

" 'The hen is busy, thrifty, hard-working', he said, 'while the eagle is a bird of prey and not typical of America.' "

A knowledge of Benjamin Franklin's letters reveals that Mr. Bryan was not the first American to suspect the ability of the eagle to represent correctly the land of the Stars and Stripes. For in a serio-comic letter to his daughter on January 26, 1784, Franklin had this to say about the selection of the eagle as our national emblem (the expression was evoked by the objection of some to the badge of the Society of the Cincinnati because the displayed [both wings extended] eagle resembled a turkey):

"For my part I wish the bald eagle had not been chosen as the representative of our country; he is a bird of bad moral character; he does not get his living honestly; you may see him perched on some dead tree, where, too lazy to fish for himself, he watches the labor of the fishing-hawk; and, when that diligent bird has at length taken a fish, and is bearing it to his nest for the support of his mate and young ones, the bald eagle pursues him, and takes it from him. With all this injustice he is never in good case; but, like those among men who live by sharping and robbing, he is generally poor, and often very lousy. Besides, he is a rank coward; the little *kingbird*, not bigger than a sparrow, attacks him boldly and drives him out of the district. He is therefore by no means a proper emblem for the brave and honest Cincinnati of America, who have driven all the *kingbirds* from our country; though exactly fit for that order of knights, which the French call Chevaliers d'Industrie.

"I am, on this account, not displeased that the figure is not known as a bald eagle, but looks like a turkey. For, in truth, the turkey is in comparison a much more respectable bird, and withal a true original native of America. Eagles have been found in all countries, but the turkey was peculiar to ours."

We have grown so accustomed and incidentally so fond of the "old bird" that it is difficult to realize that he may not have always had the approval of every honest American.

To Guide the Mariner—Portland Light

(*Concluded from page 2*)

there was always the haunting terror of what might be happening just a little way below, on Trundy's reef. For here lived a family who were reputed wreckers. On stormy nights or thick o'fog the rumor was that they set a lamp in their window so that boats would mistake it for the lighthouse and make the turn too soon for the harbor.

One wintry night the keeper's family was aroused by a beating at the door, and when it was opened a young man pitched in, sobbing, "Poor old Uncle Nelse is drowned." They tried to thaw his frozen hands while he told them that a fishing boat had broken on the rocks. The men had jumped into dories, but an older seaman had fallen on the floe ice not to rise again. The father hastened to the wreck and sent the boys with lanterns along the rocks. It was a wild search against the wind and driving snow, but they found two men, numb with cold and exhaustion, who at first resisted being dragged to safety away from the treacherous surf.

Surf along the rocks and its companion, undertow, are dangerous near neighbors even in fair weather. One day, after a blow, a party of eight ladies drove out in two hacks from Portland for a picnic. As they spread their cloth on the edge of the cliff, the drivers started down to be nearer the spray.

"Don't go too far and get drowned," called out one of the ladies gaily, "we don't know how to drive."

"Better be keerful," warned the keeper, "waves are tricky. There's generally three big rollers come in together and if they trip you up—"

"We'll look out for ourselves," called back the men, "and be on hand for luncheon," and they commenced the descent. One was never seen again, and the body of the other was found a few days later, terribly bruised, against the rocks.

Christmas Eve, 1886, was a festival in the lighthouse. The oldest son was home from the sea and the family was preparing to celebrate his return. Two great chicken pies had been baked, besides the mince and squash variety without which a New England Christmas is but a name. Some time after midnight the household was startled by the cry of the watcher, "All hands out! Ship ashore on the rocks!"

In haste the family tumbled out and there, almost in the front yard, was a ship aground with a heavy list to her. Luckily there was no sea running or she would have beaten to pieces in no time. As it was, every one, including the captain's wife and ten-year-old son, could jump ashore in safety.

The boat was the *Annie C. Maguire*, returning from Buenos Aires. She had run into bad weather, provisions were low, and the man at the helm, weakened by hunger, had made an error in judgment in turning into the harbor. The Christmas dinner of the family went to the half-starved sailors who were so delighted with their cheer that some persuasion was necessary to make them see that their privilege as guests might not last indefinitely.

Portland Head Light

Drawing by Stanley W. Woodward.

Another wreck in which there was no loss of life was the *California*, bound for Liverpool with a cargo of cheese and bags of peas. She bore too far away from the Point in heading out to sea and went ashore on Ram Island about a mile distant from the Light, staving a big hole in her side so that her cargo floated merrily out. It takes news no longer to fly across the water than the land, and soon every little boat in the vicinity was alongside, spearing the cheeses as they sailed past. For a time cheese and stewed peas were the staple diet along the Cape.

But if the sea occasionally has her little joke, her mood is more often grim, exacting a heavy price from those who find their joy of life in her beauty and restless surging. There were four sons in the keeper's family and three of them went to sea. One fell into an open hatchway and was killed, one was washed overboard in a blow, and the third sailed out of San Francisco to round the Horn in a ship that was never heard from. No wonder that he refused the request of the youngest to be off.

And the fourth son, the present keeper, will be retiring soon, their combined time of service being eighty-three years. In that period there have been changes, but not so many as in the newer lighthouses. Instead of lard oil, kerosene is burned, two gallons to the longest night, for target practice from the forts makes gas impossible. When projectiles weighing half a ton whizz by, it seems as if the solid rocks were shaken in their places. No plaster can be used in the dwelling house, and windows are broken and doors split by the crashing.

The unusual beauty of the spot has always attracted many visitors. Years ago, when picnicking was a satisfying jaunt, parties would come to spend the day, building fires on the rocks to try out salt pork and cook a wash boiler of lobsters. Now visitors climb the shining stairs for the view seaward and pause a moment by the cross that marks the spot where the *Annie C. Maguire* was stranded. Not long ago two ladies from the interior came here for their first glimpse of the ocean, as they wished it to burst upon their gaze in all its vastness. But the morning was foggy and mists shut in the horizon.

"My dear," said one to the other in an aggrieved tone, "I expected that it would be a great deal bigger than *that*."

Tourists come and tourists go, but the Light stands firm as when it was established in the days of Washington, speeding the ships as they pass by for the Seven Seas.

Veteran Ship *Scorpion* Comes Home to Die

I have lived long enough: my way of life
Is fallen into the sear, the yellow leaf:
And that which should accompany old age,
As honor, love, obedience, troops of friends,
I must not look to have.

—*Shakespeare.*

HOME to die! An honored veteran with a proud past, patriot and protector of America, limps into port to lay her weary bones to rest. For twenty-nine years she has buffeted seas and fought adverse winds. She has battled billows in winter waters and reclined at ease in the ports of the Riviera or off the coast of sunny Greece and Turkey. Could she but speak the old *Scorpion* could tell many a bloody tale of her experiences since her launching in 1896.

The *Scorpion* was first placed in commission in April, 1898. Under the command of Lt. Commander A. Marix, U. S. N., she was sent to join the blockading squadron off Santiago, Cuba, in the war with Spain. In July of the same year she participated in the attack and destruction of four Spanish gunboats and captured a provision lighter. She was highly commended for her gallantry in action throughout the Spanish-American War. From the end of the Spanish War until 1908 she was assigned to duty with the Isthmian Canal Commission, cruised with the North Atlantic squadron and in the Caribbean Sea. She also protected interests in Santo Domingo. In October, 1908, she was ordered to Constantinople as a station ship, the first American ship for many years to receive the authority of the Turkish Government to pass the Dardanelles. Old-timers predicted that the voyage would be too much for her, but on the contrary she soon began to win new fame.

U. S. S. *Scorpion.*

At the time of the great earthquake at Messina, Sicily, in 1909, the *Scorpion* was rushed from Constantinople to aid in the relief work. She was greeted with cheers by the stricken people of that section who were in dire need of medical attention and food. When she had ministered to these people and they were no longer in need, she returned to Constantinople as a station ship.

In 1911 she was laid up in Trieste for months undergoing repairs. Immediately after this she steamed to the aid of earthquake victims in the Sea of Marmora district. Later her crew aided in protecting American schools and colleges in Turkey.

The *Scorpion* has been a messenger of peace for the past twenty years. She has carried the American flag into dangerous quarters where she could easily have been sunk by the field guns of foreign armies stationed on lands adjoining the Balkan waters. In later years her apparent helplessness became a decided advantage. Her weakness was her strength for none feared her and the United States High Commissioner in Constantinople could talk for her which was all that was necessary. She is only a 775-ton vessel, 212.9 feet long with a beam of 28.1 feet, and would have been an easy target for land forces.

Since Admiral Mark L. Bristol was named American commissioner in Turkey the *Scorpion* has had a more active career. Her trim lines and jauntily flying flag have become familiar in the near eastern ports and withal she has been widely respected. Now, however, the *Scorpion*, with Admiral Bristol aboard, is crossing the Atlantic by way of Spain and the Azores and she will probably never be seen again in European waters. She will no doubt serve as an aerial target and be *spurlos versenkt*. Such is the end of even the best of our ships. The "breakers" get them sooner or later.

Edison's Stamp on World's Work

(*Concluded from page 4*)

years ago is, in its fundamentals and many of its details, the system that is used today. The first electric lighting station in America was established in New York in 1882.

Edison next turned his mind to the generation of electric power. The dynamo existed, but it was no more than a laboratory toy. Its defect lay in the fact that it gave back but 40 per cent of the power put into it, and electrical authorities, the world over, said this was the best that could be done. Edison never had much respect for electrical authorities when they were telling what could not be done. He went to work and for a while got no tangible results. But eventually he passed the mark of what scientists said was the limit of what could be achieved. "Now," he said, "having proved that they do not know what they are talking about, we will go to work." He continued to work until his dynamo returned 92 per cent of the power that had been put into it. He said he believed he could have made it still more efficient, but 95 per cent was enough to make it commercial.

Without Edison's work on the dynamo, not an electric car could operate anywhere, nor a plant driven by electricity.

Edison's motion picture machine was patented on November 22, 1877. The idea was not new. It had long been known that the retina of the eye holds one impression long enough to blend it with another provided the subsequent one comes quickly enough. Men had tried to make motion picture machines, but with no success worth mentioning. Edison succeeded because he put the same brain behind it that invented the incandescent electric light and for the further reason that extremely sensitive photographic plates made of gelatine were at hand. Glass plates would not do for motion pictures.

The full story of Edison's inventions is the story of more than 1,400 patents, but what has been set down here covers the high spots. Hundreds of his inventions represented improvements upon earlier inventions of his own. In addition to the inventions noted here, Edison invented the mimeograph, the tasimeter, which is so sensitive to heat that it registers the heat from distant stars, the messenger call box, telegraph alarm and signal boxes, pneumatic stencil pens, apparatus for drawing wire, magnetic ore separator, electric locomotive, nickel storage battery and a process for burning Portland cement.

After the United States went into the Great War, Edison made forty-two war inventions for the government among which were devices to detect the presence of submarines and to blind submarine periscopes.

Such, in brief, is the story of the greatest inventor of this or any other age—a man whose fame is so far flung that Marshal Foch, when he was introduced to him in New York, bowed low and called him "the grand Edison."

Why Not Eliminate "Boarder" Cow?

One Reason, at Least, Why Farming Sometimes Does Not Pay

By GEORGE H. BROWNELL

BEFORE I proceed any further with this non-optimistic recital of some of the reasons why farmers fail to make money and city folk fail to buy food more cheaply, I want to call on another lot of figures by way of substantiation.

This time we shall use the figures supplied by no less an authority than Edgar W. Cooley, of the Agricultural Extension Department, International Harvester Company. I have a lot of faith in the accuracy of these figures because any business organization that is engaged in selling its products to the farmer must have exact information about farm conditions. If the Department of Agriculture or a state agricultural college issues an incorrect statement or statistical bulletin, the authors thereof suffer no loss financially. But when the business organization—large or small—gathers information and statistics about any phase of agriculture on which to base its operations, it must come pretty close to having them accurate. A mistake may mean bankruptcy. Here, in part, is what Mr. Cooley says in a recent bulletin:

"The principles of good business applied in manufacturing or commercial pursuits apply also in the business of farming. The average annual loss on the farms of the United States is about 30 per cent of the gross income.

"The principal sources of this loss are as follows:

"Failure to test seed corn, more than $100,000,000; improper harvesting and storing of seed corn, millions of dollars in yield and quality; planting of infertile seed corn, cannot be estimated; ravages of corn root worm, more than $100,000,000; waste of corn stalks in field instead of being put in silo, at least $500,000,000; failure to treat small grains for smut, fully $35,000,000; waste of manure through careless handling, $100,000,000; weeds, fully $300,000,000; hog cholera, over $65,000,000; Texas fever cattle tick, nearly $500,000,000; 'scrub' dairy cows, fully $745,000,000; depreciation of farm machinery and tools from failure to house or care for them, impossible to estimate; soil erosion resulting from one-crop system of agriculture, many millions."

The definitely, but conservatively named figures in the foregoing bulletin total $2,445,000,000 as the loss for a single year; and these figures are by no means complete. Except among the thrifty, competent truck-gardeners located near our large cities, the waste in every form of agricultural effort is appalling. If it were possible to determine grand total loss that is saddled upon agriculture each year by all of the poorly run farms in the country, I feel safe in saying that this total would be more than five billions annually.

The total value of all farm products in this country in 1924, according to the Farm Census, was $17,355,000,000.

Dairying is generally recognized as being a form of agricultural effort that confers the greatest benefit on the soil, the farm-owner and the consumer. Dairying calls for the growing of leguminous crops that add to the nitrogen supply of the soil, instead of depleting it. Dairying enables the farmer to sell milk every day in the year. If he sells the fat in the milk, and feeds the skim milk to calves, swine and chickens, he is sending away no nitrogenous fertility from his farm except as it walks off in the carcasses of the livestock he markets. Dairying furnishes a long list of articles indispensable to the human diet and to human welfare.

Glancing back to the list of losses sustained by agriculture, as given in the Cooley bulletin, we find the item: "'scrub' dairy cows, fully $745,000,000."

It is the largest single loss given in the list; it is a loss that cannot be justified by any living being. It explains why the dairy farmers of this country, as a class, are forever protesting against the alleged low price of milk.

Every agency and influence devoted to the betterment of agriculture is today directing its energies toward the elimination of the "boarder" cow, yet the progress being made is almost negligible.

The Department of Agriculture estimate is, that of the total of 25,000,000 dairy cows now engaged in supplying milk to the people of this country, one-third of them only are actually paying a profit to their owners. Another one-third, it is estimated, are sufficiently appreciative of kind treatment to pay for their board; the remaining third, or about eight million cows, are being milked and cared for, day after day, by the farmers of this country, with an actual loss of three-fourths of a billion dollars.

Out of this great multitude of

Drawing by W. W. Clarke

25,000,000 cows, only 307,000 of them belong to the 800 cow-testing associations that have been formed by great effort for the purpose of keeping track of the milk-production and feed consumed by each cow.

On this subject of the annual loss which dairying sustains because of the refusal of farmers to eliminate from their herds those cows that do not pay a profit, a recent bulletin of the Department of Agriculture says:

"It has been estimated that the average dairy cow in this country produces yearly about 4,000 pounds of milk containing about 160 pounds of butter fat. Selection, feeding, and breeding could double this low average. Doubling the present average production would make it possible to furnish the present supply of dairy products with fewer cows and at a much less cost.

"A study of yearly butter fat and income records of 18,014 cow-testing association cows for the period 1910 to 1920 showed that the cows giving 100 pounds of butter fat a year produced an average income for the farmer above feed cost of about $10; at 200 pounds of butter fat a year the income above feed cost averaged about $42; at 300 pounds a year the income averaged about $72; and at 400 pounds of butter fat the average income was about $106 a year per cow.

"While the cows in the last class averaged four times as much in production as those in the first class, they gave an average income over cost of feed that was more than ten times as great. A tabulation of the records of dairy cows from those districts where the product was sold as milk showed similar results. In all cases the high-producing groups were the profitable producers from the standpoint of income over cost of feed.

"The groups of high-producing cows were also the groups that produced milk and butter fat economically from the standpoint of cost of feed per pound of butter fat or per 100 pounds of milk. As production increased from the lowest-producing to the highest-producing groups, the feed cost per unit of production went down, rapidly at first but more slowly as production reached a high average. In the economical production of milk and butter fat, the largest gains are to be obtained through the culling out of those cows that produce less than 4,000 pounds of milk, containing less than 160 pounds of butter fat."

In the foregoing polite language the Department of Agriculture tells us that the present average annual production of all of the 25,319,000 milk cows in this country is only 4,000 pounds of milk—or just about what the production of a cow must be to *begin to pay* a profit to her owner.

How long could a manufacturing plant survive in which one-third of the machines engaged in turning out the product were of such type that the cost of operation was in excess of the price received for the finished product?

Let us now hear from another eastern state where the density of urban population makes the question of an adequate, fair-priced food supply one of vital importance. Here is what Professor C. J. Fawcett, of the Massachusetts Agricultural College, says about the boarder cows of that state:

"There are fully 100,000 cows in Massachusetts that do not make any profit for their owners. A Massachusetts cow must produce at least 6,000 pounds of milk a year to be profitable. The average of the state is 4,500. About 100,000 of the 150,000 cows in the state are producing the average or less. One cow producing 20,000 pounds will offset 30 cows producing 4,000 pounds. There are many cows in Massachusetts producing from 10,000 to 20,000 pounds annually. It is only because the state has a considerable number of high producers that the average production is as high as is now estimated. Cows producing less than the average must be eliminated if the average is to be brought up to the point of profitable production."

In New York State the situation is no better. In a recent bulletin, professor H. A. Hooper, of the State College of Agriculture at Ithaca, says:

"A total of 462,000 New York State cows do not produce enough butter fat to pay their board bill.

"One-third of New York's cows are not only failing to pay their own way, but are making it difficult for the other 938,000 cows to return a profit.

"The cow-testing associations now in operation in various parts of the state are doing valiant work in coping with this menace to the dairy industry, but what is needed is more of them and more men who are not afraid to beef the low producers."

A ton of feed, in 1924, cost New York farmers approximately fifty dollars. The feed bill for a half-million cows, each eating a ton of feed at $50 a ton, in 1924, cost New York farmers a total of $25,000,000. And, according to the figures of the most reliable authority in the state, every dollar of this tremendous total was fed to cows that failed to pay their owners a profit.

Ignoring the tremendous burden of loss at the source of supply, the Dairymen's League of New York is striving to bring prosperity to its members through the greater economy in *marketing* that is supposed to arise from the sale of milk in a pooled supply.

There is no need to question whether these dairymen have or have not found a marketing vehicle that actually sells their milk at a lower cost than they could sell it as individuals. The basic fact remains that the milk which they sell, before it leaves the farm, is burdened with a charge that does not belong there. This charge is for the cost of keeping one cow that does not pay for her board and stall-room, in every three which the dairyman owns.

Common sense would seem to indicate that the crying need is for an organization or agency of some kind, in each of the several dairy states, that would have for its first purpose the elimination of the loss-producing cows of that state.

Business history fails to reveal that any merchant, manufacturer, or industrial enterprise ever made a success by ignoring costs of operation and concentrating all energy on the marketing of the product.

Exact knowledge of raw material and operating costs must first be secured, in all other lines of industrial effort, before the selling price of a product can be fixed.

Yet in the Dairymen's League of New York, and in other coöperative marketing enterprises everywhere hailed as the one means by which farmers may secure a profitable price for their products, there is a complete indifference to production costs.

Coöperative marketing has attained a standing among farmers that it does not deserve; but he who essays to speak a word of caution is named as a traitor and a hireling of "the interests."

As these lines are written, the Grain Marketing Company is being dissolved and handed back to the overshrewd gentlemen who sought, through it, to market their plants at a highly profitable figure. Owned by themselves, these plants could not form a near-monopoly in defiance of the provisions of the Sherman Anti-Trust Law. As a coöperative farmers' organization the law could not touch them.

Neither coöperative marketing nor any other plan for aiding the farmer can give him any real help. For the farmers who are continually demanding and rejecting one crutch after another in their efforts to make money on a farm without sufficient capital, ability or a lead pencil stub, the future holds forth little promise of happiness.

> ¶ Boarding "scrub" cows, who do not pay for their keep, costs U. S. farmers $745,000, a year.
> These "boarders" number 8,000,000—that many cows fail to pay for their feed.
> This is only one of the "inside losses" of present farming methods.
> Yet quack farm advisers are trying to cure this condition by "marketing."

"I Read *in the* Papers"

I read in the papers that "How to be happy though harried" is a modification of the title of a famous book which the English taxpayer is using as a maxim these days. American travelers returning from England tell us that the people over there are getting more enjoyment out of life with low wages and "doles" than Americans get with prosperity and substantial bank accounts. It is a tradition of "Merrie England" that it must be "merrie" under all circumstances. Dickens' Mark Tapley, who was always "jolly" when things were going badly, is a type of the English people today, who are enjoying their cricket and football and week-end trips with all the zest and abandon of pre-war times. They are apparently getting as much out of their sixpence as we are getting out of our dollar as far as recreation goes; but what about industrial recovery?

I read in the papers that Los Angeles is winning favorable comment upon the suave, efficient young Chinese and Japanese women who have been recruited by the department stores as sales persons. This new order of clerk is not only very agreeable to the regular clientele of the stores, but is said to be especially adaptable in dealing with Mexican and Negro laboring people who are sometimes severely trying to American store clerks. These Japanese and Chinese clerks are, of course, the children of colonists who came here long since. They doubtless have attained an American viewpoint, but at the same time they retain the imperturbability and calm that marks the Oriental. They are quite unable to understand the reactions of foreign barbarians to ordinary distractions.

The International Jew in 4 volumes: *The International Jew*, Vol. I, 235 pages; *Jewish Activities in the United States*, Vol. II, 256 pages; *Jewish Influence on American Life*, Vol. III, 256 pages; *Aspects of Jewish Power in the United States*, Vol. IV, 246 pages. Price: 25 cents each; set, $1. The Dearborn Publishing Company, Dearborn, Michigan.

I read in the papers that those Montrealiens who once regarded gleefully the rum-running business because they visioned smugglers spending easy money in the Canadian metropolis are now in despair. The rum runners no longer come back empty-handed to Montreal. They fill their swift motor cars with silks, cigarets, smoking tobacco and other highly taxed luxuries, and bootleg them to the public of the Montreal district. Montreal merchants thus find themselves unable to compete with a constantly increasing volume of products that do not pay duty and stamp taxes. These very lines were once highly profitable to local traders, many of whom formerly applauded the original rum running into the States. Other Canadian communities are wrestling with the same smuggling problem, which goes to prove that evil communications corrupt good manners. Crooks are of no use to either country.

I read in the papers that the consumption of copper has mounted during this generation until authorities declare that it would be more correct to say that we are living in the copper age than the iron age. The world consumed as much copper during the last 15 years as it did in the preceding 4,000 years. In 1850 the world output of copper was one pound to every 125 pounds of iron; the respective proportions in 1910 were one to seventy-two and in 1924 the rate was one pound of copper to fifty pounds of iron.

If shaving leaves your skin inflamed

INGRAM'S Therapeutic Shaving Cream is made particularly for you. It is more than a rapid beard softener—it prevents all after-shaving irritation and heals troublesome little cuts. It leaves your skin smooth, cool, invigorated and refreshed.

Thousands of men have told us that it makes shaving a pleasure—no longer a job to be dreaded.

If your druggist cannot supply you, send 50c. for the blue jar that contains six months of shaving comfort. Or send two cent stamp for sample.

Made particularly for tender skins

They All Wanted Third Terms

(*Concluded from page 5*)

did Thomas Jefferson, Andrew Jackson and Theodore Roosevelt. It is evident that there lingered in the fine mind which survived in Wilson's shattered body a feeling that he should, and if nominated again by his party, would, be elected for a third time.

Coolidge did not forestall, as Roosevelt did, possible resort to the obscurantism of words when the time for choosing arrived; and he is not applying the currycomb to the back of any favored one among those who aspire to the successorship—nor is he likely to do so.

If his sound Yankee sense does not immunize him against the third-term lure he will be no outstanding exception to the rule of the past.

What accounts for the third-term lure? One thing is the vacuity which we —perhaps out of allegiance to the old two-term limitation—decree for ex Presidents. No other people ordains that men who serve in the highest political station shall drop, upon leaving office, so suddenly and so deeply into a vacuum of comparative political impotence. Only a few who have survived the Presidency escaped what was tantamount to being a political "living grave."

Another is the stream of flattery which pours incessantly upon the presidential chair. It is as with Caesar:

> "When I tell him he hates flatterers,
> He says that he does, being then
> most flattered."

The flattery of criticism may be even more persuasive than that of praise. Both kinds tend to make the object prone to develop a belief that he alone can steer the ship of state safely through the eddies that always whirl about the presidential office. Presidents not only leave office reluctantly but often with a feeling that without them the country's future is hopeless.

Nevertheless, the lesson of history is that a vocalized third-term aspiration leads only to disaster—for the one who entertains it and his political party. Grant never got over his last and only defeat—nor did his party until two periods of Democratic administration welded it together again. But for the Roosevelt movement in 1912, this century to date hardly would have known a complete Democratic régime in Washington.

To be the first to controvert history as to this would raise the aspirant to a height of distinction, in one particular, above all predecessors—a lure which now makes the third-term virus doubly potent.

Calvin Coolidge has a ticklish question—that is, for an American—to decide.

Five Million Work on Sunday

(*Continued from page 15*)

also makes the statement that "There are 52 Sundays and 7 recognized railroad holidays, a total of 59 days. A full regular assignment is worked 46 out of every 59 holidays." Certainly a big change is needed here and the movement is now under way to bring relief to this class of employe.

These guardians of life and property have been forgotten public servants.

In a letter dated August 11, received from one of the National officers of the Order of Railroad Telegraphers, we find two challenging paragraphs:

"I am sure there are thousands of our members who deeply regret their impossibility to attend church with their families, owing to conditions of employment. I worked for years a shift seven days a week and the rest of the family attended church and Sunday school without me.

"It is possible that the public are partially responsible for much of the Sunday service. At the present time popular priced Sunday excursions are in vogue on many railroads in this territory and are very heartily supported by the public. I have in mind an excursion run from Minneapolis and St. Paul to Chicago and return at a $7.00 round-trip rate about the middle of July, approximately six thousand persons making the trip. This probably did not greatly affect the employes in the service we represent, but is merely an indication of the fact that a great many people do not have to work Sundays."

The great telephone companies are swinging into line in the movement for the Sunday and weekly rest day for employes. As an illustration, we cite in part a letter (August 13) received from Bancroft Gheradi, vice-president of the American Telephone and Telegraph Company, in reply to our communication of July 30:

"As a public service, we operate twenty-four hours a day and seven days a week, but we aim to do this with the minimum number of people needed on Sunday to meet the service requirements.

"The total number of employes in the Bell system is, in round figures, 320,000. Service requirements are such that about 20 per cent of this total are on duty on Sunday either for all or part of the usual eight-hour working day. The percentage varies, of course, somewhat with the class of labor, according to the demand for each class of work on Sunday. The necessary Sunday work is assigned in rotation within the various groups. When an employe works on a Sunday, a day off during the week is given, so that all of our employes are on a six-day basis. As you will see, we agree with you that each employe is entitled to a weekly rest day, and that this should be Sunday as far as conditions will permit.

"Normally, the year round, about seven employes out of ten are off duty on Saturday afternoon. In summer this ratio increases to about eight out of ten."

Coming into the field of policemen and firemen, we note with pleasure the increased success of the movement, for a weekly rest day. At the last session of the Congress of the United States, a bill was enacted into law, providing a weekly rest day for the policemen in the District of Columbia. Inquiry made by me in Washington on July 30 brought the answer that the one day of rest in seven is now the established order for the policemen at the nation's capital. In states like Wisconsin, Massachusetts, New York and New Jersey, policemen for the most part, due largely to the helpful influence of the one-day-of-rest-in-seven state laws, now enjoy their weekly rest day. The movement is spreading and within a decade will probably sweep the country.

As a further help to these servants of the people, guardians of both property and life, the three-platoon system is rapidly coming into vogue. The old two-platoon system for policemen is still in operation in a number of places.

As for the firemen, likewise, guardians day and night of property and the life of our cities throughout the commonwealths of the nation, they have been among the forgotten servants of the public. In some instances, the one-platoon system for firemen of 21 hours a day has prevailed, a menace to health, home, happiness and a robber of social pleasures and recreations, so common to the vast multitudes of the nation today. Cities of New Jersey, where, during the past five years, the two-platoon system has been introduced and the weekly rest day or fortnightly rest day has brought the firemen more properly into the enjoyments of these reforms, are pointing the way to other states and cities of the nation.

Most railroad telegraphers are at their keys seven days a week.

A letter under date of August 5, which we received from Commissioner Drennan of the Fire Department of New York, indicates not only that the two-platoon system is in vogue there, but also a twenty-four-hour leave is granted to the firemen on each successive six days, the plan operating as follows: The first and second platoons alternating the first three days out of nine hours and the second three days of fifteen hours each, a certain number of the men being off on each day of the week and occasionally men being called upon to put in a full twenty-four-hour day of continuous service, working both the nine and fifteen hour turns.

A reform brought about for Customs guards and inspectors in the Port of New York in 1915 and later in other ports of the country, corrected sorely needed rest-day conditions, in this arm of service of the Federal Government. It was discovered that men went as long as 110 days without having a day off and that generally it amounted to less than twelve days in a whole year, while most of the employes were actually receiving, aside from an enforced sick-day leave, not more than seven days in the whole year. Coöperating with the Alliance, Thomas E. Rush, who was then surveyor of the Port of New York, and to whom a great share of the credit is due, introduced one day of rest in ten and within a half-year brought it down to one day of rest in seven.

Another rest day reform meriting attention is that which brought the weekly rest day to the engineers, firemen, coal passers and electricians of the Federal buildings of New York and other cities. Here but few of the employes were receiving more than five rest days in a whole year. Speaking about this reform, near the close of the year 1915, William G. McAdoo, Secretary of the Treasury, pronounced it "a desirable reform" and Alfred B. Fry, supervising chief engineer of the Port of New York, the same year publicly thanked the

Alliance and said, the reform "was a benefit both to the employes and to his department."

With the campaign vigorously on to correct conditions in Washington, where Sunday is wide open, it is of interest to note what President Coolidge said to our delegation on October 10, 1923:

"I also appreciate your attitude toward the improvement of Sunday observance in the District of Columbia. There is certainly room for improvement. Of course, there are some kinds of work that must be done, but there is really more work being done on the Sabbath day than is absolutely necessary and I hope to see this work minimized as rapidly as conditions will permit . . . I promise you my influence toward a more wholesome observance of the Sabbath Day in the District of Columbia and elsewhere throughout the Nation."

A nation-wide movement is being started for the securing of Sunday rest for barbers. In many cities and boroughs, the barber is now freed from this unnecessary Sunday work. New York State makes it illegal to barber on Sunday, except for the cities of Greater New York and Saratoga Springs. In New Jersey, Pennsylvania, and many other states, the business is also legally under the ban.

One of the outstanding weekly rest day benefits secured for thousands of employes is that of the elimination of the slaughtering of cattle, sheep and hogs in New York, Jersey City, and a few other centers of the packing establishments. It is especially interesting to note that with complete victory against this character of Sunday labor, more than 6,000 employes, including 200 Federal inspectors, were relieved of unnecessary Sunday work in the vicinity of Greater New York alone. Packers, as well as employes, are now highly pleased that this unnecessary kind of Sunday business has been entirely abolished throughout the United States.

The Optometrists Close in New York City

A movement is on to secure legislation that will protect the master bakers of New York and the retail baker establishments, grocery stores and similar places of business against unfair competition by merchants who are determined to make Sunday the biggest business day of the week. Partial relief has already been secured through legislation closing all grocery stores, except those in Greater New York.

The optometrists of the East Side of New York, as well as in other parts of the city, are closed on Sunday, including the Jewish optometrists. The national president of the association, and the local New York president urged the closing on Sunday and the movement within a short time became a pronounced success.

Apropos of the victory won for the keeping of theaters in New York and in many other cities closed on Sunday are a few facts leading up to this great achievement. In line with the movement for maintaining the Sunday law of New York, on February 11, 1923, a prominent theatrical manager of New York attempted to make a test case of the open theater in New York City, was promptly arrested and summoned to court. The case was heard February 13, 1923, and again on February 27, when the court held the defendant under bail for the Special Sessions Court in April. On March 11, 1,500 actors and actresses met in New York City and unanimously vindicated the position taken against the opening of the theaters on Sunday by solidly voting against Sunday plays or shows. Not only in New York State, but in Wisconsin and other states, bills attempting to legalize theatrical or spoken drama plays have been decisively defeated.

Other Concerns Are Moving for Six-Day Week

A statement issued by the Actors' Equity Association in May, 1924, explains that a contract has been entered into between the Actors' Equity Association and the Theater Owners Association, which contract extends from May 1, 1924, to May 1, 1934, whereby no performances will be given on Sunday, where it was not, previous to the signing of the contract, the custom that such performances be given or where it is in violation of the Sunday law; also and further, that no rehearsals are to be given on Sunday.

Many of these corporations are moving from a bimonthly to a weekly rest day for their employes. In a number of places, Pittsburgh, Pennsylvania, for instance, and many places in southern states, oil and gasoline stations are chiefly closed on Sunday. A few of the stations are open by common understanding for emergency needs.

Take the position of the United Cigar Stores: several summers ago, when they decided to try out the closing of all their stores on Sunday, which policy was adopted for a period of six Sundays or more, the first vice-president, Mr. Sherlock, in answer to a communication we sent him, wrote that the reform, as instituted, was meant to be permanent and that it would accomplish at least three things. First, it would be an advantage to their employes by affording them one day of rest each week; second, that it would lessen the overhead expenses in their vast number of chain stores; and third, it would also prove advantageous in taking up the slack. The sharp competition of other cigar companies, who continued to keep their stores open on Sunday, caused the United Cigar Stores Company later to go back to the open store on Sunday. The Sunday closing took place, even in New York State, where the law favors the sale of tobacco, cigars, confectionery, et cetera, on the Christian Sabbath.

In more than one hundred replies to a questionnaire sent out to strategic centers in cities of the United States, we have made the discovery that a tendency in great business and industrial concerns is not only toward the six-day week, Sunday being almost uniformly the day elected for the cessation of labor, but Saturday afternoon also being added to the weekday rest period. The business houses which are more uniformly open on Sunday than any others are the confectionery and ice cream parlors, drug stores, cigar and tobacco shops, and motion picture houses; in the field of business in the open spaces, amusement parks to which concessions have been purchased by the American Amusement Corporation or similar outfits bent on making Sunday the big money-getting day of the week, commercial baseball, professional football and, in quite a number of instances, tennis and golf matches and tournaments. In many of our cities, the large department stores are closed on Saturday, from July 1 to September 1, as, for instance, all the department stores in New York and Philadelphia, several in Pittsburgh, at least one in St. Louis, one in Minneapolis, several in Chicago, some in Detroit, several in Boston.

In nearly all the states of the nation, the Sunday laws have been held intact against the heavy attacks of motion picture theater owners and exhibitors, bent on making Sunday a dollar-grabbing day.

"Movie" Houses Move for Seven Days

A movement, which, according to official publication of the motion picture industry, will undoubtedly make Sunday the work day for scores of thousands of persons throughout the country if that movement succeeds, is the one being persistently pressed by the motion picture industry to open the movie houses throughout the country on Sunday. The *Moving Picture World*, of December 27, 1924, contains an article on nation-wide opening—fight to the finish being waged by exhibitors. The *Exhibitors Trade Review*, which according to its advertisement is the business paper of the motion picture industry, in its issue of January 3, 1925, contains a two-page article, entitled "The Sunday Closing Evil, and How to Combat It." The author of the article even urges the motion picture managers and exhibitors to enlist the friendship of civic organizations, and of churches, specifically mentioning three different religious denominations who can be counted upon to "gladly lend you assistance" toward securing the open Sunday for the commercial movie. Labor forces, as well as organizations seeking to preserve Sunday rest, must be on guard at this post of duty, lest this institution, the motion picture industry, controlled by a handful of

greedy Jews and boasting itself the fourth largest manufacturing industry in the country, put the rope of Sunday labor about their necks and draw it too tight for reasonable comfort.

Overriding the Sunday laws in many states, the monopolized vaudeville industry is working its employes three and four turns or tricks on Sundays. Repeated appeals for relief to the President of National Circuit have not availed and other plans have been prepared to bring about its discontinuance. The American Federation of Labor at its El Paso Convention, November 17-25, 1924, "favored legislation that would prohibit the production on Sunday of the so-called legitimate musical comedies."

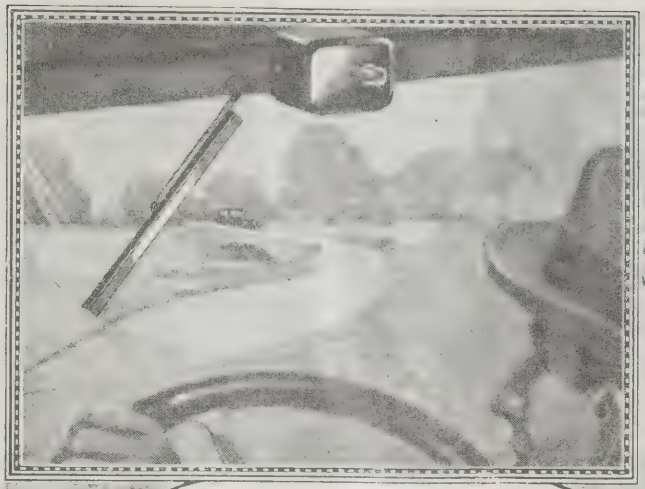
In closing this article, it may be pertinent to suggest that with the increasing favor with which the 5½ day week is being received by nearly every conceivable line of industry, except those which demand continuous operation, the day is not far distant when every worthy toiler will be in possession of at least one full rest day in every week; that the rank and file of labor will have, for most of the year, 1½ days of rest per week and that at least several million workers and wage-earners during the summer months will be in possession of a five-day working week with Saturday for recreation and other diversions and the American Sunday free for the more quiet and appropriate uses of the established national weekly rest day, the American Sabbath, an institution which has done more than any other single agency as a colleague of the church, to help build the incomparable and magnificently successful American Republic.

Samuel Pepys—Diarist

ONE hundred years ago *Pepys' Diary* was placed on sale so that all the world might know the peculiarities of the age in which he lived. The diary was published 122 years after the death of its author.

Pepys left to Magdalene College his large collection of books, manuscripts, and prints, including more than 2,000 ancient English ballads which formed five folio volumes. But Pepys is now remembered chiefly for his *Diary*, which was written in shorthand and extended to six volumes.

Members of the Braybrooke family, frequent visitors of Magdalene College, became enamored of these mysterious volumes, and induced a relative, Lord Granville, to prepare a key from which the shorthand notes could be deciphered. Lord Granville, who had made shorthand his hobby, was able to prepare this key and the Rev. John Smith, an undergraduate at Magdalene, spent three years transcribing the *Diary*. Lord Braybrooke made a selection from the completed manuscript and this formed the first edition as published.



Stewart-Warner
Electric Windshield Cleaner
Complete, $8.50
West of 100° Meridian, $8.75

Lower the Cost of Operating Your Car-

YOU can actually operate your car for less if you install Stewart-Warner Speedometer, Electric Windshield Cleaner, Bumper, Shock Absorbers, Spotlight and Rear Vision Mirror.

The Speedometer will save you fines and loss of time from arrest. It will also tell you *when* and *where* to lubricate, thereby preventing damage from lack of proper lubrication.

The Electric Windshield Cleaner clears away heavy snow as well as rain. Assures clear vision at all times.

Bumpers save repair bills in the event of a bump. They also save lives.

Shock Absorbers hold the car on the road, preventing accidents and damage to car and person.

Spotlights light the way, saving you from running off the road.

Rear Vision Mirror prevents rear end collision and side-swiping.

Equip your car with these *protections* and keep your car at its best and out of the repair shop.

Any dealer can install Stewart-Warner Accessories on your car.

The Village That Didn't Keep Its Promise

(*Concluded from page 13*)

(perhaps facetiously written) even before an acre of land has been sold."

The Will Wimbles enjoyed this colony affair immensely. They had burned no bridges behind them; they found the experiment in Tennessee very good fun for a time at least, with well-filled days, afoot and in saddle, in the midst of scenery where it was good to be alive.

The more serious and astute Americans who were responsible for what was actually being done—the necessary construction—smiled a little to themselves. Yet they found the young Englishmen, socially, delightful companions with every evidence of good breeding, except perhaps for a sense for being usefully employed. The title of the company—The Board of Aid to Land Ownership, Limited—must have been especially attractive to those who wanted to be aided in life's progress.

It is quite possible that Mr. Hughes thought of having some of his colonists prepare to teach these young men farming. In one case, in fact, a young Englishman purchased a farm and was "prepared to take pupils," but this young man must himself have been a poor pupil. No lands were cleared preparatory to the arrival of the colonists. In fact, the whole movement lacked clearing. No one seemed to know just what they were, as the natives said, "aimin' at."

A Mr. Milnow, who, it was understood, had been a butler in the household of a sheep rancher in Australia, purchased a tract of land near the village and began the preparation of a sheep ranch, building sheds for the accommodation of the stock which he proposed to acquire and surrounding his purchase with a high stake and rider fence, building a comfortable house on a sightly position. Yet when it was completed his funds had run out and that was the end. There were no sheep to buy anywhere about, and nothing, anyway, with which to buy them.

Bad Sanitation Killed the Colony

Mr. Hughes remained at the colony a comparatively short time. His aged mother, established in a house built for her at what is now virtually the end of the village street, died and was buried there.

The colony failed. Through the careless placing of a cesspool, drinking water was contaminated and a dozen or more of the colonists died in a few days. Not long after, the exodus began.

While from the outset the development was to be agricultural, the soil was only fairly responsive and at that almost none of it was ever cleared.

Nothing better illustrates the hasty conceptions by which the colony was ruled than the organization, when agriculture had failed, of the Rugby Canning Company, where the mainstay was to be tomatoes. Mr. Milnow, the English butler who had gone into sheep ranching with everything but the sheep, was made general manager and went to Cincinnati where he bought boilers and other paraphernalia which were brought with great difficulty to Rugby. Labels for the cans were printed enthusiastically well in advance, and one of them may still be seen at Rugby—a hand bearing a tomato, and in bold type "Rugby Brand, price Two Shillings"—so clean forgot was the fact of the colony and the market itself being in the United States. Even this was but a detail of forgetfulness, for the boilers were set up in the woods (where they may even now be seen, flaked with 40 years of rust and grown up around with a tangle of brush) when no land had been cleared on which the tomatoes were to be grown.

The failure of the development as a whole and the gradual disintegration of the enterprise from its original conception caused the Board of Aid to permit the option on the Clarke lands, in Fentress County, to lapse, so that later these were opened up to a German colony, which though small, remains intact at Allardt, supported by farms stubbornly and seriously worked.

Of the Original English Boys Only Two Remain

The Tabard Inn burned, leaving only the foundation. The boilers of the canning factory remain where they were originally left. The Hughes Public Library, with scarcely a volume added, is a minor influence in the community. The shelves remain in the commissary, the coöperative store, just as originally built, and here such community spirit as remains suffices to get the store trimmed once a year with cornstalks (last year's stalks are there now), as a background for something approaching a county fair, where the prize pumpkins and squashes are shown.

Of the original English boys only two remain at Rugby in these times, one a farmer not far away from Rugby—another a sexton of the village church and a collector of butterflies.

Hughes' brother, Hastings, left Rugby for Boston to become a wine merchant; one of the colonists who was to have been a teacher of agriculture and himself a failure at his Rugby attempt moved away into Alabama. Mr. Blacklock, who had seven sons, was a Methodist minister but became an Episcopalian and rector of Rugby's "English Church"—he left many years ago and has since died. An Englishman and his wife who came from Russia to help colonize Rugby returned whence they came. Most of the colonists being remittance men, whose remittances followed them, failed Rugby when Rugby failed. One is a lawyer still in Tennessee but most of them drifted—Rugby's oldest inhabitants do not know where.

Coming now to Rugby, we may still enter by the covered bridge and find the village much the same, but for the wear and tear of forty years.

All That is Left of the Enterprise

The first house, hidden behind great cypresses, deserted now, was the home of one of the first settlers, whose son still is in these days Rugby's chief man of affairs, assuming all civic duties and remaining as the functionary of the corporation whose plans once held so much promise.

Beyond and to the right is a little church and to the left the smaller school and beyond them two ragged rows of houses deep in shade. Pickets are broken and wires are missing, sagging and twisted. Razor-back hogs freely room with the chickens over the stoops that tilt away from the doorsteps. Wood piles, tumbled just beyond the front fences, and the chopping blocks and scattered chips, plainly tell that no one does any unnecessary fetching and carrying. Only two or three houses on the street were ever painted, and one of these many years ago. Standing back from the street, reached by cross-lot paths, are other scattered houses, beckoning to streets that were only on paper and never reached out to them.

And for all this, the first glimpse of the place reveals only a quiet beauty—in two or three dooryards flowers persisting long after anyone has thought to give them any care; over the whole unkemptness the great oaks spread their shade, while the cattle keep the grass down; two or three orderly little garden patches still assert a certain undying spirit in the place. The old minister at the little "English Church" (for that is what it was meant to be) and his three adopted children, keep one of these.

The storekeeper isn't bothered much by his store—because he hasn't much to sell, and that is because nobody buys much, there being a minimum with which to buy. He works at his blacksmith shop or his garden until a housewife simply *must* buy something. He goes to the house and gets his key; walks over the wide lot to his store; unlocks it and makes his sale, and asks about the children, and then he locks the door and goes back to more important things—except at 10 o'clock in the morning! Then he doesn't at once return.

A City of Romance

Charleston, S. C., With Its Quaint Old Gateways

By VIRGINIA L. PORCHER

"Steps run down to large gardens."

FEW cities in America have retained so much of the charm of the early days as Charleston, South Carolina.

Geographically she is situated very much as New York. A long, narrow peninsula runs into a wide bay. On each side the broad waters of the Cooper and Ashley rivers go past her shore to the counties beyond. Unlike New York, the point of this peninsula called the "Battery" is still her favorite residential part.

Fine old houses are built overlooking the water. The "East Battery" walk commands a view of the ocean, and her "Southern Battery" looks into the White Point Garden of long ago.

To those who come to Charleston by water,

"She looks a sea-Cybele fresh from Ocean,
Rising with her Tiara of proud towers
At airy distance with majestic motion,
A ruler of the waters and their powers."

—*Childe Harold.*

Her houses gleam like many colored jewels, for Charleston people paint their homes to suit themselves, and a pink house, a brown house, with a white house between makes a landscape full of color.

Some of these houses have been standing since the days before the Revolution. One of them was occupied by Colonel William Washington, a cousin of General Washington, known during the Revolution as "The Sword of the Army." Most of the old houses were evidently modeled after English homes, for they resemble them greatly. On the first floor are the library and dining room, with pantry, kitchen and servants' quarters going back to greater or less distance. On the second floor are one or two parlors, finished in the best workman ship. The bedrooms are generally on the upper floors. Most of the houses have their gable ends to the streets, with wide piazzas which run the length of the house.

This mode of building showed the wisdom of the early settlers. They knew that in a warm climate a piazza is a summer parlor. Steps run down to large gardens. Every month in the year there is something blooming in these gardens. In winter they are brilliant with poinsettia. This plant was brought from Mexico by Joel Poinsett, of Charleston, and named for him. It grows eight or ten feet high and blooms until a very cold spell kills it. The oleander is in its glory here, and in the spring the gardens glow with every kind of blossom.

The William Washington Home—a house of Revolutionary times.

An old gateway with porter's lodge.

In many piazzas is the unique joggling-board which the young people all love. These are long supple boards on wooden "horses" which joggle up and down and also rock back and forth. I don't know where these boards originated, but they certainly afford much pleasure, and are responsible for many love affairs, for it is hard not to get close to a person when the board slides down, nor do I know what a nurse does without them. In Charleston the favorite place to mind a child is on the joggling-board, and there is no better place to put a baby to sleep than with the gentle motion of these boards.

Artists show great interest in the large old houses with their elaborately carved woodwork, and their fine cut-glass chandeliers.

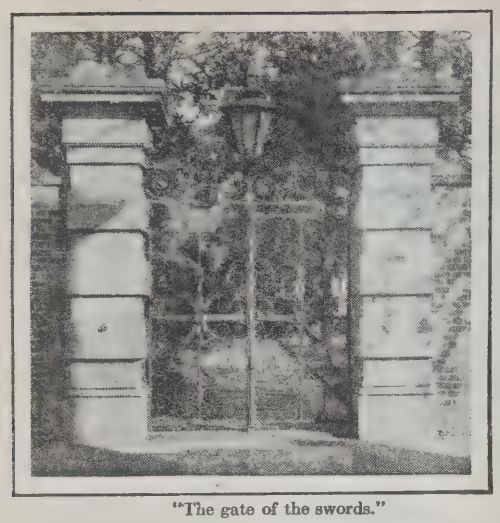
At the time when people in other cities were replacing their mahogany with golden oak or mission, or even fine French furniture, when they were modernizing their homes, building bracket mantels over their fireplaces, and covering their walls with ornate plaster, Charleston was recovering from a great war, and even if her people had desired to make these changes, they had no money to spend in this way.

In consequence she has retained her "Adams' mantles," carved in graceful scenes, her painted paneled rooms and her high brick walls. It would be difficult to find in America so many buildings unchanged by the passing years.

As a daughter of Charleston, I love her old gateways, her high walls, her quaint bits of architecture found in less frequented streets. I love the cool shady yards in some of the homes in the upper part of the town, where rows of tall magnolia trees shade brick kitchens and "outhouses," and where old-fashioned flowers bloom in profusion.

As we walk up Meeting street to the "Battery," we come to many places of interest. In one of the houses lived Benjamin Huger, who must have been a youth of great persuasive powers. He fell in love in those early days, about 1770, with a certain Polly Golightly who was wealthy, while he had no great estate. The family refused to consent, but Miss Polly took things in her own hands, and at a ball one evening picked up her hat and ran off with him. There is a lovely picture of her with the hat, her whole trousseau, slung on her arm.

Farther down the street is the South Carolina Hall, the home of a society founded in 1727. This hall was built in 1804. It is in good Colonial style



"The gate of the swords."

and still in constant use for public and private entertainments.

There is nothing dearer to the heart of a Charlestonian than St. Michael's Church and the sound of her historic bells. The first church in the town was built on this site of cypress logs, and was called St. Philips. This church was burned, and St. Philips now stands on Church street. St. Michael's was built in 1752. A chain was hung across the street during the hours of service, and anyone talking outside the church was liable to arrest. Near St. Michael's is the City Hall. On these steps Lafayette stood when he visited Charleston in 1825, and when he received an ovation that is seldom accorded to any man.

In the council chamber of the City Hall are several fine portraits, one of John C. Calhoun, and a full-length portrait of General Washington by Trumbull. It is taken of the General when he was quite a young man and before he wore a wig. The city has been offered a quarter of a million dollars for it.

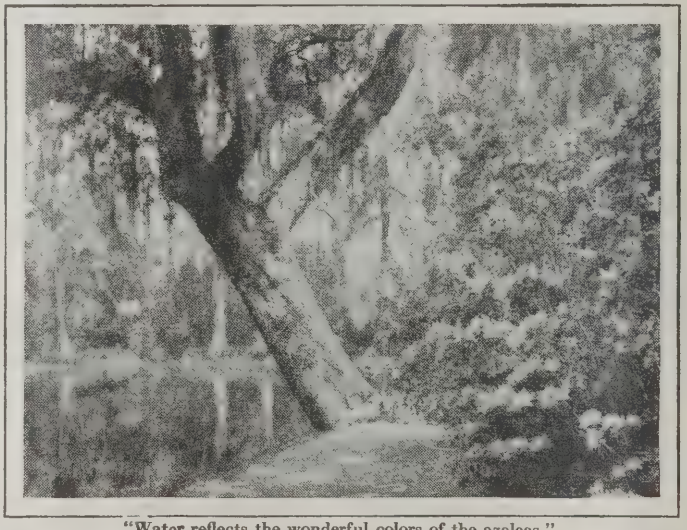
Next to the City Hall is what is called the "Fireproof Building." This was designed by the famous architect, Robert Mills, who was born in Charleston in 1790. He designed many famous buildings in the United States, among them the Treasury Building and the Washington Monument. This building in Charleston was the first fireproof building in America, and is used now to preserve records.

Farther along on Meeting street Robert Mills designed and built the first unsupported dome in America, which was over the Circular Congregational Church, and afterward destroyed by fire.

Charleston has some quaint customs, among them, the Negro street cries. Early each morning, Negroes may be heard crying their wares of vegetables or fish. Negro women come from the nearby farms. On their heads they balance baskets filled with variicolored flowers, or heavy with fruits and vegetables. They make themselves heard under your windows calling their wares in their soft southern voices—"Any green corn this morning—raw tomatoes—beets—hard-head cabbage?"

"Honey, honey, fresh from the comb! You want honey, Honey?" The men often sing their calls—"Raw, raw s-h-r-i-m-p—raw, raw. Fresh whiting." Later in summer the ice cream pushcarts call "Ice cream blocks hard as rocks." The watermelon man sings, "Watermelon fresh and fine, just from the vine."

Charleston is the city of romance, not lost nor forgotten. Tales are still told of the first settlers, when the English came over with orders from the king to build a town in this province. In 1671, the daughter of a lord came in the capacity of a servant to meet and marry her sailor lover, and to become as Mrs. John Cumming, a power in the new land. At each period of Charleston's history a bit of romance brightens her pages. We read of many incidents which even today thrill you with interest. It is hard to realize that there was a moat around the lower part of the town with a "half-moon" draw and gate on Queen street. It was ordered that all lands adjoining this moat should be kept clear for half a mile, so that the inhabitants could see the approach of the enemy. In addition to these protections, many of the houses had secret, underground passages to the river in case of an attack by the Indians. There are some of these still visible. In one house a flight of iron stairs is concealed by the side of a chimney. This leads to the cellar, where an iron grating still shows some light in the passage to the river.



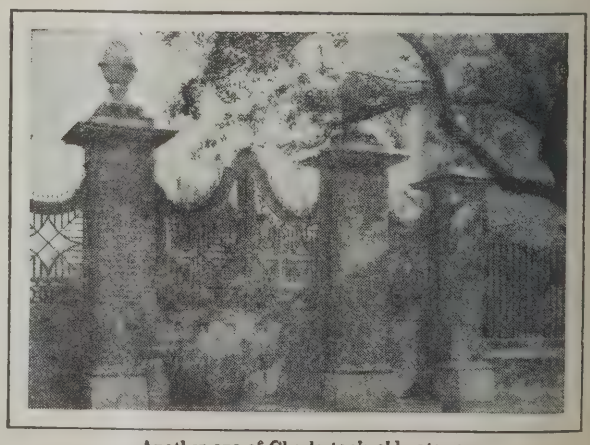
"Water reflects the wonderful colors of the azaleas."

Charleston has gone through many vicissitudes. The siege of 1781 reduced her from a prosperous community to a devastated heap of buildings. In 1864 fire destroyed a third of the town.

The great earthquake of 1886 did tremendous damage, and wrecked many of her fine buildings. With the help of the nation, she started putting back the fallen walls before the earth stopped trembling.

A story told of one of her women seems to typify the pluck of Charleston people. After the Civil War a mother and daughter were left alone. The mother, accustomed to every luxury, broke down in health. The family physician ordered "rest, change and a sea voyage." All of these cost money, and there was none. The daughter was not discouraged. She got work and each morning she took her mother with some books and a basket of lunch to the boat which went many times each day to Sullivan's Island, just seven miles from Charleston. This delicate woman went back and forth all day. Commuting friends met her, and strangers became friends. People made much of her. They brought her every sort of present, she heard all the gossip of the town, in between trips she read undisturbed. At the end of the summer she was a well woman, having had rest, variety, and a sea voyage without leaving home.

With the same pluck some of our Charleston men have stuck to the town. They have developed her commerce, they have enlarged her business, and, in spite of many difficulties, they have brought her safely to a place where the world looks at her and says, "This is a town that has kept the charm of the old days, and yet is ready for the business of the new." A city that can show houses that hold and keep their Colonial workmanship and style, and silver and furniture used by the same family for generations. Nearby are gardens of richest bloom.

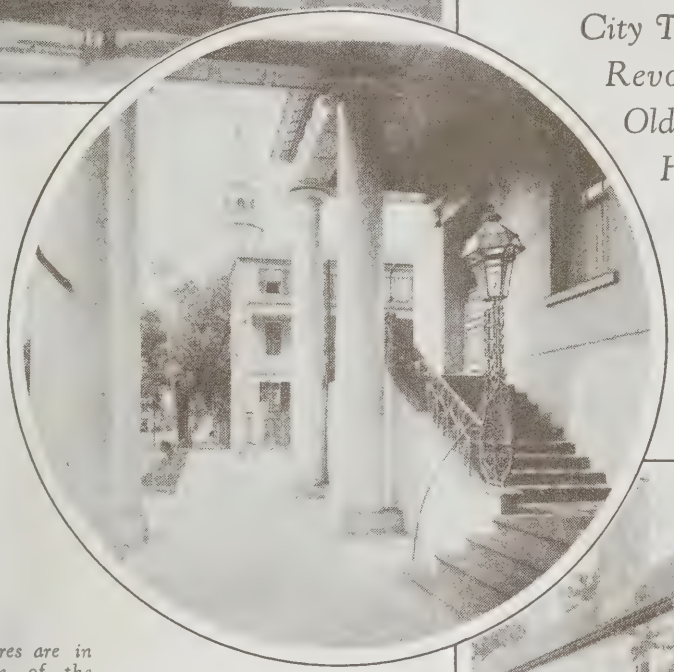


Another one of Charleston's old gateways.

Almost Unchanged by the Passing Years

Charleston, South Carolina, City That Still Retains Its Revolutionary Houses, Old-Fashioned Gardens, High Brick Walls, Fine Gateways and Quaint Customs.

THE "East Battery," where Charlestonians are wont to walk and view the ocean.



CIRCLE—South Carolina Hall, with St. Michael's Church in the distance. The hall was erected in 1804. The church marks the site of the first church in town, constructed of cypress logs and later burned.

These pictures are in illustration of the article, "A City of Romance," by Virginia L. Porcher, beginning on page 31.

ABOVE—One of Charleston's old houses, reminiscent of English homes of its time, and with gable ends extending to the street. In the garden back of the old brick wall there is a profuse growth throughout the year.

There used to be a light high up in the steeple of St. Philip's Church (above) for the guidance of vessels on the ocean. The structure at the left is the old Planters' Hotel. The Huguenot Church is on the right side. Nearby stood one of the very first theaters in America.

A VOCATION looked on as degrading will . . . degrade those who follow it . . . If indeed there were an employment which could not be dispensed with, and yet which tended to degrade such as might be devoted to it, I should say that it ought to be shared by the whole race, and thus neutralized by extreme division, instead of being laid, as the sole vocation, on one man or a few . . . So far is manual labor from meriting contempt or slight, that it will probably be found, when united with true means of spiritual culture, to foster a sounder judgment, a keener observation, a more creative imagination, and a purer taste, than any other vocation. Man thinks of the few, God of the many; and the many will be found at length to have within their reach the most effectual means of progress.

—*William Ellery Channing* (1842).
